A tentative program of permanent relief, worked out by the men on the ground, was adopted by the state board of the Red Cross, Archbishop Ireland presiding. Its administration was placed in the hands of a special committee composed of W. A. McGonagle, president of the Duluth, Missabe and Northern Railroad, chairman; Mr. Beek and Mr. Lies. The executive officer is Colonel F. E. Resche, chief probation officer at Duluth, who had been in the burned district as an officer of the National Guard. Temporary houses had been built, the Treasury Department co-operating by waiving customs duty on lumber from Canada, the only source of a quick supply. The permanent relief plan had for its main feature the building of houses—a prime need in that northern climate. Building operations are going on vigorously, largely by the men themselves under direction of carpenters. Some are able and willing to rebuild their own homes, and to those who prefer log houses the committee gives doors, windows, hardware and lumber for roofs and floors. A warehouse and administrative headquarters have been established, typhoid checked, the guardsmen practically all withdrawn, the local banks reopened for business in temporary buildings erected over their vaults, which escaped the fire and, in Mr. Bicknell's words, "a general air of activity and industry has taken the place of the idleness and depression of the first few days after the fire." Barring unforeseen obstacles, no further relief will be needed beyond an appropriation for seeds and agricultural implements which will be asked of the Legislature.

HALF MILLION RELIEF GIVEN

At the annual meeting on December 6 it was reported that during the past year the Red Cross has assisted in the relief of sufferers from the storm at Key West, Fla.; the mine fire at Cherry, Ill.; mine explosions at Mulga and Palos, Ala.; and forest fires in Idaho, Montana, Washington and Minnesota. In all 506 lives were lost and 7,500 people required immediate help. The Red Cross expended $196,000 in relief and $218,000 more was spent in conjunction with it, making a total of $414,000 for relief in the United States by the organization or through its leadership. It contributed, also, to the sufferers from floods in France, Servia and Japan, and from the earthquake in Costa Rica. Relief was given sufferers from Armenian massacres, and to the captured army of President Zelaya of Nicaragua, which consisted largely of boys from twelve to fourteen who were found in a starving condition. The total contributions to foreign disasters were $66,500, making the total disbursements for the year amount to $480,500.

Encouraging progress toward the endowment fund of $2,000,000 was reported, the committee in New York announcing that it had secured $510,000. Thirty-six states have thus far organized under the new plan, with a board of representa-

tive men in each state who are to be custodians of Red Cross funds and advisers in the conduct of relief measures within their states. The value of such boards has been practically demonstrated during the year. Fifteen charity organization societies have been appointed institutional members, under pledge to lend trained social workers to the Red Cross for executive work in administering relief. During the year such service has been rendered by the Atlanta Associated Charities, the Chicago United Charities, the Cincinnati Associated Charities and the Minneapolis Associated Charities.

PRIVATE HOSPITALS TRY CO-OPERATIVE BUYING

The first report has been issued by the fourteen larger private hospitals in New York which united to maintain a joint bureau of standards and supplies. This marks the initiation of a broad effort at co-operation, which it is believed would prove of great benefit for city and private hospitals in other places to duplicate.

The bureau has made careful investigations to ascertain the requirements of members, and qualities, quantities and sources of supply of different materials used by each. This has been followed by the obtaining of samples, standardization of requirement, drawing up of specifications, and securing and passing upon competitive bids, as preliminary to closing an agreement with the selected supplier. In little over half a year twenty-one agreements were closed for the purchase of about twenty-five different articles. These differ in form from those in ordinary commercial use, but now that the system has been put in operation the work will progress more rapidly.

The agreements are of two classes, local and general. Those in the first group, for such articles as ice, coal, and meats, are advantageous to hospitals within New York, but are not directly useful elsewhere except as a basis of comparative reference or for specifications for independent purchases. General agreements for articles such as gauze, incandescent lamps, paints, blankets, towels and drugs contain special provisions for deliveries outside New York. By a system of non-resident membership the usefulness of the bureau could be made widespread.

The plan of operation involves no interference with hospital autonomy, as orders under the agreements negotiated by the bureau are placed directly by the individual hospital. The expenses of the bureau are slightly less than $12,000 a year and a staff of four suffices for the work. The hospitals contribute to its support in proportion to their total current annual expenses.

The full success of the bureau could be assured by increased membership, which would reduce the proportionate expense of each participant and afford a larger buying capacity and thereby make it easier to negotiate purchasing agreements. Very considerable savings have already been effected by the members, according to the report, and the results show that co-operation in standardization and combination in purchasing are of benefit to hospitals as well as in the business world.

OPEN-AIR SCHOOLS NO LONGER MERE "FAD"

The opening of windows in a Providence school not quite three years ago was so novel a feat that the whole country watched. Newspapers reported it at length and committees came to inspect. The example set by Providence has been followed from coast to coast. Now the open-air school is almost taken for granted. In 1908 three cities had outdoor schools, in 1909, five; at present there are twenty-seven schools and some fifteen or sixteen cities have adopted this new feature of an educational system.

Boston, New York, Chicago, Hartford and Rochester, the pioneers after Providence, have had a number of imitators in the last few months. Pawtucket, R. I., besides establishing a very fine open-air school, has adopted the progressive policy, which also prevails in Boston, of including an open-air room in each new school building. Montclair, N. J., has started a school in a tent, which has attracted wide newspaper attention. In Orange, N. J., the new open-air school is run under the joint auspices of the

Board of Education, the Health Department and the Bureau of Associated Charities. These supply respectively teacher, medical inspection, and supervision of the special diet which it is customary to give the children in these schools. A somewhat similar plan is being started in Philadelphia.

Washington, D. C., Milwaukee, Wis., Albany and Buffalo, N. Y., and Oakland, Cal., have recently adopted the new gospel of fresh air for school children. In Detroit Superintendent Martindale has ordered that on pleasant days all classes in schools with large enough playgrounds shall be held outdoors.

A host of cities are seriously considering the opening of fresh-air schools, among which are Atlanta, Brockton, Columbus, Erie, Grand Rapids, Mich., Minneapolis, Newark, Toledo and Wilkesbarre. Pittsburgh has an open-air school supported by private funds and Philadelphia a private tuition school for normal pupils conducted out-of-doors.

The progress and spread of open-air schools seem to be pretty well assured. In another three years there will probably be such schools in fifty cities.

SOUNDING THE KNELL OF COMMON DRINKING CUP

Examinations in Hartford of 2,000 children suffering from sore throats, showed in nearly a third true diphtheria germs. In Minnesota the inspection of throats of thousands of apparently healthy people disclosed virulent diphtheria germs in nearly one per cent. Such discoveries led to agitation against the common drinking cup.

Recently THE SURVEY noted that drinking utensils for common use are prohibited in streets, public parks, hotels, theaters, public schools, railroad stations, trains, and ferryboats in seven states. In California the pupils publicly smashed and buried every common drinking vessel in each school building the day the new rule went into effect. Sixteen railroad companies now provide individual drinking cups. Forty state boards of health have condemned the public cup.

Some of the cities which have passed ordinances on the subject are St. Louis, Portland, Ore.; Boise, Ida.; Little Rock, Ark.; Wheeling, W. Va.; Fargo, N. D.; Colorado Springs, Camden, S. C.; Elgin, Ill.; Childress, Tex.; New Rochelle, N. Y.; Georgetown, Pa.; Rutland, Vt.; Syracuse, N. Y.; Warwick, R. I., and Cranston, R. I.

The Colfax school district in Pittsburgh from public funds has supplied individual cups to 800 pupils. St. Louis has taken advanced measures to enforce the sterilization of cups, glasses, forks and spoons in all hotels, restaurants, bars and soda fountains, which is an added step much needed.

To make the reform effective it is necessary not only to abolish the old style drinking cup, but to afford proper facilities for obtaining individual cups. In Wisconsin and Massachusetts this fall people have been seen using the cover of a water tank as a drinking cup while others have put their lips to the faucet. Apparently containers must be provided that will make it impossible for unconventional people to pollute the water supply.

While the new laws apply to public fountains and not to drinking places in factories, many of these are voluntarily adopting sanitary drinking systems. A corset shop in Worcester employing 1,500 persons has installed, at a cost of $5,000, a system of forty drinking fountains in the different departments. The water is filtered and passed through an ice-making machine and then is conducted through brass pipes to different parts of the establishment. It is drawn from bubbling fountains which make a cup unnecessary.

The factory inspector of Rhode Island has recently sent out requests to the factories to have cupless attachments placed on their faucets. He claims that the state law requiring that fresh drinking water of good quality be supplied includes the prevention of contamination up to the time it reaches the lips of those using it. This is perhaps the first case where such a request from a state officer has come from one other than the health commissioner.

The crusade for sanitary drinking arrangements, which has led the makers of a popular beverage to supply a paper cup with each five-cent drink, has passed beyond the stage where it was popularly regarded as a Kansas freak, for it was that state which passed the first regulation. The public can do much to help. A soda fountain which put in individual cups to be used if the purchaser requests, serves ninety-nine drinks in glasses to one in the sanitary paper cups, in spite of a conspicuous sign offering them. If there were a demand for them, other fountains would have to follow suit. And a very small protest, we must believe, would displace the single glass which, in the lobby of the New York Academy of Medicine, serves the doctors and such of the laymen as attend meetings on medicine and sanitation.

PLAN TO PRACTICE BUSINESS ETHICS

An organization with an ethical philosophy behind it and an ethical purpose ahead of it has been formed by some of the business men who are members of the Ethical Culture Society of New York. At present it is in the nature of a voluntary committee holding periodic meetings in the new meeting house at the corner of Sixty-fourth street and Central Park West. Stated succinctly, its purpose is this: first, to understand, and then to put into practice, business ethics. The members comprise heads of manufacturing and commercial establishments in New York city.

The organization, according to the statements of its founders, is not one with a definite social program. It has not armed itself with preconceived ideas of reform. It is an outgrowth of the ethical philosophy which briefly put teaches that the individual born into this world is surrounded with social duties; that these duties center in the paramount obligation to aid in the harmonious, all-embracing development of human society; and that the performance of these duties constitutes the chief object of existence. The movement roots in this conception. It is therefore nothing hasty or ephemeral or superficial. Its desire is that its efforts shall fructify in the application by the members in their own business of those ethical principles which are espoused by them as members of the Ethical Culture Society.

At present the committee is engaged in informing itself, through lectures and discussions, as to the best that is being done in civilized countries by employers for their employes; in a word, as to welfare work affecting the wage-earner. It is the object of the members to acquaint themselves thoroughly with the immediate conditions under which employes, especially their own, are forced to live. They frankly admit that at present their knowledge of their employes does not extend beyond the wage they pay them. To go beyond the payroll into the family circle, to discover what sort of home the payroll creates—this is the more immediate plan of the committee. Social cooperation and mutual assistance are fundamental working principles in its activities.

It is hoped that as a result of this campaign of education ways may be opened, both to members of the committee and to other employers, for the removal of those limitations which today render the lives of thousands of families socially undesirable and mock at the ideal of an harmoniously developed community. To make the life of each employe a social asset is the practical aim of the organization.

THE SOCIAL IMPORTANCE OF MAGISTRATES' COURTS

The importance of magistrates' courts from the standpoint of humanitarianism and citizenship was brought out strongly by Alfred R. Page at the New York State Conference of Magistrates at Albany. Mr. Page spoke as a justice of the Supreme Court, and as chairman of the state commission which thrashed out the whole question of minor courts in New York city and resulted in the Page law, which worked great improvements in their organization and administration.

The minor courts include the usual police or magistrates courts, the juvenile courts, and the Court of Domestic Rela-

tions. They form an institution capable of working the greatest social good or ill. Their responsibility is especially great, Mr. Page said, in cases of immigrants whose whole conception of our government often depends on their experience with our police and police courts. A mistake made in a higher court may be overruled in the Court of Appeals, but a mistake in a lower court usually stands uncorrected. In scarcely any other court does the personality of the judge count for so much.

In that he gave the cue for, without expressing, the dissatisfaction which social workers feel for the personality of many magistrates. Partly because of the law, partly for lack of appropriate institutions and efficient probation, and often largely because of their personal attitude, they have been the stronghold of the antiquated system of petty fines and short repeated sentences which shows up badly, for instance, in such a study as was printed in the inebriety issue of THE SURVEY.[1] It was all the more to the credit of the conference, therefore, that it voted to bring to the attention of the Legislature the need for enlarging the State Training School for Girls at Hudson. As a whole the magistrates have been most reluctant to commit girls to Hudson and women to Bedford Reformatory on indeterminate sentences.

This Albany conference was the second such gathering of magistrates in New York, which shares with Massachusetts and Michigan the credit of meetings at which the judges of minor courts gather to discuss methods and procedure. Forty magistrates from twenty-six cities and nine villages, and representatives of the State Probation Commission were present. The meetings resulted in a permanent organization which will seek to study and confer about the problems of the inferior courts of the state and to promote desirable legislation. The president is Police Justice John J. Brady of Albany; the vice-president, Magistrate Otto Kempner of New York; and the secretary-treasurer, Arthur W. Towne, secretary of the State Probation Commission.

Resolutions were passed urging the press not to publish names and descriptions of children taken before the juvenile courts; and recommending that the state establish a reformatory for male misdemeanants, a colony for vagrants, and special institutions for inebriates. There was an interesting discussion of the use of the summons to avoid unnecessary arrests. Judge McAdoo declared the plan had worked well in New York under the Page law, and a resolution was passed urging the Legislature to authorize such practice throughout the state in children's and other suitable cases.

[1]October 5, 1910.

MOUTH HYGIENE MASS MEETING

Careful examination and especially actual treatment of the decayed teeth of school children is a phase of medical inspection which is getting more and more attention. In Rochester, N. Y., the dental society, which with the assistance of the health association and the Board of Education has maintained a free dental clinic for five years, conducted a three weeks' campaign in the public and parochial schools, which ended with a mouth hygiene mass meeting in Convention Hall. Forty schools were visited, and lectures illustrated with 200 views delivered. A small booklet containing reasons for keeping the teeth clean was given to each child. Dentists from all over the country contributed their services. Dr. John P. Corley of Sewanee, Tenn., and William H. Allen of New York were the principal speakers from outside the city. One of the schools gave a special toothbrush drill at the mass meeting, at which the mayor awarded to the dental society the prize of $1,000 given by William Hodge for the most deserving charity in the city.

The Associated Charities of Spokane, Wash., last fall conducted a free dental clinic for children at the City Hall. In Los Angeles the dental association built a bungalow on the grounds of the Children's Hospital, where it gives professional services free of charge to children whose parents are unable to have the work done at regular prices, and who are recommended as being eligible for treat-

ment by the Children's Hospital Committee of the Los Angeles Federation of Parent-Teacher Associations. In Philadelphia, though for years the medical inspectors have reported cases of decayed teeth, it was not until this fall that practical measures were taken to see that the recommendations the doctors made were followed. A number of dentists volunteered their services and many children were brought to the City Hall to be treated. In Indianapolis the Board of Health is beginning to devote special attention to the inspection of teeth, largely through the efforts of Dr. George E. Hunt. These are a few of the instances throughout the country that show an awakening to the importance of having sound teeth to ensure good health.

MUNICIPAL COMMISSION ON NEGLECTED CHILDREN

After careful inquiry made over the whole country, through correspondence, personal interviews, and investigations, the St. Louis Commission on Delinquent, Dependent and Defective Children has outlined its report to be made in February to the Municipal Assembly. The field is inclusive because of a rather remarkable ordinance reading in part: "An ordinance to create a commission to investigate and report as to the best method of the care and education of delinquent, dependent and defective children of the city of St. Louis, and the best plan for the removal and re-organization of the St. Louis Industrial School, and to make an appropriation to pay the expenses and outlays which may thereby be incurred."

The ordinance was the outcome of a conference between the Board of Education, an independent body, and representatives from both houses of the Municipal Assembly. Though the resulting ordinance establishing the commission is extremely broad in scope, the conference was called principally to devise some method for the removal and reorganization of the city's Industrial School. This is an old congregate institution, built in 1850-60, which houses under two separate departments 200 delinquent and 300 dependent children from three to seventeen years old. The Board of Education conducts the school of the institution under contract. Although the institution is well administered, social workers have all, at one time or another, advocated its removal to the country. The report also involves the work of the Board of Education so far as these groups of children are concerned.

HARTFORD REGULATES CHILD STREET-TRADES

For a number of years attempts have been made to secure city ordinances to regulate the street trades in Hartford and New Haven, Conn., and twice bills to the same effect have been introduced in the Legislature, but all such regulation has been systematically opposed by one of Connecticut's leading papers, the Hartford *Times*, which employs about thirty-five newsgirls. For some months past the Juvenile Commission of Hartford, a kind of local children's bureau chartered in 1909, and some interested members of the Consumers' League of New Haven have been at work on an ordinance for both cities, which was passed in Hartford by unanimous vote and accomplishes for that city what the friends of children have worked so long to secure. The text is both simple and brief:

> No child under the age of ten years shall be allowed to sell, offer for sale, or distribute any article of merchandise on the public streets or in any public place within the city. No child between the ages of ten and fourteen years shall be allowed to sell, offer for sale, or distribute any article of merchandise during the hours in which the public schools are in session, or later than eight o'clock in the evening, or until such child shall have obtained a badge or permit so to do from the superintendent of schools. Said license shall be issued without fee and in the discretion of said superintendent, under such restrictions as he shall deem expedient, and shall be revocable at his pleasure; provided, however, that no child shall be discriminated against or refused such license solely on the ground of sex. Application for such license shall be made in the child's behalf by his parent, guardian, or next friend.

The commission published its first annual report March 31. Its first work was to investigate everything that was

being done in the city for children, either by public or organized private effort, and its report gives the results of this investigation. It discovered 883 children between fourteen and sixteen years of age out of school and presumably at work, 487 of whom were at work in factories and stores. The plan of the commission is to co-operate with all the agencies already at work, referring to them cases which come to its knowledge and belong under their jurisdiction.

The success which seems to have been so easily won is probably due to the high estimation in which the members of the commission are held, to the thoroughness of its work, and to the co-operation of the committee on ordinances and the mayor.

The clause regarding newsgirls was included on the principle, that so long as it could not be proved they were demoralized by the work they should be permitted to go on with it. The evidence gathered has shown that "the Hartford newsgirls are a pretty good sort of girl after all." The fight to prohibit them from selling papers has been going on for something like twenty years.

ALICE WILLARD SOLENBERGER

ERNEST P. BICKNELL

Alice Willard Solenberger died at her home in Landsdowne, Pa., on Thursday, December 15, 1910. Behind this simple announcement is the story of a rarely useful and beautiful life, ended just as it rounded into a rich maturity.

Ten years ago Alice Willard was in charge of the central district of the Chicago Bureau of Charities. This district embraced the downtown section of the city and contained a great number of cheap lodging houses for men as well as other resorts into which gathered, particularly in winter, larger numbers of drifting, homeless, degenerating men and boys. Into the noisome stagnation of these institutions came unsophisticated young men from the country, lads who had run away from home, broken men on the borderline of crime, professional beggars and fakirs, petty criminals, sturdy laborers who in the summer had earned a little money in the harvest fields of the Northwest or on the lakes, and had come to spend the winter in idleness or in a vain search for employment.

Many hundreds of these men and boys within two or three years wandered into Alice Willard's little office. Some required food, clothing, or medical care. Others pretended need. All found a welcome and a friend, but none a dupe or victim. Those who went to deceive surprised themselves by telling her the truth. A confidence-impelling power was hers which often led to the most unexpected results. Beggars and tramps, confirmed in their manner of life, gave her the real facts about their homes and families and transgressions. More than one hardened fellow became her ally, and helped her search out the young boys and persuade them to go home to their parents. She had so many sources of information that her power of securing hidden facts from the lodging houses and saloons and dark places seemed almost uncanny.

It was a logical development that Alice Willard became especially interested in those stubborn problems which make the homeless man one of the most difficult obstacles in the path of social betterment. With unusual opportunities for the collection and study of data and with admirable thoroughness and patience, she gradually gathered together a body of information of the greatest value. Throughout the eleven offices of the Bureau of Charities all the superintendents and visitors knew that Alice Willard was the authority on homeless men, and her advice was in constant demand. Eventually an order was issued that all homeless men applying for help in any office of the bureau should be sent to the office of the central district. Here was a cheerful, attractive, fun-loving and wholly normal young woman, unquestionably recognized as the most skillful and best informed person in a city of two million people in all matters pertaining to homeless men and boys.

It was while both were connected with the Chicago Bureau of Charities, about

seven years ago, that Alice Willard and Edwin D. Solenberger were married. Although her active relation to the bureau ended, Mrs. Solenberger lost none of her interest in efforts for social betterment and continued her study of the problems of the homeless man. When Mr. Solenberger's appointment as general manager of the Associated Charities of Minneapolis required their removal to that city, Mrs. Solenberger entered actively and influentially into social movements there, and later became a strong and helpful member of the social workers' group in Philadelphia, after her husband had become general secretary of the Pennsylvania Children's Aid Society.

The valuable data which Mrs. Solenberger had collected upon the subject of homeless men and the unusual success of her work in their behalf led the Russell Sage Foundation to invite her to prepare a book embodying her knowledge and views upon this topic. It is stated that the manuscript for the book was recently completed and that it will soon be published.

Mrs. Solenberger was of a high type of womanhood. Large minded, deeply and actively interested in many movements making for social improvement, she was yet a devoted mother who brought to her family the patience and tenderness and wisdom which must make of her home a fragrant memory to those who knew its happiness.

CONSULTING HOUSEKEEPERS

MARY K. SIMKHOVITCH
Headworker, Greenwich House, New York

In these days of standardization the home is left marooned. The consulting physician is summoned in hours of illness by the anxious mother; the father employs a standardizer to come in and set his factory right; the town in which the family lives employs an engineer to perfect a town plan; the architect plans the house and the landscape architect the grounds; the children go to a school, which presumably has some sort of a duly considered educational program; the hospital knows what it is about from laboratory to operating room; even American cities are taking themselves in hand and asking how they can use their incomes to the best advantage, although they are not yet alive to the more important question of how that income can be increased.

In all this modern maelstrom of organization and efficiency where is the home?

In many of our states farmers can get expert advice in regard to the use of soils. They can learn how to obtain a maximum productivity for the least expenditure. But the farmer's wife, like everybody else's wife, has been left to go it alone. She is governed by tradition on the one side and her belief in her own capacity on the other. She thinks very little of training and is inclined to believe that she can work out her own economic salvation without outside assistance. This does not show any inherent weakness in the individual woman, but simply indicates that organization, which has developed in every other field, has not yet penetrated to the home.

Women are wise. They know that much so-called training is nothing but a new way of spending time foolishly, and that experience is the most valuable of teachers. They are not averse to learning, however, if they are convinced that the method is sound. They merely view with suspicion, often well grounded, any scheme which has not been thoroughly worked out. The love of the new and exciting, common to men and to very young women, fails to appeal to the mature housekeeper. But she will not prove impervious to ideas of efficiency and standardization if they are presented in a concrete and practical way.

Not only every agricultural school, but every training school teaching household administration, should include the development of a corps of Consulting Housekeepers (capital C. H. you notice). The work of such a Consulting Housekeeper would be to go into a home, study the situation thoroughly, and make a careful report on how that household could be administered with a maximum of efficiency on the income available. The time

necessary for such a study and the nature of the report would vary according to the size or complexity of a given household. Fees would vary in proportion. Such a Consulting Housekeeper would naturally on request install proper bookkeeping, would indicate what proportion of income should be devoted to the different elements of the budget, would give instructions necessary in simple sanitation, and would in fact thoroughly overhaul the household management.

It is possible and probable that a certain amount of useful work could be done in bringing about efficiency in the home life among small wage-workers, but it is in families with an income of from $1,000 to $10,000 that this plan would be of the most use. In the lower income groups the income is so small that necessity proves of itself a sort of automatic standardizer. The emphasis in such families should be placed rather on procuring a larger income.

THE TREND OF THINGS

A very interesting booklet is the first annual report of the United Charities of Chicago. The story of the first year's work of the organization, formed by the Relief and Aid Society and the Bureau of Charities, is well told, well printed, and illustrated by charts and remarkably good photographs. A few of the latter—one, for instance, of a sick man surrounded by his family—invade home privacy perhaps more than they should, but for the most part the pictures are not open to this criticism, but are illustrative of fresh air and nursery work. The work of each of the eleven districts is described well and succinctly. Through these and the registration bureau, the United Charities, during the year ending in April, 1910, came into contact with 14,191 families, or 55,894 persons. For food, fuel, clothing and rent, $55,986.16 was spent. In the Home for Men 436 men, many of them convalescents needing special care, were provided for at an expenditure of $1,497.48, and advice or employment was given many other stranded men. Besides distributing 750 tons of coal for the Coal Dealers' Association and acting as almoner for the Soldiers' Home Committee, the United Charities has carried on many and varied social activities. In the Mary Crane Day Nursery, where a daily average of fifty-three children ranging from three months to ten years were cared for, the relief department supplied both work and instruction for mothers through the domestic science kitchen, the laundry and the sewing room, where work is done for the various departments of the association's charitable work and not for the market. The nursery is equipped with a kindergarten, a milk depot, a dispensary, and a roof garden. But the work for children is not limited to the nursery. The summer infant welfare work carried on for several years by the Relief and Aid Society was very much extended this season with the co-operation of the Board of Health. The work was centered around the thirty distributing stations of the Milk Commission, to which a corps of nurses was assigned; five tents, some on the roofs of houses, were equipped, partly by private contribution and partly by an appropriation through the Board of Health. Visiting nurses, doctors and lecturers were employed and by the end of the summer the Board of Health reported a death rate sixteen per cent lower than the preceding summer.

The Fresh Air Department sent 2,640 children on two-week visits to friends of the society in the country or to the society's summer home, Camp Algonquin.

For tubercular children the United Charities, in co-operation with the Board of Education, conducted an open-air school with forty-nine pupils and the record of the year's experiment shows a gain for these children in weight, energy and intelligence. Other branches of the United Charities' activities are the social Service Department of the Cook County Hospital and the Inquiry Department which furnishes information in regard to charitable institutions. The total expenditure for the year throughout all branches of the work of United Charities was $195,622.64.

* * *

The American Steel and Wire Company has gotten out a pamphlet on the accident relief plan inaugurated by the United States Steel Corporation. It gives the terms of the plan in thirteen languages: Polish, Slavish, Croatian, Hungarian, Swedish, Norwegian, Finnish, Greek, Turkish, Armenian, Italian, German, American.

* * *

The last number of the *American Journal of Sociology* contains a study of "non-family" men in lodgings in Chicago. These are not 'hoboes' but the steadily working, unskilled laborers in the steel works, on the streets or railroads or in lumber camps—those classes "whose life is dominated by industry . . . all whose other interests are subordinated to the chance of a job, and whose family life is given up for sordid surroundings, inadequate wages and unremitting toil—the latter broken by sleep and periodical unemployment."

Eight hundred and fifty men were studied in ninety-six groups. A large proportion were in the prime of life and forty-seven per cent had wives and families at home whom they hoped to bring over in time. In the meantime they were permanent lodgers living in rooms, the vast majority of which proved to be crowded to such an extent as to violate the law. Croatians, Servians and Bulgarians—

"hewers of wood and drawers of water"—for the most part lived under a lodging boss at three dollars a month, occupying a bed and paying for their own food, which was cooked by the boss or his wife, who sometimes also did the laundry for the group. In other cases they lived on a co-operative basis without a boss and shared expenses for lodging and food alike. A large number of these worked at the steel works earning sixteen dollars a week for a twelve-hour day. Practically all were unskilled.

The Italians, of lighter build and of longer residence in this country, were not for the most part engaged in heavy or ill-paid work, but were many of them union members employed in the building trades, working only eight hours a day. Few even of the unorganized worked a twelve-hour day. Lodging conditions were much the same as in the case of the Bulgarians, Servians and Croatians. The study covered also thirty-nine Greeks, whose condition presented individual elements in that all but four men were in business on their own account as bootblacks, fruit and flower dealers, etc., and very few were married. Their lodging arrangements were peculiar to themselves. They lived on the co-operative plan, hired whole houses, generally of the small two-story frame variety, in the lower story of which they stabled their horses and stored their pedler's wagons. Except for the presence of these stables the houses occupied by the Greeks were the only ones that were clean and well cared for. Some light is thrown on the bad housekeeping in most of the houses as well as on the complete lack of family influences by the fact that in the lodgings of these 850 men only eighty-nine women and children were found.

• • •

The Women's Municipal League of Massachusetts reports an interesting experiment in prenatal care made by its committee on infant social service. In the past eighteen months a visiting nurse has had supervision, up to within a few weeks of confinement, of some 600 pregnant women, advising them in matters of simple hygiene and seeing, when their symptoms demanded, that a doctor was called in. The year and a half's record shows no deaths at confinement, only three miscarriages, and though almost one-eighth of the women cared for showed the first symptoms of eclampsia, so promptly were they treated that not one case was allowed to develop. When to this record is added an average weight of the babies born of nine per cent above the general average, the committee feels that its prenatal care has been justified by results.

The word orphan is not used in all Australia, nor is there an orphan asylum—facts interestingly brought out in the report of the Children's Council of South Australia, which has a population of 250,000. THE SURVEY is indebted to Dr. Bayard Holmes of Chicago for a summary of its contents. Its method is common to all the Australian states.

During the year ended June 30 last, 1,479 children were under its control, 1,220 of whom were boarded out, seven in hospitals and thirty-two in institutions for defectives and delinquents The total budget was about $100,000, of which fifteen per cent was for central administration. The expenses for the children boarded out, including administrative expense, was twelve pounds a year, or about five dollars a month, each. Some of these children, working part time after they are thirteen, earned and deposited in the Postal Savings Bank a total of $6,500 . Applications for children, which are always greater in number than the children to be placed out, totaled 364. Visits and reports on the homes selected are made by both official and volunteer inspectors.

One of the most notable results of the council's work is the reduction of mortality among illegitimate children from 27 per cent to 4.58 per cent. All illegitimate children, whether destitute or not, are in its care and it has charge of 231 lying-in homes.

• • •

"To provide those who are called upon to contribute to the financial support of these institutions, societies, or clubs, with specific information which will be useful in determining the preferable channels for the distribution of that financial assistance which the average business man is daily called upon to render," is the ambitious purpose of a report just issued by the Rhode Island Bureau of Industrial Statistics upon the Charitable and Philanthropic Agencies in Providence.

The pamphlet, which was compiled by George H. Webb, commissioner, and Carol Aronovici, special agent, contains a synopsis of the report of each organization arranged in alphabetical order. The name and address of each institution are given, the object and scope of the work undertaken, under what auspices it is conducted, the names of officers, members of executive committee and directors, who decides upon amount paid or assistance to be rendered, limits of work, number of beneficiaries, property valuation, income from private contributions and from public funds, how funds are collected and whether or not accounts are audited regularly. The investigation excluded all charitable or philanthropic agencies which were conducted strictly as branches of church or parish work.

The report contains a serviceable classification of the organizations whose activities it describes, and a discussion of the work done in each field of effort. Four agencies failed to reply to the inquiries sent. The report states that "in so far as we have been able to gather data concerning the cost of charitable and philanthropic work of the city of Providence, this is, so far as we are aware, the first study of its kind.

COMMUNICATIONS

THE WESTMORELAND STRIKE

To the Editor:

I have read with much care and with keen interest the article on The Westmoreland Strike, published in The Survey for December 3, and I wish to compliment the writers of the article upon their comprehensive and thoroughly impartial review of the causes, the progress, and the status of this industrial contest.

During the ten years of my presidency of the United Mine Workers of America, I became quite familiar with the policy of the coal companies operating in this field and with the character of the workmen employed in the mines; and it is entirely within the lines of conservatism to say that no group of employers has been more hostile to the establishment of trade organizations, or more inconsiderate of the welfare and safety of its employes than has the group of coal operators in the Westmoreland field of Pennsylvania. These operators have always refused to pay as much wages or to concede as reasonable hours of labor as obtain in the competitive coal fields located east and west of them.

The coal seams underlying Westmoreland county are so advantageously situated, that the companies operating the mines there are able to ship their product to both the eastern tide-water markets and the western Pittsburgh market. This is an advantage enjoyed by no other coal field in Pennsylvania; and because of the favorable location of the mines, these companies are well able to pay the rates of wages prevailing east and west of them and to accord their employes the same hours of labor and conditions of work that are now enjoyed by the miners in the central district of Pennsylvania, to the east of them, and in the Pittsburgh district, on their west.

The refusal of these companies to treat their employes with that broad spirit of justice and fair play that has been the predominating factor in promoting industrial peace and prosperity in other coal-producing counties of Pennsylvania is the genesis of the present strike in Westmoreland county.

No amount of subterfuge on the part of these coal companies will convince anyone familiar with the situation that the responsibility for this strike should be placed upon anyone else. It is puerile for them to say that the strike was caused by the machinations of "agitators" from other fields. Men do not strike for nine months to gratify the ambitions of the "agitator"; they will not endure the long, weary struggle of hunger, eviction, and idleness unless they have real grievances to correct; men will not subject their wives and babies to the cold winter blasts, to the danger of living in tents, suffering the indignities and hardships that the men and their families in Westmoreland county have undergone, unless some great principle is involved.

The miners of Westmoreland county are fighting for the right to live their own lives in their own way; they are contending for the right to have a voice in determining under what conditions they shall live and work. This principle is as dear and as fundamental to them as workmen as are the blessings of liberty to them as citizens.

John Mitchell.

New York.

IN THE NIGHT COURT

To the Editor:

Homer Folks asks in your columns where I got my information that "the men who crowd the Night Court all see if a girl is given a clean bill of health by dismissal, and some of them often follow her out of the court." My informant was Lavinia L. Dock, who says that she has seen it with her own eyes. Of course, the statement does not apply to the girls who were sent to the hospital while clause 79 was in effect, or to the workhouse, but only to those let off with a fine.

Alice Stone Blackwell.

Dorchester, Mass.

"ON AGAIN!"

To the Editor:

I have sent The Survey to several friends. One, a prominent manufacturer, writes: "I wish to thank you for several recollections since you were here, but mainly for The Survey. This is quite a wonderful magazine for, like Finnegan's letter to Flanagan, 'it boils reports down to almost the ultimate word'."

CALENDAR OF CONFERENCES

Changes—See new dates for Federal Council of Churches of Christ in America, and New Jersey Conference of Charities and Correction.

International (previously announced).

International Congress on Tuberculosis. September 24-30. Rome, Italy. Secretary-general, Professor Ascoli, Via Lucina. Rome, Italy.

International Association for Labor Legislation, September, 1912. Zurich, Switzerland. Secretary, Stephen Bauer, Basle, Switzerland.

International Prison Congress (Quinquennial). London, 1915. Secretary, F. Simon van der Aa, Groningen, Holland.

National (New)

National Conference on City Planning, March. Philadelphia, Pa. Secretary, Flavel Shurtleff, 19 Congress street, Boston, Mass.

American Society of Municipal Improvements, September 26-29. Grand Rapids, Mich. Secretary, A. Prescott Folwell, 239 West 39th street, New York city.

National (previously announced.)

National Civic Federation. January 12-14. New York city. Secretary, D. L. Cease, 1 Madison avenue, New York city.

December 31, 1910.

Federal Council of Churches of Christ in America. January 24-26. Washington, D. C. Corresponding secretary, E. B. Sanford, D.D., 81 Bible House, New York city.

American Society of Sanitary and Moral Prophylaxis. Second Thursday in February and April. New York, N. Y. Corresponding officer, James Pedersen, M.D., 29 West Forty-second street, New York city.

Federated Boys' Clubs. Annual Meeting February 15. Fall River, Mass. Executive secretary, Arthur B. Leach, Room 308, 35 Congress street, Boston, Mass. Annual Conference, June, Brookline, Mass.

Religious Education Association. February 14-16. Providence, R. I. Secretary, Henry F. Cope, 153 Michigan avenue, Chicago, Ill.

National Child Labor Committee, March. Birmingham, Ala. Corresponding officer, Owen R. Lovejoy, 105 East Twenty-second street, New York city.

National Association for the Study and Education of Exceptional Children, March or April. New York city. Corresponding officer, Waldemar Gronsmann, Pittsfield, N. J.

Convention of the Young Women's Christian Association of America, April 19-27. Indianapolis, Ind. Secretary, Lois J. Viele, 125 East Twenty-seventh street, New York city.

American Federation of Arts, May. Washington, D. C. Secretary, Leila Mechlin, 1741 New York avenue, Washington, D. C.

National Conference of Charities and Correction, June 7-14. Boston, Mass. Secretary, Alexander Johnson, Ft. Wayne, Ind.

National Probation Officers' Association, June 5-14. Boston, Mass. Secretary, Roger N. Baldwin, 906 Security Building, St. Louis, Mo.

National Women's Trade Union League, June. Boston, Mass. Corresponding officer, Mrs. D. W. Knefler, 5,273 McPherson avenue, St. Louis, Mo.

National Federation of Remedial Loan Associations, June. Boston, Mass. Secretary, J. T. Lincoln, 914 G street, N. W., Washington, D. C.

Conference on the Education of Dependent, Backward, Truant and Delinquent Children, June, Boston, Mass. Secretary, Elmer L. Coffeen, Westborn, Mass.

National Conference of Poor Law Officials, June 7. Boston, Mass. President, Dr. Robert W. Hill, State Board of Charities, 105 East Twenty-second street, New York city.

American Academy of Medicine. Annual meeting, June 24-26. Los Angeles, Cal. Secretary, Charles McIntire, M.D., 52 North Fourth street, Easton, Pa. Subject of both meetings: Medical Sociology.

American Medical Association, June 27. Los Angeles, Cal. Secretary, George H. Simmons, M.D., 535 Dearborn avenue, Chicago, Ill.

National Education Association of the United States, July. San Francisco, Cal. Secretary, Irwin Shepard, Winona, Minn.

National Fraternal Congress, August 21. Mackinac Island, Mich. Secretary, C. A. Gower, Lansing, Mich.

American Hospital Association, September 19-22. New York city. Secretary, J. N. E. Brown, M.D., Toronto General Hospital, Can.

American Prison Association, September. Omaha, Neb. Secretary, Joseph P. Byers, 13 Central avenue, Newark, N. J.

American Board of Commissioners for Foreign Missions, October 10-13. Milwaukee, Wis. Secretary, Cornelius H. Patton, 14 Beacon street, Boston, Mass.

National Conference of Catholic Charities, September, 1912. Washington, D. C. Secretary, William J. Kerby, D.D., Catholic University, Washington, D. C.

STATE AND LOCAL (NEW)

New York City Conference of Charities and Correction, May 9-11. New York city. Secretary, John B. Pine, 287 Fourth avenue, New York city.

Missouri Conference of Charities and Correction, November. Kansas City, Mo. Secretary, W. T. Cross, State Board of Charities and Correction, Columbia, Mo.

New York Conference of Charities and Correction, November 14-16. Watertown, N. Y. Secretary, John A. Kingsbury, 105 East 22nd street, New York city.

Pennsylvania Conference of Charities and Correction, November 14-16. Pittsburgh, Pa. Secretary, Fred S. Hall, 1533 Real Estate Trust Building, Philadelphia, Pa.

STATE AND LOCAL (PREVIOUSLY ANNOUNCED)

Colorado State Association for the Prevention and Control of Tuberculosis, January 15. Denver, Colo. Secretary, S. Poulterer Morris, Room 29, State House, Denver, Colo.

New York Child Welfare Exhibit, January 18-February 12. New York city. Secretary, Roy Smith Wallace, Room 5,105 Metropolitan Building, New York city.

Alabama Conference of Charities and Correction, March. Birmingham, Ala. Secretary, Maurice Willows, Birmingham, Ala.

Connecticut Conference of Charities and Correction, April. New Haven, Conn. Secretary, Charles P. Kellogg, Waterbury, Conn.

New Jersey Conference of Charities and Correction, April 2-4. Princeton, N. J. Secretary, J. Byron Deacon, 1701 Chestnut street, Philadelphia, Pa.

Arizona Association for the Study and Prevention of Tuberculosis, May. Bisbee, Ariz. Secretary, John W. Flinn, Prescott, Ariz.

Canadian Conference of Charities and Correction, May 8-12. Hamilton, Ont. Secretary, F. M. Nicholson, Parliament Buildings, Toronto, Ont.

New England Conference on Street Cleaning, June. Springfield, Mass. Corresponding officer, Carol Aronovici, 55 Eddy street, Providence, R. I.

Northern Baptist Convention, June 13. Philadelphia, Pa. President, Emory W. Hunt, Denison University, Granville, O.

Sagamore Sociological Conference, June 27-29. Sagamore Beach, Mass. President, George W. Cabot, 348 Congress street, Boston, Mass.

Stony Brook Assembly, August. Stony Brook, L. I. Director, J. W. Jenks, Cornell University, Ithaca, N. Y.

Pennsylvania Association of Directors of the Poor and Charities, October 10-12. Indiana, Pa. Secretary, L. C. Colborn, Somerset, Pa.

Ohio Conference of Charities and Correction, November. Toledo, Ohio. Secretary, H. H. Shaw, 805 Harrison Building, 21 S. High street, Columbus, Ohio.

KEEP THE DOORS OPEN

Wider Use
OF THE
School Plant

By Clarence Arthur Perry

Illustrated. Price Postpaid, $1.25

PUBLIC MONEY PAYS FOR our costly, handsome, well equipped school buildings. To get the best results from this investment they must be kept open longer than seven hours a day. In many cities the day-instruction is now supplemented by other activities which yield large dividends in social and civic service.

THE COMMUNITY OWNS THE SCHOOLHOUSE. It is the natural neighborhood center, day and evening, the year round. It can be used effectively for a surprising number and variety of gatherings. It can serve the whole neighborhood and bring back to the taxpayers who paid for it a rich return in recreation, education and good citizenship.

THE DEPARTMENT OF CHILD HYGIENE of the Russell Sage Foundation, commissioned Mr. Perry to do this work. He has brought together the hard-won experience of many cities which have opened their schools to the people. He gives a practical outline of organization, cost and adminstration of "wider use". The introduction is by Dr. Luther H. Gulick.

SCHOOL EXTENSION OF THIS SORT was given a special session at the last meeting of the National Municipal League and has been widely discussed by Public Education Associations, Parent and Teacher Associations, Settlements and other organizations. Mr. Perry's book furnishes just the information needed to give the movement impetus. The chapter titles tell the story:

THE COMMON WELFARE

THE U. S. IMMIGRATION COMMISSION'S REPORT

What of a tale of adventure in forty volumes? That, after all, in spite of its statistical tables, in spite of its encyclopaedic length, in spite of other and sundry disguises, is the report of the Federal Immigration Commission now in press and introduced to the readers of THE SURVEY in this issue. For, when all is said and done, it is a narrative of exploration on the part of tens of thousands of "undistinguished Americans," as Hamilton Holt calls them, into the fastnesses of a new world and into the economic frontier of our civilization; and a tale of discovery also, on the part of the staff who prosecuted the inquiry. The agents of the commission, to quote its secretary, W. W. Husband,

spent days and nights in the wilderness along the Mexican border studying methods of gangs organized for the purpose of smuggling Chinese into the country, they traveled in disguise in the steerage of transatlantic ships, they lived in immigrant homes, sought work through immigrant employment agencies and visited the haunts and studied the methods of traffickers in white slaves. Their work was carried on in the congested districts of great cities, in industrial centers, in remote mining regions and construction camps, in agricultural colonies and communities.

TAKING THE PART OF THE IMMIGRANT. An agent of the federal commission in the garb in which she took ship to this country.

When somebody said that the three-volume novel was extinct, Kipling, his ire aroused, wrote his ballad of The Three Decker, in which he held

Spite of modern notions, I find here first and best,
The only certain packet for the islands of the blest.

It is not so much the blessed isles as the continents of desire, for which the heroes and heroines of this governmental chronicle are bound, and whether Kipling would stand for the sailing qualities of a Forty Decker, still less for the Lettres de Marque of this one, is a matter for speculation; for in praising the old romance, he said:

We asked no social questions—we pumped no hidden shame,
We never talked obstetrics when the little stranger came.

And those, after all, were the sailing orders of this governmental expedition, for not only has it been dealing with the adventures of a migrant people, but with a perilous experience through which the nation has been going for the past few decades and on which new light was sought.

The recommendations of the commission (page 603), together with a brief statement of its findings, were presented to Congress on December 5, and these offer points for endorsement and dissent, such as Mr. Lee and Miss Abbott bring out in contributed editorials on another page. But it will be a matter of months before the full body of material upon which these or other conclusions may be based, will be available for analysis and review.

SCOPE AND MEMBERSHIP

In 1882 the federal government first assumed the function of controlling immigration and in the succeeding twenty-five years public opinion became more or less divided between the advocates of two opposing policies. The federal commission created by section 39 of the immigration act of February 20, 1907, has been called a compromise between the immigration restrictionists and the anti-restrictionists in Congress, and therefore, from the congressional point of view, its work may fairly be regarded as an inventory to find out whether the existing policy of the government respecting immigration ought to be continued or whether present conditions demand actual restriction.

In the summer of 1907 six members of the commission spent ten weeks abroad, visiting ports of embarkation and the districts from which immigrants come. Certain lines of inquiry were inaugurated under various committees, but this first year the work was tentative and scattered. In the second year it was centralized and a staff built up for carrying on sustained lines of inquiry, the industrial investigation involving the study of twenty-five leading industries, a study of city congestion, and of agricultural distribution, which may be said to have been the major lines, although several others, as will be noted, are of all but equal rank. To quote Mr. Husband:

> In the course of the investigations original information was secured from, or concerning, more than 3,000,000 individuals, or about one-thirtieth of the total population of the United States. One-eighth of all the public school children in the country were included in the inquiry and in some of the leading industries as many as fifty per cent of the total number of wage-earners employed were canvassed. About 300 communities were more or less exhaustively studied, and every state in the Union and practically all the larger cities were included in some phase of the inquiry.

After what might be called the preliminary explorations and before the field work in the industrial investigation was taken up, a detailed plan was mapped out. Special agents who had been in charge of the experimental work, together with statisticians in the employ of the commission, met in Washington in a ten days' conference, drawing up schedules to be used in the various lines of investigation. In the industrial investigation, for instance, field work was begun in the summer of 1908, and continued until July 1, 1909, the force numbering in the latter part of the year as high as 200 agents. 750,000 individual schedules were taken, 23,000 families were visited and detailed reports made on 250 communities. A similar work was carried on in the Rocky mountains and on the Pacific Coast under a separate staff, which specialized in its inquiry of Japanese and Hindus, but studied also European and Mexican immigrants in manufacturing, mining and farming.

Among the other specialized studies of immigrant groups, mention should be made of the schedule-census of the children of immigrants in schools, in which for one day the public school teachers of thirty cities and parochial school teachers of twenty-four acted as unpaid agents of the commission; the study of alien criminality, which included a case investigation of more than 500 individuals in New York and vicinity and which brought out incidentally the utter lack of uniformity in American criminal records; the study of immigrant charity seekers in forty-five cities, conducted with the assistance of the secretaries of the various associated charities; and the study of immigrant hospital cases in Bellevue and Allied Hospitals, New York.

Another group of specialized inquiries, which required expert work, often of a detective nature, was that of immigrant banks (this included the inspection of books and records), of labor camps, berry and fruit picking districts, railroad and other construction work involving

[1]It organized under the chairmanship of Senator William P. Dillingham of Vermont, and included as members Senators Lodge of Massachusetts and Lattimer of South Carolina, Representatives Howell of New Jersey, Bennet of New York and Burnett of Alabama. Charles P. Neill, commissioner of labor, Prof. Jeremiah W. Jenks of Cornell and William R. Wheeler of California were appointed by President Roosevelt. Senator Lattimer died in 1908; his successor, Senator McLaurin of Mississippi, in December, 1909, when Senator Percy was appointed to fill the vacancy.

the floating immigrant labor supply; the investigation of steerage conditions, including every line engaged in Atlantic coastwise trade and twelve transatlantic ships—(in some instances the agents began their journey at some point in the interior of Europe, traveled on immigrant trains to the point of embarkation and after landing in the United States proceeded to their destination on the trains provided for immigrants)—; the so-called white slave inquiry carried on by a special corps of agents; and that of immigrant homes, employment agencies and aid societies to which agents of the commission applied in the guise of immigrant girls and men.

From a scientific standpoint, possibly the most distinctive contribution of the commission is Professor Boas's report on changes in the bodily form of descendants of immigrants. A dictionary of European and other immigrant people by Daniel Folkmar will be a unique feature.

The last year and a half of the commission's work was devoted to the tabulation and preparation of data. At times more than 200 statistical clerks under Fred C. Croxton, chief statistician, and a large corps of writers, were employed at the Washington headquarters. Nevertheless, in the time remaining between the completion of the field work and the dissolution of the commission on December 5, it was not possible to tabulate the mass of incidental data secured, and tons of schedules will be turned over to the Department of Commerce and Labor, containing a great amount of undigested information along all lines.

A brief summary of the commission's conclusions and recommendations, with views of the minority, has been issued the past month; a summary volume will come from the presses in January; the forty volumes of from 700 to 900 pages each will follow in the course of the year.

The reports are largely of a statistical nature and while some of the statistics were derived from already existing sources, in the main the volumes represent entirely new data collected by the commission. The commission's task would have been a large one, even for a well-organized and equipped government bureau, but in this case it was necessary within a limited time to study the field, plan the work, and create the machinery for carrying it on and completing it. It would be out of place for me to comment on the value of the commission's work, but if plans and hopes have been realized, the reports will stand as an interesting, valuable and, so far as may be, conclusive exposition of the subject of immigration, and also as a correct picture of industrial, economic and social conditions in the United States at the present time.

A FIRE COLLEGE FOR NEW YORK

Within the past fortnight, the establishment of a fire college has been announced by the New York Municipal Fire Department, so that, to quote the *Sun*:

The lore of fire fighting gained by individuals in years of fighting thousands of fires, might be preserved instead of dying with the individual.

Practical work in machine shops, lectures on explosives by well known chemists, talks and demonstrations by electrical engineers on the new problems offered by the high voltage electrified railroads, the handling of blazes in Singer buildings, a better understanding of the high pressure system and very practical lessons in the scaling of walls, jumping into life nets and the handling of all kinds of tools used by firemen—all these subjects and many more of a practical nature will be taken up and drilled into the force by the fire college.

It is believed that the establishment of this school will create new standards of efficiency in the work of *extinguishing* fires, carried on by the city as a municipal function. It, however, calls attention to the failure of American cities to create fire *preventing* agencies at all comparable to their extinguishing service. The record of the new-law tenements in New York—in which there have been no fire fatalities—shows what the application of progressive standards in construction and sustained oversight can do for a given class of buildings. The hazards of another great group of buildings, equally freighted with defenseless human beings, have been called to public attention by the recent Newark factory fire. This is made the text of a series of three articles in the current issue of THE SURVEY, two of them by

experts who have made a scientific study of different phases of fire prevention. A branch of the Newark Fire Department was directly across the street from the factory which burned. It could not have been better located from the standpoint of convenience to get at its work. Yet it was unable to put out the blaze in the first half hour and in that half hour twenty-five people were killed.

The contention of the students of fire prevention science is that a fire, so far as fatalities are concerned, ought to be out, not in the first half hour, but six months *previous;* and that while there will remain an irreducible minimum of property destruction due to fires, the human risks involved should be eliminated by precautions devised with this sole end in view. Their plea is one of common forethought and constructive optimism, which challenges the finality of such a verdict as that of the Newark coroner's jury:

> We find that Carrie Robrecht came to her death by misadventure and accident caused by a fall, and not as the result of a criminal act, either of omission or commission, on the part of any individual or individuals, whether as private citizens or public officers.

PROPOSE A FIRE INSTITUTE

They assert that fire prevention, panic control, and life preservation are practicable, that here is a great field of municipal activity to which the cities have yet to direct their energies. Mr. McKeon puts it that fire is a disease of buildings; and in a campaign for its prevention the same sort of educational propaganda is needed as in preventing tuberculosis.

In this connection Mr. McKeon has made an interesting proposal for the creation of a fire institute, "to improve living conditions in so far as they are detrimentally affected by fire." His plan for the institute includes research along remedial lines, not only to place the fire problem on a scientific basis, but also to use the accumulated knowledge in devising practical measures for securing safety from fire in homes and dwellings. The program he suggests for such an institute folows:

RESEARCH: STUDY OF FIRE AS A DESTRUCTIVE SOCIAL PHENOMENON

a, Compile records of fires for statistical information, such as number, locality, character of buildings, class of persons affected, causes of origin and extension, results in person and property loss.

b, Analyse causes of death and injuries to persons to ascertain if due to habitation, employment, housekeeping, accident, arson, absence of life saving appliances.

c, Determine effect on living conditions such as increased cost of living due to payments for fire insurance, fire tax, higher rents, uninsured property destroyed. Reduction of income for individual and family by loss of employment, or injury or death of wage-earner. Break-up of family due to death of parent as wage-earner, or as home-keeper.

d, Report on precautions exercised in homes and dwellings, such as structural features of buildings, condition of heat and lighting apparatus, housekeeping methods, use of fire alarms, extinguishers, and escapes.

REMEDIAL: DEVELOPMENT OF FIRE PREVENTION AS AN APPLIED SCIENCE.

e, Educational: The preparation of instructive articles for publication in newspapers and magazines. The delivery of lectures in public and private lecture courses and centers. The advocating of fire prevention as part of the courses for domestic science and home economics teachers. The advocating of some instruction in fire prevention for public school children. The conducting of practical courses for janitors, housekeepers and others having charge of buildings and institutions. The maintenance of a bureau of information.

f. Engineering: An exhibit of mechanical appliances, devices and systems used for fire preventions. The study of engineering methods of preventing fire. The inspection of homes and dwellings and the recommending of proper safeguards. The examination of plans for new buildings. The training of fire prevention engineers.

g. Insurance: The preparation of a plan for furnishing fire insurance at a minimum cost and by installments.

h. Legislation: Calling the attention of public officers to the enforcement of existing fire laws. Securing the revision of defective fire laws. Agitating the adoption of new fire laws.

POSTAL SAVINGS BANKS START AT PENNY SIZE

The postal savings bank system starts this month on a small scale, the appropriation limiting the number opened to one second-class post office in each state. The important thing is that a plan for promoting public thrift, which in other countries long ago became a big factor in the economic fabric of the nation, is to have a trial at last.

The board of trustees for the postal savings bank system selected towns that range in population from three or four thousand to twenty-five or thirty. From the accompanying map it is easy to see how scattered they are. A line drawn from the middle of the northern boundary of North Dakota to the southernmost point of Texas would scarcely come within 200 miles of a postal savings office. An enormous belt through the populous heart of Michigan, Indiana, Ohio, Kentucky, and Tennessee is untouched.

The communities picked are said to be those which have greatest need of this service. Over twenty have for their chief industry mining, smelting, foundries, or blast furnaces, a dozen or so are factory and mill towns, while nearly half a score are devoted to shipping or lumber interests. These are all industrial cities where facilities are in demand for depositors who can make only modest savings. But one or two are quite small farming communities, one is a summer resort and another a suburb of commuters, and it is a little hard to know why they were chosen. Four have a considerable foreign population which is accustomed to postal savings banks and tends to distrust our privately managed institutions.

Scarcely half a million of our great population can possibly be served by the

offices that have been established. It will be a long time before the results of the trial will be known, and not until more postal savings banks have been opened and arrangements completed for making deposits at branch offices in the larger cities, will it be possible to judge fairly the success of the system.

In cities possessing sound savings banks under state supervision, depositors will prefer these because they pay almost, if not quite, twice as much interest as the government. But in rural sections and communities devoid of well established facilities for saving, post-office banks will furnish a strong incentive to thrift.

CONSERVATION OF EYESIGHT

The agencies at work to promote the public health by preventing unnecessary disease, injury and strain, have a most promising recruit in the National Association for the Prevention of Blindness and the Conservation of Vision, which will be organized as a result of a recent conference in New York. The aptly descriptive terms of the name will make strong appeal to the groping, bespectacled sons of civilized men. The association has opportunity for the widest usefulness in this twentieth century, when every condition of work and living make constant, disastrous war on eyesight.

By the terms of the resolution which led to the appointment of a board to effect a permanent organization under Dr. F. Park Lewis of Buffalo as chairman, the field is charted off in three parts:

Prevention of infantile blindness.
Prevention of blindness from industrial and other accidents and from diseases.
Conservation of vision through improved hygiene during school life and in industry.

The association will invite the co-operation of all societies interested in the blind, in social purity and sex education, in preventing infant mortality, in safeguarding industrial occupations and all medical, educational, commercial and labor bodies, women's clubs, and organizations dealing with social and economic questions. It will become a clearing house for the conservation of eyesight.

The organization is due immediately to the conference which was called by Dr. F. Park Lewis of Buffalo, chairman of the committee on blindness of the American Medical Association; Edward M. Van Cleve of Columbus, president of the Ohio Commission for the Blind; and James P. Munroe of Boston, president of the Massachusetts Commission for the Blind. But the interest to which this committee and the association itself owe their existence was created by Louisa Lee Schuyler, chairman of the New York Committee on the Prevention of Blindness, and Dr. Lewis, who called a similar conference a year ago. The nation-wide effort to prevent unnecessary blindness springs from the quiet efforts of these two workers who, in organizing the New York committee in 1908, formed the first lay body in the country.

The study of midwifery by the New York committee was presented by its executive secretary, Carolyn C. Van Blarcom. It led to an offer by Dr. John W. Brannan, president of the board of directors of Bellevue and Allied Hospitals, to co-operate in furnishing the first training for midwives in this country. The importance of such a course may be realized from the fact that about one-half the children born in large cities are delivered by midwives and about one-half the cases of preventable blindness are due to infection at birth. A few states have attempted the supervision of midwives, and three, New York, Rhode Island and Massachusetts, give free prophylactic treatment at birth. Aside from this midwives are free to go their way, unregistered, unsupervised, often untrained, but charged with responsibility for thousands of babies each year. The responsibility of physicians is even greater because of their larger numbers and the larger number of confinements which they attend. Of 116 cases of *ophthalmia neonatorum* (infantile blindness) recently investigated in Boston, 114 were of children delivered by physicians and two of children delivered by midwives; of 33 investigated in New York, 22 were by physicians and 11 by midwives. Of the

22 physicians responsible for blindness only one had used prophylactic treatment, while of the eleven midwives three had used it. The new association thus offers a fresh and interesting example of the need, and the recognition of the need by medical men, of co-operation by laymen in the prevention of disease.

The prevention of infantile blindness is first and perhaps most pressing of the association's work, but other phases were strikingly brought out at the conference. They include better birth registration, the effect of tobacco on eyesight, work-accidents, infection in swimming baths, *phlyctenular keratitis* in undernourished children, bad lighting, particularly in schools and factories, and "department store" eyeglasses.

TERMS OF LICENSE FOR HARMLESS PHOSPHORUS

The instinct to "fear the Greeks even bearing gifts" has made many wonder if the Esch bill in Congress to prohibit poisonous phosphorus in matches would not establish a monopoly, since the largest company favors this measure and has patent rights to the most widely used non-poisonous substitute for white phosphorus. The Diamond Match Company drew up licenses upon fair, if not generous, terms to govern the use of sesqui-sulphide of phosphorus by other manufacturers. Eight companies accepted the conditions and have paid in whole or in part their share of the cost of the patent protecting this non-poisonous composition.

Although each licensee was allowed to produce an unlimited quantity of matches or to use any other form of non-poisonous phosphorus, of which there are several, some have feared that all the agitation against white phosphorus was but a scheme to place the small independent companies at the mercy of the trust which owns the patent for sesqui-sulphide. To make this suspicion impossible the president of the Diamond Match Company, in a letter to Representative Esch, the author of the bill, calls attention to some changes which have been made voluntarily in the licenses already issued. A royalty of four-tenths of a cent for the use of sesqui-sulphide for every thousand matches beyond the quantity which a company was entitled to make, on the basis of its percentage of the number manufactured for the year ending June 30, 1910, has been remitted, and all restrictions as to the number to be contained in a box waived.

As the president says in his letter, however, "there still remains the problem of how we can best formulate a proposition in respect to granting licenses in the future" to existing manufacturers, or to any other companies that later on may desire permits. He offers to assign the patent in trust to any department or bureau of the federal government or to any official of any department and his successor in office, in order that "licenses may be granted on such terms as may appear in the discretion of such department, bureau, or individual equitable and fair." If no department, bureau, or official will accept such an assignment the company offers to execute it in favor of any corporation, association, or individual who can give reasonable assurance of prompt and just treatment of applications for licenses.

The cause of this remarkable offer is said to be the fear of the manufacturers that if federal legislation is not passed the agitation about the dangers to the workers in the trade will result in state legislation, which will not be uniform throughout the country. In fact a law to prohibit the use of poisonous phosphorus has already been recommended in New York by a high state official.

PROGRAM TO PREVENT INCREASE OF INSANITY

The first public meeting in the campaign of the Committee on the Insane, of the New York State Charities Aid Association, whose plans were described in THE SURVEY of November 12, was held under the auspices of the American Academy of Medicine two days before Christmas. The speakers represented all the elements which are to co-operate in the effort to prevent insanity, that is, the School of Philanthropy as interested in all matters of social importance, the medical profession, the State Charities Aid

Association, and the State Commission in Lunacy. The representative of the state commission was its president, Dr. Albert W. Ferris, who gave the actual figures of insanity within the state, showing the state hospitals filled beyond their capacity with 35,520 dependents with mental defect, of whom 31,606 are insane, and whose care costs one-sixth of the total public expenditure. Adding to these the patients cared for at home the state shows as a whole 54,520 persons with mental disease or defect, an average of one to 167 in the population. Almost half the institutional cases came from New York city.

Even more alarming than the actual figures at the present time, is the increase in insanity as compared with population increase in the last twenty years, for within this time the population of New York state has increased only 49.9 per cent as against an increase of 103.9 per cent in the number of the insane.

To find the cure it is necessary to analyze the causes of insanity. This was done by Dr. M. Allen Starr of Columbia University, who outlined the classification made by Dr. Kraeselin of Munich and showed the probabilities of prevention and cure in each class. Of the so-called internal causes, inheritance, development and education, education alone is susceptible of regulation. Preventive work has already been started in the special classes for defectives in the public schools, and in the training of normal children in habits of attention and self-control, as well as in the special instruction given in sex hygiene and the dangers of alcoholism.

The second class of causes is external and includes the use of alcohol and drugs, which is, according to the figures of the lunacy commission, responsible for 28.9 per cent of all cases of insanity; and syphilis which is responsible for 22 per cent of the men patients from metropolitan districts. Other external causes are certain infectious diseases, like typhoid and grip, and auto-intoxications due to chemical defect in the digestive system. Though not so directly preventable as those that can be dealt with by education, a certain percentage of these cases are undoubtedly preventable. The proportion of the third class, the psychical causes: overworry, overwork and overstrain, that could be prevented, is hard to estimate; but probably one-third of all cases of insanity are preventable.

The campaign to prevent this one-third was described by Homer Folks and Dr. Ferris. It includes what Samuel McCune Lindsay spoke of as the distinctly modern element in education, the movement for publicity in all matters of practical social importance, by means of lectures, leaflets, exhibits, and moving pictures. Besides this education of the public, the educational side covers the re-education and diversion of patients, and the special teaching of backward children. For after-care of the patient and prevention in his family the State Lunacy Commission hopes to extend widely the dispensary system, to employ at each state hospital one physician and one social service visitor for each of the eighteen state hospitals, who will look after discharged patients in their homes. The work of the hospital will be further supplemented by the work in the home of the prevention and after-care committees of the State Charities Aid Association.

EDITORIAL GRIST

THE RESTRICTION RECOMMENDATIONS

JOSEPH LEE
Boston

The gist of the Federal Immigration Commission's report is in its conclusions —first, that there is an oversupply of unskilled labor in the industries of the country sufficient to demand a restriction upon the further admission of unskilled labor; second, restriction should be sufficient to produce a marked effect upon the present supply of unskilled labor; third, in making the exclusion, the aliens debarred should be as far as possible those who, by reason of their personal qualities or habits, would least readily be assimilated or would make the least

desirable citizens. The practical recommendation is summed up in this sentence:

> A majority of the commission favor the reading and writing test as the most feasible single method of restricting undesirable immigration.

From this conclusion only William S. Bennet dissents.

The commission, therefore, comes out squarely, not merely for selection, but for restriction of immigration, and bases its conclusion upon industrial grounds. Its most important finding as to facts is that the continued large immigration of unskilled laborers has kept conditions in the semi-skilled and unskilled occupations from advancing; that the presence of the recent immigrants in constantly increasing numbers has prevented progress among the older wage-earning class in certain sections; that the standard of living of the newcomers "is so far below that of the native American or older immigrant workman, that it is impossible for the latter to compete successfully with them"; that the numbers of recent immigrants "are so great and the influx is so continuous, that even with the remarkable expansion of industry during the past few years there has been created an oversupply of unskilled labor." In some industries this condition "is reflected in a curtailed number of working days and a consequent yearly income among the unskilled workers which is very much less than is indicated by the daily wage rates paid; and while it may not have lowered in a marked degree the American standard of living, it has introduced a lower standard which has become prevalent among the unskilled industry at large." In short, practically unlimited immigration of unskilled workers keeps the unskilled class of labor in this country permanently below the American standard of living. It is to remedy this condition that restriction is called for entirely apart from all other considerations.

With this view it would seem that all who believe in a living wage, or in any standard of living for the working people of this country, or in any effective attempts to raise that standard, must agree; for it is certainly the case that so long as every rise of wages operates merely to suck in unlimited thousands of the surplus population of Europe and Asia, no permanent raising of our own standard can be hoped for. The net result of present immigration is simply to spread the unfortunate conditions which the poorer immigrants represent over our own country and to leave their home problem as far from solution as it was before. It is the old case of the English sparrows over again; there are not permanently fewer of them in England since they came here and drove out our native birds.

The placing of this industrial question of the standard of living as the foremost consideration in the report is justified, not only by the effects of immigration on this country, but by the motive and nature of the immigration itself. That the motive is now chiefly industrial is shown by the accuracy with which the waves of immigration follow the labor market; by the facts, noted by the commission, that forty per cent of the immigrants return home (chiefly with the receding of the prosperity waves), that seventy-five per cent of the new immigration consists of males, and that it remains to a great extent in cities and does not settle on farms.

A large part of the present movement, especially from southern and eastern Europe, is made possible through assistance of relatives or friends.

> A large number of immigrants are induced to come by quasi-labor-agents in this country who combine the business of supplying laborers to large employers and contractors with the so-called emigrant banking business and the selling of steamship tickets.
>
> Another important agency in promoting immigration from Europe to the United States are the many thousands of steamship ticket agents and sub-agents operating in emigrant-furnishing districts of southern and eastern Europe. . . . The steamship agent propaganda flourishes everywhere.

The existence of the propaganda "is a matter of common knowledge in the emigrant-furnishing countries, and it is fair to assume is acquiesced in, if not stimulated by, the steamship lines themselves." To the steamship companies the emigra-

tion from southern and eastern Europe is peculiarly attractive because so many of the immigrants from these countries go forward and back, so that the company gets a fare both ways.

In short, our present immigration, thus fostered for purely industrial purposes, is largely a cold business proposition. It has behind it, partly, the same business motive—the desire for a supply of cheap labor—which formerly brought about the African slave trade (although, of course, the two cases are not closely parallel in other respects), and partly the natural desire of the steamship companies for larger dividends.

A natural consequence of this selection largely by steamship agents is that the types selected are not such as easily to assimilate with our present population. The absence of family life among a large proportion of the immigrants, the overcrowding and congestion in cities, the fact that "the tendency to become naturalized citizens, even among those who have been here five years or more, is not great," are all natural and consistent consequences of the purely commercial motive on the part of the importer and of those imported.

The fact that the bodily form of some children has been found to differ in type from their foreign-born parents is the most hopeful discovery made in this connection. But until the Negro, who was imported very much earlier and has been subjected to American conditions now for many generations, has become more fully assimilated in form, color, and other perhaps more important attributes, to the white race, any conclusions drawn from changes in bodily structure of other immigrants cannot be accepted as indicating a reasonable hope of early social assimilation.

The commission is of opinion that our present restriction laws are safeguarding us against disease, insanity and pauperism. This may be so under the present administration at Ellis Island; that it was not wholly so under the previous administration, I think the New York Lunacy Commission might be willing to testify. In the matter of crime certain improvements in the restriction laws and procedure are suggested. The commission considers that the immigrants show no marked excess in this direction, except for a foible for homicide among the Italians.

That the illiteracy test will have a considerable effect in lessening the present flood of immigration is shown by the fact that more than thirty-five per cent of it is made up of illiterates, as compared with less than three per cent of the old immigrant class. It is also fortunate that the illiteracy test will not hit that portion of our immigration which still might be classed as political, because caused by political persecution, inasmuch as the Jews can almost all of them read and write.

The commission's conclusions are based upon a belief that

> the measure of the rational healthy development of the country is not the extent of its investment of capital, its output of products or its exports or imports, unless there is a corresponding economic opportunity afforded to the citizen depending upon employment for his material, mental and moral development.

Such an opinion will come as a shock to many people. The development of our natural resources is sometimes regarded almost as a religious duty. To some people it seems a terrible thing that we should not run through our national patrimony in the shortest possible time. So long as there is an unexhausted mine or foot of soil, or a forest not yet cut down, there seems a sort of furor to remedy such oversight. The commission, however, seems to me to have taken a sound basis when it says:

> The development of business may be brought about by means which lower the standard of living of the wage-earners. A slow expansion of industry, which would permit the adaptation and assimilation of the incoming labor supply, is preferable to a very rapid industrial expansion, which results in the immigration of laborers of low standards and efficiency, who imperil the American standard of wages and conditions of employment.

ADJUSTMENT—NOT RESTRICTION

GRACE ABBOTT
Director Immigrant Protective League, Chicago

The student of immigration should perhaps postpone any discussion of the finding of the United States Immigration Commission until all of its reports have been made public. But a "brief statement of the conclusions and recommendations" of the commission has just been submitted to Congress, which will undoubtedly be widely circulated and become the basis for legislation before the publication of its forty volumes of evidence has been even authorized. For this reason some discussion of these conclusions is prematurely forced on all those who are interested in the problem of immigration.

The commission has recommended that the Division of Information and Distribution shall be developed; that steamship lines shall be required to improve steerage conditions; that the exploitation of the immigrant shall be reduced by better federal supervision of existing agencies and the enactment of more effective legislation by the states; and finally, that because of the character of the "new immigration," and because of the oversupply of the kind of labor it furnishes, immigration should be considerably restricted by means of a literacy test. Public attention will probably be focused on this last recommendation and it is necessary, therefore, to consider with some care the reasons on which it is based.

Regarding the character of our recent immigrants the report says that conviction for crime is not more common among them than among the native born (p. 25); that they are not diseased and are rarely found among the victims of alcoholism (p. 27); that pauperism is "relatively at a minimum" among them (p. 27); that their homes are in "reasonably good or fair condition" (p. 28); and that their children attend school in such large numbers as to indicate that the advantages of an education are appreciated by immigrant parents. But all of these facts are outweighed in the eyes of the commission because it believes that the "new immigrants" do not intend to remain here permanently; that they come only to take advantage of the higher wages paid for industrial labor in this country and expect to return in a few years. While admitting this is not true of them all, the report says it is sufficiently common to justify "referring to it as characteristic of them as a class." This is the usual argument advanced against the immigrant of today and it has done service against those of every generation.

Admitting that it is true, it might be urged in the immigrant's defense that he has never been known to take back with him the railroads, canals, and subways he has built, or the great industries that have been developed through his labor. But, as a matter of fact, it cannot be shown that these new immigrants will not remain in this country. The commission finds that forty per cent return to Europe and thirty per cent remain there. Moreover, among the thirty per cent who remain are many who have not acquired a competence, for among those who return, according to the report, are the victims of disease and industrial accidents, the aged, the temperamentally unfit, and the widows and children of immigrants who have died here (p. 16).

What thirty per cent do is usually not regarded as indicating the motives of the whole group and if the thirty per cent is made up very largely of the unfortunate victims of American industrial life, is it reasonable to say that even thirty per cent intended when they came to remain only temporarily in the United States?

The reason for emigrating, the commission finds, is no longer a desire to escape "intolerable conditions", and the public is therefore warned not to consider the immigration movement from the "standpoint of sentiment", but to look upon it as an "economic problem." When from among the many stories of Russian atrocities, that of the young Russian Jewish mother who saw her baby's eyes burned out and her husband killed in one of the "pogroms", and who is saving enough to bring over the remainder of her family to America so that they may know some years of peace, is contrasted

with the very mild persecution suffered by those Puritan ancestors whose courage we have been taught to respect, it would seem that an entirely new standard of "intolerable conditions" has been adopted by the commission. As a matter of fact the causes of immigration today are not really different in principle from those in the seventeenth or in the nineteenth century.

The Letts, Lithuanians, Finns, Poles, and Russians who are coming from all parts of the Czar's dominions are fired with the same political idealism which the German revolutionists contributed to American life; the Jews from Russia and Roumania, the various racial groups that come from Turkey, and the Spanish Protestants are seeking a religious asylum, just as the Puritans, the Huguenots, the English Catholics, and the Quakers did so many years ago; the south Italian, like the Irish immigrant, comes to escape a landlordism which keeps him and his children in abject poverty; others, better situated, are coming from all parts of Europe because they have decided that the only hope of real economic and social independence lies in a newer country; still others are plain adventurers, and it is probably safe to say that about the same per cent of these are succeeding today as have succeeded in every century since the time of Columbus.

As for the economic reasons for restriction, the commission's statements are somewhat difficult to reconcile. It finds that "comparatively few immigrants come without reasonably definite assurance" that they can secure employment, and "that as a rule they know the nature of that employment and the rate of wages" (p. 17). Moreover, according to the commission, they are quick to adjust themselves to changed conditions, and return home when a period of industrial depression like that of 1908 leaves them without employment (p. 28). On the other hand, the commission declares that there is an oversupply of unskilled labor, and so recommends that a "sufficient number" of immigrants should be "debarred to produce a marked effect upon the present supply of unskilled labor." In other words, the commission finds that under existing conditions we seem to have a quick response to an increasing or decreasing demand for labor, and recommends restrictive legislation which would mean the adoption of a quite inflexible system.

With regard to the argument that the immigrant is responsible for the introduction of a lower standard of living in the United States—and the commission does not show that he is—it should be pointed out that the immigrant *prima facie* would never intentionally underbid in the labor market. No one is more eager than he to raise the standard of living, for it is the hope of accomplishing this that has been a determining factor in his decision to leave home. Unwittingly he may accept wages below the market rate if he falls into the hands of disreputable labor agents and unscrupulous employers, who take every advantage of his ignorance of American conditions. Protective measures could, of course, be devised to prevent these practices, but the public unfortunately continues to be more interested in restriction than in means by which these immigrants may be saved from industrial exploitation.

Certain classes of immigrants are, in the opinion of the commission, to be regarded as peculiarly undesirable. It is especially recommended, for example, that men who come unaccompanied by their families should be excluded. While those who are familiar with the immigrant question realize that large groups of men living together present a problem with peculiar difficulties, they are none the less convinced that our efforts should be directed to a solution of these difficulties, rather than to devising some test by which some of the men will be excluded. As a matter of fact the best men, that is the best husbands and fathers, usually emigrate before their families. The man who seriously considers the welfare of his wife and children and is not driven by immediate persecution will precede them to America, learn something of the country, secure employment, and have a little home ready for them when they come to join him. To discourage this practice would seem to be wholly undesirable.

As for the literacy test, it is difficult to find anything to recommend it as the best means, or even as a good means, of selecting our future citizens. What we desire is a character test, and the ability to read and write has never been regarded as a means of determining honesty or thrift. It is not even a test of ambition, for the immigrants come without this meager educational equipment because they have been given no opportunity to attend school in the countries from which they come. There is nothing which is so much the result of conditions over which the immigrant has no control as his ability to read and write, and no deficiency which we are so well equipped to supply.

As for the other tests considered by the commission—an increased head tax or the requirement that an immigrant bring twenty-five, fifty or a hundred dollars—they fail also as tests of a man's "economic fitness." The man who comes with several hundred or thousand dollars may be much less "desirable" than the intelligent and adaptable man who emigrates while he is still young and begins his industry in his new home.

The recommendation that as a condition of admission to the United States the immigrant must present his official police record showing no convictions should never be adopted. The German students of the forties and fifties, to whom America is greatly indebted, would have been excluded under such a requirement, just as the Russians would be at the present time. The commission's searching study of crime in New York city failed to show that crime is any more prevalent among the foreign than among the native born. Skilful criminals will get into the country no matter what rules are adopted, and it is certainly unwise, in an attempt to reach these few, to exclude those who have declared for American political principles in Europe and have suffered conviction in consequence.

In conclusion it may be well to point out that whatever tests are adopted the immigrants will continue to come to us by the hundreds of thousands every year, so discussion of the pros and cons of restriction is quite futile. The real national problem to which we should devote our money, our energy, and our intelligence is how the industrial, social, and political adjustment of the immigrant may be accomplished with the least possible loss to himself and the community.

AN IMMIGRANT LABOR TARIFF

PAUL U. KELLOGG

The sobering generalization clinched in by the findings of the Federal Immigration Commission is that in America today common labor is paid less than a living wage. This is not news. But because this common labor force is largely made up of foreigners and because this federal commission dealt solely with immigrants, its findings visualize this great underlying labor group in its national aspects with fresh and tremendous distinctness.

If, by self-support, is meant for the adult male the ability to maintain a family on his earnings; if, by poverty, is meant the failure of a man to attain such self-support, then American day laborers fall as truly below the poverty line as the 27 per cent of families that Roundtree found in York or the 30.7 per cent that Booth found in London. With us, the rapid expansion of industries and the constant inflow of new immigrants have disguised the situation; but the figures which Mr. Lauck gives, drawn not from one industry but from twenty, not from one community but from two to three hundred, clear away these disguises, and we see the crude, brutal fact that the common laborer, immigrant or native born, who attempts family life in the United States, must supplement his wages by the earnings of wife or child, or must take in lodgers with resulting overcrowding and infant mortality. We read of Asiatics in the Himalayas, the meagerness of whose pasturage has led to polyandry. In an economic sense, we have a counterpart in the thousands of boarding boss establishments in the industrial districts, where one woman keeps house for a dozen men. Unless such a woman supplements the wages paid her man by corporation or contractor, she

cannot bring up children even according to the peasant standards of East Europe. As a social group, American common labor is shown to be bankrupt in the sense that a business, with the same ratio between receipts and expenditures, would be bankrupt. And "this fundamental common labor base," as Professor Willis points out, "lies at the root of the present industrial system of the United States."

Enormous impetus has been given to American industries by the exploitation of this raw labor supply. It is as if the chambers of a coal mine, once cleared with pick and chain-saw, were automatically to flood themselves with new fuel to be had for the digging. In weighing its influence on American labor conditions in the past, Professor Willis's favorable verdict is not altogether convincing, although we have no means for knowing the array of data on which he bases this generalization; but with his judgment as to the undermining effect of such an uncontrolled stream of raw labor in the future, there is instant agreement. It is not enough to urge that this sort of common labor is good for the immigrants who engage in it; that it means unaccustomed opportunity for savings to the single men; for if present policies of treating immigrant labor are to be defended as a philanthropic exercise, sophistry will be bent double. Nor is it enough to urge that unskilled labor is transitional work, and that the men scatter into the country districts. Crowded tenements, insanitary milltown courts, construction camp barracks, and the shacks of outlying mining towns are scarcely reasonable way stations to country life; if we are seriously engaging in the business of distributing immigrants, machinery less socially wasteful could be devised. It is, in fact, the very surplus of immigrant labor that more than anything else depresses these living conditions to levels which would never be known were the employing corporations seriously confronted with the business of attracting to their doors workmen self-resourceful enough to make choices. Nor is it enough to urge that the unskilled men move up to the highly paid grades. Even if this were so the group remains—sixty per cent of the whole force in steel production, for instance,—and, unless there is a change in industrial policy, hundreds of American towns will permanently bear the stamp of household life at under two dollars a day.

If we cannot have cheap, ready-made clothes unless the garment manufacturers can turn needle-workers adrift on the street with every sag in the market; if we cannot have cheap transportation unless the steel car manufacturers can use successive groups of raw immigrants to hammer down the rates of pay of the older men; if we cannot have cheap meat without a crowd of men clamoring for work each day at the gates of the stockyards,—then as a nation better for us to pay more for these things and less for our hospitals, our orphanages, our courts and our prisons, and the other social institutions where the waste of industry comes back as a toll upon humanity.

The very fact of immigration has blocked comprehensive trade union activity to raise the rate paid common labor in the United States. American notions of freedom of contract and inter-state competition have seemed to stand in the way of legislation looking toward the establishment of minimum wage boards—a governmental resource in England and Australia for dealing with the depressed trades,—although Father Ryan's address at the St. Louis Conference of Charities and Correction, last May, voiced a rising sentiment in this country to give serious consideration to such social measures. But the very fact that it is oncoming immigrants who perpetuate and depress this low income group in the American population, suggests the channel through which the situation could be controlled. Yet the two most discussed proposals for restricting immigration — property and educational tests—have the disadvantage that only indirectly do they reach the economic springs of what is distinctly an economic inundation. An alien with a full purse may yet underbid a native for a job; it is not the cultural deficit of a husky country lad from Croatia that threatens American standards; he may be eager for night schools. Is it, therefore, beyond American invention to devise

some instrument to reach the economic sources of the problem more deftly than by the restrictions named? Would it not be possible to apply minimum wage standards directly and solely to the currents of immigration? That is, provide that until an immigrant has spent five years in America he cannot be hired for less than a living wage, say, for purposes of discussion, $2.50 per day.

This adaptation of the principle of child labor certificates to the employment of immigrants is, so far as the writer knows, a proposal hitherto unadvanced. It is ventured while this issue is in press, without testing it in its various aspects, but with faith that there is a working principle here which, once it were threshed out by lawyers, legislators and reformers, might be made the basis of a national program of immigration control more comprehensive and simple than any yet advocated. The suggestion presents various allurements as it is turned over in the mind. As it would involve aliens, who may be disposed to have a different constitutional status from natives, it would seem to a layman that a measure could be framed which would avoid the question of freedom of contract in its ordinary form. There is indeed a precedent for restricting the foreigner's right to contract in the existing contract labor laws. The measure might also conceivably be limited to corporate employers (and contractors for corporations) who are recipients of special legal advantages not possessed by individuals, and might therefore be subjected to the imposition of this restriction in hiring—a point which, on the face of it, lawyers would perhaps be less ready to accept. By such a provision, the application of the plan could be limited largely to those industrial operations where crude labor is handled in the mass, to the detriment of the general welfare; it would not interfere with the minor employments of farm and store which absorb a proportion of each year's newcomers, and which under such an immigration law would claim far greater numbers. Such a plan, affecting equally all states in which immigrants settle, would put none at a special disadvantage. Its proposal would give new alignment to the forces for and against immigration restriction in this country. It would smoke out the exploiters of immigrant labor, who today are glad to have others do the work of agitation against restriction. The various patriotic organizations which are opposed to shutting off America as a refuge for the oppressed would find in such a law no impassable barrier, and at the same time it would tend to bend their energies toward constructive schemes for distributing their co-religionists and fellow countrymen throughout the country and upon the farms. Its tendency would be to stave off congestion in the centers of corporate industrial employment; to check oriental immigration without international discrimination, and to cut down stimulated immigration of all sorts. Its conceivable reaction on American industrial conditions would be even more important, for its tendency would be to force American managers to devise scientific methods of handling crude work other than by means of the back muscles of young country boys. If $2.50 worth of labor had to be gotten out of a man in a day, the work would be put into his hands as a developed stint and not as a piece of lumbering drudgery. Such restriction could not fail to tone up wages in all industrial grades, and its effect on the organization and pay of skilled labor would be cumulative; nor would the change come at once in such a way as to dislocate industry.

The idea of enforcing a minimum wage standard upon unnaturalized immigrants bristles with suggestiveness in its every relation; it has in truth that infectious quality which leads you to suspect some radical flaw. But if, on analysis, the legal and administrative obstacles in the way were to resolve themselves, much tried and tested argument for the enactment of such legislation could be found in the political archives of the last half century. For in essence a minimum-wage immigration certificate would give promise of being—what the wool schedule and the steel schedule and the cotton schedule have failed to prove—a "tariff for the protection of American labor."

PETER JOSEPH McKEON

CONSULTING ENGINEER ON FIRE INSURANCE AND FIRE PROTECTION

I

There are no records of the life loss in factory fires. Records of the property loss are available, but it is only when a fire is of harrowing proportions and happens in a prominent city that the human hazard receives attention from the general public.

An investigation of the recent factory fire in Newark, N. J., in which twenty-five employes were killed and injured, shows it to have been identical with many others which occur with periodical regularity, and which have to a greater or less extent the same attendant circumstances. It is the same story of dangerous processes carried on in unfit buildings, the same crowding of these buildings with hundreds of work-people, the same neglect of fire alarm facilities, the same omission of panic or exit drills, the same failure to provide safe and sufficient exits, the same failure to use modern mechanical appliances for checking and extinguishing fire, the same failure of laws and public administration to prevent controllable combustion and unnecessary death.

This particular fire occurred in a building which was built in 1855 and had been used ever since for operations involving the handling of oil and grease, so that it contained the fifty years' accumulation of oil and dust which makes fire travel with the speed of an explosion. It was a four-story brick building with wood interior construction; 125 feet in length, so that each floor constituted one large, open room almost a city block long, without any fire walls to stop the spread of a blaze once started.

It was an omnibus tenant building occupied by six concerns manufacturing metal articles, paper boxes, and muslin underwear. They employed all told over 200 employes, and as the fates would have it more than half of these were on the top floor of the building, and unfortunately also were almost entirely girls and women engaged in the manufacture of inflammable muslin underwear.

Directly underneath these 100 women workers, the manufacture of electric lighting lamps was carried on. In this work some gasoline was used. The quantity was reported to be but two quarts, and the operations of manufacturing the lamps were not considered ex-

pecially dangerous. As a matter of fact, the beginning of the fire appears to have been what is to be expected of a fire in almost any manufacturing plant. There was no explosion and the fire did not spread on the floor where it started with any great rapidity. All the employes on the third floor were able to leave it in safety and unharmed by the fire, except one girl who was slightly burned when the fire started.

While this girl's companions were attending to her burns, the foreman tried to extinguish the fire, and one girl ran down stairs and notified the fire company across the street. The firemen ran into the building, assisted the girls on the third floor down the stairway, rescued the foreman, and were then driven off the floor by the fire, which by that time had gained headway.

In the absence of any interior fire alarm system, the earliest notice that the women on the top floor received was the smoke, first rising past the rear windows and then through the stairway and the elevator shaft. In the absence of any prearranged drill or march, a panic occurred and the women rushed wildly to the exits, which, insufficient and unsafe at best, were suddenly taxed far beyond their capacity.

The single stairway, the natural exit, was built of wood and became an avenue by which the fire extended to the top floor. This stairway was located in the center of the building, so that in addition to being useless and unsafe as a means of exit, it introduced the fire into the middle of the top floor, and thereby helped extend the smoke and flames in all directions. Moreover, it divided the women into two groups and cut off one entirely from reaching the two outside fire escapes.

One of these fire escapes was at the extreme end of the building, so that the women who reached it had to travel as much as 125 feet through a workshop crowded with machines, tables, and merchandise. The other fire escape was near the center of the rear of the building. This was more accessible so far as location and distance were concerned, but it was in line with the stairway, and the women who reached it had to pass close to the smoke and flames belching up into the top floor.

In order to reach these fire escapes, steps had been built inside the windows to the level of the sills. So many clamb-

WHERE THE GIRLS PLUNGED.

Ledges of the fourth story windows from which they jumped are still embedded in the brick. Note the iron pipe bend in front of the basement windows and the broken wooded picket in the fence. Bend and break were made by falling bodies. An engine house of the Newark Fire Department can be seen opposite.

ered to the steps, that they collapsed and added to the confusion. Entry to the fire escapes was also made more difficult, because the windows did not have sash cords and weights and had to be kept open by the use of sticks or wooden pegs fastened at the sides.

One of the fire escapes was of the balcony and slanting ladder type, and this was used by most of the women who escaped. The other fire escape was of the balcony and straight-ladder type, which is more difficult to climb down, and very few of the women were able to use it.

Nearly fifty women did not reach the fire escapes, but were herded at the other end of the building where there was no means of exit except to jump from the windows. Enveloped in the smoke and feeling the blistering heat, they became frantic and desperate. Some jumped; others were pushed out headlong by the pressing of those behind them, and a number stayed to die by suffocation and burning. It is pitiable to conceive of these fifty women imprisoned by the obsolete ladderless windows, with death in horrible forms at their backs and compelled to choose between that and plunging fifty feet to a landing on the pavement, or in the branches of a tree, on iron pipes, on the sharp pickets of a fence gate, or crashing through the roof of a lower building.

It is a mockery to point out that the girls jumped before the flames really reached them; that if they had waited the firemen could have taken them down safely by way of the ladders; that if they had restrained themselves and jumped singly instead of by twos and threes, the life net would not have been broken and might possibly have saved them all. If factories are to be maintained as fire traps and the workers compelled to stand at windows calmly waiting the result of a race between the flames and the firemen, then they should be instructed how to remain calm and cool amidst blinding smoke and choking heat. But if factories are to be made decently safe for the human beings within them, then the workers need no such instruction, but they do need safe stairways in buildings protected against the rapid spread of fire.

What were the causes of this disaster, and could they have been forestalled? The physical causes which existed in the building were as follows:

A. The absence of a panic or exit drill, which would have tested the safety and capacity of the exits, and also accustomed the occupants to marching out of the building in an orderly and rapid manner.

B. The absence of an interior fire alarm system, which would have promptly warned all the occupants and started the panic or exit drill.

C. The absence of an automatic sprinkler system, which would have extinguished the fire at its start, or held it in check long enough for the occupants to escape and the fire department to stretch hose lines.

D. The presence of a wood stairway and elevator shaft, which quickly conveyed the fire from the third floor to the fourth floor.

E. The dependence on inadequate outside iron fire escapes, which were insufficient in number, small in capacity, difficult of access, difficult of use, and unprotected against fire, which originating on a lower floor rendered them entirely useless to those above.

F. The absence of interior stairways, sufficient in number and constructed in a flameproof manner to make them safe and reliable exits.

Who was responsible for these preventable causes?

First, private responsibility rested on building owners and employers, in their failure and neglect to give adequate thought to the safety of the buildings they owned or housed their work-people in. Only the owners and occupants of a building in the last analysis can prevent fire disasters. The owner is this case is a non-resident woman who, when she was served with an order to provide an additional fire escape and had complied with that order, probably felt that she had done all that could possibly be asked of her. But had she felt concern for the fire dangers of her building, she would probably have placed the matter in the hands of her real estate agent or fire insurance broker. These are interested in the commercial side of the fire problems, and personally concerned with commission rates and premiums more than with the danger to life and limb.

What is true of the owner's attitude is

Courtesy Newark Evening News.

RUINS OF THE NEWARK FACTORY AFTER THE FIRE. COMPARE WITH DIAGRAM ON PAGE 532.

also true of the employer's. In this case, the employers did not own the building and accordingly shifted the responsibility for the building conditions upon the landlord. To the occupancy conditions, for which the landlord was not responsible, they paid no attention beyond buying some iron fire pails. That they owed it to their employes to provide safety against fire was an absent consideration; or like the landlord they depended on their fire insurance advisers and upon such precautions as the public authorities actually enforced. The employer of the girls who were killed is quoted in the public press as testifying at the coroner's inquest that the blame, if any, belonged to his forewoman, who was one of the victims. Thus, private responsibility is left to run in a vicious circle and those concerned shift it about among themselves.

Public responsibility takes much the same course, involving as it does state laws and city ordinances which are defective, inadequate and antiquated in respect to fire prevention.

The local ordinances are faulty in construction, because they do not center responsibility for preventing fire in some competent and equipped municipal authority and because the Fire Department (the department most directly concerned at present with all fire matters) is not empowered to secure the correction of dangerous conditions with which it acquaints itself. They are also faulty because they set a standard of outside fire escapes, which are inadequate and difficult to use.

The Fire Department is organized and maintained on the basis of extinguishing fires, not preventing them. Its organization does not include a bureau equipped and empowered to make a thorough study of fire conditions in buildings, nor to issue specific orders calling for the safeguarding of occupants according to the established rules and principles of the science of fire prevention. Newark is like most other cities in that it maintains a corps of men and an array of apparatus for *outside* fire work; but the *inside* fire work, the rigid inspection of buildings by trained and competent fire inspectors, is missing.

It will only be when the citizens realize that a bureau of prevention must be equipped and supported just as much as a bureau of extinguishing, that they can expect permanent improvement in the fire conditions of their homes and business buildings.

Local ordinances place upon the Building Department the duty of seeing that fire escapes exist on buildings, but since the passage of the state labor law, in 1904, the Newark Building Department has left this matter to the Department of State Factory Inspection, on the ground that the latter has superior jurisdiction and deals especially with factories. Such a dual authority always results in one department neglecting its share of the work. In this case, the superintendent of buildings offers the additional explanation, that the small staff of his department has been fully occupied in inspecting the erection of the large number of new buildings and the alteration of old buildings, and has not had the staff or facilities to inspect old buildings.

The state labor law of New Jersey provides in respect to the number of fire escapes:

> Every factory, workshop, mill or place where the manufacture of goods of any kind is carried on, which is three or more stories in height and in which twenty-five or more operatives shall be at work, shall be provided with outside fire escapes.
>
> Fire escapes shall be located at such places on the said buildings as may be best suited for the purpose intended or as the commissioner may designate in writing, and shall take in one or more windows on each floor above the first floor.

Such a law is deficient on its face because it does not specify any minimum standards, sufficient to accommodate the number of persons depending on them as an exit in case of fire. It is defective because it relies on a style of outside iron fire escape which has been proved to be undependable and difficult of use. The law is most faulty of all in neglecting other fire prevention measures which are much more necessary and effective.

With a law so defective, little could be expected of its administration: but it is to be noted that the authorities had considerable discretionary power under it, and that to a degree they could have raised

standards. The state commissioner of labor in published interviews states:

> Since the organization of this department in 1904, this building has been inspected at least twice a year and some times three times a year by different inspectors of this department. Reports were received from five different inspectors.

He states that following the first of these inspections the owner was compelled, under threat of legal proceedings, to erect the fire escapes at the north end of the building. Of the subsequent inspections the commissioner says:

> None of these reports from any of these inspectors has recommended or in any way suggested to this department the necessity of additions or alterations in the means provided for escape from the building.
>
> In view of the fact that this building had been inspected continuously by five different inspectors, whose reports show no material difference with regard to the adequacy of the escape protection in this building, this department had no reason to assume either that the inspections were in any way inadequate, or that the reports of the inspectors were not reliable.

The commissioner concludes:

> The fault lies in the law itself and not in its administration.

The local state factory inspector is reported to have said:

> I can't understand how it could have happened. It doesn't seem possible under conditions as I found them at the time of my last visit to the factory, that under any circumstances would there have been any trouble in getting out of the place.

The fact that the fire did occur and that twenty-five lives were lost under distressing circumstances would seem conclusive that the state factory inspection department was not dealing in a competent manner with the fire conditions of factories.

If the State Factory Inspection Department stands by its inspection of this particular building, it seems a natural inference that there are many factories in the state of New Jersey which are in a similar condition, and which should without delay be brought under new standards of law and enforcement. It is publicly claimed that in Newark alone hundreds of factories are as dangerous as this factory proved to be. The Newark *Evening News* for November 30 quotes from fire insurance records a number of instances from which five are here quoted in abbreviated form by way of illustration:

> In a closely built up section of the city there exists an extensive industrial plant employing from 500 to 600 men, women and girls; not a single fire escape is provided for their use, and the industry is of a peculiarly perilous character.
>
> In another factory 650 employes in the four stories of the plant are limited to the fire escapes on which to fight for their lives if a disastrous blaze should occur. The building contains several special hazards and in it there are three open stairways and two open elevators.
>
> In a three-story and basement structure, eighty girls work where the usual means of escape from the building might be quickly cut off because of the unenclosed elevators and stairways, yet no fire escape is provided.
>
> One factory occupies the third, fourth and fifth floors of a building and employs more than one hundred women, while the first floor of the building is used as a garage. There is a solitary narrow iron escape in the rear; the elevator shaft is open and the stairway is not generous in width.

II.

This Newark fire is a challenge to public opinion throughout the metropolitan industrial district centering in New York—especially with respect to the fire hazards in the loft buildings in Manhattan.

Factory conditions in Greater New York are undoubtedly as bad as those just described in Newark. Any fire inspector can testify to this from personal observation, and the larger number of factories means a greater number of people endangered. New York has nearly 30,000 industrial establishments, with close to 700,000 workers in them. These are distributed among 12,000 buildings, only 1,000 of which are of fireproof construction. The remaining 11,000 factory buildings are of ordinary non-fireproof construction, with the same wood stairways and outside fire escapes which made the Newark factory a fire-trap. The fireproof factory buildings have an advantage in their incombustible construction, but this advantage is offset by the fact that they are built of such height and area that they represent a

TYPICAL NEW YORK FRONTS.

Fire escapes on twelve-story building. The drop ladders shown here are out of reach, hanging from the fire escape platform on the third story. These ladders, when out of place, often require three to four men to move them, even when the manipulating is done from two or three floor levels, and the upper ones are supplied with a rope. Photograph taken in December.

IN THE MIDDLE OF THE BLOCK.

Fire conditions, typical of rears of many loft buildings similar to those shown in adjoining photograph. Fire escapes, without ladders, such as those shown, enable the occupants of a given floor to escape around the fire wall. They are of advantageous design but are useless if, as here, the neighboring windows are shut and barred with metal doors. The ground level shown in the picture illustrates the spiked and obstructed sort of pocket, down into which the fire escapes of many loft buildings lead. Photograph taken in December.

special fire problem, whose possibilities are yet to be demonstrated. Some of these buildings are twenty stories high; their areas exceed 10,000 square feet, and single buildings house over 1,000 employes. It is usual for this small army of people to have no prearranged drill or march whereby they are accustomed to leave the building in an orderly and systematic manner, and in case of fire they would simply rush to the available exits. These exits are usually only two in number, one of which is an outside fire escape, likely to be covered with snow or ice in the winter season or to be cut off by smoke and flames in case the fire is on a lower floor.

The state factory inspectors of the State Bureau of Labor, who particularly supervise the factory conditions, are working under a fire escape law which is as defective as the New Jersey law. It reads:

> Such fire escapes as may be deemed necessary by the commissioner of labor shall be provided on the outside of every factory in this state, consisting of three or more stories in height.

In practice this leaves it to the discretion and competence of the staff to decide whether fire escapes shall be needed, and it is therefore proper to inquire what instruction or training in fire prevention science is given these inspectors. As a matter of fact, however, in New York city, the State Bureau of Labor refers all fire escape matters to the Municipal Bureau of Buildings, because the Appellate Division has ruled that the Bureau of Buildings has exclusive jurisdiction over fire escapes in Greater New York.

The Fire Department is able to do little to make factory buildings safe against fire, an argument for the reorganization of this department urged by Commissioner Waldo. The Fire Department company commanders, on their semi-annual inspection of buildings, make recommendations that fire escapes be placed on structures which in their judgment require them. This important duty is performed by subordinate officers, and as a general rule, the Fire Department recommendation has the purpose of pro-

TYPICAL DANGEROUS FACTORIES IN NEW YORK CITY

Artificial Flower Manufacturing. Non-fireproof construction. 125 feet long. One wood stairway, unlighted, with doors in the way at each floor. One fire escape for 200 persons. Three gas engines. Heating apparatus reported unsafe.

Strawbraid Manufacturing. Seven-story, non-fireproof. Wood stairs and elevator. 400 persons. Two fire escapes, both on one side of building, liable to be cut off by fire.

Omnibus Manufacturing. Seven-story non-fireproof construction, fire escapes in rear, 150 persons. 300 pounds of chlorate of potash in basement (the chemical that caused the Tarrant explosion). On upper floors, benzine, alcohol, varnish, sulphuric acid, etc., are used in processes; also steam- and gas-heated glue tanks and kettles.

Handkerchief Manufacturing. Three-story frame building, 400 feet long. 300 girls on top floor. Fire escapes insufficient and windows difficult to open. No fire drills.

Sweat Shop. Five-story, non-fireproof, L-shaped building with one wood stairway at end of building. Fire escapes deficient. Sweat shops with 200 persons on two top floors and lower floors. Used by dangerous woodworking factories.

Printing House. Five- and six-story building, old-style fireproof construction with structural iron unprotected. Area over 15,000 square feet. 500 employes. No fire escapes. One circular stairway. Heavy iron frame windows, cannot be used for exits and would obstruct entrance of firemen. Benzine and collodion, ether and gun cotton used in work.

Printery. Seven-story, fireproof building. 38,000 square feet area. Unprotected steel and iron columns supporting floors. No fire escapes. Over 1,000 employes. Hazards of high tension electric current on first floor and hazards of printing and engraving on other floors. Heavy machinery above third floor. Handling of benzine in large quantities in manner unapproved by New York Board of Fire Underwriters. Stairways at one end of building.

Garment Manufacturing. Non-fireproof building. Wood stairs, unlighted. Sixty persons in room with door barred and fire escape blocked.

FIRE ESCAPE ON A NEW YORK LOFT BUILDING.

The ladder is hung from the fourth floor balcony, and can be reached only from the third. In case of fire the last story would inevitably be taken at a jump by the occupants of the building, with their companions crowding on down behind them. They would pile up in an injured heap on the sidewalk. Photograph taken in December.

viding a means of entrance for firemen in their work of extinguishing the fire, and not a means of exit for the occupants of a building. The recommendations for fire escapes made by the company commanders are forwarded to the chief of department, who is expected to send them to the Bureau of Buildings for action.

All the means of exit that the law provides for factories are thus focused on the fire escape provision of the Building Code, which reads as follows:

> Every factory, mill, manufactory or workshop . . . shall be provided with such good and sufficient fire escape stairways, or other means of egress in case of fire as shall be directed by the Department of Buildings.

The application of this law is made by inspectors who are required to be competent in construction details, but it is a question whether their experience and training fit them to pass upon fire conditions, and the special problems connected with discharging great numbers of people from a building on fire.

The type of fire escape which is almost universal on factory buildings in New York city, is the balcony and ladder fire escape. The illustrations indicate plainly some of the bad features of this type. Many others could be illustrated, such as obstructions to the windows leading

A JUMP OFF.

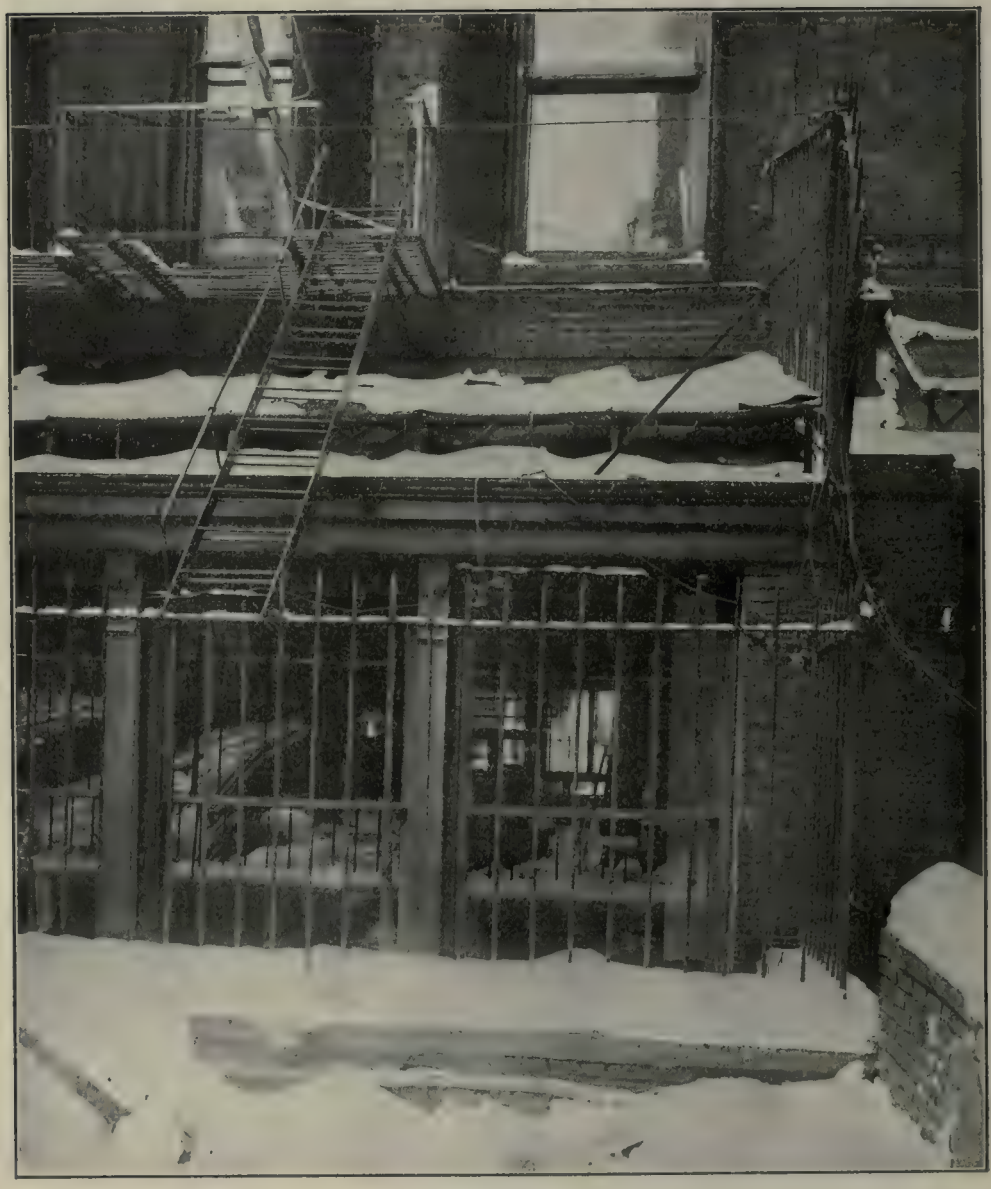
Fire escape on laundry building. No ladder at all. Photograph taken in December.

to the fire escapes; the difficulty of opening these windows and entering upon the balcony, the closing of fire escape entrances by iron shutters, the difficulty in descending iron ladders placed at varying angles, the practical impossibility of using such fire escapes when covered with snow which must be raised by women and girls, etc. etc.

The neglect of the fire danger is deep-rooted and widespread. A campaign against fire should be waged, just as there is a campaign against tuberculosis. Fire is a disease which is epidemic in all

AN EXTREME EXAMPLE OF HUMAN FIRE RISK.

Non-fireproof factory building, New York, 125 feet long with fourteen windows. One fire escape reached by only one window on each floor. Fifty to one hundred persons work on each floor of this building. Photograph taken in December.



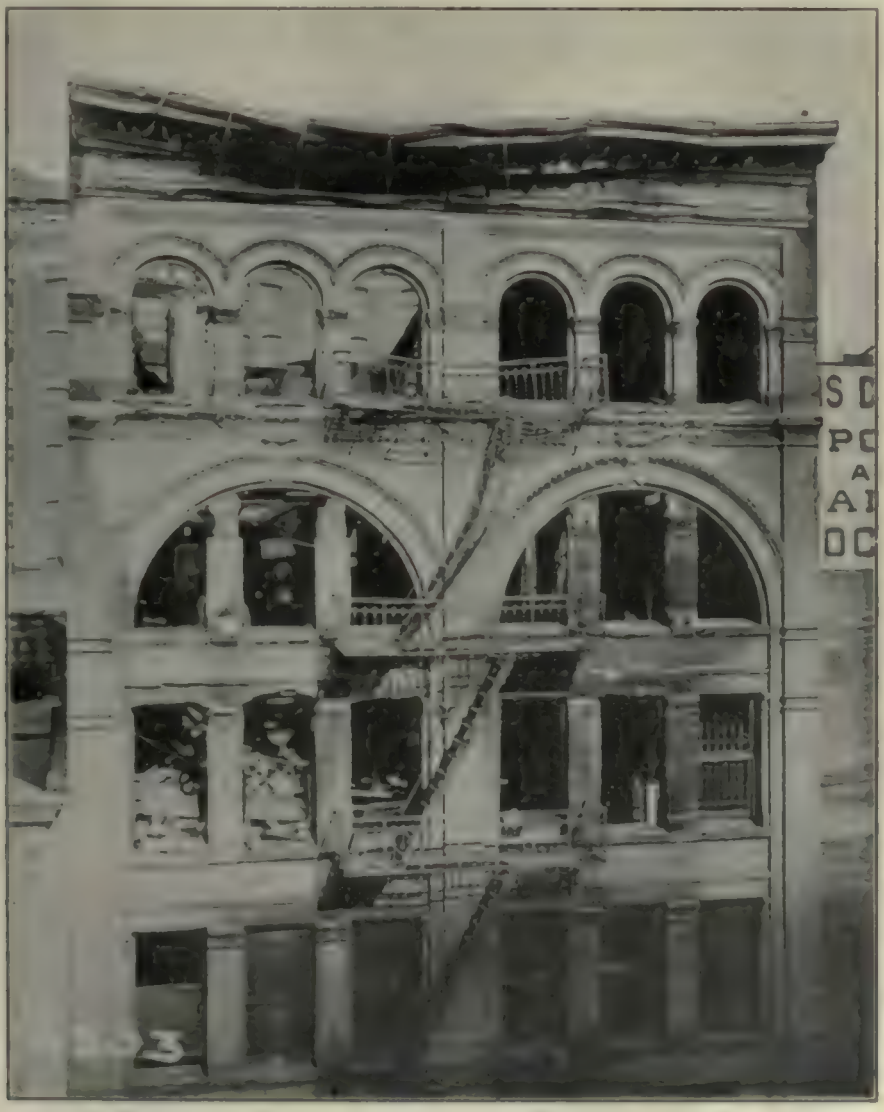
or ice or if the fire is issuing from the windows underneath, the necessity for a drop ladder at the last landing, the difficulty of placing this ladder in position, the fact that it is frequently missing or out of reach, the weight of this ladder, buildings and which will yield only to the same treatment which has been successful with other diseases. Education is the first step. The same conditions which existed in the Newark factory building, which killed women and girls, can be

FIRE TRAP A.

Fire escape on side of building for the accommodation of 125 men and girls, employed on three floors of hardware manufacturing establishment, New York. Ladder swung back to wall and held there by the iron gate which is latched open by hook near the ground. People coming down fire escape could not free the ladder, and pushed off by those behind them, would likely land on the pointed barbs of the iron gate. Photograph taken in December.

found in many other buildings. Many of the people who are indignantly calling for the punishment of those responsible for this loss of life in Newark are probably maintaining buildings equally as dangerous. If they do not own or lease factories, stores, hotels, or other business building, they are actively interested in schools, hospitals or similar institutions which are without proper fire protection. Their own homes, indeed, are, in nine cases out of ten, personal death traps.

FIRE TRAP B.



Fire escape at rear of building used for industrial purposes, the lowest ladder ending on an iron picket fence, spiked, with a five-foot jump to the snow covered lumber below.

If a man does not protect his home and his family, is he likely to protect his factory and his employes?

Some improvement can be secured by legislation. If theaters and tenements[1] can effectively be safeguarded, so can factories. But the laws will have to be based on sound principles of fire safety and will have to take heed of what fire prevention science has already established as necessary precautions. They will have to set standards for new constructions and they will have to recognize the changed demands which changed oc-

[1]Protection against fire is one of the features of the New York tenement law most vigorously looked after by the Tenement House Department in passing upon plans for new buildings. There has not to date, been a fire fatality in a "new law tenement."

cupancy, processes, and populations make on structures. The application of the laws will also have to be made by competent inspectors: either special fire prevention inspectors will have to be employed, or the regular inspectors will need instruction and training in fire prevention science.

FIRE ESCAPES SHOWING DESTRUCTIVE ACTION OF FIRE ON OUTSIDE BALCONIES.
The photograph illustrates the danger of relying solely on such means as a way of exit.

And responsibility for the enforcement of the law must be centered inescapably upon a public agency commissioned and equipped to carry out its full purpose. My belief is that this agency should be the state factory inspection department, in each state; and that in cities where professional fire departments are maintained, it should logically be turned over to this department, particularly organized to protect life and property from fire. The state labor department and other

interested departments should co-operate. It should be in position to call on the building department to see that structurally, new buildings meet its standards, but the power and responsibility for constant inspection and enforcement should be concentrated. The fire department is expected to extinguish fire; why not to prevent fire? The fire department officers are best informed about the fire conditions in buildings; they know from personal experience the characteristics of fire and its capacity to destroy life and property, and this practical knowledge should be co-ordinated with fire prevention science and made the basis of a fire prevention bureau.

WARDING OFF THE FACTORY FIRE PANIC AND ITS LOSS OF LIFE

H. F. J. PORTER
INDUSTRIAL ENGINEER, NEW YORK.

The tendency in building construction nowadays, is manifestly towards the use of fireproof material for the obvious purpose of preventing fire and the resulting loss of lives and property. It will, however, be years before all factory structures will be fireproof, and in the meantime it becomes necessary to consider methods for protecting the lives and property housed in such factories as now exist, and will continue to exist for a long time to come.

The laws of the land and of the community in which a factory is situated require the fulfilment of certain obligations to insure such protection; but the moral responsibility which rests upon the employer of labor who assembles many people in a building to work for him should incite him to do many things for their protection while there, which it is evident cannot be embodied in the law.

Moreover, it is clearly to his own self-interest that every consideration should be given to effect a prompt escape from the building in case of fire; for it is the first duty of a fire department to save lives which are in jeopardy, before attempting to save property, and meantime much property may be destroyed. In addition, experience shows that there are more casualties resulting from panic during a fire than from the fire itself, and that panic frequently occurs simply at an alarm of fire, and on other occasions when there is only a suggestion of danger. It therefore, devolves upon the employer to take such precautions as will not only insure the rapid exit of his employes from the building, but will also protect them from the results of panic due to any cause whatever.

Let us consider the methods in vogue for protecting the lives of employes in the ordinary factory, of which there are hundreds in every large city of the country. In all we find fire buckets; in many of them standpipes with hose attached; and some of them have sprinkler systems. But in few of the factories so provided have certain specified individuals been assigned to the duty of using the buckets or the hose in case of fire, or of turning off the sprinkler system after the fire is out; and what is anybody's business is nobody's, especially under stress of excitement. All such appliances can become effective only by the development among the employes of a regular fire-fighting corps.

The fire escapes supplied to buildings are generally of such construction as to be themselves more a source of accident than an escape from it. As a rule they consist of outside iron balconies, one at each floor, connected by means of ladders, the lowest balcony having its ladder detached and hung up, so as to prevent people from entering the building from the ground. These ladders are at an angle of fifty or sixty degrees, and

BALCONY ESCAPE STRADDLING FIRE WALL BETWEEN BUILDINGS.

Tenants on any floor do not have to crowd down the ladders to the street but pass around the fire wall to safety in the adjoining building. A suggestion for tenement construction.

in order to descend, people have to turn around and go down backwards, with others crowding down on top of them. In cases of emergency when both men and women have to descend by such means, and especially in winter weather when the iron is cold and perhaps covered with snow or ice, these so-called escapes are prolific of hazards which add to rather than take away the dangers attendant upon a fire. At the lowest balcony, the ladder is often a long one, correspondingly heavy, and the combined strength of several men is necessary to handle it. This is particularly true if it is out of place, as it frequently is. Men are not necessarily the first to reach the landing where it is located, and if not they cannot well get there after women have crowded down ahead of them. On such occasions a jam results, crowding those who are near the opening to a fall. Many of these fire escapes can be improved by making slight changes in them. The ideal fire escape has no ladder whatever, but is merely a balcony running from one building to another, separated by a fire wall. This enables an immediate horizontal escape from the blaze, with

COUNTER WEIGHTED LADDER.

A few of these can be found in New York. They are an improvement over detached ladders, but dangerous on account of the rusting of chain and pulleys.

the discharge of the people to the street at their convenience from the adjoining protected building. Detached stairs, hung vertically on a pulley, are often no more available than detached ladders, for the pulleys often get clogged, and the wire rope rusts and breaks, letting the weight fall on someone. A ladder which swings horizontal to the lowest balcony, which has neither chain nor pulleys, and which drops gradually when the person runs out upon it has obvious advantages; while a fireproof well or bricked-in fire escape with proper inlets, such as has been developed by the New England Mutual Fire Associations, excels these others, and can be erected in new constructions and added to many old.

It is usually assumed that where fire extinguishing apparatus has been installed in a building and regular fire escapes provided, everything necessary to meet an emergency has been arranged; that the fire, if it occurs, will promptly be extinguished; or if not, and danger threatens the occupants of the buildings, that the latter will get out without difficulty over the fire escapes.

But somehow or other experience does not bear out this assumption. It seems that the mere installation of fire extinguishing apparatus does not make it effective at those critical times when, if it is not effective, it has no excuse for being. It must be kept in order; someone must be instructed in its use and assigned to the duty of using it at the proper time. It seems, too, that fire escapes become obstructed or broken through not being used; that people, not being accustomed to them, prove afraid to go down in an emergency; or that

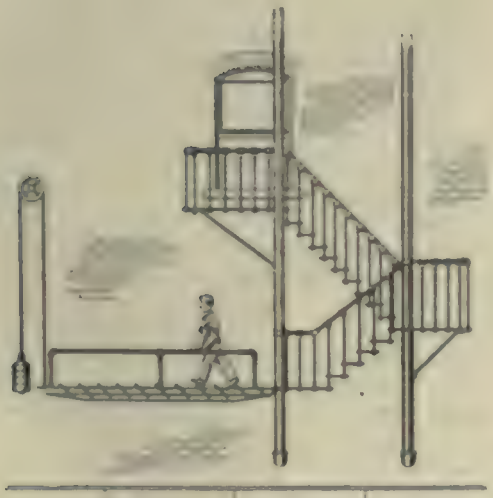
MASSACHUSETTS STANDARD FIRE ESCAPE DROP LADDER.

This ladder lowers automatically with the weight of the first person to set foot upon it. No pulleys and chains to rust out. No ladder to lift, with a frightened mob of people crowding behind the first comer. So far as the New York Building Department knows, there is no such ladder in Greater New York.

I.

II.

THE A B C OF FIRE ESCAPE CONSTRUCTION.



I.—Old style fire ladder stowed away. Must be unhooked and lifted into position and is often too heavy for the first comer to handle, or is found to be misplaced and out of reach.

II.—Old style fire escape ladder lowered. Every person descending must stop and turn round to climb down while the stairs above may be jammed with people who may crowd each other off the balcony and ladder in their effort to get down quickly.

III.—Improved ladder, stowed away.

IV.—Improved ladder lowered. It falls gradually with the weight of the first person who steps upon it.

III.

IV.

Note.—The diagram shows a weight and pulley apparatus to balance this ladder. Such apparatus is likely to get rusted and out of order. A better design is that in which the ladder is swung on an axle with a counterbalance to hold it horizontally when not in use. It locks itself in position when lowered. [See Boston Standard, page 540.]

if many try to use them at the same time they are jammed on them and injured. In one great New York factory, the engineer in charge was offended that an outsider should be called in to investigate the system of fire precaution in vogue. The factory had several varieties of fire extinguishers, tanks, grenades, etc. One of each type was taken to the rear of the building to demonstrate its efficiency. Not one of them worked. The tank, for instance, had been religiously refilled from time to time, but its nozzle had been plugged by someone with a pencil which stuck fast. It is a truism that in order to depend upon anything being ready for effective service when needed, it must be used occasionally.

The only way to accomplish this, in the case of fire appurtenances, is through recurrent fire drill, whose effectiveness has long been proved in the public schools. Boys drilled in it are now men, and appreciating the soundness of its principles have here and there put it into effect in their own factories, and in other buildings where people congregate. In these adaptations its benefits have been at once apparent, for every thing is so supervised that a fire is not apt to occur, and this knowledge lessens the danger of panic.

Under ordinary circumstances, however, where no plan of action has been preconcerted, everybody is naturally always in a state of more or less anxiety; and when a fire does take place no one knows what to do. Where a fire drill has been installed, everyone knows exactly what to do; he has done it from time to time when the signal has been given unexpectedly. Here is all the difference between ignorance and knowledge. One inspires terror, the other confidence; one breeds panic, the other promotes orderly escape. Meanwhile, the fire fighting corps, which is part of a comprehensive fire drill organization, attacks the fire effectively in its incipiency; and the public department, once on the scene, can center its work on the task of extinguishing a burning building from which the human hazard has been eliminated.

Employers who have installed fire drills in their organizations say that they feel relief in the fact that they have done what was in their power to make conditions as safe as possible for their employes. Employes who have worked where a fire drill is installed say that they can go at their work with their minds freed from anxiety, and this in the last analysis is a paying investment for the employer.

Sometimes panics occur where there is no danger. The daily press recently told how fifty girls became hysterical and several fainted in a shirt factory, where a newspaper blazed up from a spark from an electric motor, and many women were trodden down in a senseless panic by men who were more terrified than they. The press has also told of a large neckwear manufacturing plant, where the employes became frightened by smoke entering the windows from a burning tar pot in the street, and in their rush for the exits a dozen were so injured as to require the attention of surgeons.

Although against the law of many states, it is not infrequent that factory doors used by the employes are kept locked during working hours. In one such case, of the 400 girls locked in on the fifth floor of an underwear factory, some leaped into nets held by the firemen and others were taken down on the fire ladders; many were more or less injured, all nervously shocked. In a recent fire in a feather factory, the girl employes went down the fire escapes until they reached the last balcony, where they could not handle the heavy portable ladder; when they were later carried away by the firemen, some were fainting from the suffocating smoke.

In similar instances fire drills have saved lives. For example, not long ago in a Chicago factory fire, the employes on signal formed and marched from the building which shortly afterwards burned to the ground. An equally significant case occurred recently in a Brooklyn public school. The children, who were in real danger, were marshalled by the teachers in the fire drill, and the building was completey emptied in a few minutes without panic or excitement, while across

the street the inmates of a factory, who were in no danger whatever, but who had no fire drill, became panic stricken. Several were seriously injured and considerable property was destroyed before they could be controlled.

In a factory where I was engaged several years ago, I found conditions such that in case of a fire either within the building or in adjacent buildings it would be necessary to empty the factory of its occupants promptly. I established a fire drill, which by occasional repetition reduced the time of exit from more than seven minutes to less than three, a saving which in a rapidly burning fire or one involving considerable smoke might be the margin between life and death. Since that time I have introduced similar drills into many factories and in every case with remarkably desirable results. Sometimes, as usually happens in the case of actual danger, the drill is at first accompanied by the fainting of a few of the girls. Later all become possessed of a feeling of security, which largely counteracts the tendency to faint or stampede, and a habit of prompt and rapid dismissal is acquired. Near one of the buildings where I was at work, a clothing factory employing nearly 1,000 hands, both men and women, an altercation occurred between men in an adjoining railroad yard. One of the employes called out "fight!" Mistaking the call to be "fire" a panic followed, the factory was emptied, but only after many accidents, one man leaping from a second story fire escape and breaking his leg. The fire drill has altogether eliminated this sort of hair trigger trepidation.

In another factory, where 1,000 girls were engaged in making shirtwaists, the appearance of a rat occasioned a stampede, in which many girls were injured. There have been similar alarms since the drill has been introduced, but the girls have gone quickly to the nearest exit without excitement.

Factory fire drills naturally vary greatly, depending upon the character of the building and the type of occupants. A large New York candy factory is composed of several buildings, some of them ten stories high, located side by side with fire walls between. The superintendent had thought he could empty any one of the buildings in from ten to twelve minutes, taking the occupants down to the street. To take the place of this, a drill was arranged so that the occupants of each floor on any building moved horizontally through a fire door (already existing) into the same floor of the adjoining building. In this way any one of the ten-story buildings was emptied, not in ten minutes, but forty-five seconds. Later, a fire occurred in this factory during a Christmas holiday rush (a cigarette or a match had been thrown into a lot of paper boxes), and the drill operated perfectly. A pencil factory covering a city block, with thirteen separate buildings, was drilled so that if a fire should occur in any building it could be emptied in less than three minutes, the occupants of no other building being disturbed unless they became endangered similarly.

I have installed fire drills in several cigar factories. A description of the largest and most complicated of these may be of interest, as indicative of the way some of the problems presented by factory fires can be met:—The building is seven stories high, and unusually large for its kind, covering 7,500 square feet of ground. It is of brick with ordinary wood beam interior construction, and houses on an average more than 2,000 employes, mostly women, a large percentage of whom are foreigners, with always a fair sprinkling of recently arrived immigrants. They had to be dismissed at noon and evening by departments, in order to prevent accidents on the stairways and to facilitate exit. The fire drill which was installed is comparable to what in the city streets is known as "traffic regulation." In teaching it, instead of letting everybody leave the building by any exit he or she chose, certain exits were assigned to the occupants of certain floors, so that the stream of people from one floor could not intercept that from any other, collisions being thus absolutely avoided.

It had been the custom to have all the employes enter and leave by one doorway, in front of the building, to which leads stairway "A." The people on some

of the floors used stairway "A" direct to the street, while those on other floors used the rear stairway, "B," as far as the second floor, and then crossed to the front of the building to stairway "A." For ordinary occasions this one exit sufficed, but for an emergency, such as a panic or a fire, it would have been inevitably congested and the weak would have been trampled under foot.

To provide for a prompt dismissal with ample exits was the problem. In the matter of exits the end desired was, if possible, to provide a separate stairway for each floor. In studying the building it was seen that by proper arrangement stairway "A" could provide for the second and third floors. The second floor contained a number of office employes as well as a number of cigar workers. The office employes were assigned to a small private stairway leading to the office on the first floor, whence they made their exit through the office street door. One side of stairway "A" was given to the cigar workers. The first flight of this stairway was wide enough to accommodate two streams of people. By putting up a stout handrail, the flight was divided into two stairways. The second floor workers took one side, while the third floor workers had the entire use of the stairway from the third to the second floor, and then used the other half of the stairway from the second floor to the street.

To the fourth floor was assigned the rear stairway "B," by which the occupants descended to the first floor, whence they had an exit directly to the side street. The fifth floor was connected by a bridge with a tobacco storage building adjoining, and thus had access to its stairway.

The sixth and seventh floors remained to be provided with exits. All the stairways had been utilized to their full capacity, so that some other means had to be devised. It happens that there are tenement houses adjoining the factory on the side and rear, and the roofs of these are nearly level with the sixth floor. As the company owns these houses they could be utilized, and it was arranged

EFFECT OF PREVISION.

Fire drill, developed by Mr. Porter, in seven-story tobacco factory, New York; 2,000 employes reached the street level at all trials, in less than five minutes.

to discharge the sixth and seventh floors to their roofs, and have the workers descend through them to the street. To accomplish this, three doorways were broken through the walls of the building at the sixth floor level. In this way it was possible to arrange for the sixth floor to discharge its 400 employes immediately through two side doorways, while the 150 employes on the seventh floor came down the upper flight of stairway "B" to the sixth floor, and then went out through the doorway opening on the roof at the rear. Thus, in each case, the neighbor's tenement stairways became available and the operatives on the two upper factory floors, who previously, in case of fire, would not have been able to escape, were able to leave the building as quickly as those on the floors under them.

MAKING HASTE SLOWLY.

Employes on sixth floor of New York tobacco factory making exit to roof of adjoining tenement and thence to stairs and street. Employes on seventh floor are at the same time making exit to the roof at rear of building. These emergency outlets for the upper floors were designed to prevent a stampede on the main stairway.

This arrangement of stairways and exits provided satisfactory means of egress without using the fire escapes, which were left for the Fire Department to use as entrances.

Once the question of exits was settled, the actual work of drilling began. On account of the various nationalities, age and character of the people, this had to be done slowly and carefully. The first step was to post notices, simply announcing that the company was about to introduce a fire drill as a means of getting the employes out of the building rapidly and without confusion. A little later a second notice was posted, giving some detailed information about how the drill was to be carried out. Copies of this notice were given to all employes to be taken home, so that those who did not understand it readily could have it explained by friends familiar with fire drill as carried out in the public schools. After a time a third notice was posted, giving the rules and directions to be followed by employes.

In the system devised the foreman of each floor acted as captain, and all the employes on that floor were instructed to follow his orders. Some of the men were detailed to handle the fire extinguishers; others were appointed guards to open the doors, stand at the stairways and congested points, keep the lines moving and assist any one who needed it.

FIRE DRILL IN ACTION—1.

Sending the alarm on the fourth floor. Each floor has such an alarm box, which signals automatically to every other floor, indicating not only that there is a fire, but on what floor it has broken out. Defender Manufacturing Company, the manufacturing branch of the H. B. Claflin Company.

Certain women were designated as searchers to examine the dressing rooms and make sure that no one was left behind.

A system of gongs was introduced, so that when a fire was discovered an alarm could be sent from near the foreman's desk on any floor simultaneously to all floors, and to the main office where there was connection with the public fire department. The alarm indicated by the number of strokes which floor was afire. At its sound the men detailed as guards opened the doors and took their places on the stairs, the fire-fighters without delay got the factory fire-fighting apparatus on its way to the floor indicated by the signal. The employes worked seated at long tables in many rows with aisles between. They were instructed simply to rise at their places, put their seats under the tables, so as to clear the aisles, and then stand at attention. At a signal from the captain they were to file out, those nearest the stairway starting first, followed by the others in regular order. In passing out the girls were instructed to go in pairs, linking arms as a support to each other, each holding up her dress with her free hand, in order to prevent the girl behind from tripping over it on the stairs. They were drilled not to touch the couple ahead, thus preventing crowding and increasing the speed.

In actual operation only a few seconds elapsed before the lines were formed and in motion. In thirty seconds some of the employes had reached the street entrance and were out of the building, and in a minute large numbers were safely upon the sidewalk. There the captains led them away from the building, to clear the way for the others to come after them and to give the firemen an opportunity to do their work; for it must be remembered that the arrival of 2,000 people on the sidewalk in a few minutes produced congestion. A fire marshall was put in charge, who saw that the signal system was kept in order by testing it every morning before work began, and who was held strictly accountable for keeping the fire apparatus and general conditions about the factory up to standard.

Naturally there was one floor which took the longest time to be discharged. In a seven-story building it is not possible to empty all floors with equal rapidity. On several occasions the drill was timed by disinterested observers, such as representatives from the Fire Department, Labor Department, Building Department, and civic organizations, and in each case the last employe was out of the building well within five minutes of the alarm.

FIRE DRILL IN ACTION—2.

This fire-fighting corps is brought to the scene of the fire by the definite information given through the alarm signal. The apparatus is inspected regularly and the men are trained to handle it. Defender Manufacturing Company, the manufacturing branch of the H. B. Claflin Company.

This was the net result of system and order, the following of a prearranged method of exit, which was repeated until the employes became thoroughly accustomed to a fixed course of action whenever the fire alarm sounded. In other words, where formerly everything was left to chance, with the probability of a holocaust in case of fire, effective arrangements were made for discharging over 2,000 persons from a seven-story factory—a life hazard equalled only by the largest auditoriums in New York, and that before any fire short of an explosion could be expected to get headway enough to imperil the occupants.

In the many factories which I have examined at the request of the proprietors, to satisfy them that they were doing all they could for the safety of their employes, I have failed to find any which, in one way or another, had not introduced some obstruction to the availability of their fire escapes, and had not allowed some of their fire extinguishing apparatus to go uninspected until it was absolutely useless. Many factories give no thought to the subject, and on one occasion my question to the superintendent, as to what he would do in case a fire occurred right then, was met by the amazing reply that he would think of some way to get his employes out. When pressed to think then, while he had plenty of time, of a way to do so, he was utterly unable to say how, under conditions as they existed, he would get them out. It is only by going through the manoeuvers which would occur in case of an actual fire that the efficiency of the escapes and appliances can be tested. A fire drill will do this, and once introduced its desirability is so evident, that one would suppose it would never

FIRE DRILL IN ACTION—3.

The fire signal heard, occupants of room are filing through fireproof door leading to the adjoining building, separated by fire wall through which they can descend in safety. Defender Manufacturing Company, the manufacturing branch of the H. B. Claflin Company.

be discontinued. Yet owing to the fact that it develops such conditions in a factory that a fire or panic is practically impossible, the employer, after a considerable continuance of this immunity, often forgets that the immunity is simply an effect, not a cause; and when a busy season arrives he begins to postpone the practice, and then lets it drop into total disuse.

Even the drill I have described at length is now practically discontinued, notwithstanding the fact that the treasurer of the company, through whose active co-operation it was originally installed, was himself burned to death with several of his household in his summer residence, where conditions were much more favorable for escape than they are at the factory; and notwithstanding that the present president, while at the opera, nearly lost his children and servants in a fire, which recently swept through his apartments and burned off the two upper floors of a building, which was, and still is, advertised as the most fireproof and expensively equipped structure of its character in the city.

Unless, therefore, public opinion can be aroused so as practically to insure that fire drills be instituted and operated universally in factories, as they now are in public schools, legislation should be passed to make them compulsory.

As a concluding observation, on the basis of my factory experience, let me say that all places occupied by people should have a fire drill installed in them.

Loft and apartment buildings and hotels should be supplied with fire alarm signal systems of a type which will notify the occupants on what floor the fire is. Vibrating bells are no better than shouts of "fire." The signals should be frequently operated to see that they are in order, and occasional drills should be carried out to show that conditions and apparatus are respectively safe and in order.

In building and maintaining homes, tenements, hospitals, theaters, ferryboats, steamers, department stores, museums, and such places, where many people congregate, fire exits should be considered and drills should be installed and operated. Alarm bells in stores, hospitals, museums, etc., should be so small as to be audible only to those who are instructed to take charge of the people who are to be handled. These drills should vary in their character as greatly as the conditions which surround them vary. Steamers, for instance, should have public drills frequently, with one of the crew entering the cabin and putting on a life preserver to show the people how it is done.

It is useless to say that structures of this kind cannot be so treated, for they have been so treated and what has been done can be done again. Frequently when a building is inspected the most astounding conditions are revealed. In the largest art museum in this country, where the property value is priceless, it was found several years ago that there were hours of each day, and several days of each year, when on account of fires in the neighborhood, which drew away the available fire engines, it was inadequately protected by the municipal fire service. This condition continues today.

To those who point to the fact that they have gotten along for forty years or so without a fire and that therefore they never will have one, I can only quote that it is the unexpected that happens. Witness the following clipping of a recent cable:

BARCELONA, Spain.
February 27.

The Historic Church San Pablo Del Campo, erected 914 by Count Wilfred II; originally a Benedictine Convent; restored in 1,117; of Catalin architecture; was today destroyed by fire, possibly of incendiary origin.

It took nearly 1,000 years for fire to reach this place, but it got there eventually.

WHEN A WOMEN'S WORKROOM BURNS

MARY BROWN SUMNER

It was just before nine-thirty on the morning of November 26 that the first alarm of fire was turned in from the four-story factory building at Orange and High streets, Newark. Sixteen minutes later a third alarm was turned in, and by that time sixteen girls and women had leaped from the fourth story to their death and three hospitals were filling with the dying and the injured. When later search was made in the burned building nine more were added to the list of dead, making a total of twenty-five.

These dead and injured were young women, few over twenty-five years of age; all employes of the Wolf Underwear Company on the fourth floor. Altogether the garment workers in their loft the morning of the fire numbered 110. At 8, and at 9, and 9:15 they were wrapped up in the whir of ninety power sewing machines, or engaged in sloping, lace running, trimming and other operations in the making of "white goods." Upon them, without their will or power to forfend, came the catastrophe. We think of a fire as a blazing structure; it may be the sharing of a few bursting minutes with a hundred companions followed perhaps by weeks of agony, and slow months or years of incapacity and dependence. They were of various nationalities, these young women; perhaps a third were Americans, then a group of Germans and German Jews, one not much smaller of Italians, a half dozen Polish needle workers and a few Irish. Most of them had been with the firm for several years, for in pay and treatment the Wolf Company had won for itself the white label of the Consumers' League. A score of others made up a group by themselves, of a sort which in its self-revelation of the ties which bind working women to each other, must quicken the pulses of those who have felt the glow of fraternity in common labor. They had come in a body at the beginning of the busy season from another firm that had recently failed. They had worked side by side for years, and one of their number had brought them together to apply at Wolf's, so that the group of friends should not be broken up. On November 26 the group was broken past all recall.

ANNA HAAG.

The forewoman who might have escaped by the stairs if she had not gone back to direct her girls to safety and put the company's books in the safe.

The girls were for the most part experienced workers from whom more than the average self-reliance could be anticipated in an emergency. The fire experts tell us that if there had been no delays, such as an organized factory fire drill might have prevented, the casualties which followed need not have taken place. They tell us, also, that if there had been adequate exits, or fireproof construction, such delays as occurred need not have been fatal. These safeguards did not exist, and in their absence, a series of petty delays ate up the

precious margin which lay between the steady whir of the power machines and that ghastly quarter hour which snuffed out a life a minute, and left charred bodies to be picked up in the ruins, and maimed ones to be picked up from the sidewalk and the picket fence outside.

The fire originated not in Wolf's, but in the Anchor Light Company on the third floor, from a short circuit which ignited a bottle of gasoline. The first few moments slipped out of reach while the foreman there tried to put the fire out. Then the flame leaped to the ceiling, spread out, he said, "like a stream from a cannon," and in the room above one of the girls tells of a thin tongue of fire which she noticed shoot up through a scuttle door. Others saw smoke at the windows, and still others remember hearing a commotion downstairs and commenting on it to an expressman who was just entering the freight elevator to descend. A minute was lost because they did not realize what was the matter, and the elevator went down with but the one occupant. The next instant the foreman from the third floor pounded on the door at the foot of the stairs, which locked with a Yale catch and could be opened only from the inside by the forewoman. Again a precious minute was lost before she heard and opened the door and hooked it back, and the fearful consequences of that degrading, but not uncommon, practice of locking factory girls in at their work was in that minute demonstrated. The forewoman ordered the girls to scatter to the exits. A few slipped out by the stairs, the last of these having to jump to clear the burning lower steps. Others, and not a few, in response to a first impulse to save their belongings, went for hats and coats, and came back to find the stairs gone. This was the last of the series of petty delays. About seventy girls crushed down the fire escapes at one end of the building, where after a struggle a strong woman managed to adjust the heavy lower ladder. The other end of the building was without balconies or ladders. The girls there crowded out on the window ledges. They did not seem to feel ordinary fear; height had no terrors, only the flames behind and below and all around them. One girl describes how she leaned far out of the narrow old-fashioned window, the sash resting heavily on her back, until she caught sight of the net below. She struggled from under the sash and next felt hands upon her as someone dragged her out of the net. Like many others, she suffered afterwards in nervous collapse for the terror she did not feel at the time. Other women hung on window ledges till their muscles failed and they dropped; others jumped hand in hand into the nets which broke with their combined weight and killed them. Still others jumped from windows where there were no nets, only to be killed or maimed. To this group belongs the heroine of the fire, Anna Haag, the forewoman, who might have escaped by the stairs had she not gone back to direct the girls; and then, before making her own escape, stopped to put the company's books into the safe.

A week later a canvass of the girls on Wolf's payroll showed twenty-five dead and sixteen in the hospital of whom two may die, seven will be invalids for years, and the rest for months until broken bones and other obscurer injuries harder to deal with are healed. In their homes sixteen others were found who will be in bed for months suffering from fractures, displacements, contusions or shattered nerves. Putting aside for the moment the subtler miseries, let us consider the more easily calculable material loss in the death or injury of these fifty-seven needle workers. In that propertyless class where the lack of a wage-earner means destitution, daughters and sons are brought up to go to work early to assist prematurely aging parents in the support of the household. "I want my girl back again," said one mother, "not battered and broken as she is, but strong and healthy as she was, to work for me." She loved her daughter, but inextricably mingled with her love was the material need that she had of her.

The girls in the Wolf workrooms gave no small addition to the family income, for in Newark pay is, if anything, rather higher than in New York. Many of the

conditions of their work were above the average. The hours were from 7.30 to 5.50 with one hour for lunch, making a little over nine hours' work. There was no night work, and Saturday was a half holiday; so the season lasted about ten months with less than two months' half time and only two weeks' unpaid holiday. The ninety operators at power machines earned from eight to fourteen dollars a week—one girl even as much as eighteen. The twenty other workers were employed, either on piece work as slopers, ribbon and lace runners, earning a little less than the operators; or as week workers, trimmers, examiners, and workers at the button and buttonhole machines earning from five dollars and a half to nine dollars according to length of experience. Nine dollars probably fairly approximates their average wage. In almost all the homes the standard of living was enough higher than among the same grade of workers in New York to make the expenditures proportional. The households of the Americans took more account of appearance; but in only a few was there any lack of cleanliness or necessities. Comforts were most apparent in large families of working sons and daughters.

Unlike similar workers in New York, who often seem alone and adrift, these girls had with few exceptions a background, not only in their immediate family, but of more distant relatives, established associations and social life. The funerals showed throngs of young cousins and close family friends.

Of the twenty-five women who were killed six left behind relatives who had been wholly dependent upon them. Of these dead bread-winners three were widows who left children, and in two cases an old mother also, without support; one deserted wife left three children, and two girls left old parents. Of the thirty-two who were injured one, probably crippled for life, was the main support of her father and mother, and two others were wives who worked to eke out the earnings of husbands, whose unskilled labor brought insufficient wages to meet the needs of a houseful of children.

Seven of the dead and eight of the injured were childless wives or single women without dependents.

A large group, eleven of the dead and twenty-two of the injured, were working daughters in working families. In but three of these homes were there evidences of poverty. Two were Polish households and the third the household of a German widow living in a basement with a grown son and a daughter. The latter is a consumptive whose disease has been aggravated by exposure and shock at the time of the accident, for she was one of those who had to jump from the window. Two of the dead left a brother or sister as the sole support of a widowed mother. The greater number had father, mother and large families of brothers and sisters, some small and some working. Several of the fathers were small shopkeepers. One of these had one girl killed and two injured, leaving two grown sisters and one child in the family unhurt; another lost three grown children out of a family of eight. In all the families, the fathers were passing middle age, and all had gradually readjusted their standard of living as sons and daughters grew up and went to work. In such homes when all are working, the needs and comforts of all can easily be met; when one worker is withdrawn—even leaving out of account the expenses of sickness or burial—the family standard of living is affected. In one case a working son and daughter had made it possible for the overburdened mother of seven children to take in a half-grown girl to help her with the housework. Now one of her wage-earners is returned to her with two broken hips—an invalid perhaps for life.

This crippling of families piles up the economic cost of the fire. There can as yet be no exact estimate of the loss to the workers' families. For the dead it would include funeral expenses and the hole made by their death in the family income; for the injured, the wage loss, and the cost of their care, even were we to bar out any reckoning of that agony of mind which impairs earning power and which is always reckoned high in damage suits. A wage-earner's loss is not offset by that credit which often

enables a business man to re-establish himself after a catastrophe. Many of the girls had industrial insurance, but it was limited in most cases to burial benefits. The Newark *Star* has raised a fund of $20,000 to which the Wolf Company contributed $500. When it is remembered that the first year's wage-loss of the killed wage-earners will amount to over $10,000, it can be realized how insufficient such a sum is to make good their loss. Nor can such funds, with the elements of gratitude on the one hand, and a favor conferred on the other, be the ultimate solution of cases like this, where injury was sustained by those who had no control over the mechanism of the fire trap in which they were caught.

In the last New Jersey Legislature a bill was introduced which was a step toward establishing responsibility, and not merely proved negligence, as a basis for employers' liability. It failed of passage, but an Employers' Liability Commission was appointed, and there is hope that this year statutes will be introduced establishing automatic compensation at least, as in the New York laws of 1910, in some trades.

The program which expressed the majority views at the recent conference of one federal and nine state commissions in Chicago,[1] affords a test of how adequately such a compensation plan would insure such a working force as that in the fourth floor of the Newark factory, were it to cover fire as well as machinery hazards. To the girls injured would be given medical expenses and half their earnings for life or until recovery. In all cases, then, a cripple would have to bear at least fifty per cent of income loss. For the dead, the plan would allow medical and burial expenses, and to the families of five of those who left dependents, from twenty-five to fifty per cent of their earnings, according to the number of dependents, for a period not to exceed 300 weeks; after that they must shift for themselves. To the family of the widow whose picture is given, who left behind in Austria an old mother and three little children, one a cripple, to whom she sent regular remittances, no compensaton whatever would be given, since non-resident families of aliens are excluded from the plan.[2] Few, if any of the working families, the weekly pay envelopes of whose daughters rounded out their household income, would be adjudged "partial dependents" and therefore eligible to any compensation for wage loss. Thus even under compensation a good share of the actual financial loss would still remain with the family bearing the whole spiritual burden.

Limited as it would be, however, such automatic compensation would provide more adequately than a charitable fund of $20,000 can, and more important still, by making the human loss a fire risk to the employer, it would accelerate the work of fire protection in the crowded "omnibus" city factories, where hundreds of thousands of working girls are now in constant danger. Without this economic motive, as things stand today, this human fire risk is not an ever present consideration with the majority of factory managers. They at the most feel that they have met their responsibility in obeying the minimum which laws that are anachronisms demand. Fire protection is not a thing which unorganized working girls can secure for themselves; or if they could, it is not likely that they would take the lead in doing so. None of the girls injured and few of their families realize that they are paying the penalty for the criminal sins of omission of the community as a whole. By the majority, the calamity is looked upon as the "will of God." "I have much to be thankful for," said one mother who had one daughter killed and two injured; "my two girls will be well in a few weeks, and my dead daughter's face was not marred as she lay in her coffin."

But this uncomplaining acceptance of what has happened does not mean lack of suffering. The whole tale of the Newark fire is not told when its economic effects are reckoned. Two weeks after the accident only about half of the girls who escaped uninjured were working, though work was offered by more than one New-

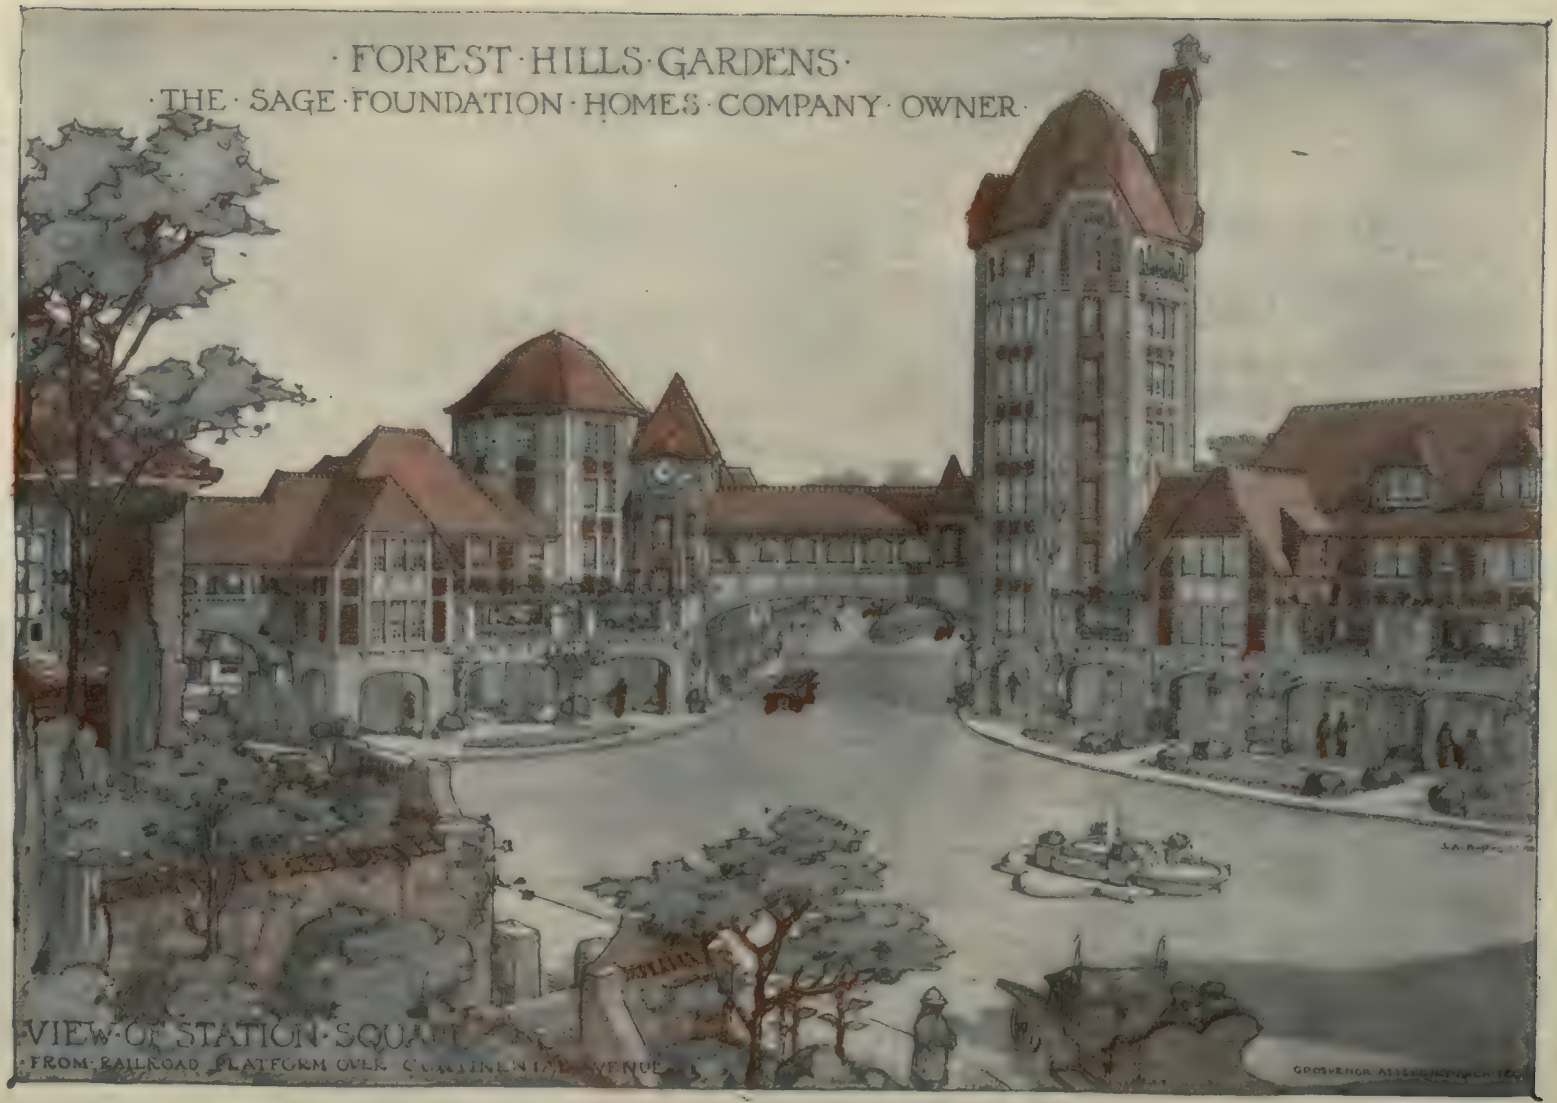
[1] See THE SURVEY, Dec. 1, 1910.

[2] The English and German systems do not make this unjust discrimination nor does the New York law of 1910.

ark firm. An explanation lies in the fact that most of them have suffered from nervous shock. They can talk of nothing but the fire. The tears stealing unheeded down their cheeks as they tell the story, their apathy, their night-terrors mean in many cases impairment of earning power. At the very best, these girls have learned early that those dreads and imageries of death, which physicians tell their patients are but unnatural fears of imaginary dangers, are facts in life. In them the seeds are sown of that chronic nervous prostration which clinics find so hard to cope with among working people, in great part because it is based upon the real facts of the patients' lives. For in some lives nothing is more morbid than the events of life itself, and realities cannot be reasoned away even by the kindest of physicians.

If the nervous cost to these girls cannot be estimated, still less can the spiritual cost to the families of the dead and injured. One father was recovering from illness when the news was brought him that his daughter was terribly hurt. They are both now lying at the point of death in the same hospital. Two girls who were to be married soon will probably be cripples for life; and as the brother of one, in bitterness of spirit stated the crude and brutal truth, —"What does a young man want of a woman like that?" Families of little children are deprived of a mother, or their mother is returned to them from her work an invalid for months or years; childless husbands are widowed; old women robbed of all they loved best. Parents are left with a crippled daughter to care for, and sisters and brothers deprived of a companion, not by natural death, but by a nightmare. As one Italian boy expressed it: "I can't get it into my head that it happened to my own sister." But this was no nightmare; it was in the day's work. How truly work may dominate life and death is shown in another family. The girl's mother, an incurable invalid, had lost her husband by a work-accident four years ago; and now in this fire her daughter, her support, followed him through the factory door to the grave. Perhaps a great industrial catastrophe gives us in this way a glimpse of what lies behind the idealization of death by the poor, who make it typify the life of human happiness that they feel their lost ones should have lived, were their world not so sadly marred by toil and terror. In the home of one victim is shown her photograph, a strong and handsome girl of sixteen lying on her white coffin, which opens out like a bed, and wearing the veil and wreath of a bride. This is the ideal; her real life of work, begun the moment childhood ended, is put in the background. But the sign of those stern realities which were her life and death remained in the two small wounds on cheek and temple.

ONE OF THE VICTIMS.
An Austrian widow whose death has left her mother and three young children destitute.



FOREST HILLS GARDENS

A STUDY AND DEMONSTRATION IN TOWN PLANNING AND HOME BUILDING UNDERTAKEN BY THE RUSSELL SAGE FOUNDATION AT FOREST HILLS, LONG ISLAND

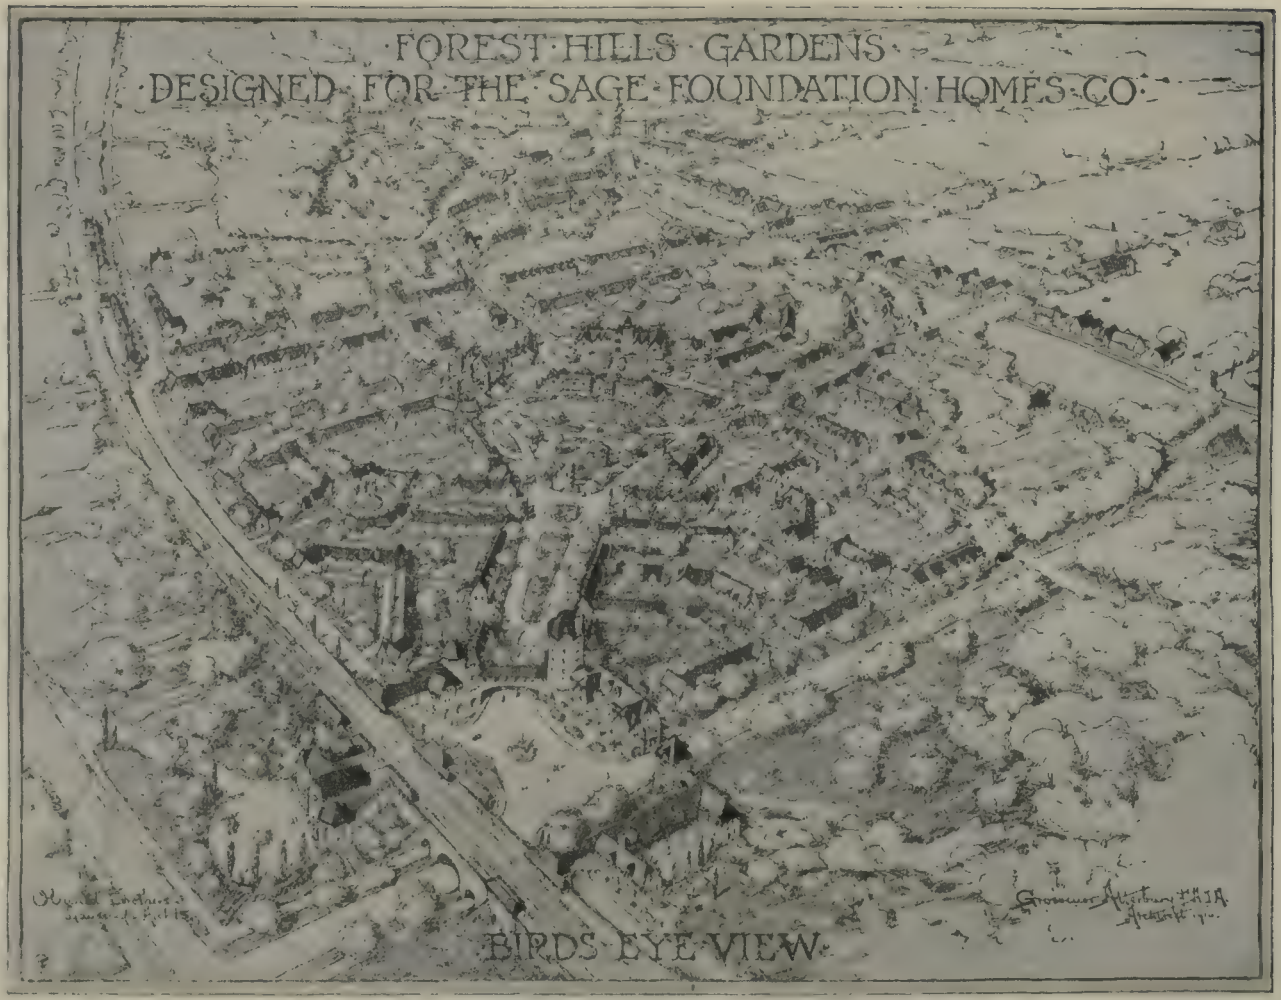
FOREST HILLS GARDENS

GROSVENOR ATTERBURY

Most prefaces are written after the book is completed. The present statement of the general character of the work undertaken by the Russell Sage Foundation at Forest Hills Gardens, if taken as a kind of foreword, must be read with this essential difference in mind—that it is written at the beginning and not at the end of the work. And furthermore, that while the general aims of this undertaking may be outlined on paper in advance and the general conditions expected to be met may be fairly well anticipated, it is nevertheless distinctly a problem which must be worked out along the lines of least resistance, under practical conditions and in spite of practical obstacles, many of which cannot be foreseen and almost all of which are subject to change.



The educational value of the undertaking must be its justification. If for no other reason, therefore, it must be considered on a business basis, for the value of the experience required in any success achieved will depend first and last on obtaining results in the face of conditions no more favorable than ordinarily met with in other land development, and by the use of means ordinary available in other instances.

That some further explanation of the project in this respect is necessary, notwithstanding Mr. deForest's statement already published in these pages, becomes evident from the character of the press comments current throughout the country. Evidently something must be said, above all, to lay the ghosts of "Spotless Town" and "Pullman," not of course in answer to the facetious paragrapher, who calls attention to the fact that a real model town must have shade on both sides of the street, and no telephone, gas or electric companies; or to the Texas editor who urges that Mrs. Sage must "fix it so that the average man in moderate circumstances can reach the soap without having to get out and grope under the bathtub"; but rather to meet such honestly felt criticisms as point to an inevitable failure of Forest Hills Gardens as "the plaything of a wealthy widow, destined to be managed with more sincerity than the Zion City of Elijah Dowie, to be more enduring but less heroic than Brook Farm, more wisely conceived and more practical than the Helicon Hall of Upton Sinclair, and more carefully planned than the city of Pullman, but like all of them—foredoomed."

While comments indicating such serious misunderstanding of the situation are the exception, the public is nevertheless in danger of not realizing the fact that Forest Hills Gardens is a study and demonstration in town planning and home building, and not in city administration; that it lies within the city of New York, and that it will be governed when completed by no more spotless government than that town itself, however different the immediate environment and terms of occupancy of the citizens of Forest Hills Gardens may be from the dwellers in stratified Manhattan.

How largely, under these circumstances, Forest Hills Gardens may be self-governing or may tend to modify its own and surrounding conditions will be more evident when the undertaking has progressed further toward accomplishment. How far such co-operative schemes as may be possible will respond to and grow under the influences and opportunities of the environment which we are endeavoring to create in this instance can be answered only in the final outcome; certainly not in the preliminary outline published so far on behalf of the Russell Sage Foundation. One should not look for conclusions in a preface, unless perhaps it be that of a second edition.

One other question seems to trouble a number of editorial writers: Assuming the possibility of creating a model town, where can you find the citizens with which to people it? This truly is difficult, and why? Very possibly because while we have been building model stock and poultry farms for a decade or two in which to breed blooded cows and prize

WHERE TOWN AND COUNTRY MEET.

Station Square, the traffic and business center of Forest Hills Gardens, is in the lower center of the picture. Beyond it and in the center of the picture, is the Green, the residential focus formed by the dividing of the two main avenues. The picture brings out clearly the avoidance of straight, wind swept streets and the private playgrounds in the centers of the blocks.

hens, we are only now beginning the attempt to provide similarly well for the breeding of "blooded" citizens. Naturally no town can long remain "model" without "model" inhabitants. It will surely not rise above the level of its citizenship. That basic principle of hydraulics is an apt enough simile. But it is equally evident that water will not rise, even to its own level, unless the walls of the containing vessel are carried up to that height.

Perhaps, moreover, we have more model citizens than we realize, though the use here of the word "model" is somewhat inaccurate and to be regretted as applied to both town and people. In fact the "Model Town" is in danger of the fate of the "City Beautiful." A misconception, similar to the idea that the beautiful cannot be the sensible and practical, is likely to create a corresponding prejudice aganst things that we call "model."

And it is perhaps not out of place to point out in this connection that probably the most important function of the European "Model Town" or "Garden City," usually on some kind of co-operative basis, is a purely economic one, practically a matter of commercial self-defense. While the medieval walled town was a refuge from marauding barons, the so-called model town or "Garden City" of today is primarily a means of protection against our modern land speculators.

And it is unfortunate that the somewhat misleading word "model" must be applied to such an eminently practical scheme as this development of the Russell Sage Foundation, for the further reason that there is a kind of subtle odium which attaches to "model" things of almost any kind, even when they are neither charitable nor philanthropic—a slightly sanctimonious atmosphere that is debilitating rather than stimulative of success. It is a handicap to be reckoned with, and those who are responsible for Forest Hills Gardens are seeking to avoid the "holier than thou" attitude of people, who claim to know how those who live in suburbs should regulate their lives. Yet this rare opportunity for practical study and demonstration, however appalling the responsibility that comes with it, and however subject to misunderstanding, is certainly rich in possibilities, despite the failure of Pullman and other undertakings of its kind,—or perhaps in a measure because of them. Doubtless the most hopeful aspect of the case is that the designers and administrators of this demonstration at Forest Hills Gardens are well enough aware of the difficulties of the problem which has been given them to solve.

While the Russell Sage Foundation is primarily seeking to make its housing demonstration especially applicable to dwellings of low cost and rentals, it is essential to the financial success of the enterprise that the size and quality of the houses be suited to the value of the property upon which they are placed. Any attempt to put up and market a type of building unsuited to the land would be to violate the first principles of successful housing development. And if by reason of certain rather unusual conditions pertaining to operations conducted by the Russell Sage Foundation such an attempt could be successfully started, its educational value, as in all probability also its ultimate financial value as an investment for the individual purchaser, would inevitably suffer. The equation is fundamentally an economic one, however aesthetically it may be put upon the slate, and its solution must be found in terms of dollars and cents.

It should be remembered also, that transit conditions, both as regard time and cost, in a suburban development of this kind, constitute an even more powerful factor in determining the type of prospective tenant or purchaser, and consequently both the size and quality of the dwellings that should be erected. We can alter neither of these conditions. Anything we may accomplish in the line of progress in suburban housing at Forest Hills Gardens must be in spite of them and with full recognition of their influence, however regrettable it may be.

This much is said in explanation, because many people will doubtless be disappointed to find that the first housing

THE BUSINESS CENTER.

Long Island Railroad station on the left. In the middle and right, buildings for business purposes including restaurants; non-housekeeping apartments above.

demonstration to be made by the Russell Sage Foundation will not reach the so-called laboring man, or even the lower paid mechanic, which is impossible in this instance by reason of the cost and location of the land. The fact seems the more surprising when it is realized that the larger number of the houses erected in this first operation are contiguous or block houses, and on plots oftentimes smaller than our usual city ones. Of course in a large measure the reduction in the individual lot area is purposely made, and carefully counterbalanced by larger public open spaces from which in various ways it benefits. And the word "block" is not here to be taken in its ordinary dreary and hopeless sense. "Small groups" might be a better phrase to use.

Yet the apparent anomaly remains that a supposedly model town is being built largely of contiguous houses in more or less continuous rows directly adjoining ploughed fields—a fact which is at once a good illustration of one of the fundamental difficulties in American city planning, and an evidence of the consequent serious need for just such attempts to study and solve its problems as the Russell Sage Foundation is undertaking in the present instance.

While it is measurably true of all cities, that suburban land values reflect far in advance the coming transportation facilities, and the consequent accessibility to the metropolitan center from which their original agricultural value receives practically its entire enhancement, its disturbing influence could be met here as it is met in other countries, except for the fact that the increase of values in America is so incredibly rapid.

Heretofore in this country our "unearned increment" has fairly run riot; and while it has meant tremendous profits to many small investors, as well as to the real estate speculators, and stimulated suburban development generally, it has served equally to create and perpetuate the most uneconomic methods in development, design and construction, practices such as are totally inconsistent with really economic and scientific housing development.

But the time is here, or must shortly come, when the owner cannot safely assume that, no matter how short-sightedly he plans, the further rise in the price of the land will more than cover the depreciation, upkeep, and sinking fund charges which should properly be figured in any building operation, not to mention any errors and extravagances in design, construction and handling of the property, together with the almost total loss which time and again occurs in the demolition of the original building long before its normal life has expired, in order to provide for increased housing capacity in consequence of increased land values, due to our abnormally rapid increase of urban and suburban population.

For the Russell Sage Foundation to take advantage of any such fortuitous conditions would be particularly unfortunate. Rather is it incumbent upon it to tend to the opposite extreme in discounting the uncertainties of the future and establishing sound practices.

Just as obviously, too, it must market its property from the point of view of selling, for the ultimate benefit of the purchaser, at the same time that it makes a profit on the transaction sufficiently attractive to induce others to follow its example—instead of building for a quick sale and a safe "get-away" like the majority of the present-day development companies.

This point of view can scarcely be over-emphasized to a public which undoubtedly expects to find the Russell Sage Foundation offering even more glittering bargains than the usual suburban development. And the fact that it thus proposes to offer only what it believes to be a good investment, instead of a speculation, for the small purchaser must never be lost sight of in judging its work at Forest Hills Gardens.

While a very large proportion of the land area to be developed will undoubtedly be sold without building improvements, the Sage Foundation Homes Company, in order to set a standard and control more surely the architectural character of the future town, has planned to

erect and hold, certainly for a time, a large number of dwellings.

To this end plans have been prepared for an initial operation contemplating ten different groups of buildings, involving an expenditure in land improvement and building construction of a million and a quarter dollars. The majority of those to be erected in this first operation, which will be largely confined to the more expensive and central property, are in the form of contiguous or block houses; the detached and semi-detached types of dwellings of various grades and sizes being necessarily possible only on the less central and lower priced portions of the property.

The different types of buildings included in these groups cover as wide a range as is permitted by the economic conditions,—which necessarily determine also their distribution and location on the property. Adjoining the railroad station and forming the Station Square are three- or four-story buildings containing stores, offices and restaurants, and in the upper stories small non-housekeeping apartments for both men and women. From this center out towards Forest Park, which bounds the property on the southeast, the houses are planned to correspond to the varying values of the lots as determined by their size, location and prospect, the larger single-family dwellings containing ten or twelve rooms, and the smaller, four or five. Following the land and road contours these are combined in smaller and more detached groups, as the property becomes more hilly. While they will vary greatly in size, arrangement, cost and architectural treatment, an attempt will be made to make them alike in their domestic and livable character.

From an architectural point of view our greatest opportunity—apart from certain novel uses of material and methods of construction—will lie in that general harmony of design, which is possible only where the entire scheme of development is laid out and executed under such a system of co-operation by the various experts as at Forest Hills Gardens. These are Frederick Law Olmsted as landscape architect; William E. Harmon of Wood Harmon and Company, on the business side; Edward H. Bouton, president of the Roland Park Company of Baltimore, on the administrative side; Robert W. deForest and Alfred T. White, trustees, and John M. Glenn, director, of the Russell Sage Foundation; and the writer as architect.

The following statements from the announcements issued by the foundation are included here to indicate, as far as is possible at this time, the character of the new suburb in its general, business, administrative and structural aspects.

By ROBERT W. DEFOREST[1]

Forest Hills Gardens is a suburban land development of 142 acres, within city limits, on the new line of the Long Island Railroad, at Forest Hills station, nine miles in distance and thirteen minutes in time from the new Seventh avenue terminus of the Pennsylvania Railroad in New York, and about three miles on the New York side of Jamaica. The railroad station is directly at the entrance to the estate. It is a business investment of the Russell Sage Foundation. It will be conducted on strictly business principles for a fair profit. The buildings at and around the entrance will be built and controlled at the outset by the foundation. Other houses, of attractive designs and of varying costs, will be built and sold or rented. Lots will be sold under protective restrictions intended to insure to their owners and to adjacent owners the residential advantages of the neighborhood.

In its business purpose Forest Hills Gardens does not differ materially from other Long Island real estate enterprises. It is not a charity. It will not be managed as a charity. Whoever deals with it, whether as tenant or purchaser, will be expected to pay fair value for everything received.

Notwithstanding this emphasis on the business side of the enterprise, a distinct educational purpose exists. Not but that the Russell Sage Foundation might wisely and properly make a pure business investment of this character, but that a business investment with an educational purpose is more appropriate.

Mrs. Russell Sage, and those whom she has

[1] [Mr. de Forest's statement was published in full in THE SURVEY for November 26, 1910. It is here reprinted in part to make this a rounded statement of the foundation's plans and for the benefit of our 1,200 new subscribers since that date. Ed.]

associated with her in the foundation, have been profoundly impressed with the need of better and more attractive housing facilities in the suburbs for persons of modest means, who could pay from twenty-five dollars a month upward in the purchase of a home. They have thought that homes could be supplied like those in the garden cities of England, with some greenery and flowers around them, with accessible playgrounds and recreation facilities, and at no appreciably greater cost than is now paid for the same roof room in bare streets without any such adjacency. They have abhorred the constant repetition of the rectangular block in suburban localities where land contours invite other street lines. They have thought, too that buildings of tasteful design, constructed of brick, cement or other permanent material, even though of somewhat greater initial cost, were really more economical in their durability and lesser repair bills than the repulsive, cheaply-built structures which are too often the type of New York's outlying districts. They have hoped that people of moderate income and good taste, who appreciate sympathetic surroundings, but are tied close to the city by the nature of their occupation, might find some country air and country life within striking distance of the active centers of New York.

If these expectations can be realized at Forest Hills Gardens, the Sage Foundation will accomplish several objects. It will provide more healthful and more attractive homes to many people. It will demonstrate that more tasteful surroundings and open spaces pay in suburban development, and thereby encourage imitation. It will encourage more economical methods of marketing land. It will secure an attractive income for the foundation.

No initial outlay has been spared on roads, water supply, sewers and other features which make little show above ground, but are fundamental to the performance of a healthy and attractive residence district. Careful and comprehensive initial layout; attractive, substantial, durable building; experienced management are the keynotes of the enterprise. Lots of various sizes and variously located on paved, sewered, and tree-planted streets will be placed on private sale as early in 1911 as possible, on which buyers may build their own houses in harmony with the general plan of development.

Some people may ask why the first housing plan of the Sage Foundation does not provide for the laboring man, whose wages are small. The Sage Foundation has not forgotten the laboring man. It may be ready to announce something for his benefit later on, but the cost of the land at Forest Hills Gardens, and the character of its surroundings, preclude provision there for the day laborer.

By FREDERICK LAW OLMSTED

In laying out Forest Hills Gardens there has been an attempt to secure the full benefit resulting from three important principles in city planning, the advantages of which are coming to be more and more clearly recognized as part of the rapidly advancing expert knowledge of the subject.

One of these principles relates to the main thoroughfares, which should be direct, ample and convenient, no matter how they cut the land. Two 80-foot streets are carried straight through the property, on lines 1,260 feet apart, fixed by the location of bridges under the railroad and in accordance with the city's tentative street plan covering adjacent territory. A boulevard 125 feet wide, also coinciding with the city's tentative street plan, is provided along the line where the property fronts on Forest Park, a 536-acre tract forming the largest reservation of public park lands in the Borough of Queens. Two avenues 70 feet wide, with an ample set-back of buildings, radiate from Station Square, where the most important of the 80-foot streets passes under the railroad on direct but gently curving lines, so located as to secure the best grades and the most agreeable setting, through the midst of the property to the entrances of Forest Park and to the boulevard which is to follow its easterly boundary. Other streets secondary in importance and 60 feet in width, also with a set-back for buildings, follow lines carefully related to the topography and to the city's tentative plan.

A second principle is that streets not needed as thoroughfares be planned as quiet, attractive residence streets. To this end the local streets at Forest Hills Gardens are laid out so as to discourage their use as thoroughfares. While not fantastically crooked, they are never perfectly straight for long stretches; and their roadways, well paved with bituminous macadam, are narrow, thus permitting additional space for the front gardens which will be one of the characteristic features. Probably one of the most notable characteristics of Forest Hills Gardens will be the cosy domestic character of these local streets, where the monotony of endless, straight, wind-swept thoroughfares, which are the New York conception of streets, will give place to short, quiet, self-contained and garden-like neighborhoods, each having distinctive character.

A third principle is the deliberate setting apart of certain areas for the common use of residents. The location adjoining Forest Park has made it needless to provide any large park, but a public Green has been formed at the point where the two main avenues divide, within view of the station and central to that part of the property which is farthest from Forest Park. This will form the residential focus of the community just as the neighboring Station Square will be its business focus. The portion of the Green lying between the roads and devoted wholly to lawn and paths and ornamental planting occupies one and one-half acres, but the whole open space of the Green, from building line to building line, is about three and one-half acres. Beyond the upper end of the Green and upon its axis is reserved a public school site, and in connection with it sufficient space for a school playground and school gardens.

The Station Square, although primarily a traffic center, is of considerable size and the whole of the surrounding architecture is being developed as a single composition for the pleasure which the residents may derive from its use. In addition to the school playground and the Green, a space of about an acre and a half, surrounded by streets, is being held as a public recreation ground.

The most novel recreation feature is that of enclosed "block playgrounds." These are spaces of varying shape and size, occupying the interior of some of the blocks and intended for the exclusive use of those living on them. They cannot be used for the noisy games of large boys and will not be open to the public, but will provide places where smaller children can get room to play. They will be reached through gates directly from the back yards of most of the houses in these blocks.

Where land is of such high value, such a liberal provision of land for common use and enjoyment is possible upon a sound commercial basis only by paying a round price for it, and in the last analysis the price must be paid by the occupants. It is therefore a fair question how that price is to be paid—just what loss is to be set off against the gain.

The question may be answered in two ways. On the one hand, lots having such advantages are made more desirable, and are actually worth more to their occupants and worth more in the open market, lot for lot, than other similar properties; just as lots on a paved and sewered street are worth more than upon a street that is unimproved, the increased market value going to cover the cost of the improvement. In the opinion of most students of city planning and of many experienced real estate operators, land set apart for public recreation purposes in reasonable amount and in an intelligent manner adds considerably more to the salable value of the adjacent lots than it costs to set it apart. On the other hand, it is possible by a reduction in the size of back yards so slight as not to reduce their practical usefulness, to save out enough land for these neighborhood purposes without increasing the price of lots at all. Some of the lots in Forest Hills Gardens, intended for homes of moderate size, are made shallower than the customary New York lot on which the deep, badly-lighted tenement house has developed, and will have the advantages described with no increase of cost; while in order to suit every purchaser, other lots are laid out of the usual depth and in a few cases of more than the usual depth, for a price that is but slightly advanced.

By WILLIAM E. HARMON

The wholesale improvement and sale of suburban land, the construction and distribution of houses on a large scale in this country, is a development of the past twenty-five years. Within this period it has assumed enormous proportions, and thousands of individuals, corporations and associations are engaged in marketing suburban real estate along more or less scientific lines. Through the practical experience gained, the opportunities for acquiring real estate have been simplified and systematized, so that multitudes of people now own their own homes who would have found it impossible under old conditions. As might have been expected in a business of such rapid growth, many different methods have been pursued, and the results have varied greatly.

In the development at Forest Hills Gardens it is proposed to formulate standards for the distribution of real estate which may be accepted by operators handling property of similar character throughout the country, with consequent elimination of waste in energy and money. The trustees of the Sage Foundation are planning to set prices and outline terms and methods of sale which will be economical for the buyer and profitable for the foundation. A great amount of experimental work has been done by people engaged in the business of providing homes for those of moderate means, and certain methods have been established which may be accepted as scientifically correct. All these will be incorporated into the scheme of purchase so that the home-seeker may secure the best results at the smallest possible outlay.

While the prices will appeal to the man in possession of cash, yet those whose capital lies in their capacity to save will have opportunities by which they can venture on the purchase of a home or an investment in land, on fair terms and under reasonable safeguards. Nothing revolutionary is expected—the aim is merely to secure a higher degree of efficiency than prevails now in this department of the real estate business.

As the Sage Foundation Homes Company will be satisfied with a reasonable profit, every economy in the marketing of property will inure to the benefit of the buyer, and it is confidently believed that the public will receive either more for their money, or the same for less money, than the competitive concerns in this business can furnish. Land speculations will be provided against, but the prices at which the lots are to be sold will give reasonable insurance of a fair return as an investment.

Three elements of value may be regarded in the purchase of property at Forest Hills Gardens, all combining for the benefit of the buyer; first, the rigid economies in methods of distribution will insure the sale of land and houses at less than the prevailing rate for similar property; second, such safeguards will be put about the buyer as will protect him against the accidents of fortune; third, he will get the benefit of the increment arising from the enormous growth of New York city, which must have an important effect upon a district lying within thirteen minutes of the Pennsylvania Terminal.

IMMIGRATION

Photo by Hine.

OLD WORLDS IN NEW

THE Federal Immigration Commission has, the past month, transmitted its recommendations to Congress. During the course of the year its findings will be published in forty volumes. The Survey takes this opportunity to present, through the courtesy of members of the staff collecting and collating the material, a series of articles which set forth the important bearings, as they see them, of the information they have gathered.

Acknowledgment for courtesies extended is due:

THE BEGINNING OF THINGS.

THE FINDINGS OF THE IMMIGRATION COMMISSION

H. PARKER WILLIS
EDITORIAL ADVISER TO THE IMMIGRATION COMMISSION

The findings of the United States Immigration Commission will undoubtedly be regarded by different persons in different lights. The work of the commission is voluminous; the statistics it has collected are multitudinous; the scope of the investigation has been encyclopædic. With so much actually collected in the way of detailed data, and with but scant time in which to summarize these data; lacking moreover a sufficient number of trained writers and statisticians to study the information acquired and to set it down with a due proportion of properly guarded inference, it is a fact that much of the commission's information is still undigested, and is presented in a form which affords no more than a foundation for the work of future inquirers. Such inquirers ought immediately to take the data in hand before they become obsolete and while they still represent existing conditions with substantial accuracy. Pending the results of such inquiry, however, those who would judge what the Immigration Commission has done and who would fain find there material in support of their own preconceived ideas should be careful. And those who wish simply to appraise the work of the commission, with a view to drawing some well-founded conclusion as to its meaning and its merit, must confine themselves to very narrow limits. They must recognize that only in the broadest way can conclusions as yet be drawn from the masses of statistics and the very general textual treatment to be presented in the reports of the commission. The question may be raised whether the commission would not have done better had it limited the field work more narrowly, and increased the relative amount of expenditure devoted to "overhead work" in the office. It did not do so, however, and the result has been, instead of a small and finished study, a large and uncompleted body of data.

With so much by way of warning, it remains true that certain very broad fundamental conclusions concerning the outcome of the commission's work can be drawn.

I.

Above all things else the work of the commission has been valuable in establishing the true motive for immigration. Almost inconceivable harm has been done in the United States by vicious Fourth of July oratory and sentimental maundering on this point. Probably a very large percentage of those who devote any thought to the subject now take the view that the governing reason which leads to immigration to the United States is social and political. The assumed longing for freedom of thought and religion, and the desire to get relief from governmental oppression abroad are currently considered moving springs in directing the immigration movement. The work of the commission shows the exact reverse of this belief, establishing that the motive which drives immigrants to the United States is fundamentally economic. This the commission shows in several ways:

(1) A study of economic conditions abroad proves that, in the foreign countries from which we are now drawing immigration, the lot of the unskilled workers is far less fortunate than in the United States; even under the poorer and less favorable conditions of work and pay accorded to the untrained foreigner.

(2) It shows quite clearly that the foreigner, far from being desirous of adopting American methods, is in many cases determined not to adopt them, since he preserves his own community life and habit of thought, so far as he can, after settling in the United States. Not only is this true, but,

(3) A large number of immigrants come to the United States with the distinct idea of returning home as soon as they can. While a certain number of them change their minds and remain in this country, owing to force of circumstances, or owing to changes in their own point of view which they did not expect, a considerable number of them fulfill their original intention and return to Europe

with the money which they have acquired, and with which they intend either to settle down to a life of relative comfort, or to accomplish some cherished object, such as the purchase of land, the payment of obligations and the like.

(4) Moreover, the information obtained by the commission shows that a fundamental object with the great bulk of the immigrants is either the acquirement of land in the United States, or else the saving and transmission of money abroad. If one thing is better established by the commission's reports than another, it is that the great mass of the immigrants who reach the United States at the present time are not idlers and ne'er-do-weels, but, however unskilled and unadaptable, are productive factors in society.

(5) It is moreover made clear that the economic motive predominates, since great masses of men who have been farm laborers abroad now come to the United States, not for the sake of conducting their own work under more favorable conditions, but for the sake of engaging in occupations which will actually enable them to "make money" in the narrow sense of the term, becoming factory laborers instead of agricultural workers.

Incidentally the commission, without perhaps intending to do so, has pointed out one influence that will be likely to check the movement of immigration. This is the gradual improvement of the position of the worker in foreign countries, such as Italy, and the gradual rise of such countries to a position of greater economic strength, which will make it possible to give to their own citizens a return for labor comparable to what such men could get by taking part in the exploitation of a new country. In this same connection it is made clear that in proportion as other countries—such as Canada and perhaps some of the South American states—reach a position where their systems of industry hold out somewhat the same inducements as are found in the United States, the current of immigration from European countries will tend to be diverted to them.

II.

Recognizing the movement of immigrants into the United States as a purely economic movement, one of the most important inferences to be drawn from the findings of the Immigration Commission will relate to the way in which this movement should be directed and supervised. It is evident that, when sentimental considerations about the motive for immigration are laid aside and the whole situation is recognized as economic in its nature, the fundamental question to be put by our legislators will be this: What is the economic effect of the immigration movement and how far can this be controlled and improved by state oversight? In general, the conclusion is clear from the reports of the commission that the economic effect of immigration has been that of promoting a rapid exploitation of natural resources and of manufacturing processes, which would have been utterly impossible had it not been for the enormous resources of unskilled labor upon which we have been enabled to draw. That this kind of rapid development has been highly beneficial to those who were able to control and profit from the movement needs no demonstration, but for a long time past there has been a question whether the ingress of immigrant labor in the way indicated has been locally injurious to native and former immigrant employes. On this subject the report of the commission and the interpretation of data so far as it has gone, throw a very distinct light. They indicate that the immigration movement, while frequently displacing older employes and while probably holding rates of wages down to abnormally low levels, has not thus far operated to deprive the older employes of employment or to put them into a less favorable position. The expansion of industry has afforded places for them in new lines, so that, while temporary suffering has frequently been caused and while movements for the raising of wages have been checked through the presence of an abundance of immigrant labor, it is not true that what may be called the "saturation point" with reference to immigration has been reached. There would undoubtedly have been a slower development and a less pronounced shifting of labor with a more decided upward trend on the part of wages, had it not been for rapid immigration. This might or might not have been better for the native and older immigrant employes. Conditions are now, however, at such a point as to indicate that a continuance of the present high rate of immigration will be, to say

the least, of questionable value to the community as a whole, and of decidedly obvious injury both to natives and former immigrants who are already definitely placed in industrial occupation. The commission has been right, therefore, in taking a stand in favor of the restriction of immigration, although the best method of applying such restrictions may be seriously open to doubt. Domestically, the commission's inquiries in agriculture as compared with industry make it clear that a much more wholesome and better-rounded economic development would be had, if the incoming stream of immigrants could be directed to the soil instead of to industrial centers. The remarkable success of the early German and Scandinavian immigrants in developing the agricultural resources of the central West are well known. By a series of community studies, the commission now shows that recent immigrants to the United States, such as the Italians, the Poles, the Bohemians, the Russian Hebrews, and the Japanese, have very decided capabilities as agricultural workers, and may serve to furnish a much-needed element that will redress the apparent lack of balance now threatening to exist between the cities and the country districts, due to the apparent disproportionate growth of city populations. The commission's studies unmistakably point to the opinion that, both on the economic and social sides, the bad results of immigration have been found in industrial towns and villages, and that the use of immigrant labor for the purpose of depressing rates of wages has been most frequent there.

III.

The showing made with reference to the agricultural origin of a large proportion of immigrants; the showing with reference to the industrial occupations of these same immigrants on reaching the United States, and the showing with reference to the decided capabilities of these foreign peasant workers, when properly trained to American conditions of cultivation, suggest that thus far the predominant effort has been to direct the immigration current into towns and cities instead of to country districts. This, as already noted, has been aided by the preponderating desire of many immigrants to make money, and consequently to go into those occupations where they would get the maximum cash wages. What the commission has ascertained seems to show that this bad distribution of immigrants is in part due to the operation of conditions of an artificial kind. The work of the commission has greatly tended to minimize the importance of stimulated immigration or of contract labor as a factor in the movement. It does, however, very greatly deepen the belief that the various efforts to induce immigration, whether on the part of steamship companies, labor agents, or others, has been directed toward shifting the immigrants out of their old agricultural occupations and toward occupations as industrial workers. Such efforts as have been made to direct immigrants to the soil have been sporadic and very limited in their scope. Among the Hebrews, the work of the Baron de Hirsch movement has tended to send to the farm a considerable number of probably useful Hebrew farmers, whose effectiveness will increase as they become accustomed to local farm life. In the South, the efforts of plantation owners to get south Italian and other workers as farm hands or tenants have been decidedly rewarded. The success of the Poles, Bohemians and others in becoming independent land owners in Wisconsin, Iowa, and numerous other states has been very marked. The findings leave comparatively little room for doubt that, if immigrants could be well informed with reference to agricultural openings and could be encouraged to look forward to farm work instead of industrial work, a very large number of incoming immigrants could be accommodated on the soil of the United States, with great benefit to the immigrants themselves and with decided advantage to the country as a whole. An interesting phase of the commission's work is seen in the monograph it has published on the Canadian immigration system. From that, it appears that Canada has preceded us along this very line, selecting her immigrants with a view to their usefulness

on the farm and under the conditions which now exist in the Dominion. That the United States could do the same, thereby using the immense resource of valuable human labor power offered to it to the advantage of its own citizens and the new comers simultaneously, if it would abandon some of its preconceptions on the subject of immigration and learn from the experience of others, is distinctly indicated by a comparison of our own experience with that of Canada.

IV.

In connection with the economic view of immigration, and the inference plainly to be drawn from the commission's reports that effort should be made to handle the immigration situation in an economic manner, an important corollary is suggested. This is that the United States is lagging far behind other countries, and infinitely behind general standards of enlightenment and civilization, in its use of proper means for protecting and safeguarding incoming immigrants from exploitation. Although the foreign countries which have the most intelligent oversight over immigration and emigration, such as Italy, have long since devised elaborate systems for protecting their citizens, while in transit, from the oppression of rapacious transportation concerns or local sharks of one kind or another, the United States has failed to pass adequate legislation or to enforce what it has. Investigators employed by the commission travelled in the steerage of many vessels, and found on a substantial number of them repulsive and revolting conditions, fatal alike to health, morality, and the creation of ideas favorable to American governmental methods. The commission's investigators, arriving in the guise of immigrants, were sent to so-called "immigrant homes" in charge of emissaries recognized by the government authorities in charge of immigration stations. They were there outrageously fleeced, subjected to personal indignity, and placed in positions of grave personal and moral danger. As actual workers and citizens, no satisfactory protection or facilities for transacting necessary business are granted the immigrants. The commission's inquiries show not only that the immigrant is oppressed upon many steamships, mishandled and swindled by those who operate immigrant homes and labor and employment agencies, etc., but that he is left to be victimized by unscrupulous employers, and by men of his own race who devote themselves to trading upon his ignorance and lack of adjustment to conditions. Inquiries of the commission showed that throughout a large part of the coal mining field of Pennsylvania and in some parts of other coal mining regions, as well as in very many other industries, the exploitation of the immigrant by means of company stores, company houses, and the like, was shocking and excessive. The investigations with reference to immigrant banking showed that, owing to improper enforcement (or the complete lack) of state banking laws bearing on the subject, the immigrant who has managed to save some of his earnings is subjected to a heavy toll through excessive charges, dishonest banking methods, and misrepresentations as to rates of exchange, etc. In consequence, the loss of much of what has been painfully saved by long and slow process of toilsome accumulation is a frequent result. That there are other and numerous methods of vicious exploitation of immigrants is an unfortunate but too obvious fact, which is incidentally developed in many ways throughout the commission's report. Almost total lack of co-operation between federal and state authorities, and the entire inadequacy of existing methods of handling and distributing immigrants and of enforcing existing legislation, constitute one of the most striking aspects of the commission's general findings.

V.

In spite of the unfavorable conditions under which their access to this country is secured, in spite of the disastrous system of exploitation after they arrive, in spite of the social and race prejudice and other almost unavoidable conditions which practically compel the herding of immigrants in little communities of their own in many parts of the country, the reader of the Immigration Commission's

reports is likely to reach the conclusion that the showing of the immigrant is on the whole a decidedly good one, all things considered. An elaborate study of crime and of criminal tendencies, presented as a part of the commission's report, fails to establish the predominance of criminality among immigrants, when they are compared upon a fair statistical basis with natives or with immigrants of the second generation. The study, if anything, suggests that undesirable tendencies are likely to be more marked in second generation immigrants than in their parents. The causes of this condition could be pointed out successfully only by rather long and elaborate process. The fact however is tolerably clear; and this study, in conjunction with other portions of the commission's work, will undoubtedly tend very strongly to destroy the idea that criminal tendencies are characteristic of the "imported Americans," against whom so much criticism has been directed. Educationally it cannot be said that the work of the commission has been brought to any positive or final conclusion. The school study shows a marked and very definite tendency on the part of children of many race groups of immigrants to secure education, even under somewhat adverse conditions; but the data are not sufficiently worked out to permit of the definite comparisons between different race groups, or between all foreigners as a body and native Americans as a body, that are desired by many. The fair and legitimate inference to be drawn, however, from the reports of the commission, taken in the aggregate, is that immigrants themselves and their children, when afforded the proper facilities, manifest a decided disposition to take advantage of opportunities for education, and to acquaint themselves with the English language and with American methods of government. The commission, further, found that in the distinctly foreign communities there is an immense mass of unassimilated material which, while at present merely a foreign body in the national social organism, might become actively poisonous at some future time, if not shortly broken up and reduced to a basis of uniformity with the surrounding population. Far more stringent enforcement of school laws, child labor laws, etc., and the application of effective methods of educating and leavening the immigrant communities are absolutely necessary, and these should undoubtedly be applied through private benevolence and philanthropy along lines parallel to the public economic endeavors which, as already seen, should seek to bring about a better distribution and economic application of the immigrant labor force.

As to the question of criminality, dependence, etc., the commission's findings, as already intimated, show that the problem is in no respect different from that which exists with reference to elements of our population that are of longer standing, and presumably greater ability to resist injurious influences of an antisocial nature. The effort to apply remedies to those social evils is special or peculiar only in so far as special or peculiar methods must be applied in order to reach persons with a foreign background of thought, prejudice and feeling. In this connection it is well to observe that the commission's findings distinctly indicate that some of the alleged problems connected with immigration, such as those of the *padrone* system, peonage and the white slave trade, are in no respect properly to be regarded as immigration problems in any true sense of the word. While the commission's inquiries into peonage are far from satisfactory, it would appear that this evil is decidedly not more prevalent among the immigrant population than among others, while it is certainly not confined to any one part of the country. The *padrone* system, the commission finds, is now largely non-existent, except in so far as it is seen in certain very limited forms, such as the importation of Greek boys under labor contract for employment at shoe-polishing and the like. The older *padrone* system has developed into something approximating a labor agency plan, which is founded upon the lack of knowledge of English on the part of large bodies of newly arrived immigrants, and the demand for an intermediary able to gather and place bodies

of men through his familiarity with the labor market, and their language, customs, and modes of thought.

VI.

The question of immigrant standards of living and their economic basis will undoubtedly afford one of the most fruitful sources of information and most abundant themes for discussion that appear in the report. In general, the most striking point developed in the inquiry on this subject is the exceedingly low standard of living which prevails among the men of recent arrival. Just how bare a living the ordinary immigrant is able to make can be seen from the figures submitted by the commission with reference to average earnings and hours of labor. In a general way, it is found that the immigrant labor supply furnishes the fundamental common labor basis which lies at the root of the present industrial system of the country, and that the wages paid are those which represent a minimum of subsistence. The figures for a single industry may be cited in order to illustrate this point.

Iron and steel manufacturing in all its aspects was studied in the territory east of the Mississippi river. Detailed information was received for 86,089 employes of the industry, and an intensive study was made of 2,456 families the heads of which were employed in iron and steel manufacturing establishments. Of the total number of employes in the industry 57.7 per cent were found to be of foreign birth, the principal races composing this proportion being the Slovak, Polish, and Croatian from southern and eastern Europe, and the German, Irish, and English from Great Britain and northern Europe. Of the native-born iron and steel workers 28.8 per cent were native Americans and 13.4 per cent were of native birth but foreign father. Of the total number of employes of foreign birth only 8.6 per cent had been employed in the same industry abroad, while 64.4 per cent had been farmers or farm laborers in their native countries. The average weekly wage of employes in the industry was $14.35; the average annual earnings of male heads of families was $409; and the average annual family income $568. The average annual earnings of all employes in the industry who were eighteen years of age or over was only $346.

Very striking also is the fact developed in the reports that the wives of immigrants are practically a necessary factor in the support of the household, where households exist. True, a very large percentage of immigrants have come to this country either unmarried or without their wives and children; but where families exist it is necessary for the wife to perform a substantial amount of paid work in order to keep the family together. It appears that in many of the industrial sections of the country this paid work is largely the management of boarding groups, wherein the wife of one member of the group does the cooking, washing, housecleaning, etc., for a considerable number of men; in other instances the work of the wife is done in the factory for wages, this being true in textile centers and in light manufacturing. The percentage of women thus employed is materially greater among immigrants than among native Americans, thus showing the extent to which the immigrant has been reduced not merely personally, but in family life, to a basis of commercial exploitation. In some industries the difference between the earnings of the husband and the gross family income is very large, this difference being due to the intervention of the wife as a money-earning factor in the family. In other instances, where the wife is not a direct earner of wages, the same aid is rendered as in the case of the boarding-boss system already referred to, by reason of the fact that the wife secures the means of subsistence for the family, leaving to the husband the fixed expenses, such as clothing and the like. Thus in the iron and steel business it was found that only

40.5 per cent of all the families studied derived their income entirely from the husband, while 33.1 per cent, composed principally of southern and eastern Europeans, secured their income from earnings of husbands and contributions of boarders or lodgers. The families whose heads were native-born depended more largely upon contributions of children than those the heads of which were born abroad. Of the total number of families, 7.8 per cent were supported by the earnings of husbands and the contributions of children. Of the foreign-born families, 41.5 per cent supplemented the earnings of the heads by keeping boarders or lodgers, as contrasted with only 8.3 per cent of the families the heads of which were native-born. This practice led to a high degree of congestion within the households the heads of which were for-

eign-born. The average number of persons per room in such households was 1.76 as compared with 0.93 person among the families the heads of which were of native birth; and the average number of persons per sleeping room in foreign-born households was 2.89 as contrasted with 1.96 in the native-born households. The average rent per capita in foreign-born households was only $1.14, while that in native-born households was $1.71. Of the total number of foreign-born households, 14.7 per cent used all rooms for sleeping purposes, as against only 3.8 per cent of the households the heads of which were native-born. Of the native-born employes twenty years of age or over 64.6 per cent were married, and of the total foreign-born 67.2 per cent

While, however, the earnings of immigrants rest in the vast majority of instances fundamentally upon a minimum basis of subsistence, it remains true that the foreign element in the population shows in many cases a decided disposition and ability to rise and to accept positions of greater importance. This has been particularly the case in some of the manufacturng industries of the West, where the work has fallen very largely into the hands of foreigners, who not only perform the hand labor, but who also fill the supervisory positions. It is true that immigrants in many cases do not make a favorable showing as the owners of homes or of tangible property. This, in some cases, is due to the peculiar economic conditions existing in many industrial communities, where the land and house accommodation is all owned and controlled by the manufacturing concern which there predominates. It is due also, in other cases, to the fact that wages barely suffice to keep the family together and to pay absolutely necessary living expenses; in others to the fact that savings have taken the form of remittances abroad. But on the soil where opportunities for land purchase are favorable, many race groups of foreign origin have shown not only their native perseverance in cultivating the soil and paying for it in small tracts; but they have shown also American enterprise in extending their ownership and in improving the land, thereby affording the means to pay for their original purchases. The presence of an increasing number of professional and business men of foreign birth in the various immigrant communities, and the capacity of these communities to make themselves almost entirely self-sufficing have their good side as well as their bad, since they show that the incomers are not merely a parasitic class in the community, able to do nothing beyond coarse hand labor, but that they have on the contrary the potentiality of success in the various occupations for which their social organization makes demand.

VII.

The conclusions arrived at by the Immigration Commission in its formal recommendations to Congress are of interest, but they will probably receive considerably less attention than the manifest conclusions from the facts which stand out prominently throughout the inquiry. It is plain, in the first place, that the entire immigration policy of the United States needs to be revised and reorganized. Probably at the root of a new system of new legislation should be placed an effective system of restriction, designed to select those classes of incomers who are undoubtedly most useful to the nation and who are freest from objectionable characteristics. As already noted, the experience of Canada to a certain extent points the way in this regard, although it is true that Canada's process of selection has been applied largely with a view to getting agricultural workers who would go direct to the farm. It would not be desirable to apply so exclusive a policy in the United States, but certainly the elimination of a substantial percentage of those who now enter the country merely to add to the congestion in our cities would be desirable. Closely allied with this problem of selection and restriction is that of distribution. It would seem that the most effective methods of breaking up the foreign communities which seem likely to become a menace to good government in this country would be that of assuring better distribution, preferably through agricultural settlement along lines already mapped out. It should be taken as axiomatic that the present legislation on the subject of contract labor is utterly absurd and obsolete. It should be abolished

without delay. Perhaps there is no more striking fact in the report of the commission than that Canada insists upon each immigrant having a place to work or a prospect of getting one prior to admission; while the United States absolutely excludes those who have such places in view or who have definitely promised to engage in any work. The operation of the present absurd system is not only productive of gross violations of law, the system itself being utterly unenforceable; but it is illogical and absurd, the results aimed at in our contract labor provisions being far better reached by some other method. In connection with this revision of immigration legislation, there should go a careful system of real steamship inspection and a system for the temporary care of immigrants after they have landed, whereby they would be preserved from conscienceless exploitation, proceding from sources already indicated. Not only is this the case, but a continued supervision of the immigrant by governmental authority for a considerable period after he lands and rigid enforcement of the present provisions as to deportation, with probably some extensions of the deportation and exclusion system, are indicated as desirable by the result of the investigations. There is one necessary change in present methods to which the commission has made no reference in its report, but which is plainly indicated throughout. This is the necessity of putting the Immigration Bureau and the immigration service in general upon a basis of efficiency. A fundamental step in this direction will be the transfer of the service from the hands of professional labor agitators to those of scientific students of social, economic, and racial conditions, who will enforce the law not only rigidly, but intelligently and sympathetically. It is an undoubted fact that, under existing law, considerable numbers of the most desirable classes are excluded, while far greater numbers of the most undesirable classes are admitted. Just how the field of legislation on immigration should be divided between the federal and state governments it is not altogether easy to say, and the commission itself has apparently reached no positive conclusions. In this field, therefore, everything is inferential and opinions will differ. It seems very clear, however, that there is a call for good and uniform state legislation, designed for the protection of immigrant citizens. There should be such uniform legislation as will prevent the various impositions now practiced upon the foreigner by means of immigrant banks, labor and employment agencies, and other intermediaries. Above all else, there is demand for uniform enforcement of existing state laws designed to put a stop to peonage, labor blackmail, the compulsory use of the company store and the like. In the absence of new legislation, very much can be done by securing the genuine enforcement of old legislation along these lines. Summed up, all this merely amounts to saying that the time has come when both the federal and state governments can well afford to cease worrying about the number of incomers, and begin to concern themselves about the quality of such incomers—meaning thereby both the initial quality and the subsequent modification thereof, produced by local systems of legislation and by local social conditions. The immigration problem henceforward must be essentially that of limitation, selection, distribution, protection, and assimilation. It will be partly governmental, but largely private, philanthropic and educational.

A GROUP OF IMMIGRANTS WAITING FOR WORK, CHICAGO

INDUSTRIAL COMMUNITIES

W. JETT LAUCK

EXPERT IN CHARGE OF INDUSTRIAL INVESTIGATION, UNITED STATES IMMIGRATION COMMISSION

The widespread existence of immigrant communities or colonies in the United States at the present time may be realized, when it is stated that in the territory east of the Mississippi and north of the Ohio and Potomac rivers there is no town or city of industrial importance, with the exception of the lead and zinc mining localities of Missouri, which does not have its immigrant colony or section composed of Slavs, Magyars, north and south Italians, or members of other races of recent immigration from southern and eastern Europe.[1] In the South and Southwest, because of the large areas devoted almost exclusively to agriculture, the immigrant community is less frequently met than in the middle West or East. In the bituminous coal mining territory of West Virginia, Virginia, Alabama, Arkansas and Oklahoma, immigrant colonies in large numbers have been developed in the same way as those in the coal mining regions of Pennsylvania and the middle West. Southern and eastern Europeans have also attached themselves to the iron and steel producing communities of the Birmingham District in Alabama; and a large Italian colony, as is well known, exists in New Orleans, a considerable number of whose members are employed in the cotton mills of the city and in the manufacture of cigars and cigarettes. South Italians, Cubans, and Spaniards have entered the

[1] The general industrial investigation of the United States Immigration Commission was not primarily concerned with the study of immigrant industrial communities. A large number of such communities were investigated in detail, but such studies were incidental and not fundamental. The main investigation was based on between thirty and forty selected industries, such as iron and steel and textile manufacturing and coal and iron ore mining.

cigar manufacturing establishments of Tampa and Key West, Fla., and have built up colonies in these cities. Outside New Orleans, however, no recent immigrants in the South are cotton mill operatives. Southern mill owners have frequently tried to introduce southern and eastern, as well as northern, European and British immigrants into their operating forces, but all attempts have resulted in failure because of the refusal of the present cotton mill workers, recruited from isolated farm and mountain sections, to work alongside recent immigrants. This same intense race prejudice on the part of southern wage-earners of native birth has rendered impossible the extensive employment of southern and eastern Europeans in other branches of manufacturing in the South, and has consequently prevented the development of immigrant industrial colonies, except in the instances already mentioned, and in the case of a number of agricultural communities, principally located in the Mississippi Valley.

Altogether between one and two hundred immigrant communities were studied in detail in the course of the general industrial investigation of the Immigration Commission, and more or less detailed information was secured from several hundred others. The geographical distribution of the principal communities studied in connection with the leading industries of the country is shown in the map in the next column.

These communities were studied with great care. The co-operation of officials of local industrial establishments was first secured, and through them information was gained from their employes. Addresses of wage-earners were obtained and special agents employed to secure data from families. Men and women were engaged, and the inquiries for non-English speaking races were made through interpreters. The schedule used contained 152 inquiries. Special agents with economic and sociological training were assigned to the more general study of the communities. These men examined the municipal, industrial, and institutional records of the locality, and based their work upon the data secured from

GEOGRAPHIC DISTRIBUTION OF INDUSTRIAL COMMUNITIES IN WHICH INTENSIVE STUDIES WERE CONDUCTED.

these and other historical, descriptive, and statistical sources available.

Whether located in the South or elsewhere, however, immigrant communities, which have come into existence because of the recent industrial expansion and the resultant influx of wage-earners from southern and eastern Europe, are of two general types. The first is a community which has by a gradual process of social accretion affixed itself to the original population of an industrial town or city, which had already been established before the arrival of races of recent immigration. Foreign communities of this character are as numerous as the older industrial towns and centers of the country. The textile manufacturing centers of New England and the Middle States, such as Fall River, Lowell, and New Bedford, Mass.; Manchester, N. H.; Providence, R. I., and Patterson, N. J.; cities in which other industries are located, such as paper manufacturing in Holyoke and boot and shoe factories in Haverhill and Lynn, Mass.; hardware, cutlery and jewelry, localized in New Britain and Meriden, Conn.; or leather finishing and currying, as in Wilmington, Del.; clothing manufacturing, as in Rochester; collars and cuffs in Troy; hosiery and knit goods in Cohoes and Utica, N. Y.; oil refining in Bayonne, N. J.; or cities engaged in diversified manufacturing, as Passaic and

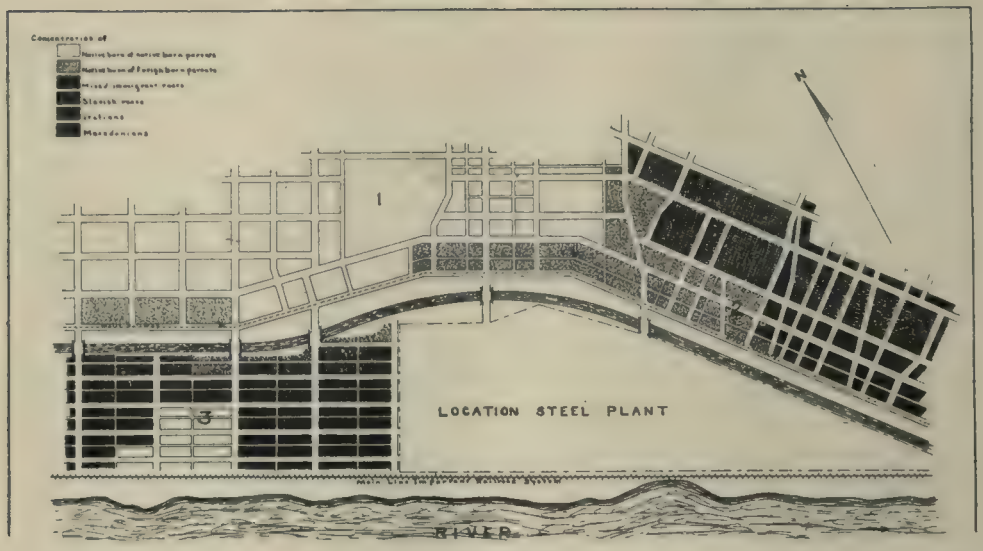
INDUSTRIAL COMMUNITIES OF THE PITTSBURGH DISTRICT STUDIED BY THE IMMIGRATION COMMISSION.

Newark, N. J.—all these have colonies or sections populated by recent immigrants. The same condition of affairs is found in the iron and steel, glass, and other older manufacturing cities and towns of New York, Pennsylvania and the middle West. As representative types of this class in connection with the manufacture of glass, Tarentum, Pa.; Morgantown, W. Va.; Steubenville and Rossford, O., may be mentioned; and as typical iron and steel localities, Steelton and Johnstown, Pa.; Youngstown, O., and South Chicago and De Kalb, Ill. Pittsburgh, Pa., or the Pittsburgh District may be said to be practically made up of industrial towns or cities engaged in the manufacture of iron and steel, glass, and allied products, each of which has an immigrant colony or section composed of households of wage-earners of recent immigration.

As representative of a community of this class, the developments which have taken place in Johnstown, Pa., may be described. The first iron furnace was established in Johnstown in 1842. Expansion in the local iron and steel industries developed the city and increased its population. Welsh, Irish, Germans and English were exclusively employed in the local industries from their establishment until 1880. During the past thirty years, however, the labor forces have been recruited from southern and eastern Europe. Slovaks, Poles, Magyars, Croatians, Servians, north and south Italians, Syrians and Bulgarians have in constantly increasing numbers found employment in the local iron and steel mills. As a result, about sixty per cent of the population of Johnstown at present is of foreign birth, and is largely representative of races of recent arrival in this country. The native Americans and Welsh occupy two wards of the city. In addition there are three distinct foreign colonies or sections. One is made up ex-

clusively of south Italians, another of 5,000 Slovaks and Croatians, and the third, the most important, which has a population of 15,000, in round numbers, contains representatives of all races of recent immigration.

The second general type of immigrant community has developed within recent years because of the growth of some natural resource, such as coal, iron ore, or copper, or by reason of the extension of the principal manufacturing industries of the country. These communities usually cluster around mines or industrial plants, and their distinguishing feature is that a majority of their inhabitants are of foreign birth and recent immigration. This type of immigrant community is common in the bituminous and anthracite coal mining regions of Pennsylvania and in the coal-producing areas of Virginia, West Virginia, Alabama, Ohio, Indiana, Illinois, Kansas and Oklahoma. In the Mesabi and Vermillion iron-ore ranges of Minnesota, as well as the iron-ore and copper mining districts of Michigan, many such communities are also found. The usual mining community of this character consists of a small town or urban center in the vicinity of which mining operations are conducted at a number of points. These outlying mining locations are generally connected with the urban center by steam or electric railroads. The town of Windber in western Pennsylvania, by way of illustration, has a population of about 8,000 persons, and is the center of twelve mining camps. It was founded in 1897 by the opening of bituminous coal mines, for which purpose 1,600 experienced Englishmen and 400 native Americans were brought into the locality. With the opening of new mines southern and eastern Europeans were attracted to the community, and at the present time eighteen races of recent immigration are numbered among its mine workers. The town of Windber proper has a section occupied by native Americans and three foreign colonies. The outlying mining villages consist of company houses in which recent immigrants live almost exclusively. The southern and eastern Europeans have their churches, banks, steamship agencies, and business establishments in the town of Windber itself, to which they go to transact their affairs and to seek amusement. Food and other articles are principally purchased in the company stores of the mining villages.



Although not so numerous, communities of this type are not infrequently established in connection with the leading industries, such as the manufacture of iron and steel, glass, cotton and woolen goods. Gary, Ind., is an industrial community largely made up of recent immigrants, which has been brought into existence because of the erection of a large steel plant within the past few years. Whiting, Ind., is likewise a small city, recently established in connection with the oil refining industry, the population of which is composed principally of southern and eastern European immigrants. Charleroi, Kensington, Tarentum, and Arnold, in western Pennsylvania, and Crystal City near St. Louis, Mo., furnish examples of glass manufacturing communities of this description. Charleroi has at present a population of about 10,500, composed chiefly of French and French-Belgians, with an admixture of Poles, Slovaks, north and south Italians, and other races from the south and east of Europe. This community was established about 1890 when its first glass factory was erected, and has grown in size and importance as the glass industry within its borders has been extended. Another illustration is the recently established iron and steel manufacturing community at Granite City and Madison, Ill., which under normal working conditions possesses the distinction of being the largest Bulgarian colony in the United States. These two cities immediately join each other, and for practical purposes are one industrial community, the distinction between them being more artificial than real. In 1892 its site was an unbroken stretch of cornfields. During the past seven years it has had an extraordinary expansion in business and population, due to the extension of its industrial activities. The original wage-earners were English, Irish, Germans, Welsh and Poles. By 1900 the demand for unskilled labor, be-

cause of the erection of new steel foundries and a car building plant, could no longer be supplied by English-speaking people. Consequently, in that year, Slovaks from St. Louis were employed by the local industries. In 1902 came the Magyars followed by a few Croatians. Mixed groups of Roumanians, Greeks, and Servians followed. In the years 1904 and 1905 began the swarming of the Bulgarians to the community, and by the autumn of the latter year fully 1,500 had arrived. Two years later Bulgarian immigration reached its high-water mark with 8,000 of this race. In addition to the Bulgarians there were about 4,000 recent immigrants, Armenians, Servians, Lithuanians, Slovaks, Magyars and Poles being the principal races represented. The total population of the community is estimated under normal industrial conditions to be about 20,000. The Bulgarians and other foreign races have built up practically an exclusively immigrant town a short distance from the American section of the two cities, which has come in popular parlance to be called "Hungary Hollow." Here Bulgarians, Servians, Roumanians and a few Magyars and Armenians live together entirely apart from any American influences.

All immigrant communities possess one or more institutions of a class peculiar to, or resultant from, such a population, each of which has an important bearing upon the life of the community. The most important of these is what is commonly known as an immigrant bank. As a matter of fact the term immigrant bank is a misnomer, for the institution is practically a bureau of information and a clearing house of services necessary to an immigrant population. An immigrant community of alien speech has many needs which can be satisfied only by a person or company familiar with the language, customs, habits, and manner of thought of the people. To meet these requirements, the institution popularly known as the immigrant bank has come into existence. The immigrant banker exercises, in the majority of cases, no banking functions beyond receiving money for safekeeping, for transmission abroad, and for exchange. He combines with his banking business the sale of steamship tickets, merchandise, books and other articles. He is often a political leader, or conducts a boarding house, bakery, labor agency, or saloon. In some of the more recent communities, however, as in the case of Granite City and Madison, Ill., one or more banking houses are sometimes found owning and operating large rooming houses, the occupants of which buy their provisions from the banker's stores and bakeries, drink in his saloon and coffee house, deposit their money in his bank, read the paper printed by his establishment, and follow, in a large measure blindly, the counsel of the banker himself.

Another interesting institution often met with is the immigrant coffee-house, which is modeled after similar institutions in Europe. It is intended to meet the tastes and habits of the Greek, Macedonian, Bulgarian and Turkish races who do not patronize the American saloon or drink intoxicants after the manner of the Germans, Croatians, Slovaks, Poles, Magyars, and the members of other races. The coffee-houses are usually large, well-lighted rooms, furnished with small tables and plain chairs. Tobacco in all its forms, including even the Turkish pipe, is to be had, as well as tea, coffee, cider, soft drinks, and ice cream.

In many communities immigrant newspapers, usually issued weekly, are published in a foreign language and appeal for support to a certain race or races. These papers are often owned and controlled by immigrant mercantile banking houses. The immigrant saloon also has certain features peculiar as compared with the ordinary American institution. Often an immigrant bank, steamship agency, labor agency, or boarding or rooming house is operated in connection with it. A large number of fraternal and beneficial organizations also flourish in immigrant communities. Moreover, in each foreign colony of any importance, churches have been erected by the different races. They are usually Roman or Greek Catholic, and are often costly and imposing edifices. Usually parochial schools are conducted in connection with these churches, and offer re-

STEELTON.

The industrial suburb of the Pennsylvania state capital; map shows racial distribution.

ligious and secular instruction. A foreign language is, as a rule, used in the schools, but in the greater number of instances instruction in English is given.

Between the immigrant colonies which have affixed themselves to industrial centers such as the New England textile manufacturing cities or the iron and steel manufacturing localities of Pennsylvania, and the older native-born portion of the towns or cities there is little contact or association beyond that rendered necessary by business or working relations. Immigrant workmen and their households not only live in sections or colonies according to race, but, as has already been stated, attend and support their own churches, maintain their own business institutions and places of recreation, and have their own fraternal and beneficial organizations. Even in the mines and manufacturing plants, there is a sharp line of division in the occupations or the departments in which recent immigrants and persons of native birth are engaged, and in the case of unskilled labor the immigrant workmen are, as a rule, brought together in gangs composed of one race or closely related races. In those industrial localities which are strongly unionized, the affiliation of immigrant workmen with native Americans is small. A considerable proportion of the children of foreign-born parents are also segregated in the parochial schools. Women of recent immigrant races, beyond the small degree of contact which they obtain in factories or as domestic servants, practically live entirely removed from Americanizing influences. As a consequence of this general isolation of immigrant colonies, the tendencies toward assimilation exhibited by the recent immigrant population are small, and the maintenance of old customs and standards leads to congestion and insanitary housing and living conditions. The native-born element in the population of industrial communities of the type under discussion is in most cases ignorant of conditions which prevail in immigrant sections; but even when acquainted with them, natives are usually indifferent so long as they do not become too pronounced a menace to the public health and welfare. Under normal conditions there is no antipathy to the immigrant population, beyond the feeling uniformly met with in all sections, that a certain stigma or reproach attaches to working with recent arrivals or in the same occupations. This aversion of the native American, which is psychological in its nature and arises from race prejudice or

ignorance, is, however, one of the most effective forces in racial segregation and displacement.

In the case of the immigrant industrial communities which have recently come into existence through industrial development, and which are almost entirely composed of foreign-born persons, or in which foreign-born elements are predominant, a situation exists of alien colonies being established on American soil, often composed of a large number of races, living according to their own standards, largely under their own systems of control and practically isolated from all direct contact with American life and institutions. The Americanization of such communities, as compared with the immigrant colonies of old established industrial towns and cities, must necessarily be slow. It is to be expected, also, that before these communities are assimilated they will have a pronounced effect upon American life, for the reason that the slowness of the process will result in the establishment, perhaps in a modified form, of many Old World standards and institutions.

The standards of living of industrial workers who have come to our mining and manufacturing communities from the south and east of Europe are also low. Recent immigrant males, being usually single or, if married, having left their wives abroad, have been able to adopt in large measure a group instead of a family living arrangement, thereby reducing their cost of living to a point far below that of the American or the older immigrant in the same industry or on the same level of occupation. The method of living usually followed is that commonly known as the "boarding-boss" system. Under this arrangement a married immigrant, or his wife, or a single man, is constituted the head of the household, which in addition to the family of the head is generally made up of two to sixteen boarders or lodgers. Each lodger pays the boarding-boss a fixed sum, ordinarily from two to three dollars a month, for lodging, cooking and washing, the food being bought by the boarding-boss and its cost shared equally by each individual of the group. Another common arrangement is for each member of the household to purchase his own food and have it cooked separately. Under this general method of living, which prevails among the greater proportion of immigrant households, the entire outlay for necessary living expenses of eacn adult member ranges from nine to fifteen dollars a month. All living arrangements have been subordinated to the desire to reduce the cost of living to its own level. This condition of affairs has had the effect of preventing increase in wages and the improvement in working conditions which might have been expected, and has led to the voluntary or involuntary displacement of a large proportion of native-born employes.

The earnings of the immigrant industrial workers, as well as those of native birth, in present-day industrial communities are generally too small to permit the maintenance of an independent form of family life. Of more than 22,000 wage-earners eighteen years of age or over who were studied by the Immigration Commission in the general investigation of immigrants in industries, the average annual earnings were only $455; and in the case of many southern and eastern European races the average was considerably less. These meager earnings in the case of male heads of families were supplemented by taking boarders or lodgers into the households, or by having the children go to work. The average annual income of immigrant families was only $704. Less than two-fifths of the immigrant households were supported by the earnings of the husbands, and more than one-fourth derived part of their maintenance from the payments of boarders or lodgers.

Congestion within the immigrant households in our industrial communities is greater than in the large cities. This is largely accounted for by the low wages received by industrial workers, which necessitate crowding in order to reduce expenses. The presence of such large proportions of single immigrant males, or married men without their wives, also renders the extensive adoption of the group system or boarding-boss method of living possible. Probably the most sig-

nificant indication of congestion in immigrant communities is the low rent payment each month per capita. The average monthly rent per person paid by immigrants in more than 11,000 households studied by the commission was only $1.51, and in the case of some races it was less than one dollar. About one-third of the immigrant households were found to have boarders and lodgers, the average number being 353 for each 100 households. There were also 138 persons in each 100 rooms and 253 persons in each 100 sleeping rooms in the immigrant households investigated. More than 63 per cent of the Bulgarians, 16 per cent of the Greeks, 12 per cent of the Ruthenians, and 10 per cent of the Slovenians used all their rooms for sleeping purposes. The effect of this crowding and the resultant unsatisfactory living arrangements upon the immigrant population of industrial localities becomes evident, not in a greater liability to disease, but in a general tendency to succumb very quickly to a disease when it has been contracted. From the standpoint of the native-born portion of the population, the conditions described constitute a serious menace on account of the difficulty in securing obedience to municipal health and housing regulations.

Another salient fact exhibited by recent immigrants who have sought work in American industries and who have settled in industrial communities has been that as a whole they have manifested but a small degree of permanent interest in their employment or in the community. They have constituted a mobile, migratory, wage-earning class, constrained mainly by their economic interest, and moving readily from place to place according to changes in working conditions or fluctuations in the demand for labor. The recent immigrant ordinarily has no property or other restraining interests which attach him to a community, and a large proportion being unaccompanied by wives or children, and having their accumulations in a cash or convertible form, are free to follow the best industrial inducements. The transitory characteristic developed as a result of these conditions is best illustrated by the racial movements from the larger industries into railroad construction, seasonal and other temporary work, by the floating immigrant labor supply handled through labor agencies and *padrones*, and by the remarkable falling off in the population of immigrant communities in times of industrial depression.

In general it may be said that the menace in the presence of the recent immigrant in our industrial communities, so far as the native American and older foreign wage-earners from Great Britain and northern Europe are concerned, consists in the low standard of living, the illiteracy, the absence of industrial training, and the tractability and lack of aggressiveness of the southern and eastern Europeans. As regards the recent immigrants themselves, their general, as well as their industrial, progress and assimilation are retarded by their segregation in colonies and communities where they have little contact with American life and small opportunity to acquire the English language. The sudden transplanting of such an agricultural class of the Old World to the conditions and environments of American industrial communities renders the recent immigrant liable to serious moral and physical deterioration. On the other hand, the existence of colonies of immigrants with low standards of living, and ignorant of proper measures for securing health and sanitation, constitutes a serious danger to the native-born portion of our industrial communities. The possible political and social manipulation of the recent immigrant population by unscrupulous leaders is not without serious import in its bearing upon American institutions. Probably the most significant feature of the entire situation is the almost complete ignorance and indifference of the native American population to the recent immigrant colonies and their condition. This attitude extends even to the native churches, and very few agencies have been established for the Americanization and assimilation of southern and eastern European wage-earners. A great field is not only open for social and religious work, but vast possibilities are offered for patriotic service in improving serious conditions which confront a self-governing republic.

IMMIGRANT RURAL COMMUNITIES[1]

ALEXANDER E. CANCE

IN CHARGE OF REPORT ON RECENT IMMIGRANTS IN AGRICULTURE UNITED STATES IMMIGRATION COMMISSION

Something like one-fourth of all male breadwinners of foreign parentage in the United States were engaged in agricultural pursuits in 1900. Although by far the greater part were of the older immigration, who came from northern Europe and settled in the middle West years ago, among them are a not inconsiderable number of recent immigrants from southern and southeastern Europe who have established themselves on the land. The races under consideration by the Immigration Commission were chiefly Italians, Hebrews, Poles, Bohemians and Portuguese; and most of these were settled rather recently in more or less sharply defined rural communities.

The inhabitant of the upper Mississippi Valley is well acquainted with immigrant farmers, and a township of Scandanavians, Germans or Bohemians excites no comment and invites no comparisons. There the foreigners, long settled in rural districts, have become so thoroughly American, have so completely lost themselves in the rural population, that they retain very few of their distinctive race characteristics. In the East and South, however, and in the instance of certain recent colonies elsewhere, the foreign rural group, composed of Italians, Poles or Hebrews, is still an object of curiosity. Not only are the foreigners on the land infrequent, but they have yet to prove their fitness for agricultural pursuits—for country life.

More than 150 rural groups or parishes of these more or less recent and agriculturally doubtful races were visited by the commission—groups representing many different forms of agriculture in nineteen states chiefly along the Atlantic and Gulf coasts, where many incipient settlements have sprung up recently. A smaller number are established in the middle West. Nearly all of these groups are racially homogeneous, but not only are they engaged in a variety of agricultural sub-industries, but the conditions of soil, climate and method of settlement are so diverse, that generalizations are difficult and the most satisfactory procedure is a monographic study by community groups.

As a farmer or permanent farm laborer, the immigrant becomes a real element in such rural communities. There is a second way in which the incoming foreigner may come into contact with the soil, but without gaining other than a casual economic interest in rural pursuits, as a seasonal agricultural laborer who lives in the city and works for a few months yearly usually in the fruit or vegetable districts.

This class of laborers is usually composed of foreign-born persons, who work in gangs and who are recruited outside the neighborhood in which they find employment. They are employed for short seasons only, frequently on piece work; ordinarily men, women and children work together; often they follow a regular itinerary, leaving the cities in the spring and returning in the autumn. Thousands are employed every year in all parts of the United States where specialized crops, for whose culture a relatively large amount of hand labor is essential, are produced. Of the seven groups of "black" Portuguese, Poles, Belgians, Sicilians, Japanese and Indians studied by the commission, only the south Italian berry pickers of New Jersey can be considered.

One who has seen a train load of incoming foreigners unloaded at some water-tank railway station in the Northwest, with children, food, bags, bedding and belongings dumped in a promiscuous heap at their feet, has a good replica of the unloading of a carload of Italian berry pickers at Hammonton or Port Norris, N. J. at the beginning of the picking season. Great bales of bedding; old trunks, barrels and boxes of cloth-

[1]The author has quoted freely from his reports written for the commission.

ing; bags of Italian bread, macaroni, peas and cheese; clanging bundles of metal cooking utensils; occasionally a stove and frequently a number of baby carriages; finally a huddle of children and confused parents await the great wains that drive up and carry them off by the wagon load—luggage, babies, baby carriages and all—to their four or five weeks' sojourn on some berry farm.

These berry pickers are largely Sicilians or Calabrians from the vicinity between South Fifth and South Fifteenth streets, along Christian and Fitzwater streets, Philadelphia, and some from Camden; and a canvass of the Hammonton district led to the conclusion that 2,500 to 3,000 pickers—with numerous infant children—were employed in 1909.

They follow a regular itinerary. During the winter most may be found in cheap tenements, the children at school, the men picking rags, sweeping or working on streets and railroads, at odd jobs and in various unskilled occupations, the women in box factories, machine tailoring establishments, or home "tailor work." In various ways they earn a hand to mouth existence until the *padrone* rounds them up about the middle of May and they remove to the strawberry fields of South Jersey, taking the entire family and most of their worldly goods.

The strawberry season over, towards the end of June they are shipped northward, to Hammonton, for example, to pick blackberries; after blackberries come raspberries, which bring the season to nearly August. Some of the families then return to the cities, but perhaps a fourth of them scatter over the country to gather huckleberries, or find work in the tomato, pepper or cucumber fields, or harvest sweet potatoes until the cranberry season begins. The last stage is the cranberry bog, after which the entire remaining company moves back to winter quarters about October 10.

The work is all done by the piece, and since most of the tasks are easily within the strength and intelligence of the women, and children from ten to fourteen years of age, the family becomes the earning unit. The wages received are not unremunerative, and because of the exceedingly low cost of living and the many hands, family earnings for the season frequently reach $200 to $500 or sometimes more, sufficient to enable them to live in comparative comfort until "picking" begins again.

Housing conditions are in general unsatisfactory. Small berry growers, especially Italian, seldom make adequate provision for the sanitary housing of labor gangs. Barns, granaries, old outbuildings of various sorts, stable lofts, and in one instance a condemned school house, are some of the makeshifts utilized. The houses especially erected for laborers are frequently little better. Most of them are constructed with a view to economy of space. Ventilation is not adequate. Often there is overcrowding; sometimes entire families occupy bunks about six feet by eight or sometimes six feet square. In a number of instances privacy or the separation of sexes is secured only by a curtain, shawl, or some article of clothing thrown over a cord stretched across the room or shed.

The berry grower (employer) furnishes well water, straw for filling the box-like bunks, and wood for fuel. In a number of instances toilet facilities were found to be insufficient, and the growers had refused to provide mosquito netting for the windows or any form of lamp or lantern. Few growers take any pains to maintain sanitary quarters, and in consequence the barracks were in many instances deplorably filthy. The chief defense made by the grower is the usual one that the pickers will not preserve or appreciate sanitary quarters, even if provided; and furthermore, that for a short season of six weeks better quarters require too great expenditure of capital, especially for occupation by gangs of laborers who do not care for better.

In standard of living, Americanization, initiative, resourcefulness, progressive spirit, civic and personal respect, and general moral tone, the Italian berry picker is far behind the land owning Sicilian for whom he labors. The contrast at Hammonton and Vineland is strikingly manifest. Many of the Ham-

monton farmers were previously itinerant berry pickers, and the colony continues to draw a few recruits from their ranks, but fewer now than formerly. With many south Italians this seasonal labor is apparently a permanent occupation, and its bearing on the second generation calls for consideration.

The moral effect of the miscellaneous housing and the unconventional life—even were two-story buildings provided to segregate the sexes—cannot, to put it mildly, be good. School authorities assert that the itinerary breaks in on the school year with very detrimental results educationally. Certain medical and hygienic experts declare with conviction that exposure to rain, cold and malarial atmospheres are provocative of fevers and tuberculosis, and that neither the water supply nor the surroundings are conducive to physical well-being. But the attention of the lay observer is first drawn to the babies, largely left to the care of some small sister, fighting the swarming flies and sweltering in the hot sun. The insects, the exposure, and the heat cannot be good for the little ones, and after one has seen little tots, not two years old, eating green cucumbers *ad libitum*, skins and all, unrebuked, he trembles for the coming race.

It is but fair to state that the housing and other conditions of the New Jersey berry pickers are worse than in the canning factory gangs in New York or in many gangs of sugar beet laborers or cranberry pickers; and on the whole the circumstances in agricultural employment are more satisfactory than those surrounding Italian contract labor gangs on railway and other construction work, so far as the men are concerned.

There is little doubt that conditions would be improved speedily were it possible for the labor groups to organize and so acquire strength to make unanimous and specific demands of their employers. Occasionally a gang does strike for certain improvements, and nearly every betterment has come about as the result of such local strikes. When the labor supply is short local ameliorations are frequent, but much remains to be done, and in New Jersey at any rate there is immediate opportunity for correction and remedial legislation.

Of the forty or more Italian communities visited in thirteen states, the oldest and largest groups are the berry and truck growers on the pine barrens of New Jersey, some of them the land owners for whom these picking gangs labor during the harvests. Both north and south Italians are landowners at Vineland, and Hammonton is one of the most promising south Italian settlements east of the Rocky mountains. In origin and development both are typically unassisted colonies, whose progress has been continuous since the seventies and whose numbers have been augmented chiefly from abroad. These groups number perhaps 1,200 families of Italian origin, and here veritably the "magic of property" has "turned sand into gold." The hundreds of little berry farms, vineyards, or sweet potato or pepper fields which make these Italian communities real oases in a waste of sand and lowland, bear unmistakable testimony to the ability of the much-maligned south Italian to create wealth and to make progress materially, morally and politically under rural conditions.

At Vineland the original immigration set in from northern Italy, but more recently a large number of Sicilians and other south Italians have come in. Several stages of material progress are clearly delineated. The first arrivals have passed well beyond the experimental and pioneer stages and many of them are pointed out as the most substantial citizens in the community. They are prosperous, influential and intelligent farmers and proprietors. Others are just emerging from ignorance and debt—just getting the upper hand of the virgin sand or muck upon which they settled—just rising above the line of subsistence farming. These men are preparing to build better, spend more freely, "labor more abundantly." Still others are yet in the dependent class—day laborers in factories, ditches or berry fields, on the highways or railroads. They own little homes with small acreages on which their wives and children are endeavoring to support the household, while the hus-

bands work for wages to pay for the house and land. One by one they are abandoning the dependent occupations and joining the ranks of the farmers,

There is a fourth class, the American-born Italian, who represents the new Italian farmer, born on the soil he cultivates. He is the progressive farmer who dares to try new machinery, new equipment, new varieties and new methods. He subscribes to an agricultural paper and belongs to a farmers' co-operative society.

At Hammonton the principal industry is small fruit growing, which has now become highly specialized and is subject to sharp competition. Beyond a comfortable living, little material return can be expected. Near Vineland, with some exceptions and limitations, the situation is decidedly encouraging. It is the region of the grape, the peach tree and the sweet potato vine; the Italians have added peppers to the list of staple products and most farmers have a small berry patch. It is a region of small farms, built on sand, cultivated by owners and made valuable by hard and unremitting toil. Whatever wealth the rural Italians of New Jersey possess has been well earned, and nearly every home, beautiful or unattractive, cheap or substantial, is a home built by the owner's own hands, the product of his own labor; all are home makers in "Little Italy,"—there are no parasites and no leisure class.

The Italians of Vineland, in the large, purchased new, uncleared, unoccupied lands, cleared them and made them productive. Not far from Vineland is the later Italian settlement, begun at Newfield and Malaga about twenty years ago. Economically considered it has a very different significance.

At an early day Malaga was a flourishing village and the surrounding country was populated by prosperous Jerseymen, who lived partly on their cereal crops, poultry and fruit, partly on the products of the forest,—timber, staves, hoop poles and inferior lumber. But the vanishing timber, the increasing poverty of the soil, the removal of the mills, the depressed condition of agriculture, and the exodus of the young people made farming in the late eighties a precarious industry. When the first Italians came in 1889 they found deserted farms and a warm welcome. "Everybody wanted to sell," said the first comer; "no one was making any money and nothing was raised for the market."

The south Italians took hold of the abandoned farms, hit upon a new industry—pepper raising—and developed it, and for the time being at any rate saved the region to agriculture. Only the fittest of the American farmers who have reorganized their farming have been able to survive. The ingress of the Italians and the exodus of Jerseymen continues, and careful observers feel that in time the countryside will be entirely Italian. By sheer hard labor, the co-operation and field work of wife and children, dogged perseverance and cheap living, the imitative Italian has been able to outcompete his more intelligent American neighbor. On the tax roll of the township ninety-four names of Italian property owners appear, part of them farm owners, part of them share tenants.

In New England, especially near Providence, south Italians have been engaged in truck and vegetable farming for many years. As market gardening has increased in importance, the Providence settlement has been augmented by defections from the industrial population in the vicinity. An entirely different type of colony has developed within recent years at South Glastonbury, Conn., where peach growing on land comparatively sterile and recently forest-covered is the chief occupation of eighty families of north Italians. It is the one successful foreign settlement studied in the "hill towns" of New England.

The Italian settlements in New York are in the western part of the state in a rather well defined area, most of them along the line of the Erie Canal from Madison to Orleans county. The south Italian colony at Canastota is typical. Fifty-four families have engaged successfully in truck farming, chiefly because of the available supply of muck land, admirably adapted to certain vegetables after being cleared and drained at a great expenditure of hard labor.

American owners were unwilling to undertake the clearing, hence the land was purchased cheaply; and since an Italian raised his first crop of onions in 1897 the farm settlement, now called Onion Town, has grown slowly but steadily.

Economically it is significant that there has been no displacement of the old agricultural population; that the Italian has developed new land—otherwise commercially unproductive—and a new agricultural industry, and that he has found this rural occupation more remunerative than his former employment on railroads or canal. Farms are small, improved land is valued at $150 to $200 an acre, and a number who are not able to purchase have rented land on shares and little houses in Canastota or Onion Town. But few continue as tenants; to most tenancy is simply a temporary condition or stepping stone to land ownership.

From the standpoint of community development, it is significant that while there has been no colonization, the settlers for the most dwell together in a rural village, and thus escape the isolation of country life, and especially during the winter enjoy the companionship of their kind. Two considerations have made this settlement possible—the peculiar quality of the available land and the opportunities afforded for wage-earning at irregular intervals, until the immigrant is able to make a living and a surplus from his farm.

Italian farming in the South covers a wide range of products, widely diversified soils and climatic conditions, several forms of land tenure, and various systems of culture. The north Italians among the mountains of western North Carolina practice a self-sufficing, diversified agriculture. In southeastern Louisiana and in the coastal plain belt of Alabama, the south Italian truckers and small fruit growers are doing exceptionally well on the light sandy soils, when they succeed in marketing their products in a satisfactory manner. In the "Delta" both north and south Italian cotton tenants are teaching the cotton growers how valuable careful cultivation, kitchen gardens, and small store accounts may be to the cotton "share hand." In the Ozarks Italians from the Sunnyside group have taken up new land, planted orchards, and become successful apple and peach growers. It is plain that the Italian farmer has been profoundly influenced by his environment. His farming has been directed and his agricultural methods taught him by his new neighbors. He has not been uniformly successful, but his economy stands out in contrast to the more or less shiftless, thriftless southern methods, much more conspicuously than Italian agriculture in Wisconsin or New Jersey.

Italian immigration to the South has been in part stimulated by the cotton and sugar-cane planters, who, dissatisfied with Negro labor, alarmed at the increasing scarcity of every sort of farm labor, and desirous of settling acceptable farmers on the immense tracts of unimproved land, have for years been striving to turn the tide of immigration southward. Instances are cited of plantation owners, who advanced the passage money for the transportation of groups of Italian families and settled them on their cotton plantations. The total immigration induced in this way is not significant, except as it forms nuclei around which gather subsequent immigrants to the United States. Sunnyside colony, originating in the importation of 100 or more families from northern Italy in the nineties', is the mother of several rural settlements.

A number of colonies, notably in Texas and Louisiana, seem to have originated in the purchase of a few acres of land by some Italian farm laborer who, arriving practically without money at a southern port of entry, sought employment on some neighboring plantation.

One of the most notable examples of this method of setlement is the south Italian group of strawberry growers at Independence, La. Independence began to be known as a strawberry center about 1890, about the time the first Italian came with his family from New Orleans to pick berries and remained to purchase a few acres of land. A second family followed in the autumn; these two waxed enthusiastic over the possibilities

of berry culture and urged their friends and relatives to join them; more Italian berry pickers came and many remained; now there are perhaps 250 Sicilian small farmers in the neighborhood.

Much of the purchased land was lowland, more or less swampy and covered with a heavy forest growth. A large number who were not able to pay thirty to fifty dollars an acre for land operated a few acres on shares; the owner furnishing the land, preparing it for cultivation, providing one-half of the fertilizer and berry boxes, and paying one-half the cost of picking; after picking, the berries were equally divided between landowner and grower. The Italians without capital found this form of tenure satisfactory, and many of them in two or three years saved enough to purchase five or ten acres.

The holdings are small, the homes, in consequence, have the appearance of a straggling rural village and the community spirit is strong. It is not a homelike village, and in the poorly constructed, rude frame, two- or three-room cabins are few evidences of prosperity or comfort. But their farms are well tilled, their berries are excellent and yield well, and thanks to their organized marketing the returns are fairly remunerative. School waits upon the berry field, but interest in education is increasing. There is little civic spirit, and of 350 adult males not twenty are voters. They have had no adequate Italian leadership, and their American neighbors have apparently given little or no attention to the development of a wholesome social or civic interest in the foreigners.

A very important economic feature is a co-operative marketing association with a membership of more than 200 Italian growers, organized two years ago. The Independence berries go to Chicago and neighboring cities; formerly they were shipped to commission merchants by individual growers. The results were unsatisfactory, sometimes ruinous. Prices were low, handling charges high, and complaints of unjust dealing innumerable. In the crisis the Italians got together, organized a selling association, hired an inspector and a selling agent, and notified the commission houses to come to Independence for their berries. At present all berries are sold to platform buyers f. o. b. Independence. The expenses of management in 1909 were about two cents per twenty-four-pint crate.

During the spring of 1910 the association sold $357,639 worth of berries for its members.

Ability to co-operate is characteristic of Italian farmers who are engaged in highly specialized forms of agriculture. They may not have a strong class consciousness, but they are racially homogeneous, and a community consciousness is readily developed. Moreover, some at least have some knowledge of co-operative organization in Italy. In ability to work together they are far in advance of the native southern farmers.

Some few colonies have been promoted either by some Italian leader or philanthropist or by land companies, honest or dishonest. Some of the exploited colonies failed utterly and none, except the Valdese and the St. Helena, N. C., settlements, seems to have prospered. The St. Helena colony is apparently one of the most successful colonizing ventures recently undertaken in the South.[1] Two large elements in this success are the thrifty character of the colonists and the fact that nearly all are immediately from farms in northern Italy. But the exceptional leadership offered at St. Helena, the opportunity to earn a livelihood while paying for his land, assurance of landed proprietorship by mere capitalization of his energy and enterprise, and the companionship of his fellows, all have proved unique elements of appeal to the home and property loving foreigner.

Among Italians, not many skilled workers in the trades or industries, here or abroad, have moved to farms, and comparatively few who have found permanent unskilled work in the industries, after landing, have engaged later in agricultural pursuits. But, notably in Texas, the building of railroads has brought in a number of south Italians, chiefly Sicilians, some few of whom have become either tenants or truckers, or inde-

[1] THE SURVEY, November 6, 1909.

pendent proprietors of small market gardens. It may be asserted confidently that there has been no marked shift of Italians from industrial pursuits or from city employments to farms in the southern states. In Missouri and Arkansas, indeed, many Italian farmers supplement their incomes by labor in the coal mines during the winter; otherwise the colonies are purely agricultural.

This brief characterization of Italian settlements sets forth the diverse conditions and circumstances incident to the settlement of immigrant rural communities. In the large, the history of the founding of Polish settlements differs little from the Italian record. The goal of early Polish immigration was northern Illinois and Wisconsin. After 1885 the stream of Slavic immigration set in very strongly, and Polish rural colonies began to dot the prairies of Minnesota and the Dakotas as well as the Lake States. Unlike the early peasants who came directly from Europe in search of cheap land and homes of their own, a large percentage of these men are day laborers who have been engaged in the mines, steel mills, quarries or urban industrial pursuits, and who are attracted to farms by advertisements in Polish papers or the solicitation of Polish land agents. They settle in small groups, their location is directed, they bring more money than the arrivals directly from abroad, and when they are fairly dealt with they make more rapid progress than the earlier immigration.

Hebrew agricultural colonies are interesting from many points of view. Most of the Hebrew farmers are in New York, New Jersey and southern New England, within easy reach of large commercial centers. Practically all of them were established on the land directly or indirectly by the aid or influence of a Jewish immigrant aid society of some sort. Practically all of the colonies have received artificial support by means of subsidized clothing or other factories, or by loans or virtual gifts from trust funds or philanthropists. A very large percentage of the 1,000 or more Hebrew farmers in New England and in Sullivan and Ulster counties, N. Y., practice what may be designated summer boarder agriculture,—since the soil is sterile, the topography rough, hilly, or even mountainous, and the principal part of the farm income comes from boarding summer visitors.

Other Hebrew farmers in New England are landowners, who depend to a greater or less extent on some outside enterprise—peddling, cattle buying, junk dealing,—for the greater part of their incomes, or who are speculators in real estate rather than permanent, simon pure farmers. Excepting the recent settlements near Ellington and Hartford, Conn., where agricultural conditions are favorable, comparatively few Jewish farmers in New England may be called successful.

The colony or group of colonies near Vineland, N. J., presents Hebrew agriculture in America at its best. Of the several colonies of Hebrews studied none shows greater apparent material prosperity, a more general dependence on agriculture for a livelihood, a more intelligent, resourceful husbandry or a more wholesome community life, educationally, socially, or politically, in a large sense. There is no doubt that a great deal of material encouragement has been given; that many of the social and educational enterprises were conceived, organized, and supported by leaders without the community, and that co-operative business associations and marketing facilities were promoted by leaders who do not live in the settlements; but once established the colonists have entered into all these enterprises with some degree of interest and are beginning to support them. To all appearances the colonies near Vineland, N. J., are permanently established on the basis of a commercial agriculture adapted to the soil, climate and demands of the market.

The study of the several Jewish settlements emphasized these facts at least: that the Hebrew is not adapted by training or tradition to make a pioneer farmer: that to win success he should start with some capital on improved land; that settlement in groups of sufficient size to maintain a synagogue is almost essential; that those who are likely to succeed are

either those who have been farmers abroad or who have had some successful experience in agriculture in the United States previous to permanent settlement.

Limits of space forbid even a mention of the Portuguese, Bohemian or Japanese settlements investigated. Indeed, any summarized account is lamentably deficient, in that it cannot portray the intensely interesting human factors, imperfectly delineated in the monographic reports of the commission, and so significant to the student of rural social science. Only a brief word can be presented regarding the effect of rural life socially and politically on the Italians—the immigrant group to which this paper has of necessity been limited.

Ownership of the land he operates is one significant factor in the social and civic progress of the rural Italian in New England, New Jersey and Wisconsin. The prestige incidental to landed proprietorship, as well as the financial responsibility of an owner, sets the farmer far above the day laborer. Not only is he independent, taking orders from no one, but he is a member of the body politic. He is stimulated to industry, for his cash returns are in a measure proportioned to his exertions. The variety of knowledge of crops, fertilizers, markets and public affairs and the familiarity with a number of occupations necessary to agricultural success educate and develop the newcomer very rapidly.

Interest in taxation, good roads, public improvements and expenses for public schools is a stepping stone to wider civic interest. The foreigner's first interest in suffrage is self-interest; but it is better than no interest at all. On the other side there is the deadening effect of isolation by foreign groups, of segregation in the open country, both on the community and the individual members. Where the Italians are intermingled with an equal number of American farmers, they assimilate rather rapidly; where there is rural segregation of large groups Americanization is a slower process than in the city.

It is certain that the settled farmers live better than the itinerant seasonal Italian laborers. Progress in language and in literacy is slower in segregated rural settlements than in cities, but more rapid among Italians than among Poles in some of the large rural settlements visited. Farm labor keeps children out of school, and lack of opportunity for intercourse with English-speaking people explains the persistence of the Italian tongue, even to the second generation in isolated districts At Independence, La., for example, the school year closes in March to permit the children to pick strawberries. In the Mississippi Delta region, of fifty Italians interviewed between ten and twenty years of age, only twelve were able to read or write English. In some of the segregated outlying communities of Vineland, Italian is almost universally spoken, since every farmer for miles around is of Italian origin.

Adherence to the Roman Catholic faith is practically universal, but the rural Italian is less a churchman than the urban Italian. Language and church affiliations are obstacles to intermingling and inter-marriage with Americans, but there is more social commingling with the better people in the country than in the city, and more where the proportion of Italians in the total rural population is small. Compared with the progress made by north European immigrants on western farms, the Italian's progress in Americanization has been slower; compared with many rural Poles, his advance has been quite as rapid. Fusion in the case of both races (Poles and south Italians) takes place in the third generation.

The quarrelsome, suspicious, mendacious Italian, so frequently heard about in labor gangs where numerous adult males live together, is infrequently found in rural communities; very rarely among landowners. The rural Sicilian is ordinarily peaceable, quiet, law-abiding, and more easily controlled than the south Italian day laborer, according to all accounts of employers and officers of justice. Quick temper and indulgence in liquor are at the root of most of the disorders that

arise in established Sicilian settlements. The north Italians seem to be fully as law-abiding as the other Teutonic races.

Progress in citizenship is less rapid among the south Italians than among those from the northern provinces of Italy, ordinarily; but leadership and live local issues touching property owners have much to do with the number of naturalized citizens. Voting is not the all-important test of Americanization, but in the town meeting of Hammonton, N. J., a vote argues more civic intelligence than in Christian street, Philadelphia. There is a noticeable cleavage along racial rather than party lines, but the country Italian in the North becomes a citizen sooner and votes more independently than the Italian in industry.

The rural Italian is still concerned with his material subsistence. He has a cheap frame house because he is not able to pay for a better one. Little about the house denotes leisure or higher living. Books, papers, and music, rocking-chairs, or hammocks, or swings find no place until the Italian is materially prosperous. His buildings and grounds do not compare favorably with his American neighbors, except in a few localities where the second generation is operating the farms; but the houses are comfortably large for even large families; there is no overcrowding in the ordinary sense, and the houses, excepting those of recent arrivals, are fairly clean and comfortable. In some old localities living conditions are as satisfactory as in any homes in the neighborhood.

All in all, the rural community has had a salutary effect on the Italians, especially those from the southern provinces of Italy. It has frequently taken an ignorant, abject, unskilled, dependent, foreign laborer and made of him a shrewd, self-respecting, independent farmer and citizen. His returns in material welfare are not great, but he lives comfortably and accumulates a small property. Where Italians have been established for some time in comparatively large groups in the open country, they suffer little by comparison with other foreign farmers in the locality, and second generation farmers are frequently not less progressive than Americans.

More than those in the North, the southern colonies reflect the influence of leaders or the want of them in their growth, economic characteristics, social progress, and institutions. The economic progress of the new colony at St. Helena, N. C., is due to oversight of a colonization company, that not only looks after the social welfare of the Italians, but oversees and gives expert advice with regard to planting, cultivating and marketing. The leaders, though not Italian, have been alert to meet the difficulties and to remove the obstacles that meet the newcomer, ignorant both of language, farm practice and methods of marketing produce. They have urged citizenship and provided a church and a school. Under this kindly tutelage the Italians have progressed rapidly. As a rather striking contrast, compare the independent spirit, the desire for ownership, the political and social progress of the Tontitown Italians with the progress along similar lines made by the Italians at Sunnyside, both originally from the same locality in Italy. Sunnyside, originated, as already noted, in the importation of a group of a hundred colonist families from Italy fifteen years ago, to the cotton region of the "Delta." Tontitown, a settlement of seventy families in the hills of Arkansas, was founded by deserters from Sunnyside, and is therefore the younger colony. Albeit, the land is naturally less productive, every farmer is an owner, while at Sunnyside all the immigrants are either "croppers" or renters.

In the South the absence of socializing factors in some districts has tended to make foreign settlements so many unassimilated lumps in the body politic. Wise leaders, either Americans or Americanized Italians, ownership of property, compulsory education, and instruction in the duties of citizenship are all fruitful and powerful influences in the development of foreign rural groups.

A POLISH MARKET IN BUFFALO.

IMMIGRANTS IN CITIES

E. A GOLDENWEISER

EXPERT IN CHARGE OF CITY INQUIRY, UNITED STATES IMMIGRATION COMMISSION

Seven cities were included by the Federal Immigration Commission in its study of conditions: New York, which with its hundreds of thousands of tenement houses and with an equal number of pages describing their evils is pre-eminently the congested city; Chicago which in lifting itself out of a swamp left behind many a basement where the poor seek shelter, and many a yard which is dry only in the hottest season; Philadelphia, with its network of narrow alleys with surface drainage, its three-room houses with insufficient water supply and sanitary equipment, in a word, with its "horizontal tenement houses"; Boston, where "Americans in process" succeed each other in the restricted area of the North and the West Ends, and where the one-family dwelling, converted for the use of several households, emphasizes the rapid change of conditions; Cleveland, which awoke to find itself one of the leading cities in America and has not had time to think of the necessity of protecting itself from the slum; Buffalo, with its enormous colony of Poles who have come from farms in Europe and have to learn the solution of the problem of existence in a city; and Milwaukee, the most foreign city of them all, where there is no limit of space, and where in spite of that, economic pressure frequently results in crowding of houses on a lot and of persons in a house.

It was felt that an inquiry covering representative districts in these seven cities could safely be accepted as indicative of what may be found elsewhere in the United States in the poorest environment and most congested quarters. This also would afford a much broader basis for judgment than the study of a single locality. For many reasons the problem of the immigrant in large cities has for almost a generation attracted a great deal of attention. The vast majority of immigrants land in two or three seaports, and large numbers remain there for a time at least. The phenomenal growth of cities and the difficulties accompanying their growth have been intensified by the influx of millions of aliens, who for the most part are unacquainted with urban conditions in their own countries, and are dazed by the complexity of existence in the great American cities. And it must be remembered that writers, like

OUTLOOK FROM CLEVELAND'S MAGYAR DISTRICT.

AN ITALIAN COURT IN PHILADELPHIA.

AN OLD BOAT HOUSE CONVERTED INTO TENEMENTS FOR ITALIANS, BUFFALO.

immigrants, congregate in large cities, and their proximity to the foreign colonies has had its natural result. The social reformer who wishes to remedy preventable evils, as well as the journalist who is anxious to present readable material, has consistently dwelt on the crowding and filth, the poverty and destitution, of which there are such extreme instances in the poorer quarters of every city. Public opinion has been aroused, and legislation enacted which has tended to minimize the evils of over-crowding in many of the older cities, and to inform the younger cities of the dangers of unregulated growth. But the result also has been to create in the popular imagination an impression that the extreme instances cited are the whole story, and that the congested quarters of large cities, full of filth, squalor and depraved humanity, are a menace to the nation's health and morals. Moreover, the responsibility for these conditions is almost universally placed by old residents on the immigrant, and primarily on the recent immigrant, from the South and East of Europe. The Italian, the Hebrew and the Slav, according to popular belief, are poisoning the pure air of our otherwise well-regulated cities; and if it were not for them there would be no congestion, no filth, and no poverty in the great industrial and commercial centers of America.

Once the cities were selected, the problem was to choose the districts. The method of study agreed upon was to canvass a certain number of blocks, representing the most important races in each city and the worst representative conditions. After the blocks had been selected every household living there was visited, and schedules were secured from them. In this way the study was not confined to individual cases showing extremes of poverty or of prosperity, but included every family that resided within the chosen quarter. In most cases the blocks studied were uniformly populated by one race. It was no easy problem to find blocks of that description. The population of the districts in many instances changes so rapidly, that the race which predominates in one of them today may constitute but a small minority tomorrow. City officials and settlement workers were helpful in locating foreign colonies, but in addition we interviewed physicians, district nurses, grocers, letter-carriers, priests and saloonkeepers. It was especially difficult to find solid blocks of Irish and of Germans, and it is only fair to add that the households of these older races often represent the failures which were left behind when their more successful countrymen moved to better neighborhoods. For the sake of comparison, it was felt that some American households ought to be included; but

that was a still harder proposition. What was meant by Americans were households whose heads were native of native fathers. Few such households were found in crowded districts, and never did they form the majority of the population of a block. They were studied whenever found within the specified areas inhabited by working people. In Boston, to secure one hundred family schedules from such native stock, about 700 homes were visited. It is worthy of note that the search for Americans in the poorer quarters of American cities was an arduous task.

To secure the desired information from every family visited was not always an easy undertaking. The recent immigrants, who are more accustomed to a paternalistic government and have not learned the hall-marks of American liberty, were the easiest to interview. Some of the old residents, who have learned to look upon themselves as the sovereign people and consider the government as their agent, were unwilling to answer the questions. I shall never forget my own experience with an Irish woman, twice my size, but as it turned out with a bad memory for faces, who not only refused to answer my timid questions, but took the trouble to escort me down stairs and to threaten violence should I come "nosing around" again. This was at the very outset of the work. A month or two later, fortified by accumulated experience, I returned to the same house and obtained schedules from all the tenants, including my formidable antagonist, who this time was quite accommodating and confided that she knew the difference between a real government agent and a fraud. As proof, she told of the treatment she had recently accorded to a "mutt" who wished to impose upon her. One of the women agents had an exciting time in a "Krainer" household in Cleveland. The owner of the house, a man of consequence in the community, refused point blank to answer any questions, grabbed the agent by the arm and put her out. The agent referred the matter to the United States Marshal who accompanied her on her next visit. The "Krainer" was impressed, helped fill out the schedule, and ended by a proposal of marriage which was taken as a great compliment by the canvasser. Another schedule-worker was one time surrounded by a crowd of irate Italians, who would not let her leave the premises until she had destroyed the records which she had taken great pains to obtain. Incidents of this nature were not unusual, but every agent who worked in this investigation will agree with me, that the proportion of "difficult" families was surprisingly small, when the large number of questions asked and the personal character of some of them are taken into consideration, and that the investigators owe a great deal to the willingness and courtesy of most of the families canvassed.

SURFACE DRAINAGE IN PHILADELPHIA.

The inquiry covered over 10,200 households and over 51,000 individuals. The largest number of households, 2,667,

THE LOCATION OF AN ITALIAN COLONY IN CLEVELAND.

were studied in New York, and the smallest, 687, in Buffalo. It is apparent that this total represents only a small proportion of all families living amid congested conditions in the United States. Yet those studied were representative of many times as many households living under substantially similar conditions in the seven cities chosen. It seems fair, therefore, to say that what the study reveals are the worst living conditions existing on a large scale in any of the large cities of America.

What then are some of the vital facts disclosed by the investigation? First of all, it reaffirms that crowded districts are largely populated by immigrants, and more particularly by recent immigrants. In the eastern cities, New York, Philadelphia, and Boston, the Russian Hebrews and the south Italians are the largest elements in congested foreign colonies. In the cities on the Great Lakes, Buffalo, Cleveland, Chicago and Milwaukee, the various Slavic races, the Poles, Slovaks, and Slovenians, are found in large numbers. About two-thirds of the foreign-born in the selected districts have been in this country less than ten years, and one-fifth has immigrated within the past five years.

A noteworthy fact in this connection is that about one family out of every ten visited, owns its home. Of course, this does not mean that the families have clear titles to the property; but it is indicative of thrift and of the intention on the part of the immigrants to settle permanently in this country. The proportion varies greatly from city to city; in Milwaukee, it is one in five; in Buffalo, one in six; in Chicago and in Cleveland about one in seven; in Philadelphia, one in fourteen; in Boston one in twenty, and in New York, one in two hundred.

In connection with the prevailing opinion about the filth, which is supposed to be the natural element of the immigrant, it is an interesting fact that, while perhaps five-sixths of the blocks studied justified this belief, so far as the appearance of the street went, five-sixths of the interiors of the home were found to be fairly clean, and two out of every five were immaculate. When this is considered in connection with the frequently inadequate water supply, the dark halls, and the large number of families living in close proximity, the responsibility for uncleanliness and insanitary conditions is largely shifted from the immigrants to the landlords, and to the municipal authorities who spare no expense in sprinkling oil to save the wealthy automobilists from the dust, but are very economical when it comes to keeping the poorer streets in a habitable condition. The water supply, the drainage, and the condition of the pavement are also outside the jurisdiction of the tenants; and yet their neglect results in bad conditions for which the resident of the crowded districts is blamed.

Congestion itself is a relative term, and hard to measure statistically without going into more detail than any exten-

sive investigation can afford to do. And yet it does seem like something of an anti-climax to the cry about terrible congestion, when the fact is stated that the average number of persons per room in the 10,000 households studied by the commission is 1.34. The average is higher in Boston, Philadelphia and Cleveland than in New York, and is lowest in Milwaukee, where the figure is 1.15. Some races show averages far higher than those for all the households studied, and yet the highest figure which is found among the Slovenians does not exceed 1.72 persons per room. These figures are significant, because they indicate that the pictures of six or more persons per room, which are frequently given to the public, do not represent general conditions, but are exceptional. It is also interesting that New York shows lower averages than Boston and Philadelphia. This suggests that after all, when a certain density of population is reached, the building of tenement houses tends to increase the amount of floor area per acre and reduce the number of persons per square yard of floor space, and presumably per room. Not that congestion per acre is devoid of evils, such as traffic congestion, lack of breathing space or of playgrounds for the children; but this problem is part of the general problem of the growth of large cities and is not confined to foreign quarters.

Another current belief is that all of the foreigners in poorer sections of cities keep large numbers of boarders or lodgers, and sacrifice comfort and decency to their inordinate desire to save money, in order presumably to return home and live on what they have earned in America. I shall not stop to consider the economic fallacy involved in this reasoning, and in the theory that these savings when sent abroad are a loss to America; I shall only point out that the study of immigrant homes has shown that only about one out of every four keeps boarders or lodgers at all, so that three-fourths of the households consist of what may be called the natural family. It is further noteworthy that crowding in larger apartments is never as great as in smaller apartments, which suggests that the immigrant household is crowded either because, having a large family, the head cannot afford a sufficient number of rooms; or because, having taken an apartment of standardized size, he finds himself unable to pay the rent and support his family without the help of one or two lodgers. There is no evidence of boarders or lodgers being kept as a business nor of a sacrifice of comfort or decency to cupidity, as it is called in the immigrant, or even to thrift, as it is called

THE DEVIL'S POCKET IN PHILADELPHIA.

in the native. Crowding, when it appears, is the result of grim economic necessity, and as a rule it disappears as soon as the pressure relaxes.

In studying foreign colonies in cities, one is constantly reminded of the forces which create them and keep them together. Most immigrants come to join friends or relatives and thus form the nucleus of a colony; the first few families attract more, and in a short time a racial island is created in the city. Once the colony is established there are many reasons for its continued existence and growth.

It is expensive to move; it is sometimes hard to find a position in a new environment or to pay car fare, or even to be deprived of the possibility of coming home for lunch. Furthermore, friendly relations, kinship, language, religious affiliations, dietary laws and preferences, and the greater ease of securing boarders in districts where immigrants of the same race are centered, tend to keep the families where they have once settled.

But when the immigrant becomes accustomed to American conditions, when he has gained a firm economic footing, when his children have gone to American schools, the desire for better surroundings overcomes the economic and racial reasons for remaining in congested districts. The stream of emigration from the foreign colonies in large cities is continuous; some move uptown when they marry, some seek new places to establish their own business; others look for cleaner streets, and still others follow the current for no conscious reason. The older immigrants do not often form colonies in American cities any longer, and the newer arrivals clearly tend to follow the example of their predecessors in congested districts, gradually scattering over the city of residence and often leaving that city altogether.

In conclusion, I wish to say that this study has not touched the general problem of the distribution of immigrants and their concentration in cities. What it has done is to show that the immigrants in cities in a large majority of cases live a clean and decent life, in spite of all the difficulties that are thrown in their way by economic struggle and municipal neglect. The study strongly indicates that racial characteristics are entirely subordinate to environment and opportunity in determining that part of the immigrant's mode of life which is legitimately a matter of public concern; and finally, it shows that foreign colonies in large cities are not stagnant, but are constantly changing their composition, the more successful members leaving for better surroundings, until finally the entire colony is absorbed in the melting pot of the American city. The population of congested quarters constantly changes, but the quarters themselves remain congested and will remain so as long as new immigrants continue to arrive in large numbers. It is vitally important for the city to keep her crowded quarters clean and her tenement houses sanitary; but it is just as important that the public understand that congested quarters of large cities are temporary receptacles of newly arrived immigrants, rather than stagnant pools of filth, and vice, and destitution.

RECOMMENDATIONS OF THE UNITED STATES IMMIGRATION COMMISSION

[Quoted from the Summary Statement Submitted to Congress December 5]

As a result of the investigation the commission is unanimously of the opinion that in framing legislation emphasis should be laid upon the following principles:

1. While the American people, as in the past, welcome the oppressed of other lands, care should be taken that immigration be such both in quality and quantity as not to make too difficult the process of assimilation.

2. Since the existing law and further special legislation recommended in this report deal with the physical and mentally unfit, further general legislation concerning the admission of aliens should be based primarily upon economic or business considerations touching the prosperity and economic well-being of our people.

3. The measure of the rational, healthy development of a country is not the extent of its investment of capital, its output of products, or its exports and imports, unless there is a corresponding economic opportunity afforded to the citizen dependent upon employment for his material, mental, and moral development.

4. The development of business may be brought about by means which lower the standard of living of the wage-earners. A slow expansion of industry which would permit the adaptation and assimilation of the incoming labor supply is preferable to a very rapid industrial expansion which results in the immigration of laborers of low standards and efficiency, who imperil the American standard of wages and conditions of employment.

The commission agrees that:

1. To protect the United States more effectively against the immigration of criminal and certain other debarred classes—

(*a*) Aliens convicted of serious crimes within a period of five years after admission should be deported in accordance with the provisions of House bill 20,980, Sixty-first Congress, second session.

(*b*) Under the provisions of section 39 of the immigration act of February 20, 1907, the president should appoint commissioners to make arrangements with such countries as have adequate police records to supply emigrants with copies of such records, and that thereafter immigrants from such countries should be admitted to the United States only upon the production of proper certificates showing an absence of convictions for excludable crimes.

(*c*) So far as practicable the immigration laws should be so amended as to be made applicable to alien seamen.

(*d*) Any alien who becomes a public charge within three years after his arrival in this country should be subject to deportation in the discretion of the secretary of commerce and labor.

2. Sufficient appropriation should be regularly made to enforce vigorously the provisions of the laws previously recommended by the commission and enacted by Congress regarding the importation of women for immoral purposes.

3. As the new statute relative to steerage conditions took effect so recently as January 1, 1909, and as the most modern steerage fully complies with all that is demanded under the law, the commission's only recommendation in this connection is that a statute be immediately enacted providing for the placing of government officials, both men and women, on vessels carrying third-class or steerage passengers for the enforcement of the law and the protection of the immigrant. The system inaugurated by the commission of sending investigators in the steerage in the guise of immigrants should be continued at intervals by the bureau of immigration.

4. To strengthen the certainty of just and humane decisions of doubtful cases at ports of entry it is recommended—

That section 25 of the immigration act of 1907 be amended to provide that boards of special inquiry should be appointed by the secretary of commerce and labor, and that they should be composed of men whose ability and training qualify them for the performance of judicial functions; that the provisions compelling their hearings to be separate and apart from the public should be repeated, and that the office of an additional assistant secretary of commerce and labor to assist in reviewing such appeals be created.

5. To protect the immigrant against exploitation, to discourage sending savings abroad; to encourage permanent residence and naturalization; and to secure better distribution of alien immigrants throughout the country—

(*a*) The states should enact laws strictly regulating immigrant banks.

(*b*) Proper state legislation should be enacted for the regulation of employment agencies.

(*c*) Since numerous aliens make it their business to keep immigrants from influences that may tend toward their assimilation and naturalization as American citizens, with the purpose of using their funds, of encouraging investment of their savings abroad, and their return to their home land, aliens who attempt to

persuade immigrants not to become American citizens should be made subject to deportation.

(*d*) Since the distribution of the thrifty immigrant to sections of the country where he may secure a permanent residence to the best advantage, and especially where he may invest his savings in farms or engage in agricultural pursuits, is most desirable, the division of information should be so conducted as to co-operate with states desiring immigrant settlers; and information concerning the opportunities for settlement should be brought to the attention of immigrants in industrial centers who have been here for some time and who might be thus induced to invest their savings in this country and become permanent agricultural settlers. The division might also secure and furnish to all laborers alike information showing opportunities for permanent employment in various sections of the country, together with the economic conditions in such places.

6. One of the provisions of section 2 of the act of 1907 reads as follows:

"*And provided further*, That skilled labor may be imported if labor of like kind unemployed cannot be found in this country.

Instances occasionally arise, especially in the establishment of new industries in the United States, where labor of the kind desired, unemployed, cannot be found in this country and it becomes necessary to import such labor. Under the law the secretary of commerce and labor has no authority to determine the questions of the necessity for importing such labor in advance of the importation, and it is recommended that an amendment to the law be adopted by adding to the clause cited above a provision to the effect that the question of the necessity of importing such skilled labor in any particular instance may be determined by the secretary of commerce and labor upon the application of any person interested prior to any action in that direction by such person; such determination by the secretary of commerce and labor to be reached after a full hearing and an investigation into the facts of the case.

7. The general policy adopted by Congress in 1882 of excluding Chinese laborers should be continued.

The question of Japanese and Korean immigration should be permitted to stand without further legislation so long as the present method of restriction proves to be effective.

An understanding should be reached with the British government, whereby East Indian laborers would be effectively prevented from coming to the United States.

8. The investigations of the commission show an oversupply of unskilled labor in basic industries to an extent which indicates an oversupply of unskilled labor in the industries of the country as a whole, and therefore demand legislation which will at the present time restrict the further admission of such unskilled labor.

It is desirable in making the restriction that—

(*a*) A sufficient number be debarred to produce a marked effect upon the present supply of unskilled labor.

(*b*) As far as possible, the aliens excluded should be those who come to this country with no intention to become American citizens or even to maintain a permanent residence here, but merely to save enough, by the adoption, if necessary, of low standards of living, to return permanently to their home country. Such persons are usually men unaccompanied by wives or children.

(*c*) As far as possible the aliens excluded should also be those who, by reason of their personal qualities or habits, would least readily be assimilated or would make the least desirable citizens .

The following methods of restricting immigration have been suggested:

(*a*) The exclusion of those unable to read or write in some language.

(*b*) The limitation of the number of each race arriving each year to a certain percentage of the average of that race arriving during a given period of years.

(*c*) The exclusion of unskilled laborers unaccompanied by wives or families.

(d) The limitation of the number of immigrants arriving annually at any port.

(*e*) The material increase in the amount of money required to be in the possession of the immigrant at the port of arrival.

(*f*) The material increase of the head tax.

(*g*) The levy of the head tax so as to make a marked discrimination in favor of men with families.

All these methods would be effective in one way or another in securing restrictions in a greater or less degree. A majority of the commission favor the reading and writing test as the most feasible single method of restricting the undesirable immigrant.[2]

The commission as a whole recommends restriction, as demanded by economic, moral, and social considerations, furnishes in its report reasons for such restriction, and points out methods by which Congress can attain the desired result if its judgment coincides with that of the commission.

[2] "The educational test proposed is a selective test for which no logical argument can be based on the text."—William S. Bennet in a minority report.

THE COST OF THE CRANBERRY SAUCE

OWEN R. LOVEJOY

PHOTOGRAPHS BY LEWIS W. HINE

In purchasing supplies for his turkey dinners this winter, the heart of Uncle Sam will leap with joy to find that one indispensable has not attached itself to the soaring aeroplane of prevailing prices. He will thank heaven that cranberries are at the old figure, and can be devoured with the relish of a conscience void of offense because he can pay for them. To satisfy the growing appetite of the nation, New Jersey has in recent years come to the relief of Cape Cod, and this year pours more than 600,000 bushels of the fruit upon our markets, according to estimates of the New Jersey State Board of Agriculture.

Nor do there arise the disquieting questions which disturb the vegetarian, nor pictures of pallid factory toilers, for the cranberry is a gift of nature and the farm is the paradise of our national traditions, where the cotter's Saturday night like a benediction ends the week of free and happy labor. Would that the tobacco fields, sugar beet fields, fruit and vegetable truck gardens and canneries might continue to wear this bucolic halo.

Unfortunately the halo dims as we pass from one to another of those industries in which the labor power of children is profitable, and even the farm is now found in some of its activities, in league with mine, store, factory and sweat-shop, in laying heavy burdens on the little child. It is almost vicious to disturb the comfort in which we have proposed to eat this fruit, by suggesting that the cash price demanded by the grocer, *and paid*, may not after all represent full payment, but may still leave unsatisfied a heavy obligation.

The vast stretches of marsh land in central New Jersey, formerly useless and barren, are now for five to seven weeks in the autumn overrun with a veritable army, organized and drilled to clean the region of its harvest. Bending at their toil for a ten- or twelve-hour day, this army crawls slowly across the marsh, stripping with deft fingers from the low tangled vines the ripe balls of delicious bitterness. Last season had one period of thirty-one days uninterrupted labor on most of the bogs in Burlington county, although Sunday labor is very rare in the Cape May region. A few in the army are men and women, but many of the rank and file, bending in a deadening monotony of toil under the omnipotent scepter of the *padrone*, are little boys and girls from fourteen years down to seven, or six, or five, whose hard labor must serve the mutual advantage of the employed parent and the hiring boss, and for whose protection no law exists.

When the Jersey harvest time approaches, the crowded tenement districts of Philadelphia literally disgorge their denizens to the cranberry bogs. Last autumn on six bogs 864 children, ranging in age from four to fourteen years, were found at work. Of this number 603 were ten years of age or under.

The cranberry vine stands but a few

CHILDREN OF THE CRANBERRY PICKERS.
All of these children lost six weeks at the beginning of the school year.

inches high. The pickers must double on their knees, causing extreme weariness and pain. The testimony of school superintendents and principals confirms the judgment of reason, that when these children return two months late for the school year, it is with deadened faculties and jaded nerves.

The bog is sometimes damp, as the crop requires occasional flooding, and ditches hidden in the weeds and vines offer not a dangerous, but a soggy and disagreeable surprise to the worker. Runners through the vines make picking difficult and scratch and tear their hands, while the myriad insects, whose fame in Jersey has long been heralded by poet and prophet, infest the swamp land, settling on the open sores of these toiling children to increase their torture. Many of the workers customarily place a wet handkerchief across the face to protect themselves from the swarms of mosquitoes and flies. The work is at top speed; for cranberries are picked by the peck which stimulates the worker, while fear of the first destroying frost stimulates the employer. Children cannot, as in ordinary agricultural pursuits, work until tired and then rest. They must work continuously. The proprietor of one of the largest bogs in the region denies that little children are compelled to work, and characterizes our description of their labor from 7 in the morning to 6 in the evening, as "wickedly false." He contends that they are "entirely under the direction of loving parents" and that the *padrone* is entirely indifferent as to the hours they work or the quantity they pick. It cannot be denied, however, that great pressure is put upon the people to get the bog cleared of berries before the frost comes, and everyone who can help is expected to do so. It is preposterous to suppose that either the owner or the foremen would permit any large number of idle people to take up space on the bog. When the vigilant *padrone* does not chance to be on guard, the parents themselves urge their children by curses and cuffs to keep in the line, as a score

CONGESTION IN THE OPEN COUNTRY.
Room ten by eleven feet in size occupied by a family of ten persons.

of pickers advance abreast across the field. The threats and curses of the *padrone*, swinging his club above the backs of tiny girls, become too common to arouse interest. Parents do not resent this abuse, for the harder the children work the greater the reward.

Children too young or frail to pick continuously are pressed into service to carry the boxes from picking-line to bushelman. When filled these boxes weigh approximately fifteen pounds. Girls and boys not nearly five years old are seen, sometimes carrying two or three boxes at a time. The box is held by an iron handle, one-quarter of an inch in diameter, which cuts the hands often already scratched upon the vines.

If a square deal were given these ignorant foreigners and their helpless children, the case would be less serious. Unjust exploitation begins the moment they leave Philadelphia. The return fare to a principal center of the industry is eighty cents. The *padrone* says he furnishes tickets to pickers at two dollars each. The name "peck" attached to the measure in which the berries are gathered is evidently used for convenience. One of the large growers, in speaking of the wage unit, ranging from ten cents to twelve and one-half cents a peck, said: "My peck boxes contain from thirteen to fourteen quarts. We expect good measure because the pickers would cheat us every time if we gave them a chance." The manager on another bog said: "The peck boxes on this bog contain from thirteen to fourteen quarts. That's where we get the best of the pickers." Another said: "Our peck boxes contain from two to four quarts in excess of the standard peck. We do this to allow for waste." A number of the boxes measured by investigators showed contents ranging from ten to eleven quarts. The growers contend that this excess is fair, as it allows for grass and other waste gathered in the haste of picking, the fruit being sent to market clean and firmly packed in barrels. This is doubtless the true explana-

"WORKMAN" AGED FIVE YEARS.

tion, but it does not explain why a ten- or twelve- or fourteen-quart measure is called a peck. Our investigators, who frequently stood for long intervals at the side of the bushelman, found that he uniformly required the boxes to be cleaned, and was in almost continual warfare with children who ventured to bring a box containing any grass or weeds.

Isolated from city food markets, the toilers depend upon local supplies furnished usually through a commissary. The prices charged and the service rendered are true to the traditions of the company store.

Despite these injustices of exploitation, the berry field is attractive to the workers; for compared with the chances of unskilled labor in the city, this opportunity to draft the whole family into the wage-working army is alluring. The D. family, employed last summer at one bog, was composed of father, mother and six children. The following table is illuminating:

	Age.	Average per day.
Father	39	20 pecks
Mother	38	17 pecks
Rose	17	15 pecks
Tony	15	13 pecks
Annie	13	10 pecks
Mary	11	5 pecks
Angelo	8	3 pecks
Teresa	7	4 pecks

In the aggregate, the three little children working a nine-hour day, add $10.43 to the family treasury in a week of seven days. For the week the family earns between sixty-five and seventy dollars. In their city home the combined earnings of the father, who is a junk dealer, and three children, who work for wages, aggregate twenty-four dollars a week.

To house this army of pickers during the brief season of employment, the bog owner carefully observes the principle of minimum cost. Shacks and barracks are erected to house one, two, six or twenty-four families, families of five or six persons living in a single room. One large shack, quite recently built, contains twenty-four rooms, each measuring five and one-half by six and one-half feet. A bunk, extending along the wall and about four feet above the floor, occupies half the room. The floor under the bunk is covered with a mattress, used as a bed for the children. In some of these rooms were found last season eight people, four sleeping on the bunk and four on the floor. Around the room hung clothing, food and other supplies. The food attracts swarms of flies and the odor in the house is nauseating. Although windows are built to open, they are almost invariably nailed shut. The sanitary conditions of these pickers' shanties are intolerable, and challenge the rigorous attention of those in our country who are awakening to the waste and extravagance of filth and disease.

A hut standing near, measuring ten by eleven feet and with a five and one-

CARRYING TO THE BUSHELMAN.

half foot ceiling, housed a family of ten father, mother, two boys and six girls. There was no partition between the sleeping quarters and no opportunities for privacy. A barrel was used to store the clothing; a table was constructed of boards hammered together; a clothesline stretched across the room, weighed down with clothes still wet, added a rank smell. Bread, peppers and bologna hung from other lines in close proximity.

It is an easy answer to all this that campers enjoy such inconveniences. The proprietors argue that since the families occupy the houses for a few weeks only, they are as good as can reasonably be required. It is confessedly a serious problem, and one in which they usually lack the co-operation of the occupants in efforts to provide decent living conditions. Simplicity of structure is justified, but neither the ignorance of the pickers nor the economy of the owners can be permitted to subject any part of our population to such indecent herding as some cranberry bogs and other truck gardens display. To those who camp on mountains or seashore, where the zest of pleasure combines with restful idle hours, a rainy day in the cranberry bog would be unendurable. You see 350 pickers crouched side by side along the field, sweating under the oppressive sun glare that precedes a storm. Not a moment can be lost, for the harvest must be gathered. Suddenly the storm

SHANTY OCCUPIED BY TEN PERSONS.

THE WHITE CHILD'S BURDEN.

breaks and the toilers spring from the ground to rush across the tangled vines —mothers with babes, barefoot boys and girls, young women in thin garments —hastening to huddle under the scant shelter of some pine tree or over the dike to their shanties. Here, crowded six or eight in a room, in garments drenched with rain and steaming with perspiration, they must wait until the storm subsides or night falls.

Cranberry raising in New Jersey is an important industry. The wild land is cheap, but preparing it for the crop costs from $100 to $125 an acre. It requires three or four years to yield the first crop. Ten years ago there were about 8,000 acres of cranberry land in the state, and the yield was 230,009 bushels, an average of twenty-nine bushels to the acre. The acreage this year has not been reported, but the yield is estimated at 200 bushels an acre. That the profits are large is indicated by the estimated earnings of one *padrone* last season. His nominal wages were three dollars a day. An informant, in position to know, said that his profits would approximate $3,260 for the season. This sum was made up from railroad fares, commissary profits and "presents"—a hold-up system to which every family is expected to respond with an average of six dollars at the end of the season.

The pitiful share of the children in

these large rewards need not be pointed out to those familiar with the prevailing characteristics of child labor. Last May, little Joe Arneo, of three years, was found at work in the ripe berry fields of Delaware. Following the procession of the delicious gifts of Nature, he had migrated with his family from harvest to harvest, still bending under the heavy yoke of the long day, until in October we found him again, harnessed to his servitude in the cranberry bogs of New Jersey. It is a lame apology for this that little Joe was better off than he would have been in the stuffy tenement of Philadelphia. Two wrongs do not make a right.

The culture of cranberries appears to be one of those industries in which ideal conditions of living and labor might be introduced—an aid to the solution of our national child labor problem rather than an added phase of that problem.

SOCIAL PRINCIPLES OF THE NEW STATE CONSTITUTIONS

A. J. McKELWAY
Secretary for the Southern States, National Child Labor Committee

The New Mexico constitution would be called progressive, except for the earlier and widely discussed Oklahoma constitution, which, by the way, has been condemned by a good many eastern critics, who did not have time to read it lest it prejudice their judgment.

The constitutional convention was composed of 100 members, seventy-one republicans and twenty-nine democrats. Twenty-four of the republicans were elected on a pledge that they would advocate the initiative and referendum as a constitutional principle. The democrats were committed to the same principle, thus giving an actual majority of the convention. However, the republican caucus had a majority against the initiative and referendum, and by way of compromise the initiative was defeated and a referendum adopted. The referendum can hardly be resorted to except in the case of the most obnoxious laws, for it was required that ten per cent of the voters of the state and ten per cent of the voters of each of three-fourths of the counties must petition for an election for the repeal of a legislative enactment. The progressives claim that other concessions were made them in this caucus, which overbalance the loss of the initiative.

The convention was dominated by five or six men of great ability, some of whom will be the peers of any members of the United States Senate when the new state sends its first representatives to that body. The democratic minority held the whip-hand, however, in the threat that they would appeal to the people to reject the constitution if they should consider it too reactionary. Through the interplay of these opposing forces, an instrument was wrought out which in my judgment will commend itself to the country. But readers of THE SURVEY are chiefly interested in the social principles which the new constitution contains.

CHILD LABOR PENSIONS

My own chief business with the convention was to effect the adoption of principles necessary to protect working children. I reached Santa Fe ten days before the convention adjourned and found that it had already adopted a provision, in the article on mines and mining, that "no children under the age of fourteen years shall be employed in mines." The attempt was made to strike this provision out on the ground that it was legislation, and that the standard of fourteen set in the constitution for the employment of children in mines was two years too low. The convention, however, decided to retain this. The mining interests, which were largely rep-

resented in the convention, feared that the Legislature would fix the age limit at sixteen, and the friends of child labor reform feared that subsequent Legislatures would be so dominated by the mining interests that they would not go beyond the present territorial statute, which fixes the age limit at twelve. However, a general provision was inserted, which says that "the Legislature shall enact suitable laws for the regulation of the employment of children."

The first section of the article on the judiciary department provides that courts inferior to district courts, and "including juvenile courts", may be established by law in any county or municipality of the state. Another provision will be of interest to the friends of prison reform: "The penitentiary is a reformatory and industrial school, and all persons confined therein shall, so far as consistent with discipline and the public interest, be employed in some beneficial industry; and where a convict has a dependent family, his net earnings shall be paid to said family if necessary for their support." Leasing of convicts is forbidden.

Under the article on education it is provided that "every child of school age and of sufficient physical and mental ability shall be required to attend a public or other school during such period and for such time as may be prescribed by law."

I paid a visit one Sunday afternoon to the penitentiary at Santa Fe. The service was conducted in the chapel, and one of the convicts acted as interpreter to the speaker since nearly every assembly in New Mexico must be bilingual. I was greatly pleased with the discipline of the penitentiary, and the general provisions for the care and comfort of the convicts. The territorial history of New Mexico during recent years is not altogether admirable, as is inevitable when a people is without real self-government, and improvement must come from legislative or executive authority 3,000 miles away. But I heard on all sides praise of the conduct of the educational, charitable, and penal institutions of the new territory.

Culver in Los Angeles *Express*.

"THE PEOPLE'S WEAPONS."

THE SPANISH AMERICANS

I wish it were possible in this brief article to remove some of the prejudices which survive in the East against the Spanish-American people of New Mexico. They form about sixty per cent of the population and have preserved the oldest civilization which has persisted on American soil. San Miguel Church was built before Jamestown was founded, to say nothing of the landing of the Pilgrim Fathers on Plymouth Rock. With their civilization was preserved the purity of their blood, through 400 years of isolation and of warfare with hostile Indians. They are not the mongrel race to be found on the southern border of Texas or across the line in Old Mexico. They do not like to be called Mexicans, and insist that they are New Mexicans or Spanish-Americans. While a good many of the older people do not speak English, the children, through the schools and their contact with other Americans, speak both languages with facility. In the convention I was especially impressed with the ability, and oftentimes with the eloquence, of the Spanish-American delegates, who numbered thirty-two. Twenty-six of these were alumni of St. Michael's College at Santa Fe, which in

the fifty-one years of its existence has sent out thousands of pupils into the territory. In the convention there was an interpreter for the chair and three interpreters on the floor, but only two members of the convention really needed their services. It is a species of philistinism peculiar to our arrogant Saxon race, that we should insist that our children be taught dead languages in school, while we object to the natural acquirement of two tongues by the children of these Spanish-Americans, as though it were a reflection on American institutions. It would be well if we could learn something of the courtesy, tolerance and hospitality of these, our fellow-citizens of old Spanish stock.

THE CONTRAST IN ARIZONA

But if New Mexico represents more than any other state the civilization of the old world, Arizona is of the West, western. No greater contrasts can be imagined than those to be met with in traveling from Santa Fe, "the city of the holy faith," to Phoenix and southern Arizona. You drop down from 7,000 feet above sea, with snow-capped mountains circling the horizon, to an altitude of 1,000 feet, where in the closing days of November roses and chrysanthemums were in full bloom. In Santa Fe the burro is still the chosen beast of burden. Phoenix boasts of more automobiles in proportion to its population than any other city in the country, and I have not seen so many bicycles since the early craze of the nineties. The compelling reason for both is the fact that Phoenix is a city of magnificent distances. The Capitol is a mile and a half from the City Hall, and the lots grow larger as one leaves the center of the city. The plain is well watered by irrigation, though it is not without its surrounding mountains, bare of foliage but glistening with rare colors in the sunlight.

As the New Mexico convention was typically republican, the Arizona convention was typically democratic. Of the fifty-two members, forty-one were democrats and eleven republicans. The able leadership and compact discipline of the New Mexico convention were lacking, but the average of native ability was higher. Only one caucus was held, for the election of officers, and there have been a hundred tie votes in the convention. Every report of a committee was threshed out in committee of the whole, each man speaking his own mind. Arizona has a population of 30,000 Mexicans, but they seem to be an inferior class to the New Mexicans, and the 4,000 voters among them had no representative in the convention. One county sent to the convention a machinist, a plumber, a locomotive engineer, two miners, a butcher, three lawyers—one of them the only corporation lawyer in the body—and a railroad switchman who successfully contested the place against one of the greatest mining magnates of Arizona and Old Mexico. But the chairman of the committee on revision was a Harvard graduate, formerly one of the editors of the *World's Work*, and the completed Arizona constitution is said to be the shortest in any state, and it reads well. The initiative, referendum and recall are writ large, the recall extending to all elective officers, including the judges. Ten per cent of the qualified electors have the right to propose any legislative measure, and fifteen per cent any amendment to the constitution, while five per cent may propose the repeal of any legislative act, and twenty-five per cent may order that the recall of an official be submitted to the people.

I found that the convention had tentatively agreed upon a measure fixing an age limit of fifteen for children employed in mines and dangerous occupations, and that it was bent upon fixing some age limit for the guidance of future Legislatures. I was able to persuade the members to adopt the following provision:

> No child under the age of fourteen years shall be employed in any gainful occupation at any time during the hours in which the public schools of the district in which the child resides are in session; nor shall any child under sixteen years of age be employed underground in mines, or in any occupation injurious to health or morals or hazardous to life or limb; or in any occupation at night, or for more than eight hours in any one day.

The fellow servant doctrine is abrogated. An employer's liability and workmen's compensation act is made mandatory upon the Legislature.

The distinction between juvenile and adult delinquency is made clear by the provision: "It shall be unlawful to confine any minor under the age of eighteen years, accused or convicted of crime, in the same section of any jail or prison in which adult prisoners are confined. Suitable quarters shall be prepared for the confinement of such minors." In another section the Legislature is required to establish and support reformatory institutions.

It is believed that both constitutions will be ratified by the people of the two territories, and as New Mexico will undoubtedly send two republican senators, and Arizona two democratic, thus continuing the present political status, the opinion is here given for what it may be worth, that Congress will conclude that each state is entitled to the kind of constitution it evidently wants.

INDUSTRIAL SURVEY OF THE MONTH

GRAHAM TAYLOR

CHICAGO STRIKE ENDING

As the garment workers' strike at Chicago is at least approaching an end, a review of the course it has run may connect the details hitherto reported in our Common Welfare paragraphs.

In its sudden rise, rapid spread, and formidable proportions, it resembled a peasant uprising more than an organized strike. All but a few hundreds of the 30,000 or more who "went out" from all branches of the trade were unorganized when they quit working. The highest paid men, the cutters, walked out first, over a difference with their employers—Hart, Schaffner and Marx—concerning a fraction of a cent in wages. And then, without having a strike "called" or organized, without leadership or concerted action, one crew after another, in widely scattered shops, under different managements, threw down their work at the news that the cutters had struck. "Now is our chance" was the only argument, to which whole shops full of men and of girls, speaking six different languages and having no bond but their common toil, yielded by common consent.

Coercion is charged with responsibility for the strike. But the Garment Workers' Union was too small when the strike began to account for so much of a mass movement all at once. There were more thousands in the mass than there were hundreds in the union. Loyalty to the union cannot account for the strike, because the present local leader has never commanded even the confidence of its members or the public. Moreover, a very large proportion of the strikers consists of recently arrived immigrants, who have not been in America long enough to understand unionism, much less to be loyal to the local union which they had not joined before they struck. They were moved instinctively to stand together as shopmates or as fellow-countrymen, who were earning their living and supporting their families by the same trade.

While the grievances, considered apart, were minor and varied, they were sufficient, when taken together in each shop, to bind shopmates together. The greatest grievance common to all shops, which united most of their workers throughout the city, was the fact that the employers neither offered nor permitted any grievances to be presented by committees of employes. Each one having a complaint was obliged to suffer in silence or to risk disfavor, if not discharge, in making it known to the overseer, singly and unsupported. This was the more difficult for the employes to understand or submit to, because they were so closely related to each other in the organization of the shop, in the work they produced together, and in their relations to one another in each room.

Had this grievance been rectified at the start, or had it not been excluded from

the other grievances which Hart, Schaffner and Marx agreed with the garment workers' international president to submit to arbitration, the strike might have ended soon after it began with far more satisfaction and less loss to all concerned, than on any other condition. When this firm, having forty-eight shops and 10,000 employes, finally yielded this point, and included "whatever grievances, if any," in their agreement to arbitrate, the Chicago Federation of Labor and the Woman's Trade Union League, which had become parties to the controversy, promptly accepted it. The joint strike committee, representing both these organizations and the garment workers, at once set out to gain the strikers' acceptance of this agreement as the basis for their immediate return to work.

Their public-spirited effort, led by Pres. John Fitzpatrick of the Chicago Federation of Labor and Margaret Dreier Robins, president of the Woman's Trade Union League, to pave the way for a just peace by explaining these accepted terms to the strikers, was nobly and courageously undertaken. With copies of the agreement printed in Italian, Bohemian, Yiddish, Polish, Lithuanian and English, they started upon their rounds of over forty halls scattered over the city at which the strikers held their meetings. The odds against the committee lay in the fact that the wholesale clothiers' organization and that of the tailors to the trade, neither of which included Hart, Schaffner and Marx, and which considered themselves as competitors to this firm, refused to accept or even to consider the agreement which the latter had signed. Persisting in the fiction that there were no grievances for them to arbitrate, these organizations of employers declined to join Hart, Schaffner and Marx in conference with the City Council's committee to mediate the settlement of the strike. This caused their employes to object to accepting an agreement which applied to one firm and not to the others.

The leader of the local garment workers' union, who never worked with the others for peace, secretly urged this and other objections to the agreement before the visits of the strike committee to the strikers in their halls. Even this might have been overcome had it not encountered most unexpectedly another more formidable obstacle to united action. Polish men strikers confronted the strike committee at their own and other halls with the cry, "We have sworn by the crucifix to accept nothing but the closed shop." Then it appeared that an excommunicated priest of an independent Polish congregation had been stirring up the fanaticism of these men and their women to resist at any cost the arbitration agreement. Immediate violence, ending in the defeat of the agreement, seemed certain, if the committee continued its pacifying effort, which was therefore abruptly broken off.

With the failure to accept arbitration some strikers began to falter. A few employes returned to their work under individual agreements, assigning as a reason the refusal of the other strikers to arbitrate in accordance with the agreement of the firm. The good-fellowship, which up to this time had remained almost unbroken, began then to be marred by a fierce fighting spirit. Some of the women appeared to change their firm but kindly attitude to that of "an animal at bay, only fighting to protect its young," as one of their friends said who noted the transformation.

The Christmas spirit was seized by the Woman's Trade Union League to counteract all this. Through the "commissary stations," which it had united with the other interests in maintaining, Christmas dinners were sent by the hundreds to hungry homes. To light up the gloom of destitution and despair with the cheer of good-will, Christmas celebrations were held at some of the strike centers. At Hod Carriers' Hall, Pilsen Park and other rendezvous of the different nationalities, Christmas trees were lighted and goodies and gifts distributed to the young people of the older strikers. Cheery talks heartened the dispirited and turned the courageous from destructive to constructive purpose.

The peace promised to "men of goodwill" belongs to a woman this Christmas in Chicago. For if there ever was a peacemaker to claim the blessing it is Margaret Dreier Robins, after her unceasing and heroic effort during three

months of strife, under the fierce stress and strain of which she has met every demand and improved every opportunity for "peace with honor," and to mitigate the horror of cruel industrial war.

Public and press alike protest against ending the struggle by the mere exhaustion of one party under the endurance of the other, or ending it without some permanent adjustment between employers and employes. This is demanded to prevent the recurrence of such disturbances of the city's peace and its citizens' business interests. But what should appeal to the proprietors in the trade is the fact that with the present peaceful and co-operative pursuit of the industry at Philadelphia and New York, the principal competitors of the Chicago manufacturers, the garment trade of the West cannot afford the disadvantage of divided forces and interrupted work.

Some assurance of a more satisfactory settlement is given by Hart, Schaffner and Marx, who conclude their final statement to the mayor and the City Council's committee in this conciliatory spirit:

> Our workers can come back to us in full confidence that we shall be ready to meet them and deal with them liberally in all matters of our mutual interest and welfare, concerning which they and we are better informed than anybody else.
>
> We feel, and have always felt, that the interests of our employes, in wages, in sanitary conditions of labor, in all that affects their well-being, are matters which vitally concern us as business men and as fellow men.

Meanwhile the joint strike committee reports quick recovery from whatever slump was threatened by the failure to ratify the arbitration agreement. This seems to be verified by the fact that the strike benefits already assure fuel and food sufficient for another month and by the wonderfully well sustained attendance and enthusiasm at most of the halls. Another big parade of strikers demonstrates the multitude and loyalty of their rank and file.

ENGINEERS' STRIKE AVERTED

The value of having some recognized legal means of settling industrial differences is demonstrated every time the Erdman act of Congress is even held in reserve. Conciliation is facilitated by the fact that its provision for arbitration may be appealed to as a last resort. For in that event both parties at issue know that there is at command a rational means of settling their differences, "ready-made," easily accessible, promptly available, which gives promise of capable and just arbitrament.

Such again proves to be the case in the threatened strike of 32,780 locomotive engineers, 97.52 per cent of whom voted to strike on a referendum ballot. For weeks the managers' committee and Pres. Warren S. Stone, with other officers representing the Brotherhood of Locomotive Engineers, had been in a deadlock. Then the mediation of United States Commissioner of Labor Neill was invoked, with a view of falling back upon arbitration in accordance with the Erdman act if this conciliation failed. When he arrived in Chicago both parties had refused to make further concessions and were about to break off negotiations for a second time. They differed as widely on the increase of wages as on the fifteen per cent demanded by the engineers and the nine and a half per cent conceded by the managers. After conferences with each side Commissioner Neill submitted a proposition to both, with the assurance that if it failed to secure their agreement further negotiations would be futile. By gaining some minor concessions from both, he was able to secure the agreement of each to an advance of wages of 10.33 per cent. This increase ranges from 8.5 to 14.5 per cent, according to different schedules of work. It adds about $4,000,000 to the payroll of the railroads, and will be the basis of a working agreement continuing several years.

But the magnitude of the loss saved by averting the threatened interruption of business may be imagined in view of the fact that sixty-one western railroads were involved and fifty-three per cent of the entire railroad mileage of the United States.

The differences between the managers and the Brotherhood of Railroad Trainmen and the Order of Railway Conductors have been settled by a ten per cent

McCutcheon in Chicago Tribune.

CHANGING THE WREATH.

wage increase for 75,000 conductors and trainmen on fifty-one western roads—a total of five million dollars. This marks the culmination of the general wage movement begun by railway employes more than a year ago.

CHRISTMAS CONTRAST IN CIVICS

Chicago presented a Christmas Day contrast which may well make a grim impression on every man in public office and every citizen responsible for public opinion everywhere.

In his modest home lay the body of Fire Marshall James Horan, awaiting the highest tribute which a great city can give a man who had served it bravely for thirty years and had died in protecting it from flames.

In the county jail a former police inspector spent his first day behind bars on the way to state prison, sentenced for from one to five years by the decisions of three state courts for accepting bribes from disorderly resorts. Two years ago they were held in almost equal popular esteem and both were considered for appointment as general superintendent of police. There is little doubt that the former police inspector would rather lie in the honored grave of the dead fireman than live in disgrace. Although not considered the only guilty officer, or the guiltiest of his rank, the discipline of the force imperatively demanded the conviction of every guilty man.

The public cannot escape complicity in the death of the one or in the dishonor of the other. James Horan, from the time he became fire marshall until the very week he lost his life, besought both City Council and packing house proprietors to establish a high pressure water system at the center of town and in the stock yards district, and it was the lack of an adequate water supply that gave uncontrollable headway to the packing-house fire and cost the lives of twenty-four firemen. Now, all too late, the City Council is heeding the voice of the dead in planning what it denied the living, and the packers and other citizens are contributing a quarter of a million dollars to the families of the men whom they cannot call back from the grave to live for their loved ones, or to protect the property and lives of fellow citizens.

So, too, the public opinion which refuses either to regulate the social vice, as might be done, or to suppress it, as might be attempted, thereby becomes responsible for the dishonor of police officers and their failure to protect the public. For the discretion which this public opinion thus forces upon the police is impossible as a public policy and well-night irresistible as a personal temptation.

Bradley in Chicago News.

THE SENTINEL.

THE COMMON WELFARE

SIX-DAY WORK AND PENSIONS ASKED BY POSTAL EMPLOYES

The December issue of the *Postal Record* reports progress in the effort of the postal clerks throughout the service to get one day's rest in seven. The defeat in the last session of Congress of an amendment to this effect in the post office appropriation bill served to stimulate the agitation of the postmen's rest day committee. With the assistance of the ministry, and especially of the Lord's Day Alliance, the committee has given the movement such publicity throughout the country that there is hope of passing a "compensative rest time bill" at the present session of Congress.

The postmasters of Colorado Springs and Detroit have been closing their offices experimentally on Sunday mornings, since the law only requires opening in case of public demand. In Denver only five out of 25,000 people circularized protested against Sunday closing and in Colorado springs no protests are reported.

The postal employes have succeeded also in bringing up the Goulden Retirement Bill (H. R. 22,770). Two postal retirement bills were introduced in the last Congress. That of Representative Gillette was a compulsory savings plan, with no contribution from the government except running expenses, and a sum sufficient to cover pensions for the first few years after the law went into effect. This cheapness was the principal argument for the Gillette bill which was vigorously opposed by the postmen. They argued that their salaries could not bear compulsory deductions, since the average annual salary in the department was only $758; and that those who could afford to save could obtain through ordinary business channels a rate of interest much higher than the three and one-half per cent offered by the government.

The alternative bill, introduced by Mr. Goulden, which has recently been referred to the committee on civil service reform, is enthusiastically supported by those who are to be its beneficiaries. It is a straight pension scheme making retirement at sixty years possible, at seventy compulsory, and providing a scale of pensions of from forty to seventy-five per cent of the average salary for the five years preceding retirement. This rate is based upon years of service, the minimum term that establishes eligibility being twenty years. Retirement on account of disability through

Harding in Brooklyn Eagle.

HE STUCK A FEATHER IN HIS HAT AND CALLED IT POPULATION

Davenport in New York Globe.

THE ONLY DOOR OPEN TO HIM.

accident or illness is paid relatively higher, the minimum term of service required being five years, at which thirty per cent salary is paid during incapacity; seventy-five per cent is paid after twenty-six years or more of service.

The principal, and practically the only, objection made to the Goulden bill is its expense, which its opponents claim will tend to prevent increases in salaries. To this the postmen reply that the compulsory savings plan or any contributory scheme would have the same effect of lowering salaries, and that, furthermore, in the army, navy and judiciary, straight pensions have not had this effect. On the contrary, they point to the fact that these departments have seen substantial increases in salaries during the same period that salaries in the pensionless post office department are averaging lower than in 1854.

THE MONEY SPENT TO FIGHT TUBERCULOSIS

The annual survey of its field issued by the National Association for the Study and Prevention of Tuberculosis shows that in 1910 nearly $15,000,000 was spent as against eight million in 1909. The largest item, $11,376,500 for treatment in sanatoriums and hospitals, is almost double that of the year before. Anti-tuberculosis associations spent $760,500, tuberculosis dispensaries $889,000, and special state and municipal expenses total $1,750,000.

The most significant point in the figures is held to be the increase in the proportion to the whole of the public money spent. It rose from 53.5 per cent last year to 62.6 per cent. The total of public moneys, $9,267,900, is almost double the amount for 1909. The ratio of public to private disbursements in the ten states making the largest expenditures is interesting:

STATE	PUBLIC	PRIVATE	TOTAL
New York.....	$3,039,000	$1,206,000	$4,245,000
Pennsylvania ..	1,431,000	673,000	2,104,000
Massachusetts ..	1,118,000	400,000	1,518,000
Colorado	105,000	731,000	836,000
Ohio	573,500	76,000	649,500
Connecticut ...	338,500	167,500	506,000
New Mexico....	250,000	251,000	501,000
Illinois	245,000	208,000	453,000
California	88,000	316,000	404,000
New Jersey....	255,000	130,700	385,700

New York again leads in both columns. Plans now under way will make changes next year as, for instance, in Illinois, where the new tax for tuberculosis work will greatly increase public disbursements hereafter.[1]

The most rapid gain of any kind is in New York state, where from November 15 to December 15 seven counties took favorable action on providing institutions—an average of two county hospitals every week for that month. This was brought about by the tuberculosis committee of the State Charities Aid Association, whose work was reviewed in THE SURVEY for December 17. The combined appropriations for the seven hospitals are over $200,000. When the association began its work three years ago only three counties out of the fifty-seven in the state made any institutional provision for consumptives. Today there are twenty-two county hospitals and several other counties with small populations are arranging for boarding their consumptives in the institutions of neighboring counties.

[1]See THE SURVEY for October 29, 1910, p. 155.

These institutions have cost to date over one and one-half million dollars. At least five more county hospitals, and increase of other provisions for consumptives are expected at the January meetings of the county boards of supervisors, and the outlook seems bright for realizing the association's terse program, "No uncared for tuberculosis in 1915."

EMPLOYERS' LIABILITY BY OREGON REFERENDUM

The citizens of Oregon were given the choice under their referendum law of two liability measures, one supported by the Manufacturers' Association, the other by organized labor. The manufacturers' bill, providing for the appointment of a commission to investigate industrial accidents, which was not required to report its results until two weeks before the end of this year's legislative session, would have put off legislation for another two years.

The labor bill, which became law by a larger majority than any other measure put to the referendum, provides that all owners and others employing men in works of "construction, alteration, removal, or painting of any . . . structure, or in the erection or operation of any machinery, or in the manufacture, transmission and use of electricity, or in the manufacture or use of any dangerous appliance or substance" shall see that all materials are carefully tested to detect defects, and all scaffolding or like temporary structure is constructed to bear four times the maximum weight to be sustained, and, if twenty feet or more from the ground, is secured from swaying and provided with a guard rail; that all dangerous machinery, shafts, or other openings are protected or enclosed; that complete insulation is provided where electricity is used and all except hand machinery is provided with a system of signals, so that the entire power can be shut off immediately in case of accident; and finally that every other safeguard possible, besides those specifically mentioned, is used in all occupations.

The bill provides further that a fine shall be imposed for failure to fulfill these provisions, and that in case the owner or his agent fails thus to protect his machinery, any person sustaining an injury is entitled to recover damages, without the possibility of recourse on the employers' part to the defences of the worker's assumption of risk or his own or a fellow servant's negligence.

The Oregon law does not go as far in the direction of compensation as the New York law, but it is in advance of that or any other state law in laying down and enforcing by fine a standard of accident prevention.

HIS START IN LIFE

The *Telegraph and Telephone Age* charges that in securing legislation to keep boys out of the night messenger service the National Child Labor Committee is "destroying the earning power of the embryo citizen."

WOMEN ORGANIZE STRIKE COUNCIL

With the object of separating its strike activities from its regular work of organization and education, the Woman's Trade Union League of New York has recently incorporated the Strike Council of New York, which is to be financed by separate funds, but directed by Mary E. Dreier, Carola Woerishoffer, and

Bill in Baltimore Sun.

BACK TO THE LAND.

Johns Hopkins University has just succeeded in raising the funds for moving its buildings from the city to the country.

Helen Marot, all officers of the league. The objects of the council are to anticipate and prevent strikes of women workers in industries where they are threatened, by building up such strong organizations of women that their demands will be respected without recourse to a strike; to co-operate with trade unions in cases where strikes are unavoidable—either because amicable methods of adjusting difficulties have failed or because a strike would facilitate the process of trade union organization — in bringing such strikes to a successful issue; and finally, to pay benefits to strikers or wages to those whose work is interrupted by trade union activities.

The council held its first meeting in December and began its work by donating $1,000 to the striking garment workers of Chicago.

EXPRESSMEN REACH FINAL SETTLEMENT

Final adjustment of the difficulties[1] between the four great express companies and their drivers, helpers, and platform men in New York, which was made early in December, grants the eleven-hour day and a rate of pay substantially that demanded by the men—fifty dollars a month as a minimum for helpers, and an increase of about five dollars a month for all other classes of workers up to those receiving seventy-five dollars or over a month, who in all cases do not receive a raise. For overtime work helpers receive from seventeen to twenty cents an hour, according to an agreement made with individual companies; drivers and platform men from twenty-five to twenty-seven cents. Five holidays with pay are promised and promotion is to be made according to seniority.

[1] THE SURVEY November 12.

THE FRIENDLY VISIT OF A CHRISTMAS TREE

In December, the members of a department of the Women's Educational and Industrial Union decided that they would like to give a Christmas tree to some Boston family instead of gifts to each other. They offered it to one of the districts of the Associated Charities. A deserted wife with three children under twelve was chosen, and a friendly visitor talked over arrangements with the mother. The day after Christmas being decided upon, the tree was delivered Christmas Eve that the children might have all the joy of anticipation.

From early morning the mother's preparations were under way; the floors were scrubbed, curtains and bedspreads washed, and the children dressed in their best. She was asked by the visitor to entertain another family of five children and their mother and responded cordially to the suggestion. An hour before the time set for the tree, the visitor arrived laden with the gifts prepared with the advice and suggestion of the children's mother. All delightedly shared in the trimming of the tree. A friend loaned a music box which added much festiveness. The children recited carols learned at school and before the candles were burned to their sockets the gifts were distributed.

The oldest boy visitor acted as Santa Claus assisted by the eldest girl hostess. The joy over one another's pleasure was a sight not soon to be forgotten. One little girl, receiving a doll, exclaimed,

"He looks just like my baby brother that died. I shall name him Johnnie!" The visitor was herself much surprised with the gift of a green pincushion, the mother telling her she had "made every stitch of it" herself.

Eight children and two mothers filled the small room to overflowing but no one minded, and the hospitable soul of the green pin cushion maker found great satisfaction in providing coffee and cookies, though she had to borrow cups from the neighbors. At the end of the afternoon the visitor was thoroughly convinced that only in a home can Christmas truly be celebrated.

RESPONSIBILITY PUT UP TO DEPARTMENT OF HEALTH

By unanimous action at its last meeting, the American Society for Sanitary and Moral Prophylaxis urged the New York Department of Health to establish compulsory reporting of venereal diseases as it does of tuberculosis, smallpox and other infectious diseases. Discussion at the meeting crystallized in the opinion that compulsory reporting is an absolutely necessary first step in any program for reducing the social evil and its accompanying diseases. Until the extent of venereal diseases is known, all efforts at improvement will be held back.

Dr. Stephen Smith, representing the State Charities Aid Association, showed that the department has full power to do this. It can make and enforce laws without interference by the courts, he held. When the bill establishing the department was passed, the sweeping powers given to it were not clearly recognized, but the law has been upheld in the courts. The department can require compulsory registration at once if it will. A number of speakers agreed to this and pointed out that all that is needed is to create the necessary support by physicians and by public opinion. This may not be accomplished in a day for, as Dr. Keyes showed, the medical profession as a whole is not friendly; when it was proposed fifteen years ago to make tuberculosis reportable, one physician was so angered that he left a meeting of the Academy of Medicine in disgust.

Harding in Brooklyn Eagle.

THERE THEY GO!

Action on this question followed a general discussion of the social evil and Clause 79 of the Page bill, which included a scholarly review of European regulation and its failure to reduce disease by Prof. Edwin R. A. Seligman of Columbia, who made six suggestions for checking the evil:

Raise the general standard of living and thus diminish the necessity for going into prostitution as a means of livelihood.

Repress the white slave traffic.

Regulate and improve dance halls and saloons which often convert a first offender into a permanent prostitute.

Develop character through special education along these lines and thus tend to affect demand as well as supply.

Require a certificate of good health as a preliminary to issuing a marriage license. This is not illusory and is being done more and more.

Organization and continuity of effort are essential. The Committee of Fifteen did some good, but went out of existence within a few months. The Society for Sanitary and Moral Prophylaxis is doing an admirable work, but there is need for a permanent organization which will do still more. Such an organization should not only study the question from the bottom up—from the economic, social, medical and ethical points of view; but should draft laws for submission to the Legislature; should see to it that the proper authorities effectively administer the law when enacted; and should educate public opinion until it recognizes the hideousness of one of the greatest evils of our time.

THE ST. LOUIS MEETINGS

HENRY RAYMOND MUSSEY
Columbia University

Those respectable persons who think the world good enough as it is may well be pardoned if they object to students of the social sciences as shakers of the pillars of social order. If such a person had wandered into the Planters or the Southern Hotel in St. Louis during the last week in December, he would soon have wandered out in disgust, for he would have found lobbies, dining rooms, and parlors filled with men and women discussing methods of social improvement and means of interesting students in such questions. Perhaps the most striking features of the meetings of the six associations that gathered in St. Louis were, first, the practical social interest of the questions they considered, and second, the scientific, straightforward spirit in which those questions were approached.

American students today are primarily interested in the solution of definite practical problems, rather than in the clever solving of theoretical puzzles. Vast questions of industrial and political reorganization insistently press for solution, and settle themselves in some fashion whether we will or not. Live men are almost irresistibly drawn to study these questions, and pure theory suffers in consequence. The result may be a bit unfortunate scientifically; practically it gives the humanitarian and the reformer reason for unmixed rejoicing. The cause of sane and rapid progress is much advanced thereby.

As evidence of these statements let the reader note a few of the subjects taken up at St. Louis. While the economists were studying the effects of immigration and various kinds of taxation, the relative advantages of railroads and canals, not only to the shipper, but to the community in general, the development of an accounting system that shall make possible the determination of a fair price, and the possibilities of socialism; the political scientists were discussing direct primaries, progressive political movements in Europe and the reform of judicial procedure; the sociologists were considering the influence and possibilities of the church and other organizations in city and country; the statisticians were presenting the facts of agricultural development as drawn from the last census; the students of labor legislation were examining the results of phosphorus and lead poisoning, the frequency of its occurrence and the methods of preventing it; the home economists were studying in the broadest possible way the baking of bread and the cooking of meat, the decoration of the house, the judgment of textiles, the questions of domestic service and the training of children. Theory there was in plenty; for after all no one can think about facts without forming some sort of a theory, but it was theory arising out of interest in real and vital questions.

The meetings of all the associations were characterized by a certain unity of viewpoint and method, no less striking than their oneness of aim. All of them kept the whole field of social life more or less clearly in view. No program could illustrate this more clearly than that of the Sociological Society. The address of the president, Professor Giddings, was a thoughtful consideration of the part played by war in the history of civilization. At present, he pointed out, war constitutes a fearful menace to social progress, and he indicated the conditions that must be fulfilled if it is to be avoided. From the broad sweep of such ideas to the detail of what the church can do for the rural community seems no small step. Yet in studying both questions alike, the point of view embraced the whole on-moving social process. Much the same thing might be said of the other programs. If they limited themselves rather more narrowly to economic or political considerations, it was generally not from lack of recog-

nition of the importance of those large biological and purely social influences on which the sociologists rightly lay stress.

Within the broad field of social betterment, the Association for Labor Legislation has taken for its particular task the improvement of living and working conditions by law. It has wisely devoted itself to two problems: industrial hygiene and workingmen's compensation. Rarely has an organization come into the field when the time was more fully ripe, and rarely has one been able to point to definite results more quickly realized. While the association is in a sense a propagandist organization as none of the others is, yet its methods of work are identical with those adopted by the other bodies—the patient collection and study of facts relating to the problem under consideration, the examination of all known methods for dealing with it, the working out of a practicable policy of action. It is only by going a little further than the other organizations do in actually urging such action, that this association oversteps the narrow line that now separates the student from the social reformer. The report of progress in the fields of industrial hygiene and workingmen's compensation made at this meeting was an inspiring one, and gave promise of large results to be attained in the immediate future. Members of the association were urged to write to their congressmen at once in support of the Esch bill to prevent the use of white phosphorus in match manufacture, the secretary pointing out that all objections to the bill on the ground of its favoring the so-called match trust had been entirely overcome.

A large part of the changes that economic and sociological study indicates as desirable are to be attained only by political action. The political scientists are engaged in a comparative study of the best methods of such action. Consequently, the meetings of the political science Association increase from year to year in interest and importance. At St. Louis they went into recent constitutional developments in Europe, the working of direct primary laws in various states under various conditions at various periods of time, the advantages of different methods of judicial procedure. Such study, based on the facts, means rapid advance in political development, which is one of the necessary conditions of healthy social progress in these days of democratic government. It was interesting to see how the work of the political scientists fitted into that of the other students at this gathering.

The Statistical Association has for its task the improvement of a tool that comes to be used more and more by workers in all scientific fields. Vice-president Hoffman's annual address on life insurance progress was an excellent illustration of the possibilities of the use of this tool, as was Professor Fisher's masterly presentation of the quantity theory of money before the economic association. The statistical method is one of the most important in the marshaling of the facts that are essential to the establishment of sound conclusions as a basic for social action.

The Home Economics Association, latest comer in this family of scientific organizations, had its origin perhaps even more clearly than any of the others in the necessity of scientific treatment of practical problems. The solution of these home problems has hitherto been by rule of thumb methods handed down from generation to generation. But since the industrial revolution the problems have been changing before our eyes, and methods must change correspondingly. Hence, the home economists have been calling in all the resources of natural science, and latterly of social science also. One of the most interesting features of the St. Louis meeting was the sight of students of the practical questions of home management, met in conference, calling in the economist and the sociologist for suggestion as to the help they might derive from those sciences. The benefit will not be confined to the home economists; they will give no less than they get. Merely in bringing to these meetings a large number of women they performed a distinct service at St. Louis, and it is much to be hoped that they will

continue to meet with the other organizations.

As to the meetings of the Economic Association, which may in some sense fairly claim to be the parent organization of the others, the one thing most evident was the disappearance of the doctrinaire and the dominant position of the student of actual life. American economists may not know a great deal about the economic life of our time, but they are anxious to learn, and they are untiring in their effort to master the essential facts. They realize the importance to social progress of a rightly-organized economic life, and they are trying to understand the working of the existing mechanism in its influence on all classes of the people. From the beginning of President James's address on the economic importance of education, down to the end of the discussion on socialism at the last session, this point of view was constantly apparent. Economists in this country have ceased to quarrel about names; they have ceased to be interested in *a priori* theories that do not spring out of the problems of the present and do not fit with the facts of today, and they are increasingly giving their thought to the intensive study of one or another part of the economic organism with a view to its more perfect functioning. At this meeting they studied money, Ricardo (rest his bones, as most of those felt who attended this session), accounting, canals and railways, immigration, industrial disease and workingmen's compensation, taxation and socialism. They are reproached, on the one hand, with being minions of capital; on the other, with being dangerous radicals indifferent to the importance of the established order. The St. Louis meeting showed them once more for what they are, a body of men earnestly intent on better social relations, and working with sober scientific care to bring them about. If they are not all on the firing line in the battle between vested wrongs and militant rights, most of them are at work in the ordnance factories and powder mills, where the arms are being forged and the ammunition turned out. Meetings like this one serve to emphasize the unity of purpose among all the students of the social sciences; they serve to inspirit them in their march toward a better social life, based on a more thorough knowledge of the working of the social machine.

The local committee in St. Louis was too hospitable to waste the time of its visitors in those social functions where the visitors meet a large number of local celebrities whom they do not care to meet and who do not care to meet them. The holding of sessions in the two comfortable headquarters hotels saved a great deal of time. The programs, as usual, were stuffed full of papers, in general not less than three at every session. Some day a committee may arise with the courage to do away with this nuisance, and give time for the discussion that is the life of scientific meetings.

THE AMERICAN SOCIOLOGICAL SOCIETY

HARDIN LUCAS
Assistant Superintendent of Public Schools
Louisville, Kentucky

The personnel of the program of the St. Louis meeting of the American Sociological Society was largely determined with a view to securing a number of "reports from the field," so to speak, from aggressive workers who have recently been busy a-pioneering, and the opening session partook conspicuously of this character. Prof. Edward A. Ross of the University of Wisconsin contributed some Sociological Observations in Inner China, his portrayal of the struggle for existence being especially convincing. Other conclusions as to physical and mental constitutions, the family, private interest and public interest, neglect of conservation, ideographic language, and the transformation of China were attentively heard. A Sociological Appraisal of Western Influence in the Orient by the Rev. Edward W. Capen, formerly of the American Board of Foreign Missions, was also based upon an extended investigation directed more particularly to the social influence of missionaries, but covering various other points: education, industry, medicine,

political movements, social reform and ethical reform.

A second sheaf of the papers had relation to certain conditions in our own country, which had been the basis of extended investigations by those presenting them. The Drift to the City in Relation to the Rural Problem was handled by Prof. John M. Gillette of the University of North Dakota, who presented the situation statistically with an analysis of the sources of city growth, and discussed the significance to rural communities of migration to cities. He emphasized the comparative fruitlessness of back-to-the-farm agitations which seem to attempt to ignore "the profound forces which are essential and intrinsic to this age," the possibility of setting up counter-attractions in the country as a partial check to city-ward tendencies, and the paramount need of reorganizing rural school life in harmony with rural interests and needs. The Church and the Rural Community, by the Rev. Warren H. Wilson, superintendent of the department of church and country life of the Presbyterian Board of Home Missions, who has been directing a sociological survey of rural communities, dwelt upon the lack of leadership in country populations, and the need of re-valuating the country church as a social institution in the present life, rather than as a means of preparing for life after death.

The presidential address by Prof. Franklin H. Giddings of Columbia University, under the title The Relation of Social Theory to Public Policy, may be regarded as introducing a third set of the papers. First, he dealt historically with Comte, Spencer and Bagehot, placing much emphasis upon the third, but his major concern was that "overshadowing question, the world-old query—'is it war or peace?'" This was analyzed with characteristic lucidity and humor, and included a treatment of simple and compound evolution, the control of public wrath, and government by discussion. This contribution might well be issued as a special pamphlet by organizations interested in the movement for universal peace.

An extended paper by Prof. T. J. Riley, director of the St. Louis School of Social Economy, showed the relation between Sociology and Social Surveys, citing especially the monumental Booth survey of London and the recent Pittsburgh Survey. His allusion to the permanent surveys now in progress in Buffalo and Kansas City was supplemented by Professor Ellwood, of the University of Missouri, who stated that the Board of Public Welfare in the latter place had requested that his department exercise a kind of continuous guidance over the work.

Social Control of Domestic Relations was dealt with constructively by Prof. George E. Howard of the University of Nebraska. He plead for "a rational examination of the existing facts," suggested the preaching of actual, rather than conventional, social righteousness, and discussed such varied aspects of his large problem as compulsory social hygiene, juvenile courts, state endowment of mothers, positive eugenics, venereal diseases, uniform marriage law, finally suggesting a college of the domestic relations.

A veritable challenge to all mere thinkers and talkers about social affairs was sounded by Prof. Frank W. Blackmar of the University of Kansas, in a paper on Leadership in Social Reform. He held that nine-tenths of self-styled reformers seldom get beyond the anarchistic stage, in which a bold, independent individual, impressed with a strong belief in the defectiveness of institutions, customs and laws, by his iconoclastic utterances may reap a large return for a small effort. It is comparatively easy to make programs and laws, but to work out the reform in practice is the difficult problem of the age. To eliminate the evils by the laboratory test in the actual human workshop is the crux of modern reform. The chief reason is that leadership in reform is not sufficiently equipped to continue to this stage of progress.

Papers of a fourth sort were analytic studies with comparatively little attempt to deduce rules for special occasions. Prof. Ulysses G. Weatherly of Indiana University wrote on The Racial Element in Social Assimilation. He quoted from

Mill, with approval, that "free institutions are next to impossible in a country made up of different nationalities," but later on showed how this general principle was modified (or evaded) in our own country by reason of our rapid "absorption" of immigrants owing to their very willingness to be absorbed. "Judaism has been dealt with in Europe as a racial fact, which it is not, while in America it has been treated as a civilization, which it is." His discussion of language as a very large factor in certain situations was noteworthy, his point being that "there is no reason to believe that the races will be merged in a universal melting pot. Both the ethnic and cultural differences between certain groups are so great that general amalgamation is for the present out of the question."

Under title of The Social Forces Error Prof. E. C. Hayes of the University of Illinois, taking his cue from Comte, urged that sociology must progress from the metaphysical stage into the scientific stage, as biology has recently done, by "replacing supposed forces and substances with scientific explanations." His argument was directed chiefly against certain writings by Professor Ward, who, to the regret of speaker and audience, was unable to attend and respond.

The last session was fittingly closed with a brilliant paper on The Rivalry of Social Groups by Prof. George E. Vincent of the University of Chicago, recently elected president of the University of Minnesota. Inasmuch as his particularly readable contribution will appear in the January issue of the *American Journal of Sociology,* no attempt will be made to abstract it here.

It was the sentiment of all that the next meeting of this society should be held concurrently with that of the American Economic Association, which, being interpreted, seems to indicate Washington, D. C., during the last week of December, 1911. Prof. Franklin H. Giddings was re-elected president and Alvan A. Tenney (also re-elected) secretary-treasurer. The very efficient service of the secretary was strongly commended. The society's abiding esteem for its former president, Prof. W. G. Sumner, deceased, of Yale University, was memorialized by a special resolution. As to the society itself, there were mutual felicitations among the members in attendance over the progress noted in the report of the secretary. The list now totals 300, comprising chiefly members of departments in colleges, advanced students, and prominent social workers. It seems regrettable that educationists have not more generally affiliated with this society and so shown their appreciation of the relation between sociology and specific work in the field of public education. But since it seems likely that at the meeting next Christmas a session or two will be devoted to the sociology of education, we may safely look for evidences of a livelier interest among specialists in that field.

AMERICAN ECONOMIC ASSOCIATION

T. N. CARVER, Secretary
Cambridge, Mass.

The meeting of the American Economic Association in St. Louis marks a turning point in its history. Though it has already passed its twenty-fifth birthday, most of its original members are still active—few of them, in fact, are yet past middle age, which is explained by the fact that the founders were a group of young and enthusiastic students and teachers of economics, who got together at Saratoga in 1886 and formed this association. When one sees and hears, at these annual meetings, such young and vigorous men as Richard T. Ely, F. W. Taussig, Edmund J. James, Davis R. Dewey, John B. Clark, Simon N. Patten, J. W. Jenks, Henry C. Adams and Edwin R. A. Seligman, it is difficult to realize that they were all active in the founding of the association.

That the founders builded wisely is evidenced not only by its continued activity, but by its very considerable growth in numbers. From a small group in 1886, the association has increased to over 1,700 members, more than 700 of whom have joined in the last two years. This increase in membership, showing as

it does a rapidly growing interest in economic studies, has determined the association to carry out an enterprise which it has been considering for several years. This is nothing less than the founding of a new economic journal to be known as the *American Economic Review*.

The final arrangements for projecting this publication were made at the St. Louis meeting. It is placed in charge of an editor-in-chief, Prof. Davis R. Dewey of the Massachusetts Institute of Technology; an editorial board of six members, Professors Henry B. Gardner of Brown, J. H. Hollander of Johns Hopkins, E. W. Kemmerer of Cornell, Henry W. Farnam of Yale, A. A. Young of Leland Stanford, and Henry C. Taylor of the University of Wisconsin. The first number of the review will be issued in March. The subscription price will be four dollars a year.

The St. Louis meeting opened with the presidential address by President Edmund J. James of the University of Illinois upon The Economic Significance of a Comprehensive System of National Education. Everyone who knows President James's views on educational topics would have expected him to shape his designs on the scale of a hemisphere in treating a topic of this kind. They would not have been disappointed. The speaker was not content merely to plan largely; he went sufficiently into details to demonstrate the economy, practicability, and constitutionality of the magnificent plan of vocational education which he outlined.

At the session devoted to the problem of money and prices, the principal papers were read by Professors J. Lawrence Laughlin of the University of Chicago and Irving Fisher of Yale. They presented somewhat antagonistic views as to the relation of the increase of gold to prices, Professor Laughlin contending that this was a relatively unimportant factor and Professor Fisher that it was the principal factor. Both conclusions were supported with elaborate statistical evidence and great logical acumen. Professor Fisher in particular showed remarkable industry and ingenuity in an inductive statistical test of the accuracy of the mathematical formula of price determination. A spirited discussion followed the papers which proved to be of great interest to scientific students, though they would be difficult reading for the average layman.

One session was given over to a subject of little interest to the non-academic portion of the association, but of great interest to the professional economists—the Ricardo centenary. The work and influence of Ricardo and the success and failure of Ricardo were discussed by Prof. J. H. Hollander, James Bonar, deputy master of the Canadian mint, and several others.

The session on accountancy showed how the interest in accountancy has grown among economists in recent years. This is due mainly to a general recognition of the fact that it is hopeless to solve such problems as the control of corporations, the reform of city governments, etc., until the public, which must exercise control, is able to understand the accounts and the management of the things which they are trying to control or reform. Of what avail is it, for example, to compel publicity of accounts if there is no ability on the part of the public to understand the accounts after they are published? Prof. William M. Cole of Harvard presented an illuminating paper on the question, What Economic Principles Should Apply in the Apportionment of All Classes of Cost to the Individual Units of Production, and How Should these Principles be Observed in a General Accounting System in Order that a Fair Price May Be Charged for the Individual Units Produced.

The session on Canals and Railways was opened by Prof. Emory R. Johnson of the University of Pennsylvania and Prof. E. R. Dewsnup of the University of Illinois. Major William H. Harts of the United States Corps of Engineers and W. M. Acworth, fellow of the Royal Statistical Society of England, took part in the discussion.

Coming decidedly closer to the heart of the social problems of the present, was the session on Population and Immigration. The opening paper, read by

title only, contended that one large factor in the bad distribution of wealth was the bad distribution of men among the different ranks of society, and that this bad distribution of men was accentuated by the abnormally high birth rate among the poorer classes, and the abnormal proportion of our immigrants entering the unskilled occupations. Prof. J. A. Field of the University of Chicago read a paper showing by means of tangible evidence how active a part the classical English economists had taken in the neo-Malthusian movement in the first half of the nineteenth century. Prof. J. Allen Smith of the University of Washington described the social and economic results of oriental immigration to the Pacific Coast. He definitely discarded the use of such terms as "superior" and "inferior" races, but pointed out the undoubted fact that where physically different races try to occupy the same territory on a basis of equality there is an inevitable conflict, frequently breaking out into race war.

A joint session was held with the American Association for Labor Legislation on the general subject of Industrial Accidents and Industrial Diseases. Various phases were discussed by a group of experts, all of whom are well known to readers of THE SURVEY: Alice Hamilton, Frederic L. Hoffman, Fred C. Schwedtman, Daniel L. Cease, and Thomas I. Parkinson.

Two excellent papers on Taxation, one by Prof. Thomas S. Adams of Washington University on The Place of the Income Tax in the Reform of State Taxation, and the other by Prof. H. J. Davenport of the University of Missouri on Land Value and Taxation were presented at another session. Professor Adams took a decided stand in favor of a state income tax. Professor Davenport's paper was an analysis of the various elements of our national wealth, with a view to finding out what proportion of it is earned and what proportion unearned. His conclusion was that a much larger proportion is unearned than we ordinarily suppose, and that land values are not by any means the only forms of unearned wealth. So far as this general conclusion was concerned, there was practically no dissent by any of those who discussed the paper, but when it came to details there was considerable difference of opinion. It is particularly significant that economists are giving attention to this problem. It is of great importance, and requires a degree of knowledge and discrimination entirely lacking in those who have usually attacked it.

This paper and the discussion which followed it, when taken in connection with the paper of the afternoon session, are especially interesting. The latter, entitled An Attempt to Define Socialism, was read by John Martin. While Professor Davenport's paper and the discussion which followed it pointed out various forms of wealth and income which are not earned, Mr. Martin, as a socialist, was ready to recede from the position of the orthodox socialist and admit that various forms of capital are earned and may therefore be left in private hands. If socialists begin to discriminate between various forms of capital and to admit that some may be earned, it is not improbable that the exercise of this kind of discrimination will lead them to recede farther and farther from the "orthodox" position that all capital is the result of exploitation, and eventually bring them to the same position as that ordinarily taken by the economist. Mr. Martin's paper was a distinct step in this direction. Such papers as his will go a long way toward giving scientific standing to socialism, provided the more extreme socialists do not forbid him and others of his school to appropriate the term socialism to their own particular doctrines and programs.

Anyone who listened to these two discussions must have felt that if socialists generally would give up their blind devotion to a Marxian creed, or their outworn formula that capital is unproductive and interest unearned, and examine the matter carefully to see whether interest is not earned after all; and if economists would give more attention to the problems discussed in Professor Davenport's paper, it is not improbable that a common

ground could be reached and a constructive program of social reform agreed upon. But so long as socialists believe in that absurd formula and refuse to reconsider it, they cannot logically recede from their program of the public ownership and operation of all the means of production.

On the whole this was one of the most interesting and one of the best attended meetings ever held by the Economic Association. The officers for the following year are: President, Henry W. Farnam of Yale; vice-presidents, F. N. Judson of St. Louis, Joseph French Johnson of New York and B. H. Meyer of Washington, D. C.; secretary-treasurer, T. N. Carver of Harvard.

AMERICAN POLITICAL SCIENCE ASSOCIATION

W. W. WILLOUGHBY, Secretary
Baltimore

The seventh annual meeting of the American Political Science Association was in every respect successful. With a single exception the sessions were held in the Southern Hotel, where the association had its headquarters, and this kept the attending members in close association with one another, giving them opportunity for exchanging individual views, making new acquaintances, and renewing older friendships. The secretary reported that during the current year the association had continued its rapid increase in membership, the total enrolment now approximating 1,350.

The president, Gov. Woodrow Wilson of New Jersey, in his address to which he gave the title The Law and the Fact, emphasized that in our day business is seldom a private matter carried on by independent individuals, but is, in the main, conducted by great corporations, which exist only by express license of law and for the convenience of society. The task of politics, it was declared, is to bring the operation of these and of other forces into harmony with one another, and to provide that the effects of all of them shall be in consonance with the general welfare of the community. Thus, as distinguished from the economist, who must in very many instances, if not generally, consider the interests of individuals as such, the task of the political scientist is ever to view the general welfare and to seek its advancement, without, of course, failing to recognize that this community good involves and implies the true interests of the individual units. The address, which was a notable one, will appear in full in the February issue of the *American Political Science Review*.

The second session of the meeting was devoted to papers dealing with Recent Constitutional Developments in Europe; the question as to impending change in the British House of Lords being discussed by Prof. T. F. Moran of Purdue University; the Tendencies Towards Ministerial Responsibility in Germany by Prof. W. J. Shepard of Ohio State University; the Russian Duma by I. A. Hourich of Washington, D. C.; and the Turkish Parliament by Prof. A. H. Lybyer of Oberlin College. With reference to the constitutional question in England the opinion was expressed that while important changes in the powers as well as the composition of the upper legislative chamber are practically certain, no serious political crisis is to be expected. As to Germany, it was pointed out that the political condition of that country, together with the peculiar constitutional character of the empire under the hegemony of Prussia, will make extremely difficult the development there of a true system of ministerial responsibility. By Mr. Hourich the character and powers of the new Russian legislative body were luminously described, and the means outlined by which the czar, in violation of the manifesto of 1905, finally secured a majority in the third Duma. Mr. Lybyer's general estimate of the Turkish Parliament, as judged by its work during the brief period of its existence, was upon the whole favorable, and therefore one offering encouragement for the future. The cautionary remark was made, however, that political predictions, always dangerous, are especially uncertain with reference to Turkish affairs.

The third session had for its general topic Judicial Organization and Procedure, the two principal papers being read by Chief Justice Olsen of the Chicago Municipal Court and Edward J. McDermott of Louisville. Judge Olsen discussed the proper organization and procedure of a municipal court, basing his views upon the remarkable work of the important tribunal over which he has presided since its establishment in 1906. Upon both the civil and criminal sides efficiency and celerity have marked the exercise by the court of its powers. The accurate judicial statistics which have been kept show that during 1910, 87,922 criminal and quasi-criminal cases were tried, eighty per cent of these being disposed of within twenty-four hours of arrest, and ninety per cent within two weeks. During the same year 48,549 civil causes were heard and adjudicated. Judge Olsen was confident that the efficient work of this court had had a substantial influence in reducing the amount of crime in Chicago. Mr. McDermott made a convincing argument against the prevalent practice of American courts in attaching controlling importance to technical legal requirements, the justification for which, if there ever were any, having long since disappeared. Mr. McDermott's views were approved and supplemented by informal addresses from F. W. Lehmann, solicitor general of the United States, and Prof. John D. Lawson, dean of the law school of the University of Missouri, the latter resting his remarks upon a study recently made by him as commissioner of the American Institute of Criminal Law and Criminology of English judicial methods.

At the fourth session problems of municipal government furnished the chief subject for discussion. H. E. Flack, chief of the Bureau of Legislative Reference in Baltimore, reviewed recent tendencies in municipal charters; and Mr. Myer of the Bureau of the Census explained what was being done and what might be done by the bureau for the collection and presentation of municipal statistics, and especially of those by means of which the administrative and economic efficiency of city governments may be measured. At the same session Prof. G. G. Wilson of Harvard University presented a valuable paper dealing with the jurisdiction of states over the air strata above their territories and, as founded thereupon, their authority to regulate aerial navigation; and Theodore Marburg of Baltimore spoke upon the methods of enlisting public opinion in international arbitration.

At the fifth session the results of the primary election laws in Illinois, Missouri, and Iowa were described by W. C. Jones of the Illinois Senate, Prof. Isidor Loeb of the University of Missouri, and Prof. F. E. Horack of the University of Iowa. Prof. C. A. Beard of Columbia University spoke briefly of the direct primary movement in New York, and Dr. E. M. Hartwell of Boston described primary elections and results in Massachusetts during the early colonial period.

The final session was held jointly with the American Economic Association, Taxation being the general subject discussed. The following papers were read:

The Place of the Income Tax in the Reform of State Taxation by Prof. T. S. Adams, of Washington University; Land Value and Taxation by Prof. H. J. Davenport of the University of Missouri. A discussion followed in which Prof. T. N. Carver of Harvard University and Prof. M. H. Robinson of the University of Illinois participated.

The following officers of the association for the year 1911 were elected: President, Simeon E. Baldwin; vice-presidents, Albert Bushnell Hart, Emlin McClain, Ernst Freund; secretary-treasurer, W. W. Willoughby; members of the executive council, A. R. Hatton, Stephen Leacock, Charles McCarthy, Isidor Loeb, C. H. McIlwain and T. E. Moran.

The papers read at the various sessions will be printed as speedily as possible either in the annual volume of the association's Proceedings or in its quarterly journal, the *American Political Science Review*. Both publications are sent to all members of the association.

AMERICAN ASSOCIATION FOR LABOR LEGISLATION

At the fourth annual meeting of the American Association for Labor Legislation, Prof. Henry W. Farnam of Yale University, who has been president for the past three years, resigned that position on being elected president of the American Economic Association. Prof. Henry R. Seager of Columbia University succeeds him.

Professor Seager brings to his work practical experience, having been engaged in securing labor legislation in New York state for some years past while president of the association's New York branch. He is vice-chairman of the New York Commission on Workmen's Compensation, and chairman of the executive committee of the National Conference on Workmen's Compensation for Industrial Accidents.

The program reflected the work already accomplished by the association, which is mainly responsible for the nation-wide interest in industrial diseases—a fact the more remarkable when it is realized that it is the result of a little more than one year's effort. The association is responsible for the investigation of phosphorus poisoning in the match industry in co-operation with the Federal Bureau of Labor, and it is energetically pushing its bill, which Mr. Esch introduced into Congress, prohibiting the use of white phosphorus in the manufacture of matches. It is responsible also for the first national conference on industrial diseases, as an outgrowth of which a memorial calling for a national investigation was presented to President Taft.

As Professor Farnam said in his presidential address, the association has passed out of the experimental stage and is now in the active stage. The membership has increased to 2,000, with a much larger affiliated membership through many different organizations that support its work.

The methods pursued by the association are undoubtedly responsible for a large share of its success. It holds that complete knowledge of the facts is the first essential, such knowledge being used as a basis for scientific legislation framed to meet the known circumstances. By this means no ligitimate interests are injured, while the nation as a whole is benefited by the increased health, comfort, safety, and efficiency of its workers. Social progress on such a basis carries with it the application of an increasing measure of scientific method to industrial processes, which is of itself a national gain of the first importance.

Frederick L. Hoffman, statistician of the Prudential Insurance Company, urged the necessity for a thoroughly equipped factory inspection service, including medical assistants trained in the principles and practice of industrial hygiene. Prof. Charles R. Henderson of the University of Chicago emphasized the great damage wrought by hidden disease inevitable under the present system of inspection. He held that physicians owe a special duty to the community in reporting industrial accidents and diseases—they alone have the information necessary to do this adequately. "If they neglect this social duty misery and death will result. If they make their reports as perfect as possible science will be advanced, legislation will be wiser and more effective, and public health and happiness will be increased."

It was pointed out by John B. Andrews, secretary of the association, that a great step towards realizing such a program would be taken if this country were to establish an industrial clinic for the study of occupational diseases, similar to the one in Milan which was described in THE SURVEY for November 12, 1910.

A short report on mercurial poisoning in the hat industry was submitted by the Women's Branch (New York and New Jersey) of the National Civic Federation. The investigation was made by Florence Roehm, who in three months secured records of sixty cases of poisoning in Brooklyn, Newark, and Orange. The number is significant when it is remembered that in England, under careful inspection, only ninety-four cases have been reported in twelve years.

On the question of enforcing labor laws, Pres. Edwin R. Wright of the Illi-

nois Federation of Labor pointed out that the co-operation of workers can be relied upon when the responsible authority makes a real attempt to enforce the law; but the workers are naturally apathetic when the authority is a mere cog in a political machine.

Dr. Alice Hamilton reported briefly on lead poisoning in Illinois. She has recorded 640 individual cases in twenty-eight trades. She found both employers and employes frequently ignorant of the poisonous nature of the materials they handled. Adequate precautions against poisoning were rare. The tendency toward improvement in the lead industry in recent years she attributed mainly to greater economy in methods of production consequent upon the increasing value of lead. President Hamar of the Hamar Lead Works spoke of the danger of lead poisoning from the standpoint of a manufacturer.

Mr. Hoffman suggested that the question of compensation in industrial diseases is closely allied to that of industrial accidents, the two frequently shading into each other, and instanced the British workmen's compensation act.

Dr. Sidney I. Schwab of St. Louis reported that he had found a quite undue amount of neurasthenia from an examination of thousands of garment workers. He found it particularly prevalent among Jews, due in large part to their highly nervous constitutions.

Daniel L. Cease, representing the railway brotherhoods, made a distinct impression by two quotations—one from a railroad company's official bulletin setting forth rules for the safety of the men; the other, a circular letter from a railroad superintendent to his staff urging the establishment, under penalty of dismissal, of working conditions in direct contradiction to the rules given in the bulletin. Mr. Cease demanded full compulsory compensation, based on an automatic scale of awards that would eliminate litigation and insure adequate relief to injured workmen.

The employer's point of view was presented by F. C. Schwedtman, representing the National Manufacturers' Association. He said he would surprise his audience by stating that he did not believe voluntary indemnity would prove adequate, nor did he believe that compulsory compensation is adequate in itself. He recommended that an opportunity be given manufacturers to show what they can do without legislation. In Europe, he said, a greater number of accidents occur to agricultural workers than to any others.

Many other speakers contributed to the interest and value of the meeting, among them Dr. William C. Hanson of the Massachusetts State Board of Health; Dr. Rogers, medical inspector of factories in New York; Thomas I. Parkinson of New York, and Mrs. Florence Kelley, secretary of the National Consumers' League. A full report will be published shortly by the association.

The outstanding features of the meeting were the general recognition of the magnitude of the problem of industrial hygiene, and the supreme importance attaching to the enforcement of labor laws.

AMERICAN HOME ECONOMICS

BENJAMIN R. ANDREWS, Secretary

The American Home Economics Association, which is a newcomer among associations dealing with economic and related problems, was organized at Washington, D. C., two years ago, at which time some 700 charter members formed a society whose purpose is stated to be "the improvement of living conditions in the home, the institution, and the community." The organization, however, has a longer history, going back some twelve years to the formation of an annual conference on problems of home and institutional management, which met first at the Lake Placid Club in 1899. Each year thereafter, at Lake Placid or elsewhere, a group of teachers and others met to discuss this field of work, and to devise educational and legislative measures to secure progress.

The nucleus of the group meeting at Lake Placid, which in turn became the center of the new organization, was a number of college teachers of household

science from the different colleges and universities, especially in the middle West, where home economics had become a subject of instruction after its introduction in the state institutions of Iowa, Illinois and Kansas about 1876. With this group were a number of high school teachers and supervisors of instruction in elementary schools, scientific workers such as Ellen H. Richards of the Massachusetts Institute of Technology and the late Professor Atwater of Wesleyan University, and other persons who felt the importance of the application of science to the practical matters of everyday life in the household.

The membership has more than doubled, so that the St. Louis convention brought together representatives of over 1,500 persons. Last year a meeting was held in Boston with the American Association for the Advancement of Science, at which time a number of prominent workers in natural science—physiologists, chemists and physicists—took part in the program of the home economics meetings, and showed the applications of these sciences in the matters of daily living.

Economists and sociologists made the contributions at St. Louis which were the heart of the program. One evening meeting was devoted to Aspects of Economics of Importance in Home Economics, and Prof. David Kinley, dean of the School of Commerce at the University of Illinois, gave the principal address, outlining a course in the economics of the household which he had given for several years for the benefit of students in household science. Prof. Frank A. Fetter of Cornell University opened the discussion.

Another evening was devoted to a parallel topic, What Courses in Sociology Should be Included in a College Department of Household Science, with a masterly paper by Prof. George E. Howard of the University of Nebraska, who outlined some eight related courses in social science, undergraduate and graduate, which might be provided in a completely developed scheme of instruction in household science. The discussion was opened by Prof. Charles A. Ellwood of the University of Missouri, who described beginnings which he had made in adapting his instruction to the needs of household science students. One especially helpful paper was given by Prof. William Morse Cole of Harvard University, pointing out How the Individual Home Economist May Help General Economic Progress.

A program of papers on Instruction in Home Economics, arranged by Sophonisba P. Breckenridge of the University of Chicago, included a discussion of The Productive System as a Preventive of Waste by Miss Van Meter of the University of Illinois; a paper on Knowledge of the Industrial System as a Basis for Consumers' Responsibility by Edna D. Day of the University of Kansas; and one on Cost Accounting by Mrs. Richards of the Massachusetts Institute of Technology. Other economic papers were by Dr. I. M. Rubinow of the Department of Commerce and Labor on Household Service as a Labor Problem, and by Mr. Lebovitz of the Library of Congress on Some Social-Economic Aspects of Labor Saving Machinery in the Household. John Leeds of Teachers College suggested the importance of a study of the economic values of various divisions of household work as performed by the average housewife, when measured in time, and outlined a projected investigation to ascertain these facts.

Throughout the convention the emphasis on economic and social problems was marked, and while the program involved the outlining of problems to be solved, rather than a record of work accomplished, yet all present were encouraged by the attendance of workers in the field of general economics, and persuaded that there is to be in time a science of the household which shall be based in due part upon the economic and social sciences. This was perhaps the most striking impression which a visitor to the convention would have received.

Especially encouraging also to members of the Home Economics Association was the long list of scientific papers which appeared on the program, particularly in the field of dietetics and nutrition. Some fifteen titles in this field alone represented scientific studies upon such practical

matters as bread making, cooking of meat, cooking of vegetables, and other food problems.

The topic of Clothing, another division in the trinity of food, clothing and shelter which roughly describes the field of home economics, was presented in a sectional meeting. Courses of study were discussed and scientific papers prepared, showing that there is coming to be a basis in science for the proposed regulation of textiles, parallel to the government regulation of food. A description of the textile testing laboratory of the United States army at Governor's Island, and a paper on textile tests carried out in selecting material for the Child Welfare Exhibit in New York, prove that the day of scientific textile regulation and honest labeling of fabrics is not far off.

A section on the Care of the Child, with papers by the supervisors of domestic science in the public schools of New York and Philadelphia and by other teachers in high schools and colleges, indicated that the care of the normal child will soon be a matter of instruction for all girls attending the public schools. Other divisions of the program dealt with housing and sanitation, extension work in home economics as it is carried on by agricultural colleges and among women's clubs, and various phases of instruction in household science.

The Home Economics Association takes as its field of interest the management of the home, and of the institution which reproduces the household on a large scale; and it looks to two lines of service: education and professional management, for the better control of these two. The St. Louis convention demonstrated that household science is not a myth, but an art which is rapidly being placed upon a foundation of natural and economic science.

AMERICAN STATISTICAL ASSOCIATION

CARROLL W. DOTEN, Secretary
Boston

The recent meetings of the several associations at St. Louis demonstrated anew the increasing tendency to utilize the statistical method as an instrument in social and economic research. It is almost a case of "carrying coals to Newcastle" for the American Statistical Association to undertake a program of its own under such circumstances. Practically all of the associations had something of a statistical nature in their programs, and some devoted a portion or all of several sessions to topics requiring the use of statistics for a satisfactory presentation.

That statistics do not always deserve the usual reproach of dullness was shown by the fact that the most interesting sessions of at least two of the associations were those where this method was employed. Economists and sociologists are finding less and less pleasure and profit in questions of theory and more satisfaction in a first hand study of facts.

The American Statistical Association contented itself with rather a short program. The presidential address by Frederick L. Hoffman on Fifty Years of Life Insurance Progress was a masterly presentation of a subject of the greatest interest. Naturally the methods and results of the thirteenth census afforded a number of subjects for discussion. The most interesting of these were presented at a special session on agricultural statistics by experts connected with that division of the Census Bureau and by professors of economics and agriculture from several of the state universities. During the ten years since 1900 great changes in land values, in the size of farms, in the shifting of rural populations, and in other agricultural conditions have taken place especially in the north central states. One striking economic fact was disclosed in this discussion, namely, that a more intensive cultivation of land under American conditions does not necessarily mean a smaller farm unit. It is true that the very large farms of one thousand acres and over are being broken up into smaller units, but this tendency is not nearly so important as the consolidation of small holdings into farms of from 175 to 500 acres.

The following officers were elected for the ensuing year: President, Frederick L. Hoffman, Newark, N. J.; vice-presi-

dents, Walter F. Willcox, Ithaca, N. Y.; Henry W. Farnam, New Haven, Conn.; E. Dana Durand, Washington, D. C.; Charles P. Neill, Washington, D. C.; Edward M. Hartwell, Boston; editor, John Koren, Boston; treasurer, S. B. Pearmain, Boston; secretary, Carroll W. Doten, Boston.

EDITORIAL GRIST

THE ROCKEFELLER FOUNDATION

EDWARD T. DEVINE

Fortunately it is a living intelligence and not a dead hand which is shaping the plans for what seems likely to be one of the most beneficent institutions ever undertaken for the promotion of human welfare. Those plans, even as formulated in the original bill of incorporation, were abreast of previous and contemporary endowments. We thought at that time that there was some ground for the hope that they might nevertheless be improved and brought fully abreast of sound economic theories and progressive social policies. We gave expression to that hope in arguments addressed, as we took pains to say at the time, primarily to Mr. Rockefeller and his advisers, secondarily to Congress, where the act of incorporation was pending. The amendments now offered by the senator who introduced the original bill are the response to this hope; and the response is precisely what might have been expected. No reasonable critic would have expected or desired that his suggestions would be adopted *verbatim*. What has been done is better. They have been considered, rejected in part, adopted in part, and improved upon.

The original bill created a corporation which "shall have perpetual succession." A proposed amendment adds after these words, "save as hereinafter provided." We are unable to find any subsequent provision which limits the existence of the corporation as such, but the reference is clearly to two new sections, one of which provides that Congress may at any time impose such limitations upon the *objects* of the foundation as public interest demands and that all gifts shall be received and held subject to this proviso; while the other provides a method for the termination of any particular *endowment*.

It was the principle of endowment in perpetuity which we challenged. It is this principle which is now definitely abandoned in favor of the alternative which we suggested. In substance this new section provides that the foundation may after fifty years distribute both principal and interest of any particular gift, however large; and that after one hundred years the foundation shall make such distribution if directed to do so by Congress. This clear recognition of the policy of social control is of the utmost importance. It may be a long time before there is occasion to make such a distribution as is here contemplated; but again it may not, and the very presence of such a stipulation is certain to have an enormous influence in that "gradual broadening down from precedent to precedent," which operates irresistibly in the field of philanthropic endowments.

The original bill states the objects of the corporation in the most liberal language which could be devised so as to include all education, all charity, all the elements of human progress. This language remains unchanged, but the amendment to which we have already referred, providing that Congress may impose such limitations upon these objects at any time as it may deem that the public interest demands, offers a safeguard against abuse of this broad grant of power.

The next amendment, fixing the maximum amount to be held absolutely or in trust at one hundred million dollars, is chiefly interesting as discountenancing the more extravagant guesses originally made as to the amount of the proposed endowment. Still it is possible to do a

great deal with a mere hundred million dollars.

Another new section adopts, in an improved form, our suggestion that the corporation be required to expend its income for the purposes enumerated in the charter, rather than accumulating and adding it to the principal. This provision is very properly made subject to such reasonable delay as may be necessary in a wise administration of the fund. No one would desire such a rigid stipulation as would require the trustees to get rid of a large sum of money over night, as if they were insurance company trustees caught on the day of an annual statement with unauthorized securities in their possession.

A minor amendment stipulates, for the sake of clearness, that the exemption from taxation for which the bill provides shall apply only to federal taxes. Under state laws the property of the foundation actually used for educational or charitable purposes would ordinarily be exempt also from state and local taxation. It is a well established principle of American finance that such property shall not be taxed. Why should it be? We raise money by taxation for the very purposes, among others, for which this foundation is to exist. Property which is already being used for public purposes under government control may properly be exempt, since to tax it would only be to transfer income from one public use to another. Our own reference to the subject of tax exemption was only to suggest the extent of the public interest as one ground for government control and participation.

This brings us squarely to the only important point on which the pending amendments do not go as far as we have considered advisable, *viz.*, the selection of trustees. The original bill contemplated a self-perpetuating board, starting with five members. Our suggestion was that the government should have a voice in filling vacancies, either by election of Congress or by appointment of the president.

To prevent misunderstanding, we may first express very frankly the opinion that this is a point on which the deliberate opinion of the founder and his advisers should prevail. It affords ample room for difference of opinion. University boards of trustees, as the New York *Times* has repeatedly said in this connection, are often self-perpetuating. The Russell Sage Foundation and many other excellent institutions are so organized. The filling of vacancies by the governing board, either by direct election or by nomination and influence, may be said to be the prevailing practice. When, therefore, Senator Gallinger, doubtless representing the founder's wishes, provides in a proposed amendment that additional members of the corporation shall be elected by the corporation itself, but that before such election becomes effective four high officials of the government and the presidents of five great universities shall have an opportunity to pass upon such election—the disapproval of a majority making the election void—he probably goes quite as far as can reasonably be expected in admitting outside cooperation in the selection of trustees.

This amendment is a safeguard against unfit appointments. Names which are to be scrutinized and passed upon by nine such competent and disinterested authorities would doubtless be selected with care. Moreover, the election of new members in this manner would probably give rise to illuminating discussion in the public press. The subject should prove at least as interesting as the balloting on candidates for the Hall of Fame. In this way public opinion would become enlightened regarding the work and policies of the foundation, and would be ready to deal with any situation which seemed likely to call for that legislative intervention for which other amendments provide.

The objections to the self-perpetuating plan are partly, but not altogether, met by the outside veto. The bringing in of entirely new elements from time to time seems to us valuable as a means of preventing the inbreeding of ideas; as a means of keeping the corporation in touch with current public opinion and fresh, vigorous ideas; as a means of preventing the development of such a situation as would require drastic interven-

tion by Congress and the courts; as a means of preventing that lofty isolation, pharisaical self-sufficiency, and imperviousness to new ideas which self-perpetuating boards tend to exhibit. At the same time we recognize that self-perpetuating boards can keep themselves wholly free from these tendencies if they deliberately set about it; and we recognize also that there are objections to any plan yet devised for compelling the introduction of outside and fructifying elements. It may be very disastrous to disturb the working harmony of a board of trustees. The financial resources of the foundation might become the football of contending financial interests. Membership in the foundation might fall to the level of a reward to political henchmen, like the consulships of a generation ago. Aside from all such rather remote possibilities, it may fairly be argued that the existing trustees are really better judges of the qualifications for membership in the board than Congress, or the president, or any other outsiders can be. Being more interested in this particular undertaking, they would know where to look for good candidates and could more easily make sure that the new members would bring to their work the necessary interest and devotion.

The arguments for and against a self-perpetuating board are so evenly balanced that a generous donor may fairly plead that he be allowed to have his own way about it. The gist of the matter is, as we see it, that our plan implies greater confidence in republican institutions and greater distrust of closed corporations. But the proposed charter clearly indicates that Mr. Rockefeller is more ready than any of his predecessors or contemporaries among large givers to trust public opinion, more ready to admit public participation in his humanitarian projects, and less inclined to insist upon an absolutely self-perpetuating, hermetically sealed corporation. We are therefore emphatically of the opinion that Congress should promptly give him the charter for which he asks.

There would of course be no difficulty in securing incorporation in almost any state of the Union. It is a sound and generous impulse which seeks instead to entrust the care of the new foundation to the nation; establishing its headquarters in the District of Columbia; making annual reports to a federal department; accepting freely in advance the disciplinary oversight of Congress and the ultimate control of that body for every fund which may be intrusted to its administration. The discussions and developments of the past year and further observation of other endowments at home and abroad confirm the opinion with which we began this discussion ten months ago, that in conception and purpose the Rockefeller Foundation compares favorably with the wisest and most generous of all previous donations. The general conception and purpose of the foundation remain unaffected by the amendments proposed; but the charter, as a legislative enactment, expressing the founder's intentions on the one hand and the national sanction on the other, is very greatly improved by them. In one sense they add nothing to the concluding section of the original bill, that the charter shall be subject to alteration, amendment, or repeal at the pleasure of Congress. Obviously Congress cannot by one legislative act give itself power to pass a later act, which is what some of these amendments would seem to attempt. This, however, is a very narrow, technical, and essentially false interpretation of the amendments. The charter becomes not only an act of incorporation, but a contract with the trustees, a chart for their guidance, a general formulation of policy, and a precedent for other foundations. In its present form it expressly invites public interest and co-operation. It imposes moral obligations upon Congress as well as upon the trustees. The amendments diminish the probability that there will ever be occasion for hostile criticism of the foundation. They insure that it can never depart radically from its humanitarian purpose, unless the people fail to use the powers which they have reserved to their legislature against the time when trustees prove recreant to their trust.

Insignificant as most of the amendments seem in a strict construction of

their terms, they make of the foundation a more worthy and more enduring monument, for they imply a greater, or at least a more clearly expressed, faith in the ability of future generations to solve their own problems, and a desire to make an outright contribution to human welfare from present resources.

Paris, Christmas Day, 1910.

THE ROCKEFELLER FOUNDATION

ROBERT W. de FOREST

It is well that John D. Rockefeller has determined to meet the criticism with which his magnificent gift to the nation was received, by amending the proposed charter of his institution. A less broad-minded man, finding such unparalleled generosity met in a spirit of criticism which, however well intended, must have seemed to him and his advisers somewhat captious, might easily have concluded to put his hundred million dollars back in his own pocket instead of giving it to his countrymen. Mr. Rockefeller has shown himself to be above any such impulses and has considered the original criticisms of THE SURVEY in the spirit in which they were meant by its editor. In common with many others I have not shared in these criticisms; not because I did not think some future limitations upon the powers of the foundation possibly desirable, or because I did not think it expedient that it should spend its income substantially as it accrued, or because I did not think that principal as well as income might at some future time be wisely expended; but because these and any other changes in the charter that public opinion might hereafter make expedient could have been effected easily by the power of amendment expressly given by the original charter, and because insistence on making them now might have led to the entire withdrawal of the gift. The greater includes the lesser. The amendments which Mr. Rockefeller has now made, and any others that plainly seemed advisable, could have been made at any time in the original charter by the use of this reserve power. To make them now is simply stating what the trustees chosen by Mr. Rockefeller presumably would have done without any legislative command, and what they could have been made to do under the original charter at any time when public opinion was sufficiently united to force them to do so by the process of amendment.

None of the new provisions of this amended charter militate in any respect against the usefulness of Mr. Rockefeller's great gift. None of them stand in the way of its wise administration, for it is inconceivable that a majority of five university presidents and four high officials of the federal government should ever veto the election of any qualified trustee.

Mr. Rockefeller's action in this matter only illustrates again the sincerity of purpose, breadth of conception, and well poised judgment which have to such an extraordinary degree been manifest in his public benefactions.

TWO BOOKS

PAUL U. KELLOGG

Of the series of six books in which the findings of the Pittsburgh Survey are published, the two which come from the presses this month are in a special sense companion volumes. In The Steel Workers[1] Mr. Fitch deals with the work relationships of the mill men; the family end of their wages problem is the subject of Miss Byington's Homestead: The Households of a Mill Town.[2]

Bound by a hundred ties to the dramatic story of the Pittsburgh people, these inquiries are, nevertheless, of more than local significance. Steel is a basic industry for America as a whole no less than for western Pennsylvania. It has been a beneficiary of the most fiercely contested governmental policies since Civil War times. Its products enter into every tool and structure and means of traffic in civilization. By the side of half

[1]The Steel Workers. By John A. Fitch. Russell Sage Foundation Publication. Charities Publication Committee. New York, 1911. Pps. 350. Price $1.50; by mail of THE SURVEY, $1.71.

[2]Homestead: The Households of a Milltown. By Margaret F. Byington. Russell Sage Foundation Publication. Charities Publication Committee. New York, 1911. Pps., 292; by mail of THE SURVEY, $1.70.

a hundred mill sites along the Ohio and its tributaries, at our newest lake ports, and above the old mineral beds of the Superior Basin; in the sun-baked Southwest, in the valleys of the New South, and, by anticipation, in the ore regions of Alaska, what men may earn by digging, reducing, rolling, and fabricating this master metal, what leisure and resource they may gain in the process of it all, set the standards of life for hundreds of communities. A constructive statesmanship demands that Americans look well to what those standards tend to become for so numerous and vital an element in the population.

Moreover, the largest employer of steel workers in Pittsburgh is the largest employer of steel workers in the country as a whole; and the largest employer of labor in America today. That employer is in the saddle. So far as the mills and the shifts that man them go, the steel operators possess what many another manager and industrial president has hankered after and has been denied—untrammeled control. What has this exceptional employer done with this exceptional control over the human forces of production?

Here Mr. Fitch's findings state the problems of an industrial democracy in ways which cannot be lightly thrust aside. He entered upon his commission without any promptings, other than the general instincts toward an independent, resourceful citizenship inbred by the spirit of the northwestern prairies, and the quickening sense of economic justice which stirs the University of Wisconsin. To Prof. John R. Commons of that university, both for his initial field work and for his consecutive suggestions and advice, author and editor are indebted. For information and insight, acknowledgment is made to steel workers of the greater city and the mill towns, Braddock, Duquesne, Homestead, McKeesport, to engineers, foremen, superintendents and higher corporation officials, many of whom are facing in their work problems which are beyond the power of isolated men to solve. As the author points out, the steel industry could be interpreted from other points of view,—from that of its tremendous administrative burdens, of its fierce commercial competition in the past, of its wonderful technical progress. For these there are many spokesmen. Mr. Fitch makes articulate what the steel industry means to the men who are employed in it—for whom it makes up the matter of life, and who have no voice.

Miss Byington has summed up in a single phrase the negative aspects of the situation, so far as the home life of the men is concerned: "to turn daily from twelve hours in the din of the huge mills to home, supper, a smoke and bed." What steel production holds out to the families of these men is set forth within the covers of her book.

The family as a social unit takes us back into shadows beyond where history begins; the town carries with it a thousand written memories of walled boroughs, county markets and communes, where self-government had its beginnings. But the mill with its acres of tracks and sheds, its continuous operation, its intricate plan of discipline, of interlocking processes, of insistent demands upon human nature, is a newer institution. Factory production is less than two centuries old. The power transmission through which the modern plant with its thousands of workmen has expanded and developed, is scarcely as many generations old. Electrically charged wires have become the binding nervous cords of industrial mechanism well within the memory of living men.

Miss Byington's study is essentially a portrayal of these two older social institutions, the family and the town, as they are brought into contact with this new insurgent third. Have their development and equipment kept pace with mechanical invention? Have they held their own against the mill? Is the balance of life and work preserved? Or have we, in the industrial town of twentieth century America, not a "deserted village" such as Goldsmith lamented in eighteenth century England, but a more serious, antithetical problem in an overcrowded, overwrought aggregate of households. The query is not, shall "every rood of

ground maintain its man," but, shall the day's work afford an adequate basis for American livelihood?

Such a description, however modest in scope and put forth in the homely imagery of domestic life, deals thus with the forces which are wrenching at the very structure of society. There are other, perhaps more obvious, circumstances which give this book a distinctive place in the general scheme of these volumes. The colleagues in the field work of the Pittsburgh Survey took up special factors affecting the welfare of the wage-earning population—such as sanitation, housing and public education; Miss Byington's commission was to analyze these factors as they enter jointly into the life of one of the small industrial communities which are characteristic of the Pittsburgh district, and especially to analyze them as they bear upon the well-being of family groups. In carrying out this commission, she made an intimate case study of ninety households, employing methods of budget taking which have been developed for standard of living inquiries. She brought to her work, as basis for comparisons, an acquaintance with tenement conditions in New York and Boston. The resulting data have some rather obvious statistical shortcomings, which she makes clear; but as a transcript of everyday economic existence, they served at once to re-enforce and to check up the impressions which grew out of her personal contact with the people who earned the money, and ate the food, and lived in the houses, and worshipped in the churches of this town. If the book inevitably brings out sharply the odds of life with which many industrial communities have to reckon, the hope is expressed that the loyalty of Homestead residents will not take offense that theirs should have been the town thus singled out for study. "The rank and file of the people are with you," said an old mill man. To housekeepers and steel workers, to professional and business people, who gave freely of their time and information, thanks are not offered, for the book is partly theirs. Theirs, also, are the two irrepressible, grim interrogations which underlie both the statistical tables and the bits of neighborly gossip with which the author has enlivened her narrative. In their bearings upon contemporary economic and social conditions, these are questions for a nation as well as for this community.

The first has to do with the town:—how shall local self-government keep abreast of a nationalized industry?

The second has to do with the family:—here is a town dependent upon one of the great industries of America which has profited by brilliant invention, by organizing genius, by a national policy of tariff protection. It was studied at the close of the longest period of prosperity which has been known by our generation. What has that prosperity brought to the rank and file of the people whose waking hours are put into the industry?

Underlying the initial reasons for a protrayal of labor conditions in steel making is another reason which developed in the course of these inquiries, and which, like the Mariner's tale, leaves no choice open as to the telling. The issues which Mr. Fitch and Miss Byington take up are of a sort which are not publicly discussed in the mill towns of the Pittsburgh district. Old employes do not dare petition their employers to consider them. Men have been discharged for calling meetings to discuss them. It would mean instant dismissal for large numbers of men should they act together to affect these things in the way that farmers would take up freight rates or the price of apples at a grange hall, and dismissal would mean the entire dislocation of life. An old resident is quoted by Miss Byington as saying, "If you want to talk in Homestead, you must talk to yourself."

It is fully time to bring these issues out into the open, where a man will not risk his livelihood by discussing it. That is the manner of America.

SOCIALIZING COMMERCIAL ETHICS

GRAHAM TAYLOR

Very surely, though all too slowly, American business men are squaring themselves and their methods to the new

demands of the ethics of the group. In unexpected quarters and by their own associates, they are faced with the imperative mandate of a changed situation. The open resentment or silent cynicism which such facts would have met a few years ago have given way to a seriousness and responsiveness which surely indicate a change of front.

There have been three remarkable instances of this changing attitude in Chicago recently. Before the Commercial Club, the most influential and wealthy group of men in commercial, banking and manufacturing interests of the city, Alfred L. Baker, one of their most highly appreciated members, faced this issue perhaps more fully and fearlessly than had been done before in their presence. Addressing himself to the problem of harmonizing great corporations with democratic institutions, he urged the necessity of establishing ethical standards applicable to the relations between them. He demanded right of way for "collective rights," which he defined to be "the highest good of the community as a whole." He insisted that business men cannot consider lightly the derelictions of politicians, even when personal interests are not adversely affected; nevertheless moral and political progress is blocked in Chicago and Illinois by business men's toleration of dishonest politicians. He urged them to get out of such "corporation politics," and enter into such public service as the protection of the safety and health of working people, the abolition of child labor, educational progress, park and playground extension, safeguarding of immigrants, fostering continuation or vocational schools and city planning, in which latter cause the Commercial Club has already taken the most advanced action of any public body.

The Chicago Association of Commerce, the largest and one of the broadest and most progressive commercial organizations in the United States, honored itself in hearing four men who came from the firing line to address them. In simple, manful fashion Rudolph Spreckles told the story of his fight for the integrity of San Francisco against the commercialized politics of its exploiters:

> There never was a political crime committed that business was not at the back of it. Cut off that supply, and let the managers of these corporations take their stand and say, "No bribe money." If we find in operating our property that political bosses propose to hold us up, we are going to the people to get our redress and to get our rights. My experience with the people has taught me that they are fair and just and will give you what you are legitimately entitled to. It is right that you should know your own affairs and above all scrutinize the affairs of the corporations in which you hold stock, not only because you ought to know the source from which come your income and profits, but because it will pay you in money dividends, increased and saved.

Alderman Charles E. Merriam, who is professor of political science in the University of Chicago and is urged to become a candidate for mayor, spoke to the same effect out of his experience as chairman of the City Council's commission on municipal expenditures. "Good government," he said, "is not a liability; it is an asset. It is economy, not expense. You will one day find it a necessity rather than a luxury."

Boston contributed its message through Robert A. Woods, who was introduced by the president of the association in the words of the president of Harvard in conferring upon him the degree of master of arts. "A man who labors to raise his fellow men, trusted alike by those who toil and those who think; a knight of Christ's chivalry, without fear and without reproach."

The only solution of the problems of good government, Mr. Woods contended, is to be found in "a city plan and policy that will include all the people, in which racial, class and religious distinctions shall be lost in the movement for civic advance, and a new start shall be taken from the doorsteps of the people." He also affirmed that "our failure to apply our personal efforts to our human relationships results in the loss of the individual's moral sense."

Gruesome facts were cited by S. S. McClure of New York in evidence of that assertion. He inquired why our American civilization turns out so badly in having the largest proportion of deaths and injuries by accident, the great number of murders, and the unparalleled

combinations between vice and business. He accounted for our being "in so great arrears because we have not a trained body of men in official positions. We do not have them because, of all the occupations that a young man may enter in the United States, the occupation that affords him the least of honor, of income, of certainty, of permanence, employment in government is the worst."

> We cannot have a government by crooks and have a moral community. Moral welfare is absolutely dependent upon government. Any civilization can well be judged by how many chances a baby has to live its first few years and by how many chances that baby has, as it grows up, of becoming a good man or a good woman.

The Illinois Manufacturers' Association has heard less of such talk than any of our commercial bodies, until its last meeting. Gov. W. R. Stubbs of Kansas was expected to reinforce the manufacturers' fight against increasing railway rates, but he included in his vigorous indictment every "alliance between professional politicians, corporation lawyers, and financial and commercial interests, which is concerned in shaping state and federal legislation to serve its own special interests, as a menace to the welfare and life of our republic." And he added that "the relation of the federal government to the unlawful commercial institutions organized for spoils and plunder is one of the most humiliating and disgraceful chapters in American history."

A still more personal warning and appeal were incisively uttered by Gov. Woodrow Wilson of New Jersey. Appealing direct to the very instinct of self-preservation in the captains of industry, he emphasized the dangers to business and the public alike in the exploitation of either in these ringing sentences:

> It will not do to exploit the public. The trouble with business in this recent period of extraordinary expansion has been too much exploitation and too little regard for the permanent interests of society. Since workingmen are being dealt with in bodies, they must be dealt with on principles of reciprocity and partnership. We are working in the interest of business and not against it, when we oblige all to regard its action as a process of service, not exploitation.

What a whirlwind is rising against the exploiters who are sowing the wind he thus graphically describes:

> What are some men doing? They attend Peace Congresses and sit on the platform in order to sustain the speakers and give them their moral support and applause, and these very men, engaged in business, are exploiting the Orient in such fashion as will inevitably bring on war, because they are ignoring every national prejudice of the people they are dealing with, and they are sowing the seed of passion which some day will spring up in a great crop of absolutely irrepressible bloody strifes.

Our refuge and resource he finds in the kind of politics which "adjusts all affairs to the common interests, and concerns itself with the forces of business." Because of their failure to do this, he declares that "our political parties have come to a day of reckoning and are dissolving. If somebody could draw together the liberal elements of both parties in this country, he could build up a party which could not be beaten in a generation, for the very reason that we would all join in." By "liberals" he meant "the men whose votes you cannot predict."

Despite these very imminent perils to our public and private interests—and the more because of them—there are signs of a better day dawning. The boldness of such utterances as these, and the unchallenged or responsive way in which they are received by hitherto self-assertive or silent bodies of men, betoken the daybreak after the dark night which has so long settled over our moral sense in industry, commerce, and politics.

There are waymarks of progress by which we may measure the advance. One was registered by a little group of Chicago friends of William Kent, congressman-elect from California, in welcoming him back to his old home on his way to the national capital. The ease with which he was elected to Congress as a progressive was contrasted with the difficulty with which he was elected to the Chicago City Council twelve years ago on the issue of common honesty. The overwhelming majorities in Illinois for the initiative and referendum in the last election were recognized to be the legitimate consequence of those first Municipal Voters' League campaigns for integrity and independence in Chicago's city politics. The

gloom under the shadows of the black bribery in the election of a United States senator by the state Legislature, and the shame of the local failures to convict either the legislative bribers or the jury fixers, was lifted a little by the glimpse into the future which was afforded by this glance into the past.

THE PLAY-MAKERS

JOSEPH LEE
Boston

The peculiarity of the recent Playground Institute at Holyoke, Mass., as compared with any other conference that I have attended, was that it was designed, and as it seemed to me successfully carried out, purely for the benefit of those already in the business and not as a means of general propaganda.

Its purpose was to call not the sinners, but the righteous, to repentance, to furnish the actual playground workers with the definite information that they need. Nothing was said as to "why have playgrounds," but a great many very specific things were said as to what kind of playgrounds to have and how to get them. How often ought the sand in a sand-box to be disinfected and how; what is the best kind of a bank for a child to roll down; what are the ten worst kinds of surface for a playground (a good kind has not yet been achieved); are there few enough splinters in maple to make it better than cold iron to slide down—these are the sort of questions that were discussed. Some of the other things we got excited over were: Ought you to have a definite program for a children's corner (saying, for instance, that "hill dill" will be played Tuesdays and Thursdays at 2.30 sharp), and if you have such a program, how closely ought you to stick to it; ought girls to be shunted off into sewing and other quiet occupations because it is so easy to handle them in that way, or ought they to be encouraged to romp; and if you believe in the latter course, don't you have to begin at eight years old, or can a sinner return as late as nine; what are the comparative merits of "London bridge" and "three deep" (both as to the class of game and as to which is the better game of its class) for children under ten. We discussed whether in enlarging our repertoire of national games, it is best to try modifying the existing favorites or inventing new ones.

These are the kinds of questions that Dr. McCurdy, Miss Kennard, and Mr. Affleck of the Y. M. C. A. presented in a most concrete and enlightening manner. Miss LeGarde of Providence spoke of activities of children under ten.

The most exciting meeting was the one addressed by Howard Bradstreet, director of park playgrounds in New York, and George B. Markham, principal of evening recreation center, New York Public School 159, at which meeting it was shown what a system of public recreation really means and how in the concrete it can be applied in the school buildings. Edward W. Stitt, director of playgrounds and recreation centers, Board of Education, New York, at the closing session rubbed in the possibilities of school evening centers, as they are and as they may be, in a way to add to the spiritual burdens of the aspiring member of a school committee. Arthur A. Carey and Hugo Seikel of Waltham told about the principles and methods of the Boy Scouts of America.

I think the institute accomplished its purpose. There were sixty delegates from outside Holyoke, chiefly from New England, and I believe that all of us went back with a more concrete idea of where we were at, and which way we were going, and how.

Incidentally two things bearing on propaganda, as distinguished from the intensive work we came for, did clearly appear to the delegates, namely, that one man who is absolutely red hot on a subject can save a city.

Secondly, it was made evident at the reception Friday evening at Mrs. William G. Dwight's that a good playground campaign may help to fuse and intensify public opinion for all purposes. The mayor and the mayor-elect and others of the leading workers and officials were at the reception, and they seemed embued in an unusual degree with the spirit of youth and hope and local patriotism—partly I think as a result of what they have achieved for playgrounds.

WASH DAY IN A SLAVIC COURT

HOMESTEAD

THE HOUSEHOLDS OF A MILLTOWN

By MARGARET F. BYINGTON

Large 8vo, 292 Pages
40 Tables, 4 Appendices
Illustrated

PRICE POSTPAID $1.70

TWO NEW VOLUMES

Two of the volumes comprising the findings of the Pittsburgh Survey are published this month: "Homestead" by Margaret F. Byington, and "The Steel Workers" by John A. Fitch.

While parts of a set, each is complete in itself and these two are so closely related in many ways as to form companion volumes. Mr. Fitch writes of the men who work for wages in the steel mills; Miss Byington of the families who live on those wages in a steel town. Such a rounded study of the human factors in the master industry of America has not before been attempted.

Two others of the Pittsburgh Survey set were published in 1910: *Women and The Trades, by Elizabeth Bearsley Butler, and Work-Accidents and the Law by Crystal Eastman. The two remaining will be published this year.*

Each volume may be bought separately at the price given below; or the set may be had for $10., *express prepaid. Those buying the set will be sent four volumes on receipt of the order, and the other two as published.*

Homestead, by Margaret F. Byington. Price postpaid, $1.70.

The Steel Workers, by John A. Fitch. Price postpaid, $1.71.

Women and the Trades, by Elizabeth B. Butler. Price postpaid, $1.72.

Work-Accidents and the Law, by Crystal Eastman. Price postpaid, $1.71.

The Pittsburgh District, by John R. Commons, Robert A. Woods, Florence Kelley, Charles Mulford Robinson and others. In preparation.

Pittsburgh: The Gist of The Survey, by Paul U. Kellogg. In preparation.

THE MILL HOUSEHOLDS

Miss Byington's HOMESTEAD studies our two oldest social institutions, the family and the town, as they are brought into contact with a new and insurgent third, the factory. It raises sharply the questions: Have home and town held their own against the mill? Has local self-government kept abreast of a nationalized industry? What has prosperity brought to the rank and file of the steel workers? The answers are drawn from the author's experience of a year spent among the people who earned the money, and ate the food, and lived in the houses that make up Homestead; and in her household budgets and other statistical matter.

The book begins with the Great Strike—many things in Homestead began or ended with the Great Strike. There are chapters on Table and Dinner Pail, Rent, Children, Human Relationships, The Slavs; and one chapter which tells in simple, bread-and-butter terms the family story of Life at $1.65 a Day, —what was paid to common labor.

This volume, perhaps more than the others of the set, tells in human values—of men at their work and women in their homes and children in their growth—the story of life and labor which the Pittsburgh Survey is unfolding. It is not a story for student and social worker alone, but for every reader who would know what underlies the drive

THE COMMON WELFARE

CIVIC FEDERATION FOR UNIFORM LAWS

Underlying all the special subjects of discussion at the annual conference in New York of the National Civic Federation, a body whose members represent pre-eminently industry carried on on a national scale, was the theme of practically wiping out state lines by uniform state legislation on certain subjects, and by extending the scope of federal legislation on others.

At the first session on January 12, which was devoted to regulation of monopolies, there was substantial unison on the part of all the speakers with Samuel Untermyer's charge that in the twenty years of its existence the Sherman anti-trust law had proved effectual only against labor unions, and groups of small capitalists who had combined to protect themselves against the great trusts. Both Mr. Untermyer and Samuel Gompers condemned any law which aimed equally at organizations for raising the price of coal and pork, and those for protecting wages and working conditions of men.

In place of the Sherman law, Mr. Untermyer, in common with Prof. J. W. Jenks of Cornell, Edgar A. Bancroft, counsel for the International Harvester Company, and others, advocated federal license or incorporation of trusts and their regulation by a commission, with such powers as that established by the Canadian combines act of May, 1910. The possibility was even suggested of the regulation of maximum prices by the government—an interesting proposition which recalls the medieval principle of fair price, which was swept away by the *laissez faire* principles of the last century.

At the afternoon session what was almost in the nature of a spirited discussion took place. Two industrial engineers, Harrington Emerson and H. L. Gantt, pointed out the advantages of industrial efficiency. The former claimed that if all industrial waste were eliminated the full amount of saving would go to the workers. The latter outlined a bonus system, paid in part to worker and in part to overseer, by which the workers' output could be vastly increased and the increase redound entirely to his own advantage. In reply to the claims of these two speakers, Warren S. Stone of the Brotherhood of Locomotive Engineers held that the bonus system leads not to efficiency, but to bad work, and instanced an example in his own trade where work was so hastily and carelessly done in order to show quantity instead of quality and get the bonus, that it had to be done over seven times before it was permanent. He said, furthermore, that the bonus system resulted in pace-making, and was especially vicious because the bonus made the overseer a tyrant. John Mitchell offered substantially the same objections, claiming that the bonus system becomes in reality a method of over-working employes in order to increase profits.

At the Friday morning session Alton B. Parker discussed uniform legislation in its

PRISON VISITING IN 1787.

The *Journal of Prison Discipline*, published by the Pennsylvania Prison Society of Philadelphia, tells in the current issue of the beginning of prison visiting by members of the society. The warden was so doubtful of the effect that he had the prisoners assemble before a loaded cannon to hear the gospel preached by the Rev. William Rogers.

Morris in Spokane Spokesman-Review.

THE PIED PIPER UP TO DATE.

general aspects. He was followed by experts on law, insurance, and other subjects. Of special social interest was the address of John Williams, commissioner of labor of New York, on the need of such uniformity in labor laws of all states as the Child Labor Committee is endeavoring to accomplish in its field, if for no other reason than to relieve the states with decent labor laws of unfair competition from those whose laws are bad.

UNIFORMITY OF COMPENSATION

In the matter of compensation for industrial accidents the first step toward uniformity has already been taken in the proposals formulated at a meeting of commissioners of the different states in Chicago a short time ago.[1]

The uniform compensation bill proposed by the federation's committee on compensation was outlined by the chairman, P. Tecumseh Sherman, and the principle underlying compensation was vigorously supported by Theodore Roosevelt, who declared that our present liability laws and court decisions on accident cases represent a social philosophy which was applicable to the working conditions of over a hundred years ago. He repudiated the idea of the workman's freedom of contract, and said that owing to the inevitable risks of modern industry a workman's chances of death in working on a modern building are greater than those of a soldier in such a battle as Santiago or Manila. He urged that the full advantages of compensation be extended to aliens working in the United States.

The compensation act proposed by the federation provides four years' wages to a dead man's dependents, not to exceed $3,000, and in cases of injury fifty per cent of earnings for a period not to exceed ten years. Weekly payments are in no case to exceed ten dollars, nor are payments to be continued after the sufferer has reached the age of sixty.

In discussing arbitration and conciliation at the last session of the conference, C. J. Doyle, chairman of the Illinois Board of Arbitration, was in substantial agreement with E. W. Frost of the Wisconsin board, who preceded him. He spoke in the highest terms of the efficacy of the Erdman act, which has made possible the amicable adjustment of the demands of the employes on interstate railroads, to the extent of a $5,000,000 wage increase. He suggested the possibility that this federal act might be extended to carriers by water. He also strongly advised the pushing of state arbitration laws modelled on the Canadian act, which provides for compulsory suspension of hostilities during investigation of the causes of dispute. In case even so slight an element of compulsion were deemed un-American, he argued that the right be given state arbitration boards to investigate without invitation from either side, and, if possible,so soon as trouble threatens.

Seth Low, president of the federation, proposed an amendment to the New York law, some of whose provisions were later outlined by the chairman of the New York commission, A. C. Rogers. Mr. Low's amendment, which would add twenty-five citizens to the Board of Arbitrators, was designed with the object of bringing into play that disinterested public opinion which he held to be a most valuable element in arbitration. James Duncan, vice-president of the American Federation of Labor, opposed any ap-

[1] See THE SURVEY for December 10, 1910.

proach to such a scheme as the Canadian act, on the ground that a compulsory suspension of hostilities at the beginning of a strike takes away the workers greatest advantage in trying to enforce their demands—the power to strike without notice. He held that arbitration boards in general tend to encroach on the freedom of labor, and that the trade agreement is the best preventive of industrial warfare. Marcus M. Marks spoke in support of the Canadian act.

The following officers were elected for this year:

Seth Low, president; Samuel Gompers, Nahum J. Bachelder, Ellison A. Smyth, Benjamin Wheeler, vice-presidents; Isaac H. Seligman, treasurer; Ralph M. Easley, chairman executive council; William R. Willcox, chairman welfare department; John Hays Hammond, chairman committee on organization; John Mitchell, chairman trade agreement department; Alton B. Parker, chairman committee on uniform state legislation; August Belmont, chairman department compensation for industrial accidents; George W. Perkins, chairman wage-earners' insurance commission; Nicholas Murray Butler, chairman industrial economics department; Mrs. John Hays Hammond, chairman, woman's department; E. R. A. Seligman, chairman taxation department; D. L. Cease, secretary; B. J. Greenhut, V. E. Macy, Mrs. F. McN. Bacon, Mrs. Samuel Spencer, Leo Rowe, James Duncan, James Lynch, J. C. Richberg, nominating committee.

TRUSTEES CHOSEN FOR HARMLESS PHOSPHORUS

The Diamond Match Company has carried out its offer to assign to trustees its patent rights to the use of sesquisulphide of phosphorus for matches. The trustees selected are Prof. Edwin R. A. Seligman of Columbia University; Charles P. Neill, United States commissioner of labor; and Jackson Ralston, an attorney for the American Federation of Labor. They have absolute power to fix terms which they think are fair, under which all match manufacturers who have not already arranged for licenses giving to them the right to use this non-poisonous substitute for white phosphorus may acquire this privilege. Their names are a guarantee that all will receive fair treatment and no one will be so suspicious as to charge them with

Philadelphia Record.

IF THIS BE COMPETITION, MAKE THE MOST OF IT.

being under the domination of the match trust. This arrangement is in accordance with the plan followed in Great Britain at the time white phosphorus was prohibited there.

In a letter to the ways and means committee of the House of Representatives, the independent manufacturers declare that "this trust agreement, coupled with the amended contracts between the Diamond Company and ourselves, effectually meets all the objections and arguments that have been made against the favorable consideration of the bill now before you (the Esch bill) on the ground that its passage would tend to create a monopoly in the manufacture of matches." The match companies have also withdrawn their request that "a clause fixing the duty on matches imported into this country that will fairly protect the industry" be incorporated in the Esch bill.

Shortly after the Christmas holidays a bill was introduced in Congress by Representative Mann of Illinois, chairman of the committee on interstate and foreign commerce, prohibiting interstate commerce in matches manufactured from white phosphorus and providing that any person shall have the right to use upon fair terms any patents covering ingredients which may be used as a substitute for white phosphorus. This bill would

be ineffective, for small local factories could be established for intra-state trade which, owing to the fear that state legislation might be passed on the subject, would be cheaply constructed and so would tend to spread phosphorus necrosis. The provision as to the acquisition of the right to use patents is of doubtful legality and would in all likelihood be contested. So far as patents held by the Diamond Company are concerned it is unnecessary in view of the assignment made. The introduction of this second bill is calculated to confuse the issue and may prevent the passage of any legislation on the subject.

The investigation of phosphorus necrosis in American match factories, inaugurated by the American Association for Labor Legislation, and conducted by the United States Bureau of Labor, continues to scare the Diamond Match Trust. The first effect of the exposure was the abandonment by the Diamond Company of its factory in Portland, Me. This was one of the worst match factories in the country. The next effect was to substitute a policy of publicity for one of suppression as to the facts concerning phosphorus necrosis. The latest concession of the Diamond Company to public opinion is transfer of the legal title of its patent.

PREVENT CRIME TO REDUCE POVERTY

The administration of the so-called "inferior criminal courts" received special attention at the twenty-eighth annual meeting on the evening of January 10 of the New York Charity Organization Society. All those who learned from the graphic and witty narrative by Chief Magistrate William McAdoo how the former confusion and hurly-burly in these courts has been replaced by a patient, impartial, orderly and decent administering of justice, which enhances to many thousands the majesty of the law, realize the importance of the reform wrought in the past four months. No longer do "stout, surly policemen with protruding viscera," order the innocent inquirer to "g'wan out of here." The elbowing, jostling crowd of "complainants, defendants, clerks, court attendants, policemen, murderers, representatives of the press, shysters, witnesses, political bosses and curiosity seekers" all trying to get a whispered word in the private ear of the magistrate, is a scene of the past.

Robert W. deForest in his opening speech as president, after giving a brief summary of the history of the society for the past year, stated that the formation of a special committee to give attention to the administration of justice in our criminal courts "simply emphasizes the development of our sphere of work increasing along the lines of preventive or constructive charity," and shows a proper recognition of the fact that "injustice or imperfect methods of securing justice are among the chief causes of misery and want."

Bronson Winthrop, chairman of the committee and a member of the Page Commission which reorganized the Courts of Special Sessions and the magistrates' courts, outlined the importance of the work undertaken. "These courts," Mr. Winthrop declared, "are inferior only in their jurisdiction. Their immediate effect on our civilization is as important, in many ways more important, than our higher courts. Consider that to 200,000 persons who are brought into these courts in one year, to that vast multitude with their friends and witnesses, a city magistrate represents the embodiment of American justice." Not only are these courts educational, but also really charitable rather than judicial in their operation. "Many of the cases brought before these courts, I may almost say the majority of them, are in no sense criminal; they are merely unfortunate."

Mr. Winthrop explained also the benefit which has followed from greater uniformity of action on the part of the various magistrates. The main specific achievements of the new régime, in his opinion, have been the abolition of the "bridge" with its obvious opportunities for favoritism and the exclusion of the public; the establishment of the Domestic Relations Court and of the summons system, which reduces the number of

needless arrests, and the installation of more adequate records.

Julius M. Mayer, who was counsel to the Page Commission, briefly outlined some of the objects that body had in view in drafting the new law. Perhaps the most interesting point brought out by him was that in the Men's Night Court, "during the four months ending December 31, 1910, 6,865 cases have been disposed of and of this number almost one-half have been discharged, so that some 3,400, during the short period of four months, have not been detained over night but have had a speedy hearing." This, in his opinion, constitutes a full justification of the Men's Night Court.

REFORMS OF FOUR MONTHS

Chief Magistrate McAdoo concluded the program by telling the story of the accomplishment of the first four months under the new law. "To start the course in the new and better way, the law provided for a change in the physical surroundings of the court-room to make the proceedings more open to the public, and give to them the air of a well-conducted, orderly, judicial tribunal."

In pursuance of this policy separate rooms for the preferring of complaints have been set aside at each court and the "bridge" has been abolished. The 120 policemen who have rejoiced in immunity from "good, honest police duty" through political pull or by conveniently incurring lumbago have been replaced by civilian attendants. "So radical has been the improvement in these courts, that people accustomed to former methods and conditions could hardly make themselves believe that such evils were allowed to exist for so long a time."

Summonses, which formerly were passed out to lawyers, complainants and court-room loungers "as freely as hay is fed to animals in the zoo," are now issued in book form and numbered, which makes it necessary to account for each one.

The appointment of the special committee of the Charity Organization Society, which has among its members a former justice of the Court of Appeals who resigned to be a candidate for president of the United States,[1] marks an increasing appreciation of the importance of these tribunals which deal with the everyday tragedies of human lives, and not solely with large money interests as do many of the more pretentious higher courts. This fact was further evidenced by a good attendance of the members of the society, who listened to a serious discussion of a subject that formerly many would have thought hardly a proper theme to which to devote the entire program of an annual meeting of a charity organization society.

A CENT IN THE BANK IS WORTH TWO IN THE CANDY STORE.

AGREEMENT REACHED IN CHICAGO GARMENT STRIKE

On terms which, from the standpoint of the strikers, are an improvement over those recently rejected, the long struggle of the Chicago garment workers,[2] so far as the 10,000 who struck in the shops of Hart, Schaffner and Marx are concerned, came to an end on January 14. A week before an agreement had been reached with a smaller concern, Sturm, Mayer and Company, employing about 500. The interval was occupied with conferences among the strikers which enabled their representatives to deal definitely and

[1] For a full list of the members of the committee and a statement of its scope and plans see THE SURVEY for October 29, 1910.

[2] See THE SURVEY for November 19, December 10, December 17, December 24, 1910, January 7, 1911.

quickly with the employers on a basis already acceptable to the strikers.

The final agreement differs from the rejected agreement in three particulars. Most important is the elimination of the clause under which the firm could refuse to re-employ strikers who had been guilty of violence. This was the provision to which the strikers had taken most determined exception, fearing that it would be used as a pretext to refuse to take back those who had been prominent in leading the strike and recruiting the union. The other changes are that the board of arbitration is to consist of three instead of five members, and that,—specifically,—there shall be no discrimination against the members of the United Garment Workers of America, this in place of a general assurance of no discrimination against any member of an organization. All former employes of Hart, Schaffner and Marx, who were on strike, were to be taken back within ten days. The arbitration committee was to be chosen within three days, one member by the firm, one by the strikers, and the third by these two. It is to take up, consider, and adjust whatever grievances, if any, the employes of Hart, Schaffner and Marx shall have, and shall fix a method for the settlement of grievances if any, in the future. The finding of the arbitration committee, or a majority thereof, shall be binding upon both parties."

It is understood that in addition to the 10,000 to be re-employed, the firm is to select and employ 2,000 of the best workers among the 20,000 strikers who remain out.

The Sturm, Mayer and Company agreement was in the form of a letter from the firm to its striking employés, stating that all former employes would be taken back within ten days; that there would be no discrimination and no objection to employes belonging to any organization they may see fit. It goes further than the Hart, Schaffner and Marx agreement, in that it specifically provides for shop representation.

The Hart, Schaffner and Marx arbitration committee was to be selected by January 17. On that day each hall meeting of the striking employes of the firm was to choose three representatives. All of these were to meet with the strike executive committee and the joint conference board to select the labor member of the arbitration committee.

The successful negotiations toward an agreement were conducted after the strikers had all voted on the specific terms. In this respect the procedure differs from that used in the case of the rejected agreement, which was first formulated by the joint conference board, approved by them and the Chicago Federation of Labor and accepted by Hart, Schaffner and Marx, and then repudiated by vote of the strikers themselves. The final agreement was first approved early last week by a vote of the strikers, ninety-seven per cent of which was favorable. At the same time a resolution was passed authorizing and instructing the joint conference board to offer the terms of agreement decided upon to the strike-bound concerns, and giving the board the power—when the agreement should be signed by any firm—to call the strike settled so far as that firm was concerned and order its employes back to work. The strikers' executive committee and joint conference board chose John Fitzpatrick, president of the Chicago Federation of Labor, Thomas A. Rickert president of the United Garment Workers of America, Mrs. Raymond Robins president of the Women's Trade Union League, and H. C. Harris, a cutter representing the strikers directly, as a committee to present the proposed agreement to the various firms. The settlement with Hart, Schaffner and Marx has greatly encouraged the committee to hope for success with the other firms to which they have already presented or are about to present the agreement.

RICHARD H. LANE

FRANCIS H. McLEAN

Richard H. Lane, general secretary of the Charity Organization Society of Montreal, died in that city on December 5, after a short illness.

Mr. Lane was a native of Vermont. After his graduation from Vermont

College he spent some time in settlement work in London. Upon his return to this country he was a resident for several years of the New York University Settlement, and for a time was connected with the Charity Organization Society. His field of service also extended to the Pro-cathedral and in other directions.

But his longest and most valuable service was undoubtedly performed in Montreal, where he went in 1902 to occupy the position which he held to the day of his death. It was the writer's privilege to occupy the same position from the inception of the society in 1900 until Mr. Lane's appointment. So in a peculiar and intimate way he can estimate the value of Mr. Lane's eight years of hard work, realizing how roughly the ground had been ploughed then and how well cultivated it is now. The weight of influence, the good feeling of the many groups, the bulk of the service rendered —the chief agent responsible for all this has been Mr. Lane, for in one thing he was deficient—he did not know how to spare himself; he was not always just to himself. This undoubtedly hastened the end. But at least he had the deep satisfaction of knowing that in that strangely complicated city of the North he had accomplished amazing weldings; had made many differing personalities unite on common standards; had accomplished almost the impossible. For the society has not only been the most potent force in the social progress of Montreal, but has steadily developed a mutual understanding among most diverse and conflicting interests.

He bent everything to his purposes. The so-called society life of the city sought him, and in such cunning ways he combined service with social pleasure that constantly some profit was coming to the great movement he represented. Not that he himself did not find healthy, normal pleasure in society, but he bent it to his purposes, which were not to his own profit, but to that of the many. His unselfishness was put to the test, for local opportunities in other directions, offering larger pecuniary returns and demanding less strain, presented themselves, but were pushed aside, though physically he was not over strong. He believed the work he was doing was his work and he fought in the harness to the last.

Yet so essentially was he a man of the world, using that term in its best sense, that by his actions, not by word of mouth, was one able to judge just how deep and firm and good were the foundations of this jovial companion, with his piquant flavor of cynicism, his raillery, his toleration which shocked others with more confined views, his general "all aroundness."

"A strong and cheerful soul," might well be Richard Lane's epitaph.

LIMITING WOMEN'S WORKING HOURS

FLORENCE KELLEY
Secretary National Consumers' League

The enactment of laws limiting women's working hours is an immediately urgent task, with thirty-six legislatures in session in 1911, and the Southern Conference on Women's and Children's Labor pledged to introduce bills on this subject in nine southern states.

The state supreme courts having within the year sustained the Louisiana, Illinois and Michigan statutes, thus further confirming the principle of limited working hours, the path is clear for greater gains in 1911 than have ever before been made in one year.

Our efforts now rest upon the firm foundation of favorable judicial decisions of the Supreme Court of the United States, and of the states of Massachusetts, Nebraska, Oregon, Washington, Louisiana, Michigan and Illinois — the Illinois court having reversed in 1900 its adverse decision.

In the most difficult task of all, in saving such laws, when enacted, from annulment by the courts, the present simple method of co-operation has worked quite perfectly whereby, whenever a case was pending as to the constitutionality of a statute, the Consumers' League placed at the disposal of the court, in a brief prepared under the direction of Louis D. Brandeis, the common knowledge of the subject in relation to the public health,

and all the organizations interested united in making public opinion, each in its own way.

No statute has been annulled since this method has been applied. In two years since January, 1908, statutes have been sustained by the courts of the United States, Louisiana, Illinois, Michigan and Virginia. In a case now pending in Nebraska the indications are that the law will be sustained. The points at issue are the employment of women at night and an alleged insufficiency in the title.

In so vast and difficult a field of action as that of getting forty-one statutes in as many states to restrict the working hours of women, the first preliminary to co-operation is a common goal; and the second is a careful distribution of parts. As our immediate goal the following is suggested:

A working week of six days; not more than sixty hours. preferably fifty-six, fifty-four or forty-eight.

Abolition of night work.

A closing hour set at 6 P. M. in the textile industries and not later than 10 P. M. in others, following the precedent of Massachusetts.

A working day of ten hours, preferably not more than nine or eight.

A short working day on Saturday, if provided, should not depend upon longer hours on other working days.

Working hours to be posted where the persons named in the notice actually do work, not in remote corners; posted notice to show hours of beginning and hours of stopping for noon hour; hours of beginning and stopping in the afternoon; presence on premises to constitute *prima facie* evidence of employment.

The words "permitted or suffered to work" are indispensable in addition to "required" in the prohibiting sections.

No industries should be exempted in the text of the bill.

The title should state that the measure is to promote the public health (or the health of the employes designated) and must contain every subject mentioned in the text. (The statute of Nebraska is attacked because its title is defective.)

A bill containing these provisions is in preparation by the National Consumers' League, modeled on the general scheme of the standard child labor law, *i. e.*, containing all the best provisions now in force in any state. It will be published this month.

After these essentials of proposed legislation are accepted, each organization interested should immediately urge upon all its local organizations and isolated correspondents in states in which legislatures will be sitting (except Michigan which has its newly sustained statute) to get at once into touch with all available local forces and work together for an improved law during 1911.

The following proposed distribution of parts is of course purely tentative:

Wherever the trade unions,—particularly the Women's Trade Union League,—are strong, they will naturally introduce a bill for the eight-hour day and all organizations interested will rally to its support.

Where bills are already pending, as in New York, where the Workingmen's Assembly has long been pushing a bill for the ten-hour day and the fifty-four hour week for women and minors over sixteen years of age, like the laws now in force in Rhode Island and Michigan, we are all morally bound to support them. The New York Child Labor Committee and the New York Consumers' League are already doing so in that state.

Where trade unions are absent or weak, as in New Hampshire and South Carolina, the other organizations might well try for the adoption of the Oregon law. In such states we must all unite in educating public opinion in favor of the ten-hour day.

The National Consumers' League is arranging for the introduction of a Congressional bill for the District of Columbia because, although the number of persons concerned is small, the discussion of congressional bills is nation-wide and of very great educational value. Although Congress has never used its powers in this direction during the long period when it could legislate for the territories, it may follow up its recent child labor law with a statute regulating the working hours of women in the District of Columbia in line with the decision of United States Supreme Court in the Oregon case.

All the organizations interested will naturally help by enlisting all their local forces to educate their representatives and senators in favor of the proposed District of Columbia bill.

THE CORRECTION AND PREVENTION OF CRIME

EDWARD T. DEVINE

For the detection and punishment of crime we have invented and inherited an elaborate scheme of police, judiciary, and prisons. The police, it is true, serves also incidentally other purposes, such as the regulation of traffic and directing strangers to their destinations. Courts settle disputes as well as try criminals. Prisons, on the other hand, were invented for no other purpose than the punishment of crime. Now prisons, courts, and police are very expensive and it must be admitted very disagreeable institutions. The naive pleasure and moral benefit which citizens of junior republics are said to derive from the operation of their courts and jails are certainly not reflected in the larger world. A Broadway police parade is very inspiring, but not so a raid, an arrest, an arraignment in court, the leading away of a sentenced prisoner, the administration of torture to secure evidence—or almost any of the routine work of an ordinary policeman in his relation to crime.

Who, with any spark of sympathy and inagination, can stand in a criminal court, whether of higher jurisdiction where great lawyers are pitted against each other, and the issues are of life and death, or of lower jurisdiction where the worst that can befall the convicted prisoner is a term of six months in a workhouse, without turning fairly sick at heart? An angry spectator denounces the public sentence to a hospital, pronounced upon a woman who had been certified to have a shameful disease. But if we were not hardened by custom, we would feel much the same in regard to all the sentences pronounced daily upon men, women, and children in the hearing and sight of their fellow creatures. The Christ was crushed not by approaching death, but by social misery; the sorrow of Gethsemane and the agony of Calvary come again in the court room to any son of man in proportion to his clearness of vision and his greatness of soul.

One may understand crime and the criminal precisely in the degree in which he comprehends that not the individual standing there at whom stones are to be thrown, but literally the community itself, the individuals who surround the prisoner—judge, jury, advocate, and spectators—above all, the spectators—are responsible for this thing that we call crime. We measure our incapacity for self-control and for decent social control by the size and brutality of our police force. We sound the depth of our failure to deal with crime by the strength of our prisons and the subtle learning of our courts.

One to whom this gigantic social failure comes home vividly for the first time may easily lose his moorings. If police, courts, and prisons are expensive to maintain and ugly to contemplate at close range, why not join hands with any revolutionists who promise to rid us of them entirely, or to bring such a social and economic order as will make them unnecessary? This is a sound impulse. Just such a revolution is indispensable. But the revolution must go to the root of the matter; and the root of this matter is character. The best programs are those which seem likely to give us social institutions both permanent and beneficent; and those institutions are permanent which have their foundations in the past. Police, courts, and prisons have not been erected artificially out of hand to serve private or selfish ends. They have grown normally, gradually, and their roots are in social needs. We

are not to destroy, but to transform them. They are ugly—not because they were made so, but because our ideas have changed; because our standards have been raised. They have been useful in the past. They now represent a partial mal-adjustment. They must be adapted to our present and future needs, and any features which cannot thus be transformed must be eliminated—gradually, normally, but thoroughly.

The new penal system has been taking shape for two generations or more and is now practically complete—not with any ultimate unchangeable completeness, but complete in the sense that one may boldly accept it, and resolutely challenge all those demonstrably obsolete and destructive features which make it unfit to serve its purpose. Some of those features are mere ideas, theories, assumptions, traditions. Others are concrete obstacles embodied in brick and mortar, or in legislative enactments and court decisions. On the whole the latter are more vulnerable than the former. Americans have never stood long helpless before a physical obstacle. Of mountains, rivers, deserts we have made easy conquest. Manufacturers scrap their machinery, and business men replace comparatively new buildings with newer and better ones, without the least hesitation. But our traditions and theories are the most tenacious and obstinate in the world. When, therefore, we speak of concrete obstacles to reform on the one hand, and mere ideas and assumptions on the other, we put our "mere" in the wrong place. We could get rid of dirty jails and infected prisons and obsolete penal codes quickly enough, if it were not for pernicious traditions and false assumptions. We would be fortunate indeed if we had to do merely with the concrete results of our ancestors' errors. Unfortunately we have some of their errors and some of our own still to expose and eradicate. Not that we are exposing them for the first time. Our reformers are by no means lacking in originality, but nevertheless they are called upon to repeat for the thousandth time demonstrations long since complete; to expose again fallacies long since exploded; to lay anew foundations which were as sound a generation ago as logic and science and practical statesmanship could make them. Still the new penology grows stronger and more convincing as demonstration is added to demonstration, proof piled upon proof; and the bad ideas, the false assumptions, the vicious practices of our conventional penal system are surely crumbling.

The very center and citadel of the old order which is passing away is the assumption underlying the system of fixed penalties for crimes. It is assumed that for every specific offense there is an appropriate and invariable penalty, which can be determined in advance by the legislature or discovered through some mysterious illumination at the moment of sentence by the judge. The sentence is to fit the crime. Nothing is easier than to demonstrate *a priori* the absurdity of this assumption, unless it is to accumulate, *a posteriori,* instances of its absolute failure in practice. Yet the idea persists. Obviously there is no such inevitable and natural relation between specific offenses and the prescribed punishment. Obviously, if there were, there must be gross injustice in the complete lack of uniformity with which the punishments are meted out in different states, at different periods in the same state, by different judges, and even in the same court by the same judge on different days. It would be tedious to repeat the arguments against the system of definite fixed sentences, or to reproduce the comparative tables of sentences which expose its absurdity and destroy every vestige of respect which one might have retained for so venerable and universal an institution. The assumption that there is a just and natural penalty for every crime is false. It must be abandoned.

And yet, in times past this assumption had its justification. There are regions where the recognition of the principle today would be progress. As against arbitrary punishments, having not even a theoretical relation to the offense, the system of definite punishments is certainly to be preferred. As a protection against tyranny it is well to have a penal

code, to which the people or their freely chosen representatives must give their assent, a code roughly at least corresponding to popular ideas as to the relative gravity of different offenses; a code which fixes maximum penalties and determines definitely which particular acts or omissions shall be considered crimes, leaving nothing to the despotic will of the ruler. It is conceivable that conditions may again arise among us in which such safeguards are necessary. Individual civil rights, including the right to trial by jury and the right to be punished within measure by a scale determined and known in advance, have been secured at a great price and may not be lightly thrown aside. Herein lies the strength of the system which we now find on its merits so unsatisfactory and so essentially unjust. The protection of individual rights now rests upon firmer ground.

Our dangers lie in a different direction. It is not the autocrat, but the outgrown social institution, against which society requires protection. Not the legislature or the executive, but the constitution and the prevailing judicial and administrative procedure, are in the way of progress; or rather, carrying the analysis one step farther, our difficulties are not so much with the constitution and procedure, as with our own reluctance to amend and modernize them. Knowledge and conviction have gone far ahead of existing mechanism and habit. The clash is none the less real because it is not between two distinct classes, between a ruling class and a revolting class, for example; but rather between our own selves of tradition and habit on the one hand, and our selves of the present environment and new standards. These conflicts with our own inherited traditions and habits are perhaps the most exasperating and tragic of all. Leaders are scarce in such conflicts. There are generals enough for any war against an external foe. Political leaders arise in abundance when the time comes to smash the trusts, or curb the railways. But in the more critical and the more vital tasks of transforming our institutions and methods to make them fit our present needs we require leadership of a somewhat different kind. There are of course conspicuous examples of leaders who have capacity in both directions; and these are the natural heroes of social progress.

Next in importance after the false assumption of the possibility of adjusting penalties to crimes, and prior to it in time, are the traditions of vengeance and expiation. It may well be that our new scheme of penology, as Professor Adler has suggested, will still give some place to all the various sanctions which historically have entered into the social conception of the relation of society to crime. Perhaps we shall always think to some extent of punishment as expiation and as the execution of vengeance. The trouble is that as yet we give these elements an altogether undue place in our thoughts.

The underlying idea of the new penology is social protection. The means to that end are three: prevention, reformation of the corrigible, and isolation of the incorrigible. All of the new features of the social treatment of crime grow naturally from this central conception of social protection and all would seem to be illustrations of one or another of the three means by which we seek to give effect to it. Reformatory, indeterminate sentence, probation, probationary fine, juvenile court, employment of prisoners at educational tasks, separation of corrigible from incorrigible, parole, aid to discharged prisoners, modern prison architecture, and sanitation, the definite organization of preventive educational agencies, the socializing of our police, and the very reform of government in order to bring it into closer accord with our ideals of justice—these things, together with others like them, make up our new penology, and the unifying conception underlying it all is social protection. We think less of the atrocity of particular crimes now-a-days and more of the social order in which the temptation and the opportunity to commit crime are at a minimum. We think less of the personal depravity of the individual criminal and more as to what, if anything, we can find in him out of which to make a law-abiding and useful citizen.

The new penology is not sentimental. The slightest acquaintance with the writings of its foremost apostle—Brockway of Elmira—will sufficiently indicate the contrary. At least in its present transitional stage, the average term of restraint which it imposes is considerably longer than in the penal system which it displaces. It sentences, however, to a hospital by preference rather than to a dungeon. It sentences to cleanliness, good food, and wholesome discipline, and not to infection and degradation. Its sentences are not relished by professional criminals and their lawyers, and they are imposed reluctantly by courts in which precedent and tradition create the stifling atmosphere of despair. But its sentences are endorsed by the regenerated and cured ex-convict, and they come with enthusiasm and confidence from jurists who have in their nostrils the fresh and invigorating atmosphere of humanity and science.

Fixed sentences, imposed under the impulse of vengeance on a conviction resulting from a prosecution in which vengeance is the controlling motive, have been the chief obstacle to overcome; but insanitary and unsupervised jails and prisons of inappropriate construction are a close second. In the long controversy between the Pennsylvania system and the Auburn system—solitary confinement *vs.* congregate labor under the rule of silence—this generation takes only a historical and academic interest. If half the indignation inspired by Charles Dickens's story of a German prisoner dying of solitary confinement in the Eastern Penitentiary had been expended on more fundamental questions, we would have made greater progress. Warden Cassidy might well chuckle over the fact that long after the novelist was gathered to his fathers the dying German was yet alive and serving another term in prison. For us he points another moral. Being yet alive we naturally expect to find him serving another term. This, under the old penal system, is the natural fate of the ex-convict. What is he good for except to serve another term?

Pennsylvania and Auburn were both great improvements on earlier prisons, but neither was ever able to show its real capacity for reformation. Both have been overcrowded. Both have had to deal with inmates sentenced for definite periods, with only a narrow margin of discretion. Both have been handicapped by lack of educational facilities. Both have had to keep prisoners in idleness because of foolish prison labor legislation. Both have lain under the blight of party politics. Both have been essentially prisons, with no opportunity to make the natural differentiation into reformatory on the one hand, and colony for permanent segregation on the other. They have had in common so grievous a heritage of ignorance, prejudice and misunderstanding on the part of the public, that the controversy in which their respective partisans engaged seems ludicrously insignificant. Yet it was not without its educational value. Earnest men cannot write scores of papers and addresses in such a controversy without touching now and then the bed rock of common sense and sound judgment, and the new penology is built largely upon the conclusions of these controversialists.

Solitary confinement as a general rule of prison life is no longer defended. The rule of silence is subject to frequent suspensions. Architecture and construction are to be determined by the twofold function: training, reformation, education, for all who are capable of profiting by it; humane segregation on the analogy of a hospital for the incurably insane, for those who cannot be entrusted with liberty. This is at least the ideal of the new penology. It demands cleanliness, sunlight, opportunity for useful occupation, facilities for education, especially for industrial and agricultural training; and it involves the abolition of the local jail as a place for the treatment of convicted offenders.

Centralization of all penal and reformatory institutions in the hands of the state is a specific reform to which first attention may well be given. It is futile to rely upon local interest to keep the jail in order. The plan has been tried and fails. The state prosecutes and convicts. The state alone can carry out a comprehensive and effective scheme of

correction and segregation. The abolition of sheriff's fees and systematic visitation of jails will accomplish something, but thorough-going reform involves a transfer from local to state control, analogous to the transfer of responsibility which has had such excellent results in the case of the insane. As a result we should secure buildings better adapted to the modern idea of social protection through reformation or segregation. We should have more efficient and continuous and authoritative inspection. We should have more reforms and fewer scandals. We should at least have the possibility of knowledge as to what is happening. We should have a better opportunity for the introduction of that systematic and continuous acquaintance with the prisons by competent voluntary visitors for which Dr. Beverly Robinson has so often and so earnestly pleaded, analogous to the visitation of public charitable institutions to which we are already accustomed, and in which the Prison Societies have already made a beginning.

The new penology concerns itself less with what is done in penal and reformatory institutions and in courts—radical as are the changes which it would introduce there—than with agencies for prevention. Crime in the last analysis is not to be overcome after arrest, but before. Schools, churches, playgrounds, settlements, trade-unions, and charitable societies—agencies of social progress and of social reform, public and private—are the hand maidens of the new penology. We shall transform police, courts, and prisons when we have further transformed society, and the forces which help to raise and give stability and vitality to our standards of living and our standards of action are the forces to which in the end the bad features and the obsolete features of the existing penal system will yield. The environment is transformed by child-labor laws and the protection of children, by housing laws and improved sanitation, by the prevention of tuberculosis and other diseases, by health-giving recreational facilities, by security of employment, by insurance against the fatalities of industry and the financial burdens of death and disease, by suitable vocational training, by all that adds to the content of human life and gives us higher and keener motives to self-control, strenuous exertion, and thrift. The stronghold of crime is social misery. The cure for misery is better adjustment of social elements to one another and to the infinite possibilities of the environment. The new penology is of the warp and woof of all rational progress. Hence he was a foolish man who proclaimed that the societies of the class in which he was interested would attend to their business, and that others must attend to theirs. There is no private enclosure for any group of social agencies from which others who care for their fellow men, and even the state itself, can be warned off. The failure of one is the concern of all. The efficiency of all is the concern of each.

Four substantial volumes compiled at the suggestion of Samuel J. Barrows, the American member of the International Prison Commission, but, after his death, completed under the editorial supervision of his successor, Charles Richmond Henderson, published by the Russell Sage Foundation under the oversight of its director, John M. Glenn, and presented as a souvenir to the official delegates to the recent International Prison Congress, constitute an altogether remarkable monument in the development of American penology. Of the contributions to penological science made by the congress itself it will be more appropriate to speak when the published official proceedings are available. Perhaps, however, the writer may be permitted to take advantage of his temporary, but for the time being complete, detachment from editorial responsibility to congratulate his colleagues on the report of the congress in the first magazine number of THE SURVEY after its adjournment, and especially,—for all other acknowledgments would be equally appropriate from the most active of editors,—on the brilliant interpretation of the congress as a whole from the point of view of a layman, by Paul U. Kellogg, acting editor of THE SURVEY.

Of the souvenir volumes[1] it is to be said, first of all, that they embody the best thought of many men and women who have thought to some purpose; the ripe experience of administrators who have really administered and not merely held office; the definite programs of reformers who have been so fortunate as to exercise a genuine reformative influence in the old world as well as in the new; and at least some first fruits of scholars whose labors both in scientific research and in the application of the results of their studies to a difficult and complicated set of practical problems have already won recognition. The names of Captain Lynds, Brockway, McClaughry, and Mrs. Johnson among administrators; of Dorothea Dix, Wines, father and son, and Barrows, man and wife, among reformers; and the two principal authors of the volumes before us, Professor Henderson and Dr. Hart, among scholars, may be mentioned without incurring the danger of invidious distinctions. The brief biographies of Livingston, Lieber, and Dwight, and the liberal quotations from Dugdale and Warner, connect the volumes with some of the best American scholarship of earlier years; and special contributions appear from many active men of our own time. Even though it involves some repetition we must name them all: Frederick Howard Wines, Frank B. Sanborn, Z. R. Brockway, W. M. F. Round, Isabel C. Barrows, Robert W. McClaughry, Joseph P. Byers, Paul U. Kellogg, Amos W. Butler, Richard Sylvester, Warren F. Spaulding, Frederick G. Pettigrove, A. J. McKelway, Joseph F. Scott, James A. Leonard, Robert V. Ladow, William J. Batt, Julius B. Ransom, Robert B. Lamb, Mary W. Dewson, Frederic Almy, William H. Pear, Roswell C. McCrea, Bernard Flexner, Julian W. Mack, Harvey H. Baker, Franklin Chase Hoyt, Henry W. Thurston, Homer Folks. If liberal quotations are taken into account the list becomes even more representative of active social work and vigorous thought on social subjects in the United States: Jane Addams, Graham Taylor, Lawrence Veiller, Jacob A. Riis, Joseph Lee, William H. Allen, Henry M. Boies, O. F. Lewis, B. C. Marsh, Luther H. Gulick, Irving Fisher, Hugh F. Fox, John Dewey, F. W. Blackmar, E. P. Bicknell, Felix Adler, and even Theodore Roosevelt and President Taft, come into the volumes in this informal way—some of them, in fact, having written to the editor letters which are scarcely less important than the signed articles.

To Professor Henderson and his associates we extend our hearty congratulations on the success with which they have carried out the plan which they conceived. If there is any point on which a word of criticism may appear to be necessary this lies not in the execution, but in the plan itself. Nothing is, perhaps, more ungracious than to criticise a work which is good of its kind because it did not try to be something else. Nevertheless, we cannot help indulging the speculation as to what Professor Henderson could have done if, instead of pursuing the policy of compilation and quotation, he had assembled all the splendid material which he presents in these volumes, and the still larger amount which he has obviously had at his disposal, had thoroughly digested it all and had then presented to the delegates the concentrated result in a brief well-written volume half as large as any one of these four. It would have been more generally read, it would have reflected even greater credit on American scholarship, and it might easily have become a classic handbook of reference. The present work can scarcely serve such a purpose. It resembles too much the proceedings of the congress itself, or of the National Prison Congress. One feels like congratulating the editor when he could not find an

[1] Correction and Prevention. Four volumes prepared for the eighth International Prison Congress. Edited by Charles Richmond Henderson. Russell Sage Foundation Publications. New York, 1910. Charities Publication Committee. Price per volume $2.50 net; price per set $10 express prepaid. The four volumes are as follows:

Prison Reform. By various writers. Pp. 320. Price $2.50; by mail of THE SURVEY $2.66.

Penal and Reformatory Institutions. By sixteen writers. Pp. 350. Price $2.50; by mail of THE SURVEY $2.70.

Preventive Agencies and Methods. By Charles R. Henderson. Pp. 440. Price $2.50; by mail of THE SURVEY $2.68.

Preventive Treatment of Neglected Children. By Hastings H. Hart, assisted by others. Pp. 420. Price $2.50; by mail of THE SURVEY $2.70.

apropos quotation. He is then able to express his own conclusions and convictions with clearness and vigor. The objection to the policy of quotation is that it never quite fits the need, though to a superficial reader it may appear to do so. An amusing illustration of this arises in the volume on Preventive Agencies and Methods. We find on page 292, under a discussion of immigration, an extended quotation from a personal letter to the author, introduced by the explanation that the writer is himself an immigrant and one of the illustrious citizens of America. The introduction is perfectly just and the letter is interesting; but on page 384, in discussing the public school as a social center, we find *in extenso* the same letter, with the same tribute to the illustrious citizen, himself an immigrant. Even so genial a correspondent as Jacob Riis might well prefer not to be introduced as an immigrant twice to the same audience. This, of course, is an accident such as might happen to anyone, but it is mentioned as typical of the danger inherent in the method. Irrelevant matter, such as the details of the Barge Canal dispute on pages 89-91, is bound to creep in. It is difficult to exercise judicious discrimination as to the selection of authorities. For example, our good friend, Dr. S. Adolphus Knopf (page 104), may well be pardoned for his slip as to who furnishes the scholarships for children kept out of school in New York by the child labor law, as this is not one of the subjects on which he claims to be an authority; but for this very reason he should not have been quoted on a subject which is so fully covered by accessible publications of the child labor committees. Even the present writer, while appreciating the compliment of quotation, might fairly protest against appearing as sponsor for the statement in Bliss's Encyclopædia as to the number of charity organization societies "at present," when there was available, in a special department of the very foundation under whose auspices these volumes were published, information three years later and more than three times as valuable for the present purpose. The plan of quotation involves repetition, as in the repeated accounts of the founding of the American Institute of Criminal Law and Criminology, some omissions, and some lack of co-ordination.

These may well be thought to be trifling defects when compared to the great merit of the work. One must not be captious, or unmindful of the sudden increase of responsibility thrown upon the shoulders of the editor in the midst of the preparations for the congress, and of the magnificent way in which Professor Henderson met these doubled and tripled demands. No one would recognize more quickly, however, than the editor of these volumes, that it would be but a sorry compliment to praise these labors as they deserve, and remain silent on the question as to whether, if circumstances had permitted, another method of treatment might not have yielded better results.

This question arises also in a less degree in connection with the concluding volume, edited and largely written by H. H. Hart. Here, also, there is some repetition, as when the author tells us on page 23 and again on page 26 that both Minnesota and Iowa have employed women as state agents; and there is some lack of co-ordination, as when Dr. McCrea is allowed, on page 207, to speak far too respectfully of the suggestion that the juvenile court was established in New York seven years earlier than in Chicago, while Mr. Flexner's unequivocal statement to the contrary is reproduced on page 260 without comment.

These are petty things; but European scholars, to whom these volumes are offered, have long been accustomed to very exacting standards of accuracy, and have been inclined to look askance at our own too tolerant attitude. The Germans have an expressive word which means *to work through*. We are accustomed, as we say, to work up the material for a volume. If we could invent a word which meant to work through our material, instead of working it up, it might help us to establish a more exacting standard and enhance the value of our product.

THE PROFESSIONAL TRAINING OF PRISON OFFICIALS

R. VAMBERY
BUDAPESTE

In the administration of a modern prison the organization of the state is reflected in miniature. As the state looks after the welfare of its citizens, keeping the balance of its economic forces and—as with us in Europe—superintending the affairs of church and school, and by wise legislation promoting the peace and happiness of society—so also in a penitentiary the interests of the inmates should be studied and, as far as practicable, the ends of imprisonment fulfilled.

Now the fundamental basis of a well organized state is the right man in the right place. This same principle necessarily holds good for the administration of prisons, but thus far has unfortunately not yet been properly realized in any civilized country. We have in Europe as well as in the United States, penitentiaries built in the United States, penitentiaries built in the most practical manner and provided with the latest modern improvements. We endeavor to make the prison rules, which regulate the execution of punishment, as effective as possible; but the selection of the human material which should put life into the dry prison system has thus far been left to chance.

PROFESSOR VAMBERY.

Dr. Vambery is a professor in the University of Budapeste. He is a royal attorney and, although still a comparatively young man, has been a judge for ten years. He was one of the leading progressives in the debates on the indeterminate sentence at the International Prison Congress at Washington and the paper here presented is his address as one of the four public lectures at the Washington meeting.

Yet the history of prison management ought to have taught us something better. At the beginning of the last century there was much agitation in Europe in favor of one or another system of prison management. As once the Guelphs and Ghibellines took sides each for his party, people favored either the Pennsylvania or the Auburn system of prisons. Duke Larochefoucauld went so far as to assert that the pudding which was given to the convicts in the Eastern Penitentiary at Philadelphia had peculiarly wholesome moral properties, and was therefore quite as important an element in cases of solitary confinement as the "most rigid and unremitted solitude" on which the system was based. In a historical, objective consideration of the subject, many really essential details of existing prison systems appear as mere accessories. One might almost say that most of the systems are not systems at all, but the products of strong personalities endowed with much knowledge of human nature and a talent for organization. When, for instance, in the forties of the last century, Obermeyer was appointed governor of the old penitentiary in Munich, he found there from six to seven hundred

chained prisoners, who although there were one hundred and twenty warders lived in the greatest insubordination. By his energetic action, by the power of his personality, Obermeyer succeeded in a very short time in gaining the confidence of the prisoners. He took off their chains, dismissed half of the jailers, appointed convicts as warders in the workrooms, with the result that only about seven per cent of the convicts after their discharge relapsed again. His method was subsequently adopted by those not in favor of solitary confinement and enlarged into a system. Frederic Wines considers this attempt, and the organizing work of Colonel Montesinos in Spain which took place about the same time, as the beginnings of the reformatory treatment.[1]

Various other prison systems, such as the system of Captain Macondchie, and Sir Walter Crofton's progressive system, possess strikingly original features,— for instance, the mark system in the former and the intermediate prison system in the latter,—but the brilliant success which the history of penology attributes to these reformers is due in large measure to their personal influence and their peculiar aptitude for the work they undertook, rather than to their systems. In the case of Sir Walter Crofton this is clearly proved by the fact that shortly after his resignation from office the intermediate prisons Luck and Smithfield began to degenerate; and the English government made short work with the so-called "Irish" system. I do not deny that the initial idea of the reformatory system, *i. e.*, the harmonious development of the body, the intellect, and the moral character has its objective value. Yet I doubt whether the scientific principles laid down by Wines and Sanborn would ever have developed into a system without the active co-operation of a Brockway, a Scott and others.

Every intelligent prison system is marked by some distinctive feature in the treatment of offenders, and is therefore thought and action combined. Without the living action the thought is dead. As was pointed out by Dr. Krohne, the most prominent European representative of penological science, it is ridiculous to quarrel about prison systems and leave the carrying out of them to officers who do not understand their theories. It is labor lost to establish the strictest rules and to make the most elaborate provisions, and then place these in the hands of officials who scarcely understand the letter, much less the spirit, of the act. It is foolish waste to spend millions on millions in the erection of magnificent establishments, and then leave the management to men who are not equal to the demands of the system of administration.[2]

One may be tempted to argue that the jailers and wardens of olden times, upon whom we look down in the consciousness of our superior culture, came nearer to the standard of the then existing ideal of punishment than modern prison officers fulfil the demands of modern penal systems. In the seventeenth and eighteenth centuries the idea of punishment was merely expiatory, and the greater the pain inflicted, the more perfectly its object was accomplished.

It is revolting to us to read of the abuses perpetrated by the prison-keepers in England up to the end of the eighteenth century. Extortion was practiced on criminals and debtors; on entering upon their term of incarceration they had to pay a fee of entrance called "garnish" of ten shillings and sixpence. For every favor granted, such as changing the heavy chains for lighter ones, extra food and drink, exorbitant sums had to be paid, so that the yearly income of the warden in Marshalsea prison amounted to between three and four thousand pounds sterling.

In Germany, prison inspectors were at that time already paid officials, but with permission to supplement their income by other means. Thus, for instance, the (note) book of Von Arnim, then Prussian minister of justice (home secretary), contains an entry which may now sound humorous. It was to the effect that the inspector of prisons at Gleiwitz fulfilled

[1] In his public lecture at Washington on the History of Prison Reform in Holland, Dr. Simon van der Aa, found earlier issues in the Rasphouse of Amsterdam opened for use in 1596. See THE SURVEY for November 5, 1910, p. 202.—Ed.]

at the same time the office of slate-layer, market assistant, and night watchman. No wonder that all the prisoners escaped in one night! Generally speaking, the jailers were the scum of society, illiterate, and morally hardly higher in the social scale than the criminals whom they subjected to the roughest and most cruel treatment. Yet these men were the expression of the idea of punishment as then understood, the earthly realization of divine retribution. Physical suffering was, as Byron expresses it in the Prisoner of Chilon,

> .....the fate of those
> To whom the goodly earth and air
> Are bound and barred—forbidden fare.

This "infliction" of punishment the prerevolutionary jailers understood to perfection. And the more brutal, that is the less humane, they were, the better they fulfilled their office.

We cannot doubt that the conception of punishment came gradually with public enlightenment to be modified; but in the last hundred years under the influence of criminological investigations it has undergone a still more marked change. Of course I am speaking of the conception of punishment not of its object. The object of punishment was always the prevention, controlling and combating of crime, even in the days when blood vengeance represented punishment. It is only about ways and means that the struggle has been going on for thousands of years, while philosophic minds have claimed exclusive right of existence for their own penal theories derived from the practical effects of the punishment. In spite of the heated contention which is still going on, especially in Germany, between the "classics" and the "moderns" of criminal science, regarding protective punishment *versus* expiatory punishment, the practical application of punishment is not seriously affected by these contending views. The chief point in the transformation of penology lies in this, that psychological punishment took the place of that which reflected the crime committed.[1]

Fully realizing that criminologically also the offender should be dealt with as a separate individual, the tendency now is towards an individual psychological treatment. Formerly it was thought that crime originated in the human will, just as, according to the myth, Pallas Athene came forth out of the head of Jupiter. Nowadays all experts are agreed that crime is the issue of social and individual components, but criminal etiology has not yet found the right method for ascertaining in what measure these separate factors contribute to the production of crime.

A second reason for the changed aspect of punishment is the ever growing conviction that expiation (retribution) by means of punishment is a form of self-deception. Even if we possessed an objective standard by which guilt and punishment could be measured, we should decline to accept Shylock's interpretation as our ideal of justice. A well-informed judge of the London High Court of Justice, Sir John Bridge, once said: "I have nothing to do with punishing crime; that rests with a higher power. My business is to protect society.". Our human intellect is too clouded, our vision too limited to allow us to usurp the divine right of meting out vengeance. Such metaphysical and unattainable ideals as the restoration of the just balance between crime and the expiation of crime are beyond the control of the state.[2] "Vengeance is mine, saith the Lord, I will repay."[3] And this must remain His prerogative, even although euphemistically revenge is called punishment. In no country has this truth been so thoroughly, and at the same time so practically, grasped as in the United States. Boies, one of your most eminent penologists, speaks of it being "an absurd and arrogant assumption, an impertinent attempt by mortal men" to exercise vengeance, and your institutions convincingly show that you have discarded this scientifically unpractical principle.

And so the old idea of punishment is gradually dying out everywhere. The law of development is exemplified also in the conception of punishment. Modifica-

tions in the original idea of punishment are gaining ground. Common sense has taught us that the complex psychological and sociological elements which we call crime cannot be combated with any one weapon alone. In Europe this truth, although acknowledged, is making but slow progress as regards the practical administration of justice.

Major Griffith, in his Fifty Years of Public Service, tells a story about a gunboat which was sent out to the East provided wih a medicine chest, but without a doctor on board. The captain, who had no medical knowledge whatever, was entrusted with the dispensing of the medicines, as occasion should demand. He mixed various medicines together in a bottle, and whenever a man was ill he received a dose of this mixture. The captain argued that the medicine required in each specific case would be sure to be contained in the mixture. Sir Robert Anderson, in his interesting work, Crime and Criminals,[1] compares with this treatment the indiscriminate application of the same punishment to different kinds of criminals.

Unfortunately our knowledge of criminology is not yet sufficiently advanced to enable us to classify crimes in causal groups, and to build up our penal methods in accordance with these. But in all civilized countries it is agreed that youthful offenders need other treatment than incorrigible adults; that professional criminals and the partially responsible must be treated in a way different from that taken with the offender who is acting from accident or passion. The practical outcome of individualization as the highest principle for the judicious administration of punishment is the progressive classification of criminals into groups, in order that the social function of punishment, that is the restoration of the offender *to* society, or, where this is found to be impossible, his separation *from* society, may be successfully accomplished.

The jailer of past ages was as little capable of distinguishing these complicated and various phases of crime, as *one* prison system—even the best—is capable of doing justice to different aims of individual punishment. It is indubitably true that the successful carrying out of the changes which have taken place in the conception of punishment, as referred to above, depends in the first place on the men who are the executive organs of the state. The transformation of the system must go together with the transformation of the officials. New conditions require new people. No one would dream of making the driver of an old fashioned stage-coach over into the pilot of an aeroplane, or of entrusting a village barber with the management of a dispensary. It is almost a platitude or truism to say that the success or failure of the system of administration depends upon the management of the establishment and the capability of the superior and subordinate officers. Mr. Goos, the late Danish minister of justice, uttered these memorable words. "*Donnez-moi le meilleur réglement avec un mauvais directeur, vous aurez aucun résultat. Donnez-moi un bon directeur même avec un réglement médiocre, et je vous réponds que tout ira á merveille.*"[2] This remark has since been repeated in different keys and with many variations. To give another quotation: Frederic Hill, for many years inspector of prisons in England, declared: "Of such supreme importance do I regard the appointment of good officers, that I should expect better results in one of the worst built prisons, where no system of discipline was prescribed, but where there was an earnest and able governor, unfettered in his choice of subordinates, than in the best constructed buildings and under the most carefully devised plans of management, but where there was an incompetent head with ill qualified assistants." Du Cane likewise said that the importance of the choice of good officers cannot be over-estimated. The prison warden has such influence for good or for evil over the convicts, that one can hardly conceive of any more responsible position, or of one in which the officer is exposed to greater temptations.[3]

Now one may justly say that surely

[1] P. 66.

[2] *Actes du Congrés pénit. intern. de Stockholm* 1878, I. 120.

[3] Tallack, p. 278.

the prison officers of our time—the higher as well as the lower—cannot be compared with the jailers of Newgate prison or of the Conciergerie. No, certainly not. Rough treatment, cruelty, and systematic abuses are unknown factors in the penal establishments of civilized nations. The officers are respectable men of proved character who conscientiously fulfil their regulation duties. All this I grant. But does this exhaust *all* that modern administration of punishment demands of its officers? Of all the things we expect the penal system to accomplish, the hardest is the reform of the criminal who needs and is capable of reformation. To the criminologist who is not utopian in his demands, this reform can only mean the restoration of the criminal to society; that is, in the first place, in the removal of the social causes of his criminality. It sounds well when Dr. Horace Bushnell says that "the soul of improvement is the improvement of the soul," but unfortunately practical experience has taught us that although it is a mistake to say that human nature cannot be changed, we are not in a position to exercise direct influence on so indefinite a thing as the human soul. Therefore, although the prison is not a mind and soul factory, yet prison discipline can lead the delinquent into better ways by accustoming him to regular labor and orderly habits. They are golden words which Brockway wrote: "Give a motive, you may direct a habit. To form a habit is to create a character. Habit is the school of conscience."[1] But this habit is not formed automatically either. It requires the assistance of a kind-hearted, able man, who possesses not only a knowledge of human nature in general, but also a special knowledge of crime, of criminals and of penal science.

There are two qualifications which are indispensable to the modern prison officer: tact and skill; in other words: soundness of character and professional knowledge. One might think that these are both self-evident. Yet, curiously enough, opinions agree only on the former point. Frederic Howard Wines says that the fitness of officers in reformatories consists in "high moral character, earnestness, devotion, self-sacrifice, rare intelligence, insight into human nature, tact, tenacity of will, experience patience, and hope."[2] In all honesty, we envy you the possession of prison officers who unite all these qualities in themselves. With us, anyone possessing such exalted virtues can become a minister of state or an archbishop! We in Europe must of necessity be more modest in our demands. So, for instance, Du Cane stipulates only a high moral character, physical fitness, and intelligence. We also can boast of philosophers as eminent as Gabriel Tarde who consider that a thorough and energetic prison reform consists in *"Mettre en regard les uns des autres á la meme prisons les pires des brutes humaines et les meilleurs des hommes."*[3] But speaking generally, we can hardly hope at present, considering the pay and the social position enjoyed by the prison officer in Europe, that high minded men with the self-sacrificing joy of an apostle will hasten to devote their lives to the prison services. We may be glad enough to enlist men of average talent, honest and clear-headed, and it is universally acknowledged,[4] that even this is no light matter. I do not wish to imply that the professional training of prison officers makes up for want of character, but I certainly believe that professional knowledge, like education in general, increases self-respect, strengthens character, and makes the performance of one's duties easier.

Now although the right choice of officials is more or less a matter of chance —since we do not possess Professor Mantegazza's chimerical psychoscope,— the professional training of prison officers is entirely in our own hands. It is not a magic means for producing ideal men, but it is the first link in the chain which from a right understanding of crime and criminals leads to a right treatment of both.

The fact that the training of prison

Krohen: Manual of Penal Science, p. 518 and foll.

officers is the essential point in prison reform has been acknowledged as early as the end of the eighteenth century by the German penologist Wagnitz. In this interesting book he describes the evil practices of German penitentiaries as boldly as Howard did in England. He suggests that every province should have a well organized seminary, not merely for testing the moral worth and strength of character of prison inspectors and wardens, but as a place where they can be actually trained for their future work. In these seminaries, special theoretical and clear instruction should also be given in the manner of dealing with those intrusted to their care.[1] This appeal has been echoed in Germany ever since. Prison reformers and prison disciplinarians—I limit myself to mentioning a few of the most prominent—such as Wichern,[2] Jagemann,[3] Berner,[4] and Krohne,[5] have never tired of advising the establishment of schools for prison officers and courses of study for higher officials. And in modern times the cry for theoretical instruction coupled with practical tests has become more and more urgent.[6] In England, Sir Walter Crofton published a treatise,[7] on Training Prison Officers, and at the first international penitentiary congress held in London, one of the points discussed was "the importance and necessity of a special education of prison officers."[8] Unfortunately the discussion, in spite of Guillaume's striking proposals, led to no practical results. The same question was also brought forward at the congress held at Stockholm, and at the St. Petersburg congress in 1890 we meet with it again in the form of "Instruction in Penology." All writers on the subject, such as Lombroso, Jagemann, Foinitsky and Lacointa agree,[9] in saying that there is a prison science which comprehends the investigation, prevention and repression of crime and that the interests of prison discipline demand that this science be taught at the universities. It was only Henry Joly, however, who, in his report, made it clear how important the acquirements of such knowledge was for the administrative staff of penitentiaries.

Strangely enough the Petersburg Juridical Society, when giving its decision on this matter,[10] denied the necessity of the special education of superior prison officers. It was thought that they might learn the history and theory of penology at the university, while for the wardens practical experience would suffice.

I was much surprised not only to meet with this same narrow-minded view in Anglo-American penology, but to find it even surpassed there. Tallack recognizes the usefulness of a special knowledge of the principle and history of penal discipline and science, but he thinks it is sufficient to encourage prison officers by occasional lectures and addresses, to study these subjects privately, penological societies and special periodicals giving ample opportunities for doing so.

At the National Prison Association in Cincinnati in 1890, Wines emphasized the fact that nowadays one expects of the warden of a prison that he possess not only firmness, kindliness and tact, but also a large measure of special knowledge,[11] but he omitted to indicate how this knowledge could be obtained. Boies also points out[12] that "the warden of a large penitentiary must needs be a man of strong personality, large experience and training," and urges the introduction of the criminal laboratories recommended by the National Prison Association in 1900, but he preserves a deep silence on the question how the officers who have had no special training are to work in these laboratories. So, for example, Brainard Smith expresses himself most decidedly against a scientific training, when he says:[13] "There are no special schools to prepare prison employes, prior

to their employment, for their duties. We do not regard such schools as essential to the good administration of our prisons." The official view in England is much the same. I have been told on good authority that the need is not felt for a theoretical training in the various branches of criminology. It is thought that the duty of the prison staff is simply to carry out the instructions of the chief authorities, while the initiative for the reform in the treatment of prisoners is the prerogative of the commissioners. It is presumed that these latter, although they do not receive any special training, are, through their higher general education, fitted for their important posts.

To some extent this view may be the result of the spirit of matter-of-factness, which is a predominant feature in the character of the Anglo-Saxon race on all social questions. But on the other hand it is curious that the meaning of Bacon's words, *knowledge* is *power,* should not be understood in the contest with crime. When a small tradesman engages a teacher for his child, he expects to find in him every imaginable qualification; but when the state undertakes the far more complicated task of the education of adults, who moreover, as a rule, are socially deficient, it is pretended that the men entrusted with this task need no theoretical preparation.

There is not in England another branch of public administration in which at least a minimum amount of professional knowledge is not required from the official in his official capacity; but in the case of prison discipline even the most elementary knowledge of the work to be done is considered superfluous. As long as the idea of detention was all that prison discipline meant to the average unschooled mind, it probably sufficed that orders should be strictly obeyed.

But now, with reformatories in America and a Borstal system in England, this standpoint has become untenable. Practical experience in the penitentiary cannot take the place of previous training. Since the German Association of Prison Officers entrusts the theoretical training of candidates for the prison service to the prison wardens,[1] we naturally presume that these officers are thoroughly competent to perform this task. Stevens, the celebrated Belgian penologist, is quite right in saying that a good prison warden cannot be improvised, but must be educated for the fulfilment of his office. And the same holds good for all superior officers; but the education required in our days cannot be obtained except by special training.

One may object that in the carrying out of punishments the decisive factor is not always reformation, for which the personal influence of the prison officer is so essential. Of course not. But punishment should be individual treatment at all events, if we are going to attain any special aims by its infliction at all. This much is certain, that the officer who understands the social and personal causes which provoked the crime will treat the offender otherwise than the officer who sees in him merely a representative of original sin, a lawbreaker acting with the freedom of will, a bad and impious subject. So also the prison officer who has a critical knowledge of the history of punishment, of the organization of prisons in foreign states, of the scientific principles of prison labor, of discipline, of the moral education, of the intruction of prisoners, will perform his duties quite differently from the official automaton who mechanically and blindly obeys the rules. He who cannot rule must needs obey, says York in King Henry VI, and we now-a-days have the right to expect that prison officers be fit and able to rule the human material entrusted to their care by the state. Individualizing after all is nothing but the carrying out of fundamental principle: *divide et impera.*

But what about America, where in the reformatories the individualizing treatment has reached, as we were told, an unlooked for height? By a happy choice it has doubtless been possible to secure in most cases competent men, but I cannot hide the fact that Paul Herr, for intance, who has thoroughly studied the reformatory system of the United States, and who is full of praise for it,

[1] Blätter J. Gefk. XXXI, pp. 477 and foll.

has to acknowledge that the lack of scientific and regular education is a perceptible want.[1] Frances Kellor likewise demands a two years' course of training for the correctional institution officers.[2] I would here remark incidentally that she considerably oversteps the boundaries of this field of labor by including in her program literature, natural history, and æsthetics, in all of which subjects, according to her, a prison officer should be proficient. However that may be, the reformatory movement would certainly not suffer in its results if more care were bestowed on the special training of prison officers, and if in the prison administration of the United States generally more weight were set upon knowledge than upon political influence, which latter, I am told, still plays an undue part in appointments.[3] I am not in a position to judge how far in America this lack of education is remedied by self-tuition, but with us in Europe experience teaches that autodidaxy produces only incomplete and superficial knowledge. One reason for the partly active, partly passive resistance of influential circles against the present day demand for trained prison officers is, I believe, to be found in Europe in the preponderating influence of militarism. It is said that to fill the vacancies in prison staffs by late or non-commissioned army officers is in the interest of the prison system, but as a matter of fact the reverse is the case. Du Cane brings prominently forward that the military type, by its sense of order, discipline, and obedience, and by its fitness "to deal with large bodies of men," is particularly suited for the prison service, but on the other hand it must not be forgotten that the ultimate object of military training is to prepare men for united action, while penal training, as Tallack rightly remarks,[4] has for its object "to prepare the convicts advantageously to separate." Moreover, the general experience is that the superior military elements only very seldom apply for positions in penitentiaries. Where it concerns the reorganization of disorderly prison discipline, as was the case, for instance, in Austria towards the end of the nineteenth century, the appointment of military officers exclusively may be a good thing; but the ideal of prison administration it certainly is not.

With you, in a democracy where the distinction between military men and civilians is not so pronounced as with us in Europe, the martial bearing, the roughness and brusqueness which so often characterize the erstwhile military man in the prison service, and which sometimes lead to brutal treatment, will perhaps not be noticeable. But in Europe—apart from penologists who once themselves were army men—we are all pretty well agreed[5] that drill and military exercises should not occupy the first place in corrective punishment, that is, if we expect from punishment something more than mere retribution. What Anatole France said of the judge: *"La loi est morte. Le magistrat est vivant, c'est un grand avantage qu'il a sur elle,"*[6] also applies to prison rules and prison officers. The letter killeth, the spirit giveth life. Even the best of military officers can only act in the spirit of the system of administration after he has received the necessary instruction.

Thus far in dealing with the fundamental principle of professional training I have not distinguished between superior and inferior prison officers; although necessarily the actual relative position occupied by them varies considerably in the different leading states of Europe. Starting with the point of view that the lower officer, the prison guard, comes most in contact with the offender, we should—in so far as we are concerned about the matter at all—attach most importance to the training of these men. In France, in addition to the guard's school which is connected with every penitentiary, the *école penitentiaire supérieure* was instituted in 1892, to give the more talented prison guards further opportunity of improving themselves, and thus ensuring

their promotion to higher offices.[1] After one decade this school was closed, notwithstanding the protests of such experts as Grimanelli, Boudenoot and others, in order to reduce the state budget by 6,000 francs.[2]

There are training schools for prison guards in Italy, organized by Beltrani Scalia of Rome, and also similar establishments in Spain, Hungary, etc. But all these being under the management of higher prison officers who have had no scientific training, they are chiefly confined to the elucidation of the prison rules. Dr. Guillaume has told me that as early as 1874, at the request of the Swiss Association of Penology, he held courses for higher prison officers and superintendents which were attended with the greatest success. In the present condition of prison affairs, the special education of inferior prison officers is most decidedly desirable, because those in highest authority, already overburdened with their administrative and economic duties, have not the time to occupy themselves with the actual treatment of prisoners. But this division of labor does not solve the problem before us, because the knowledge which it is necessary for the higher officer to possess could not be expected from the average intelligent subordinate officer. In advocating the special training of the superior officers, I take it, of course, for granted that such officers are in a position to occupy themselves personally with the prisoners. One primary condition to make this possible is that each chief officer shall have under his care only a small group, a limited number of say twenty or thirty prisoners, who from the point of view of criminal-psychology are offenders of the same nature. Thus the notion will be destroyed at last that punishment is a uniform, worn alike by all prisoners regardless of personal characteristics, and that the secret of the right administration of punishment lies in taking it for granted that all offenders are only undisciplined persons.[3]

[1] *Lois, decrets etc. se rapportant aux services penit.* 1896. p. 210; *Code des prisons* C. XIV. p. 337.

[3] This notion was still held by the Parliament of Austria in 1900. *Blätter für Gefäor.* II. 192.

Now as regards the special training of the superior prison officers, there are only three states in which institutes for this purpose have been established, namely, Japan, Spain and Hungary. In 1898, after some fruitless efforts, Japan organized an academy for the study of prison discipline, where officers in actual prison service had to attend a six months' course and candidates for the service a course of twelve months of six lectures per day. The former (the officers in actual employ) were commanded to go through this course of study and received, besides their traveling expenses, an additional monthly allowance of thirty-five yen. The subjects of the lectures included prison discipline, criminal psychology, penal law, prison hygiene, pedagogics of juvenile criminals, anthropometry, statistics and the principles of public and civil legislation. Fifteen professors were appointed to give these lectures. With practical common sense, the Japanese realized that it availed little to build beautiful establishments without also improving the human material in charge of them. Ogawa, the inspector-general of prisons in Japan, spoke at the Brussels congress of the complete success of the institution.[4]

The Spanish School of Criminology, erected in 1903 by royal decree, received less recognition at home. Its object was the special education of administrative prison officers and also to supplement the university faculties. It is a two years' course of study, admission being obtained by an examination which entitles the successful candidate to a scholarship in the first year of 1,000 pesetas, in the second of 1,500 pesetas.

The course of study is intended for the chief officers of the *cuerpo da prisiones* and the officers of the general direction, but the "agregé 's" of other faculties are also admitted. At this university there are six professors enjoying fairly good salaries, who give lectures in Spanish and comparative criminal law and penal science, prison systems, preventative institutions and patronage. Upon the conclusion of their course of training the students who are not already in the

[4] *Actes du Congress* N. p. 536. F. Crusen: Bl. f. Gefk. XXXVI, pp. 341-86

service of the state can be returned as assistant officers. The academy, from the time of its opening in 1906, has been subject to many sharp attacks. It is especially the *Rivista de las prisiones* which has inveighed against the new institution.[1] It has found fault with the heavy costs, with the difficulty of finding posts for the graduated students, the awkward position in which the trained officers stood with regard to an untrained governor, etc., all of them objections which do not touch the root of the matter and probably arise out of personal grounds. However this may be, the Spanish academy certainly displays a broadness of view not in keeping with the means and the circumstances of the country. With all due modesty I think I am entitled to say that we in Hungary, with less outward show, attain our object just as well. For two years we have now had special courses of lectures for the training of prison officers. The course is divided into two periods of ten weeks each, which the chief officers of the various penal and corrective institutions throughout the land are successively invited to attend. The choice of the candidates lies with the ministry of justice, and the officers receive, beyond their travelling expenses, a suitable remuneration. The course of study, which occupies from five to six hours a day, includes lectures on the elements of jurisdiction, criminology, criminal psychology, theoretical and practical prison management, treatment of youthful offenders, and prison hygiene. The lectures are delivered in a manner calculated to raise the general standard of education of the hearers. Upon the completion of the course, the students undergo an examination, which counts as a qualification for preferment. Of course the officers must also qualify for their special positions (such as chaplain, instructor, clerk of the counting house, etc.). The cost of the institution comes to about $1,200 a year. The theoretical part of the training includes visits to other institutions, and to the state prison museum which was established last year and already contains several thousand objects. The museum, in addition to the library, is divided into three parts, containing specimens from the history of penology, models of penitentiaries, and ethnographical and anthropological collections. To the best of my knowledge the state prison museum of Hungary is the only institution in Europe in which anthropological data of criminals are officially collected.

I do not wish to imply that the Hungarian course of study is a perfect one, but apart from the praise bestowed on it by eminent penologists such as *von Engelberg*, I am of opinion that our way is more likely to lead to the desired end than, for instance, that of Italy. There, as Commendatore Doria, the director-general of penal administration, kindly informed me, administrative officers have to take their degree in jurisprudence before they can be appointed to any post. The various branches of legal service offer the ordinary prison officer either too much or too little. In Europe many are still under the impression that the jurist is the flower of society, and juridical self-conceit has a good deal to answer for in the present crisis of criminal law, a crisis which can only be brought to a successful issue by a thorough reform of the execution system of punishments. It is, however, no exaggeration to say that a knowledge of the history of jurisprudence and of commercial law is of very little use in the rational treatment of criminals.

Of course the simplest solution of the difficulty would be for the universities to add to their program the sciences of penology, criminology and criminal psychology. This would give to judges in criminal courts and to prison officers, the chance of acquiring the knowledge so necessary to both. But I am sorry to say that in some of the universities of Europe the wind of conservatism still blows, which is anything but auspicious for the introduction of new knowledge. A hundred years ago Henrich Heine satirized the learned Georgia Augusta, where the beadles of the university jestingly have been warned to keep a sharp look-out lest "any new idea, which ought to be kept in quarantine for a few dec-

[1] *Revue penit.* 1903, p. 629, 1308; 1906, p. 635; *Rivista de las prisiones* 1906, 16 Nov., 1909, p. 1 May number.

ades, be smuggled in by some speculative privatdocents." This mockery still unfortunately applies to many European universities; now, however, the professors themselves keep watch against the too impetuous influx of the waves of radicalism. At the University of Rome, it is true, a chair of penology was established as early as 1882, and at two other Italian universities, Turin and Naples, professors of criminal anthropology have been appointed. But these exceptions, although reflecting favorably on a Lombroso or a Zucarelli, in no wise affect the principle here under consideration.

In France, as we learn from Professor Vidal's excellent work, the study of penology has won for itself an honorable place in criminal law, but for Germany the sad remark of the great Leipzig criminalist[1] still holds good: that there is no more a science of prisons than a science of hanging.[1] Although conservative criminologists practically allow that the center of gravity in penal law is the punishment system, they are not prepared to admit that the *science pénitentiaire* should, at the universities, occupy an equally high rank with penal law.

Criminology, of course, fares worse still, since it is a branch of sociology and the latter has the reputation of being a revolutionary science, shaking the foundations of throne and altar and of all existing social conditions. They who know how dependent the universities of Europe are on the power of the ruling social classes will not think it strange that until quite lately Herbert Spencer's works were not admitted in the library of the "liberal" London University College.[2] An American who may be thoroughly convinced by the writings of, *e. g.*, Chaplain Drähms, that criminal anthropology is not a wicked science, will scarcely be able to understand why in central Europe a *levis notae macula* should still be attached to the deterministic conception of criminal law as the necessary issue of criminology. Although in Italy, France and Germany, criminology — the first fruit-bearing branch of sociology—has yielded a rich harvest of scientific literature, it is yet far from being acknowledged by the worthy professional scholars of law as a grown-up member of the family of sciences, although most of the universities in the United States have accepted it as such.[3]

In conclusion, although well aware that the question has by no means been exhausted, I must mention an interesting experiment which has been made in the German Empire. The initial idea was that it was necessary for the governors of smaller penitentiaries—magistrates and state attorneys—to receive instruction in penology. At the instigation of Jagemann and Krohne courses for this purpose have been instituted in several German states: Baden, 1886; Prussia, 1895; Bavaria, 1900; Hamburg, 1904; Hesse, 1907, etc. These courses are held at one of the penitentiaries and each course occupies from ten to fourteen consecutive days. Theoretical and practical information upon all branches of prison life is imparted by means of lectures and visits to penitentiaries.[4] No words need be wasted in proving the necessity for judges and other magistrates to be well versed in prison matters.

It is quite as absurd that a judge should pronounce a sentence, the purport of which he does not understand, as that a physician having no knowledge of medicines should prescribe a physic. Yet we must not deceive ourselves by believing that these courses can take the place of the professional training of prison officers, although they might profitably attend them. Detached lectures on penological subjects are excellent helps for bridging over the gulf which still separates penal law and prison discipline, just as it is recommended for law students to offer themselves for the prison service.[1] Prison officers receive in these lectures no more than a sip of the knowledge they require; their interest is roused, but to satisfy it requires a more thorough handling of the subject than could be attempted in so short a space of time.

On the solution of this burning question depends the entire future of prison

reform as well as of penal law, and it can no longer be passed over in silence. Criminal anthropologists whose views are not clouded by the cobwebs of medieval dogmas have fully realized the importance of this fact, and I, for one, quite agree with Havelock Ellis[1] where he says that "the prison officer of today is about as well fitted for the treatment of criminality as the hospital nurse of a century ago was fitted for the treatment of disease," and further: "The criminal in all his manifold variations, with his ruses, his instinctive untruthfulness, his sudden impulses, his curiously tender points, is just as difficult to understand and to manage as the hospital patient, and unless he is understood and managed there is no hope of socializing him.

In India a "security bond" of from 150 to 500 rupees is exacted from any prison officer as a guarantee for the faithful performance of his duties.[2] What I demand is a moral guarantee of his knowledge and fitness, without which it is impossible for him satisfactorily to fulfil his professional duties. I have raised the question, but I have not solved it. For the solution we look to the practical mind of this mighty country, where full justice is always done to the theoretical exigencies of any problem. For more than a century we, in Europe, have been accustomed to see the sun of prison reform rise in the west. I am fully convinced that in this case also the light will first break forth in America; not *ex oriente*, but *ex occidente lux!*

THE HOUSING AWAKENING[3]

IV

HOUSING REFORM IN COLD STORAGE—BOSTON

EDWARD T. HARTMAN
SECRETARY, MASSACHUSETTS CIVIC LEAGUE

In considering the housing question during the past fifty or more years, Boston has been almost purely academic.

Some talk, some writing, mild laws and milder enforcement were the order of the day until in 1888 Professor Dwight Porter prepared a report on some of the tenement house districts of Boston which should have justified quite a little activity on the part of the people and the officials; but very little was done.

A decade later the Twentieth Century Club issued a "thesis based on original investigations," after the manner of the graduate schools of the country. After this a number of literary productions with housing as their subject appeared in the newspapers and magazines.

In 1903 Mayor Collins appointed a commission to investigate the subject. A fairly good report and a draft of a law were the results. This was printed in generous quantities of which the city still has a good stock on hand. It may also be found in numerous public and private libraries. In 1904 the Legislature authorized a commission which reported in 1905. On this report there were some hearings.

In 1906 Mayor Fitzgerald appointed a commission which devoted itself exclusively to fire protection, strength of materials and other structural matters. In the meantime, a committee of the Massachusetts Civic League was considering tenement house provisions, which the commission promised in turn to consider. The commission, however, reported its proposed law without giving attention to the tenement house sections. Later, at the instance of the mayor, these were embodied in the bill by the committee of the Legislature and, after many amendments, finally became the present law on

tenement houses. Many builders and owners have protested that this law renders future building impossible, but buildings are now in course of construction which show that practically any kind of lot may be used under the law. These buildings are of such a nature that the people, so far as they have given the matter attention, and most of the officials, consider them bad housing.

After the law was passed there was no further evidence of public interest, except that the Civic League committee succeeded in blocking amendments to weaken the law, some of which have been introduced each year since. The people seem not to realize that there are serious conditions and that through their indifference other interests are succeeding in pulling the local authorities their way.

While the people do not see the conditions, they are at every point painfully aware of the results. The bad housing conditions of Boston are responsible for much of the immorality, drunkenness, neglect and crime which the churches, the settlements, the courts, and many private societies are trying to combat; for much of the sickness which the district nurses, dispensaries, and others are trying to cure; and through all these for the poverty which the charitable societies are so eagerly trying to alleviate.

Boston is most insistent in season and out of season in her efforts to salve over all these superficial sores but she has not yet consciously set herself to removing this one cause. As the problem has shown itself, other movements have been developed to help. The floating hospital does for a few what the homes should do. The outdoor school conducted by the Women's Municipal League is taking care of a few children and pointing the way for a few parents. One of the main arguments for playgrounds, even, has come to be that homes are not fit places for play and that without playgrounds children cannot grow up.

What are the actual facts in regard to the housing situation in Boston? No one knows. It is known, however, that dark rooms, overcrowding, filth, impossible water closets, and many other bad conditions may be found by any who look for them in most of the blocks in the North and West Ends, and in many places in Charlestown, East Boston, South Boston, Roxbury, Brighton and Dorchester.

An example of what may be found is noted in the recent report of the Boston-1915 Committee on Housing and the situation is interestingly compared with what is found in New York:

> Seven single North and West End blocks had in 1905 from 1,017 to 1,174 inhabitants—each a fair-sized town. As numerous blocks here, however, cover less than an acre, those with smaller population are often very crowded. Of twenty-two blocks whose density in 1905 was determined, four had less than 500 per acre,—four between 500 and 600,—nine between 600 and 720,—four between 786 and 880,—and one had 1,138 per acre. In all Manhattan, 122 blocks had 750 or more persons per acre—"intolerable congestion"; and all but seven of them were on the Lower East Side. Block No. 33, bounded by Prince, Thacher, North Margin streets, and Lafayette avenue, was—so far as known—the most densely populated block in Boston; it had 956 residents on .84 acre. They lived in houses averaging 3 2/3 stories high—viz., 310 persons per acre per story. New York's most crowded block had 1,672 per acre in houses averaging 5½ stories, or 304 per acre per story.

It is not possible here to go into all the causes, but it may be said that the people are primarily responsible. Indifference and ignorance are common to both slum dwellers and those who live elsewhere. Local authorities, to whom people naturally look for assistance, find more points of contact with owners and politicians than with the public (through the fault of the latter, let it be frankly said), and they have come to consider mainly what may be permitted under the law rather than what may be prevented.

The Board of Health, for example, in which is lodged great power for activities in the right direction, has been too steadily kept in tow by the mayor and by the great zero created by the absence of public opinion. For twenty-one years the board has had power to regulate the occupancy of houses or of parts of houses, in the interest of the public health. It has been using this power, setting 300 cubic feet as the space required for each occupant of a sleeping room, and has "stenciled" many rooms found

to be overcrowded. The stencils, says the board, are papered over, painted over and otherwise obliterated. When such a room is again visited by an inspector it is treated *de novo* and "again stenciled if it needs it", the board in the twenty-one years having developed no system of keeping a list of "stenciled" rooms.[1]

But it is known that if the board had the best system imaginable it has not enough inspectors to do the work needed. The present inspectors might do the work if the public, tenement dwellers, and others were doing their part, but they are not. Many people in the tenements persist in violating regulations in regard to overcrowding, ventilation, filth and garbage; many owners do the same so far as their part is concerned; and the public gives tacit consent. It will take many more inspectors to see that right conditions are developed and maintained, and they will have to remain in service till the people learn the value of the new methods.

A much needed adjunct now is a corps of instructive district sanitary inspectors. Many tenants are wofully ignorant or indifferent as to the results of conditions under which they live. The situation could be much helped, too, by a system similar to that instituted by Octavia Hill in London.

The present Board of Health seems willing to improve matters and it is believed that it will succeed if the people stand between it and the owners and politicians. The building commissioner and the superintendent of streets, in whose department the sanitary division falls, will do all that the people make it possible for them to do. The board of appeal sees too much the material side of the housing question and apparently has not awakened to the fact that, because people have to live in houses, there is a social or human side. It has nullified the spirit and in some cases the letter of the law.

These facts are now known by many people and the present state of public opinion makes the problem look more possible of a gradual solution than at any time in the past. The settlements, nurses, charity workers, and others are coming to see that their methods are letting the problem get ahead of them. They are beginning to see that it is a part of their work to help remove the causes of the difficulties which it will always be a part of their duty to alleviate. New organizations are taking up the newer aspects of the work and many others are showing a ready willingness to co-operate. Officials are feeling the same impulse and are either strengthening their present machinery or devising new machinery to do the work. There is hope, but this hope is based entirely on the assumption that Boston has at last awakened to her needs in housing and sanitation, and is ready to learn her job by working at it.

Academic Boston has been interesting to herself and to others in many parts of the world. Boston on her job promises to be more interesting. She will hardly reach efficiency in less time than she has devoted to her academic consideration of the subject; but, if she can put herself in fifty years among the fairest cities of the land (where they will be at that time), she may congratulate herself that she decided to take her proper place and get to work in this year A. D. 1910.

[1] As a matter of fact a recent investigation showed a number of rooms occupied by sleepers each of whom had 200 cubic feet or less. "Boston not only fails to require the minimum of other cities, but seems to have no minimum at all: no minimum for working men and their families, though for every tramp in the common lodging-houses the Board of Health requires at least 350 cubic feet of air space and open windows."

RANKEN TRADE SCHOOL, ST. LOUIS.
Employers, trades unionists and educational experts commend this institution.

THE RANKEN TRADES SCHOOL AT ST. LOUIS.

A trade school which has the commendation of employers, trades unionists and educational experts is worth more than ordinary attention, for it is a phenomenon all too rare. "The Ranken Trades School is on the square," a plumber said recently. And so all of the laboring men regard it. They are as glad to have Owen Miller, president of the Missouri State Federation of Labor, on the school's advisory committee as the school is to have won labor's approbation. On the other hand, the co-operation of employers is shown by the fact that the Metal Trades Association sends forty boys to the school as regularly indentured apprentices. The employer meets the tuition fee and pays the boys their regular shop wages while they are in attendance.

How comes this friendship of both trades-unionist and capitalist? exclaim those who have always heard of the difficulties of most other trade-schools. The answer is so simple and so ideal that belief in it—and the actuality forces credence—props up one's wobbling faith that more freedom, honesty and thoughtfulness, higher principles, practically applied, will yet save the day in these "labor and capital" troubles. Single-hearted and clearheaded, with a daily study of what constitutes for today and tomorrow the best possible trade education, the Ranken School holds its independent, middle-of-the-road course.

When David Ranken, Jr., deeded over to the David Ranken, Jr., School of Mechanical Trades the whole of his large fortune, exceeding $3,000,000, he then and there endowed it with much of the freedom which characterizes it, for ideas can always be carried out if there is no concern as to where the money is to come from—a hampering, even crippling consideration which confronts nearly every institution and individual. Many of the trade-schools opposed by trades-unionists are not efficient; they profess to turn out a good plumber in three months. The Ranken School, however, trains boys long and carefully and raises rather than lowers any standard of trade workmanship. But these "three months

schools" have not freedom of action; they must be self-supporting on a low tuition rate. At the Ranken School the per capita cost in the day school during 1909-10 was $226.40, and the tuition receipts were but thirty dollars per boy. Lewis Gustafson, the superintendent, seems to have no idea that the per capita cost to the school will decrease. It is likely that the self-supporting or money-making trade school will pass, and that the growing general belief in the value of trade education will manifest itself by further endowments from philanthropists and in the establishment and maintenance of trade schools as part of public education. It is significant that the Department of Commerce and Labor at Washington should send Special Agent Durham to St. Louis to make a special study of the Ranken School for the reports on industrial training of boys in the United States.

All this independence of action gained through its large endowment—probably the largest ever made for this single purpose—is reflected in the conduct of the educational work. Each boy is a student in the laboratory, the workroom of the school, where he is directed in applying the theory learned in the lecture room. He learns not only from a book or an instructor's lecture that the cubic contents of a cone of certain dimensions are so much, but goes into the workroom and proves the answer by filling a hollow cone and measuring the contents. In all the trades taught—comprising at present carpentry, pattern-making, bricklaying, plumbing, painting, and steam engineering—honesty in workmanship is required: no temporary effects, but a lasting solidity and dignity of results are demanded. The large, plain building itself embodies wonderfully this idea of teaching, and so impresses you with the spirit of the place even before you pass the simple, dignified entrance.

In September, 1909, the school opened its doors, its policies, plans and construction having been determined only after careful study, wide observation and much consultation by Mr. Gustafson. In July, 1910, Mr. Ranken deeded over practically all his fortune of over $3,000,000, reserving for his own living expenses only an annuity not to exceed $5,000. On August 18, less than sixty days after this fulfillment of the great desire of his life, Mr. Ranken died. There is much about the David Ranken, Jr., School of Mechanical Trades, that reflects the personality of this Scotchman, its founder. Simple in his tastes, anxious to avoid public notice, he cherished quietly during the years the steadfast purpose "to give boys a chance to be useful citizens."

DAVID RANKEN, JR.

He endowed the school with his whole fortune, $3,000,000, that it might be free "to give boys a chance to be useful citizens."

How best to make useful citizens, how best to further the education of the best possible future workmen and to advance conditions in the trades, is being thought

LEWIS GUSTAFSON.

A big man in every sense, the superintendent is working out plans to further the ideals of trade education which inspired the founder.

out and worked out by Lewis Gustafson, superintendent of the school. He is earnest, far-sighted, and impartial; a big man who impresses one with a quiet, deliberate forcefulness, a man who does not waste energy. And one is not surprised to discover his appreciation of poetry and art as well as his ability to "wipe joints". This feeling for the imagination and poetry of life as well as for its practicalities and prose pervades the place in some inexpressible fashion—the art of the very bricklaying of the building subtly hints it. The Ranken Trades School does not narrow utilitarianism.

The recognition by the school of its own necessary limitations is another proof of its broadmindedness. Provision is made for a number of scholarships designed to provide means for the higher education elsewhere of pupils who show marked ability. The trustees are authorized to pay the expenses of such pupils at American or European universities and art schools, but the total expenditure for this purpose must not exceed ten per cent of the school's net income.

The general aim of the school is admirably stated in the first annual catalog as:

> The training of efficient mechanics who shall take a pride in the proper performance of their work and who shall have such knowledge and such skill as will enable them to meet intelligently whatever demands that work shall lay upon them. While it is not the aim primarily to train foremen and superintendents, it is the expectation that within a few years after graduation many of the students . . . will be enabled to rise to positions of responsibility or go into business for themselves . . . Modern industrial methods preclude the giving of such (systematic) instruction in commercial shops, and employer and workmen alike are coming to recognize that a properly conducted school can and does offer to men and boys a better preparation for industrial efficiency than can be gained by working at a trade commercially.

The registration this year is 290 men and boys. Of this number 98 were in the regular day classes—40 from the Metal Trades Association, and 157 in the night school. The night school, it is expected, will always have the largest enrollment. A nominal fee of thirty dollars a year, payable in three parts, is charged to each student in the day school. The regular course is open to men and boys of fifteen or over who have completed the work of the sixth grade in the public schools or its equivalent. Following out the purpose to be practical, the boys are kept in the institution eight hours a day and a half-day on Saturdays. There are eleven months of work and one month of vacation — the proportion which the school believes should prevail in the trades.

HOURS IN THE CONTINUOUS INDUSTRIES

THOMAS SCHLYTTER
Christiana, Norway

There are several factors in modern organization of industry which make it more and more important and even necessary, that society should regulate the hours of work. The two principal are:

The increasing tendency towards work on a large scale, each man being only a small cog in one of the small wheels of the enormous machine; and

The specialization of work, which is in itself in many ways a great advantage, but necessarily develops onesidedness unless sufficient leisure and opportunities be given the man for developing other qualities than those produced by his work.

Here I wish to annihilate, if possible, an argument that one still meets: If the working hours were shortened it would produce more drinking and disorderly life in the laboring classes. In reply to this it ought to be enough to point out the indisputable fact that in those countries and those industries where working hours are the shortest and wages the highest, there also are workingmen the most efficient and on the whole of the highest type from every point of view. Let us remember the celebrated and characteristic words of Professor Virschow in the German Parliament with reference to the Silecian cotton operatives: "Under present conditions of work they have opportunities for nothing except drink and sexual pleasure."

It is exactly the excessive hours of work; the constant physical fatigue and poor conditions of living generally that produce, almost by necessity, a certain craving for stimulants and the physical and moral deterioration which it is our business to cure.

Opposition against regulation of hours of work in industrial occupations is very often based on an absolute misunderstanding of what we who desire a legal maximum working day really want:

There has been no proposal to prohibit a man from working as much as he wants to for himself or when he himself has the control of the work he is doing. What is proposed is to prevent anybody from working others for such long hours as will be detrimental to their health, happiness and civic usefulness.

We wish that every man should have freedom enough to be something for his family, to work in his garden if he has any—and if working hours were reduced many more would be able to live where they could have their own small home;

THOMAS SCHLYTTER.

With the development of the International Association for Labor Legislation, a new group of diplomats has come into being—leaders in the field of international labor relations—such as Mr. Schlytter. He is one of the organizers of the Norwegian branch of the International Association, and at the congress last summer in Switzerland presented a paper on the continuous industries. Mr Schlytter approaches the problem both as a social student and as an employer. He is managing director of the largest match manufacturing concern in Norway. During the past two months he has been visiting various manufacturing centers in American New York, Chicago, Philadelphia and Washington; and was one of the speakers at the annual meeting of the New York branch of the American Association for Labor Legislation.

and that he should have time for healthy recreation and intellectual pursuits and pleasures.

Regulation means more freedom, not, as some seem to think, less. Those who oppose regulation on the ground of the so-called "freedom of contract" and general *"laissez faire"* principles, are out of touch with their time. They are clinging to an outworn creed which does not suit the new conditions created by our modern industrial system. Adam Smith long ago pointed out—and many leading economists have since insisted upon the obvious fact—that the worker is at a disadvantage in bargaining with the employer for conditions of work. The labor unions at times are able to change this situation to some extent, but the present strong organization of capital in most countries now more than counterbalances this effect of the unions. Reduced to their elements, the working man in the last analysis has two alternatives: to accept the hours of work fixed for him or to starve. Everybody ought to be able to agree by this time that whenever regulation will produce desirable effects, no fossilized conception of outworn theories should prevent the necessary legislation from being enacted. Thus it will be possible to preserve whatever is of real value in the "freedom of contract" and do away with abuses which have grown from changed conditions.

The working men themselves understand that regulation means more actual freedom than *"laissez faire"* and they are therefore anxious to exchange their "freedom of contract" for state regulation.

I am well aware of the legal difficulty which social workers in this country have to face with regard to a regulation of the working day. There seems to me, however, to be no difference in principle between limiting the hours for young persons and women in industrial occupations and limiting them for men. The intention in both cases is protection of the health of the individual with a further view to the health of the race, and there is, therefore, only a difference of degree, not of principle.

This is especially true in cases where the abuses are very serious as in the "continuous industries."

Recent court decisions also indicate that protective labor legislation will be sustained when the interference is justified on grounds of health. This would undoubtedly cover regulation of the excessive working hours in the continuous industries.

At the Congress of the International Association for Labor Legislation at Lugano, Switzerland, last fall, a resolution was adopted, condemning severely, both from the hygienic and social point of view, the long hours prevailing in these industries, and it was decided to appoint an international committee to take the matter in hand.

This resolution was proposed by the Norwegian section where the question of working hours in continuous industries came up in connection with a new factory inspection act. The original proposal for this act contained a provision for three shifts of eight hours in industries working continuously night and day. This part of the act was not carried. It failed on the argument of international competition, but no one actually denied the desirability in itself of a change from the two-shift to the three-shift system. The employers in fact declared in favor of it if introduced by international convention, so that, whatever increase in the cost of production might follow, it would be evenly distributed. In some cases, at least a temporary rise in the cost of production would probably follow. But arguments of this kind are certainly not always conclusive—especially when seen in the light of past experiences. In any case, to overcome such objections by arranging international agreements is exactly the aim of our International Association.

The continuous industries may be classed as follows:

1. Industries which are continuous for technical reasons.
   b. Industries which may be called "absolutely continuous", *i. e.*, which run weekdays and Sundays.
2. Industries which are continuous not because of technical necessity, but in order to reduce cost of production.

The industries running on the continuous system are practically the same in all countries; and the principal among them are iron and steel, paper and wood, flour mills, cement, mines, smelters and glass.

As a matter of practical policy the only feasible way—and perhaps also the more desirable way—is to introduce a legal maximum working day by degrees; and it is natural to start where conditions are worst, which is in the continuous industries. There the serious effects of the present system are so obvious that nobody can deny the necessity of regulation. In these industries there has been no room for gradual shortening of the working day. The choice has been between two shifts of twelve hours or three shifts of eight hours, which explains the sorry fact that the twelve-hour day still prevails in all countries. The twelve-hour day is in itself altogether too long, but the fact that these men have to work alternately night and day, and often have as much as twenty-four hours' continuous work, when the shifts are changed, increases the strain enormously.

In this country conditions are probably at their worst in the iron and steel industries where the large majority of the force work twelve hours a day, and a very considerable part of it seven days in the week—including Sunday—and twenty-four hours without stop when changing from day to night shift. Only a very few of the force have the eight-hour shift. In England more than half of all the iron and steel is made on the three-shift system; the other half on the twelve-hour shift, and there are differences of opinion as to which method in the long run is the more economical.

I trust that the committee which the Iron and Steel Institute, at the instance of W. B. Dickson, first vice-president of the United States Steel Corporation, has appointed to inquire into the feasibility of doing away with Sunday work and introducing the six-day week generally, will secure results. But it is evident to me that the real solution lies in the three-shift system, of course without Sunday work except where necessary.

In the paper industry, several of the largest concerns in the United States run all their shift workers on the three-shift system, while in Europe in this industry the twelve-hour shift is universal. Such instances show the value of international comparison. What is possible in one country ought to be possible in other countries. And what is possible for some concerns should be possible for others.

Wages are a comparatively small item in the total cost of production in most of the industries in question, and any increase of efficiency would soon counterbalance the cost of the third shift.

The argument has been advanced against the three-shift plan that it would not be possible to find men enough to form a third shift. This difficulty could in any case only be temporary, and the industries we have to deal with here are on the whole exactly those which are most affected by periods of prosperity and depression, and where production may vary thirty per cent and even fifty per cent. If the introduction of the three-shift plan took place under a period of depression there could be no difficulty; and in case we were on the upward grade of a wave of prosperity it would perhaps not be altogether bad to check the movement to some extent—if check there would be, which I doubt.

But this increased demand for labor is important in another direction. It must be our aim, of course, to reduce working hours without reducing the actual wages received. This is perhaps the most baffling question in connection with a legal maximum working day. In the continuous industries, however, the temporary increase in the demand for labor to form the third shift would strongly, and I believe quite effectively, assist the men to retain their earnings unchanged.

Every consideration, then, points to the desirability as well as the feasibility of regulating hours of work in the continuous industries.

Working hours in these industries could be regulated in two ways:

A provision that all continuous industries should establish shifts of eight hours in order to get permission to run nights for any length of time would be

most effective. This would tend towards abolishing night work where it is not really necessary, and for industries where night work is necessary or very important it would establish humane conditions of work.

A law fixing an eight-hour maximum working day for industrial night work—on the lines of the eight-hour laws for work below ground in mines—would also go a long way towards making the three-shift system general.

Eight hours for night work, it seems to me everyone would agree, are quite enough and ought to be imposed for hygienic, if for no other, reasons. This would make it possible for the men to sleep and rest and still see the sun and the light of day and have some time with their families. Human beings are not intended to be mere machines to work, and eat, and sleep.

Reform in this direction is important not only for the sake of the happiness of the men involved, but so that it may be possible for everybody to reach a certain standard of intelligent citizenship for the sake of his country, the destiny of which everyone influences for good or for ill.

Some perhaps would think that the three shifts could be introduced without the intervention of the law. The principal thing, of course, is not how the reform is introduced, but that it is introduced. I do not believe, however, that there is any other way to make the system general than legal action; and I consider it in fact one of the most important features of modern labor legislation, that it tends to impose on all factories conditions of work which either have been established by employers who have developed the highest social conscience, or which they wish to establish, but on account of competition cannot realize until the law comes to their assistance.

The industries worked on the continuous system being practically the same in all countries, it is natural that the sections of the International Association for Labor Legislation should co-operate and assist each other, as much as possible, with regard to reform work in this field. Whatever is obtained in one country will materially help the other countries, as has been the case with necrosis and night work of women.

The working men in all countries are strongly in favor of the three shifts, and our International Association needs the support and assistance of the workers and their unions, who now often feel that we are not doing enough for them. In the international agreements which have been concluded (white phosphorus and night work for women) we have precedent showing that even the argument of international competition can be overcome. I believe the time is now here when we ought to try to do something that would lighten and brighten the life of a large number of our fellow men, which would be the case if the three-shift system were generally established.

Such a reform would, I am convinced, be a long step towards a general legal maximum working day; and I think that no social reform is of greater importance and would have a stronger tendency to raise the whole level of the laboring classes, than reduction of working hours accompanied by increased opportunities for healthy pleasures and useful self-development.

FIFTH AVENUE'S GLACIER OF LOFT BUILDINGS

THE INDUSTRIAL PROBLEM INVOLVED

When, following the strikes of the cloak makers in New York last year, a Board of Sanitary Control was created, representing the employer, the employe and the public, a beginning was made towards the regulation of perhaps the most anarchistic industry in New York—one in which sanitary standards range from modern factories to sweated homes, in which new establishments start into being by the hundreds, with little or no managerial experience, and in which the oversupply of labor enables the employers to take on and to turn off employes with each change in the seasons, without other concern

than that they reach the sidewalk in safety.

The possibilities of applying on a large scale modern principles of organization and scientific management to the industry as a whole have been opened up in proposals recently made by H. F. J. Porter, industrial engineer, to the Board of Control above mentioned, and subsequently at a hearing before the mayor's Congestion Commission in the City Hall. One phase of the situation was presented by him last week before a meeting of loft building owners and clothing manufacturers, called at the instance of the Fifth Avenue Association. This association is made up of a group of the largest holders of real estate on New York's old thoroughfare which has witnessed such revolutionary changes in the last ten years. From a quiet, residential street Fifth avenue is becoming, below Madison Square, a canyon of loft buildings given over to the garment trades, and this change is engulfing block after block with increasing speed, so that what has happened is apparently only the beginning of a definite movement, the end of which is not in sight. At the noon hour the employes of each loft building, in some instances several thousand strong, run out at the bottom like the contents of so many huge vats when the spigot is turned, clogging traffic and interfering with general business by the sheer force of numbers. They have no place but the streets to go to. A sidewalk and pavement in the vicinity resemble for the time nothing so much as the mill districts of Lynn and Pittsburgh or the stock yards of Chicago. To illustrate the hopelessness of bettering the situation piecemeal, it is related that at first residents and merchants appealed individually to the factory managers. Securing no relief they formed the Fifth Avenue Association. The situation was discussed and the factory managers were again appealed to by letter and asked to meet a committee of the association. A few attended who said that they would do whatever all of the manufacturers would join in doing; but it was impossible to get collective action from the rest. They were practically inaccessible. Nor would the loft building owners as a whole respond to approaches. No relief coming from these quarters, assistance was sought at the hands of city officials but it seemed impossible to determine which department had jurisdiction over the situation. It wasn't a fire, or a riot, or an epidemic, or a fall of snow. As time passed, conditions grew steadily worse until the streets became so blocked that the Police Department was appealed to as a matter of traffic regulation. At length, as a net result of all this going from pillar to post, some working people were arrested for blocking the highway. This did not accomplish anything in the direction sought. The injustice of such a move would have been more apparent were it not outmatched by its stupidity,—like brushing water away from a leaking main. But it is the most which the municipal government of New York has as yet attempted towards regulating what is a veritable industrial inundation in the center of the city.

This traffic matter, however, is but a superficial indication of what is going on underneath; not altogether different in fact from the garment strikes themselves, which would not down, but laid claim on a public which had been content to let matters run their course. In discussing the situation, Mr. Porter pictures the powerful industrial changes which have affected the city as a whole. He says:

> We have to realize in the first place that New York has changed from a residential and commercial seaport to a manufacturing city; and this change has taken place without the city awaking to the fact that a corresponding change should be made in its governing bodies, in order to cope with the new conditions. Consequently, the latter have run riot as any unguided and uncontrolled movement is bound to do, until we now have our congested and unsanitary tenement districts on each side of the city where live the hundreds of thousands of industrial workers, and half-way between, on Broadway and Fifth avenue, are the loft buildings containing the factories where these people work.
>
> The manufacturers occupying these loft buildings are in the main those who turn out certain lines of product which have great seasonal fluctuation. They come here because they can secure advantages not presented in suburban localities. For instance, they can hire a well-lighted, steamheated fac-

tory loft, and secure all the gas, electric light and power they need by merely turning them on and paying for what they use. They can hire their labor from the group of unemployed standing on the street, at their door. They can discharge it at their whim, and when the dull season in their industry arrives they can dispense with it altogether, with about as little ceremony as they turn off the gas.

Thus as business fluctuates, they are able to vary their expenses and can shut down altogether by merely going out and locking the door, leaving the burglar and fire alarms, their insurance policies, and the caretaker of the building to safeguard their interests.

This would be an ideal way of running a factory if it did not affect unfavorably the interests of others. Sometimes, however, the wholesale discharge of labor at dull periods amounts to thousands of men and women, the theory being that this supply will be absorbed by the demand in other lines or trade. There are some industries whose seasonal fluctuations are so timed that they dovetail into the opposite variations of others, and it is true that a portion of this floating army of unemployed is so absorbed; but as the average term of employment in these seasonal trades is only from four to six months, half in the spring and half in the fall, and during this time scarcely a living wage is paid, there is a horde of half-worked helpless people which has to be reckoned with. Its effects upon poverty, vagrancy, misery, suffering, sickness, and mortality are to be found in the congested and unsanitary sections of the city, in overcrowded hospitals and overtaxed philanthropic institutions and societies. It encourages drinking, gambling, prostitution, and swells the workhouse, the almshouse, and the prison.

Now this method of doing business is uneconomic to the employer, the employe and the public, the latter having to pay the expense of the inefficiency.

With this sweeping arraignment of the disorganization in the garment trades, and its social accompaniments, Mr. Porter takes up the responsibility of the individual employer. Every employer, he points out, controls the greater portion of the waking hours of his employes. Every day he produces an effect upon them by the conditions of their environment and by his treatment of them that is either beneficial or harmful, physically, morally, and mentally. Many employers, especially in these garment shops, who are often fairly recent immigrants themselves, have had no preparation for their duties, but assume this control of their workers merely by payment of small fees to the state and city. Yet the employer's influence upon his employes, because of its continuity, is more potent than that of their doctor, their minister, or their teacher, each of whom has to serve a long apprenticeship before being allowed to practice. Where the state issues a charter to an individual or a corporation to do business, Mr. Porter holds that it should demand in return a recognition of the obligation that that business shall be run in such a way as to benefit, and not injure, the people it employs and the community in which it is located.

Some of the industries located in New York are very large. The cloakmakers, for instance, have some 2,000 factories, with about 80,000 working people, men and women, in them during the busy seasons. These, with their families, constitute an industrial community estimated at 175,000 people, which compares in size with such cities as Providence, Indianapolis, and Rochester. There are many other garment industries in New York of only slightly smaller dimensions.

With the main elements in the situation the public is to a degree familiar. Mr. Porter's distinctive contribution to its discussion has been in its presenting existing social and economic disadvantages as a group picture, and in the second place in offering as a solution not a fragmentary reform, but a daring co-operative program linked with scientific management and governmental control. Moreover, he holds that the self-interest of the various business factors involved will bring them to such collective planning; the industrial unrest among the great labor forces involved tends in the same direction. He would apply to these great, loose urban groups standards adopted by certain employers in dealing with isolated plants and self-contained industrial communities. He recommends:

The establishments in each industry should be organized as an industrial group, and their common interests should be centralized in an administration building, in order not only to attend to their own interests properly, but to be accessible to those whose interests they affect, and to the city and state governments. For example, the health and welfare of the public as a whole is in-

volved in the sanitary conditions of the factories and employes' homes to which the Cloak Makers Board of Sanitary Control is addressing its attention. This is a bigger problem than can be handled by the Cloak Makers Board of Sanitary Control alone, or by the Cloakmakers Industry alone, or by a number of similar industries acting jointly, or by several other equally involved groups of property interests acting jointly; but a great deal can be accomplished by getting each of these forces to work along certain defined lines, and having all of them work together in a carefully devised program embodying the principles of scientific industrial management, such as Louis D. Brandeis, who was instrumental in establishing the Board of Sanitary Control, has recently shown in the freight rate hearings to be essential to the efficient handling of an industry, through the resultant prevention of waste and the conservation of effort and materials. Scientific management means that conditions are always being studied and plans for their intelligent handling formulated before they get beyond control, as they have in this loft district. In an individual shop, scientific management means the establishment of a planning department. In its application to an industry as a whole, scientific management would mean that the manufacturers with their employes should organize in each industry and develop a planning department, with respect to conditions affecting all in common. In equating the public factor with the industrial, scientific management would mean that the city and state government should in turn modernize their departmental organization so as to equip themselves to meet the situation, and through boards of industrial control supervise the methods of the congregate industries so as to conserve the interests of the community as they are affected by those industries.

Applying his program to a particular trade, Mr. Porter outlines his plan as follows, describing it as a method of "industrial peace by getting together":

Taking the cloak makers industry above mentioned, let the Board of Sanitary Control composed of representatives of the Employer the Employe and the public constitute the Cloak-makers Board of Trade.

A building of considerable size, say 30 feet front by 150 feet deep by 5 stories high, located in some position central to the industry, would be necessary for the housing and administrative operations of this board, which through its sub-committees would be in continuous session. There would be an employment bureau established here with an inspector to examine physically and investigate the credentials of every applicant for work, and only those who were fit would be accepted, those who were unfit being referred to the proper city departments or local civic organizations. These applicants for positions would receive slips printed in their various languages and in English, and lantern slide talks would be given to them while waiting for employment, instructing them how to live at home and what the standard conditions should be in the factory, and they would be told to report later regarding these conditions. Thus the unfit landlord and employer would be discovered automatically and dealt with. Landlords and employers would be furnished with cards for posting in the factories and houses stating the sanitary conditions called for by the Board of Trade, and requiring the employes to live up to them. Workers would not be sent to objectionable employers or vice versa, nor to factories or houses which were not up to standard. Loft and flat-renting bureaus would be established to bring into better relationship the locations of shops and employes. Employes would, where possible, be sent to shops nearest to their homes.

In each factory a committee, composed jointly of employes elected by their fellows and of representatives appointed by the employer, would be established to consider suggestions for improvements and to settle petty grievances. All questions which could not be settled locally would be referred to the committee on conciliation and arbitration of the Board of Trade. For each employe who would contribute one week's wages to a fund as an indemnity in case of leaving without giving one week's notice, each employer would contribute the same amount as indemnity in case of the discharge of the employe without a similar notice. This employment guarantee or insurance fund, if only half of the employes should contribute to it, would amount to $250,000, the interest on which would go towards sickness and accident relief and disability pensions to participants. It would be kept in a co-operative bank which would handle all the funds of the industry. An agreement would be made that no strike or lockout could occur without the reason being referred to the conciliation and arbitration committee, which would have thirty days to investigate it in public meetings and announce its decision publicly. Compulsory arbitration would not be advocated.

Standards of hours, wages and work, of lighting, ventilation, fire protection and sanitary conditions, etc., would be established. A uniform system of bookkeeping and cost accounting would be inaugurated in all factories, to establish a common basis of competition. The seasonal fluctuations would be balanced by developing other work in the dull season, so as to make employment steady. A central purchasing agency for factory supplies and raw materials would be established as well as a sales headquarters, and in every way trade economics would be effected.

Here could also be accommodated representatives of the various activities existing in the city interested in industrial betterment, which would be willing to help in the work.

To finance this project an operating company would have to be formed, composed of

employers and employes. This company would raise a fund from the employers, each of whom would contribute one cent a day per employe; and from employes each of whom would contribute one cent a day, all in payment for the benefits derived from the privileges supplied. This fund would amount to over $250,000 per year which would make the project self-supporting; as this fund would be kept in the co-operative bank all surplus accumulations would be returned to the stockholders.

It is largely through ignorance of simple matters that present conditions exist, and the cure is not to be accomplished by legislation, infrequent inspection, and punishment for lapses. This project is based on developing an educational center for promulgating knowledge of sanitary conditions and the principles of scientific and economic business management, with the belief that education will achieve the results desired. Every feature referred to has successfully been applied on a smaller scale, so that it is known to be individually economic and feasible; and as for the rest it is merely applying the principles of democracy to an industrial community and an industry.

There are many organizations now doing industrial and civic betterment work in a haphazard and individual manner and finding great difficulty in accomplishing anything of moment on account of the method of approaching the problem which they are compelled to adopt, and the inertia of the people they endeavor to reach. By combining and concentrating these forces in the plan as outlined, and by intelligently controlling, correlating, and directing them, their helpfulness can be made available to enhance the benefits which would be projected. The public is tired of paying for the results of ignorance and inefficiency and for the inconveniences attendant upon industrial strife. It would be glad to pay an equal amount for their cure and prevention.

It is a truism of practitioners of scientific management that their greatest difficulties lie in getting the average employers to act. The unconvinced or reactionary employer will not accept their methods; progressive employers are often swinging as heavy a load as they can, individually, without the full cooperation of their fellows. Where an industry rather than an individual establishment could be approached, the situation would be different. In regard to the effect upon the warring elements of Capital and Labor of bringing their representatives together in a building where they may discuss their differences openly in the presence of representatives of the public. Mr. Porter calls attention to the fact that Mr. Carnegie who has probably given as much thought to the subject of Peace as any living man has felt that a building at the Hague where the warring elements of the nations could get together and discuss their differences would be in the right direction and has backed up his convictions by not only providing that building but by giving ten millions of dollars to encourage the representatives of the nations to get together in that building. Mr. Porter's plan is perhaps the first program for the co-ordination of an industry as a whole advanced by an industrial engineer. The reader, much less the individual employer, loft owner, or trade unionist, might be far from following him in all of his suggestions,—there is the touch which an architect puts into his work in sketching a Proposed Civic Center; but that very characteristic of his proposal throws into greater contrast the present inchoate situation in the garment trades in New York as an argument for cooperative action in this new city industrial district.

LABOR LEGISLATION

JOHN B. ANDREWS
Secretary American Association for Labor Legislation

REPORTING OCCUPATIONAL DISEASES

When the International Congress on Occupational Diseases met at Brussels last September, Dr. Legge, medical inspector of factories in England, read a paper on Results of Ten Years' Notification of Lead Poisoning. In 1900 more than 1,000 workers in that country were reported as suffering from this affliction. Last year the number was only 553, although the system of recording has steadily improved. In some branches of the dangerous trades in England this occupational poison is now only one-fourth as serious as ten years ago.

In Great Britain when a practicing physician observes symptoms of lead, phosphorus mercurial, or arsenical poisoning, or anthrax, he is compelled to report the case to the factory inspector. Scientific men in the public service are then able to study intelligently the conditions which undermine health, to sug-

gest simple inexpensive precautions to the manufacturers, and to instruct the work people how to prevent unnecessary suffering and death.

Every class in the community is directly interested in scientific efforts to conserve the health, vitality, energy, and industrial efficiency of wage-earners by improving unhygienic conditions of employment in occupations where deadly poisons are in use.

In order that necessary precautions may be taken, the state should be enabled to determine where and how men are exposed to these perils. English and German experience indicates that the most practical and economical method of securing this information is through a law requiring physicians to report every case of occupational diseases to the proper authority. From this data preventive and remedial measures could be intelligently formulated and applied. The American Association for Labor Legislation, in its campaign for the conservation of human resources, invites the co-operation of other organizations in securing uniform legislation on the subject. The chief industrial poisons are noted briefly in the following paragraphs:

LEAD POISONING

The Illinois Commission on Occupational Diseases reports upon 640 individual cases of lead poisoning. There were at least thirty-three deaths from this cause in New York last year. In 138 trades the workmen are said to be menaced by this poison. The worst occupations are the making and mixing of paints, and certain processes in printing and in the manufacture of storage batteries. Almost every large establishment has cases. The attack brings on successive paroxysms of colic, with vomiting. The nervous system is invaded, convulsions become frequent, partial paralysis ensues. Progressive hardening of the blood vessels leads often to cerebral hemorrhage and death. In some smelting works twenty-five per cent to thirty per cent of the laborers have been reported as staying not over a month, but dropping out as they become "leaded." Women are especially susceptible.

PHOSPHORUS POISONING

The match industry is the principal one in which phosphorus poisoning occurs. The fumes attack the bones and teeth. The bones become brittle; the teeth drop out; the jaw bones decay. Operations for the removal of part or all of the jaw bones are sometimes necessary, leaving the victims disfigured for life.

The use of white phosphorus in the manufacture of matches has been prohibited by all of the leading industrial countries of Europe. The president has advised in his message a prohibitive tax upon poisonous phosphorus matches, and through the Esch bill in Congress there is hope of securing legislation. The Diamond Match Company, formerly the owners of the most available substitute for poisonous phosphorus, has been forced by the Association for Labor Legislation to transfer the legal title to three trustees with full powers to grant its use to all applicants.

MERCURY POISONING

In the manufacture of hats, thermometers, electric meters and explosives, the principal injury from mercury is sustained. It brings on morbid depression, excessive salivation in the mouth and throat, intestinal derangement, anemia, tremors or "shakes," and, in time, general nervous paralysis. Much mercury poisoning can be prevented by proper ventilation, cleanliness, and the simplest devices, such as respirators and rubber gloves.

ARSENIC POISONING

In the industries connected with the manufacture of dyes, wall paper, chemicals, glass, oil cloth and in many others, arsenic endangers the health of the workers. Vomiting, severe pain in the intestines, intense thirst, neuritis, and death under symptoms resembling those of cholera result from acute poisoning. The disease in chronic form causes a falling off of hair and nails, various skin eruptions, inflammation of the mucous membrane, bleeding gums, cerebral disturbances, epilepsy, etc.

ANTHRAX

Anthrax is an infectious disease due to the entrance of a minute bacillus that clings to the hides of animals. In the wool leather and horse hair industries the malady is prevalent. Malignant pustules occur upon the neck and face of the victim. When the tissues around a pustule become inflamed the part affected sometimes assumes enormous proportions. The eyelids are especially susceptible. The treatment of the "colonies" of anthrax is by excision or cauterization, or serum. The two former leave disfigurements. When a patient becomes infected with a malignant form the cure is rare.

COMPRESSED AIR ILLNESS

The increasing amount of caisson work in building bridges, tunnels, subways, and sky-scrapers has made this disease formidable. Men working under thirty pounds pressure or more beyond the normal, if not "locked" back gradually, have a "frothing in the blood" which often renders them unconscious. Blood sometimes runs from eyes, ears, and nose, and the pains in joints and muscles are excruciating. Statistics regarding the "bends", as the trouble is commonly named, are incomplete, and information concerning extent and causes would be of material service.

CIVIC IMPROVEMENT

CHARLES MULFORD ROBINSON, Contributing Editor

A NICE KIND OF PARK

What fortunate persons are those who live in Fort Worth, Tex! There the Park Board allows them to go nutting in the parks—at least they allowed them to do so this year—the only restriction being that they must not climb the trees or damage them.

NOTABLE PARK GIFT

A notable park gift is that of five hundred acres, presented to the city of Covington, Ky. by William P. Devou and Charles P. Devou, brothers, in honor of their father and mother, who were pioneer residents of that section. In announcing the gift to the City Council, the president of the park commission stated that "one of the greatest authorities on parks in the world" had selected the hills which are included in the tract as an ideal site for a park.

FROM THE MOUTHS OF BABES

A despatch from Panama, published in all the papers, seems to mean that we are to have at least two cases of comprehensive town planning on this side of the Atlantic. It reads: "The president of Panama, as an incident to a contract just made with the United States regarding payment for municipal improvements in Colon and Panama, has issued a decree making it unlawful to erect any building or structure in either city before the municipal authorities have completely laid out and mapped the section and paved the streets."

Are our great cities to learn lessons from little Panama?

ST. PAUL'S CITY CLUB

In the autumn a City Club was organized in St. Paul, Minn., which differs from most city clubs in these particulars: Its membership is made up of delegates from other societies, clubs, organizations, and even churches, and it has a special purpose: to secure for St. Paul a comprehensive city plan. Membership includes women, and the club does not take the place of other organizations, but is designed to concentrate their influence in behalf of the one object for which it was created. It will co-operate with the City Council, and after the public has been sufficiently educated to the need for a plan to demand it, and the plan itself has been obtained, the club will devote its energies to the execution of the plan.

A TREE SOCIETY

The organization has been announced of the American Association for the Planting and Preservation of City Trees. Its purpose is stated to be the establishment of "a movement for the planting and care of trees and shrubbery in city streets, and in the yards and about the homes of the citizens, by arousing locality interest and pride and inducing local action." The headquarters are in Brooklyn, N. Y., and apparently the association's present operations are to be confined to Greater New York. The list of officers suggests, however, a later branching out, for the vice-presidents include Professor Graves, chief forester of the United States Forest Service, Dr. Merrill, assistant director of the New York Botanical Garden, and Miss Rogers, director of the Nature Club, *Country Life in America.*

CITY CHILDREN'S PLAY

The Parks and Playgrounds Association of the City of New York has issued an illustrated report of its work during last summer. It conducted thirty-six play centers, four of which were on roofs. And speaking of one of the roofs, that of the Children's Aid School of West Thirty-eighth street, the report says that during July and August the space was filled to its utmost capacity. "Over three hundred children enjoyed the summer days, high above the street and safe from the dangers of traffic." A part of the roof was set aside for the exclusive use of the babies, and was known as the nursery. Here the hammocks were swung, and mothers and big sisters came with the babies to insure them a nap above the heat and noise of their crowded homes. The report records a total attendance at the centers, which included recreation piers, of 152,790. In addition excursions were conducted to Bronx Park, Van Cortlandt Park, and Central Park.

PUBLIC SCHOOLS ATHLETIC LEAGUE

The Public Schools Athletic League of the City of New York issues its Year Book for 1910 in very elaborate form. An idea of the scope of its work may be gained from the following figures taken from the address of the president, Gen. George W. Wingate. In addition, he says, to the girls branch, which takes special cognizance of the exercises of the school girls, there are included in the league twenty-five district associations covering 306 square miles, the area of Greater New York, and assuming the direct management of 515 schools. In the elementary schools are 125 associations with a total membership of 110,000. In the games which these associations held during the year, 80,000 boys competed. Seventeen similar associations were in the high schools. It is estimated that in the whole series of athletic events held during the season the total number of boys and girls who took part was 150,000; and this does not include the games of the district leagues or the championship games of the league itself.

A VILLAGE MAGAZINE

From Springfield, Ill., comes an extraordinary publication under the title of the *Village Magazine*, which purports to be at once the first and the last number. It is characterized by a multitude of drawings, many extremely crude, and by text which is eye-destroying; and yet a spirit of sincerity and high ideal pervades it, which is to be respected. There is suggestion in it of the sort of work a village might, to its own great good, produce, generally in better form, if the community were keyed as high as it ought to be. The magazine is not for sale, but it may be obtained by request and an enclosure of necessary postage. Wandering through it in a series of full page illustrations is a Village Improvement Parade. The banners which the marchers carry bear mottoes, of which these are samples:

"Fair streets are better than silver; green parks are better than gold."

"Bad public taste is mob law; good public taste is democracy."

"To begin we must have a sense of humor and learn to smile."

The man responsible for the publication is Nicholas V. Lindsay. Another time we may quote from one of the editorials.

THE TREES OF WASHINGTON

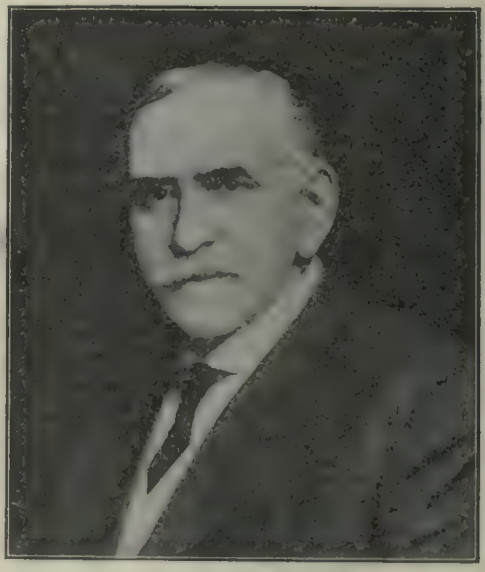
The long report of Major Judson, engineer commissioner of the District of Columbia, has appeared in printed form. It includes the always interesting report of the superintendent of trees and parkings, for in Washington city-tree planting has been done more thoroughly than in any other city of the United States. Indeed the report now submitted is the twenty-fifth annual. It states that during the fiscal year 4,080 young trees were planted in the street parking—all of them between walk and curb. This is thirty more than in the preceding year, and is the largest total in fifteen years. Of the trees 1,713 were Norway maple; 637 elm; the balance of various kinds. From an aesthetic point of view the most important work was the setting out of 32 pin-oaks in the Plaza in front of the great Union Station, in the continuous turf space at the outer edge. In addition trees have been planted on several of the streets approaching the Plaza. The number of trees removed from the streets during the years was 2,161. Most of these had died and in their places new trees were planted. At the close of the fiscal year the number of trees in charge of the department was 97,954, representing, on the basis of 352 trees per mile, a total of 535.30 miles of tree-planted streets.

RECORD OF ACHIEVEMENT

The Municipal Affairs Committee of the Grand Rapids Board of Trade has issued in leaflet form the report which its retiring secretary, John Ihlder, makes of his two years work as secretary. Mr. Ihlder—as readers of THE SURVEY know—has been now appointed field secretary of the National Housing Association. His record of work at Grand Rapids is—as readers of this department also know—one of achievement. And to this fact, which would sufficiently commend his report, is to be added the circumstance that he presents his data in an unusually interesting manner. Far from a boast, the report begins with a very modest and honorable statement of how much the committee was accomplishing before he became connected with it. He says that when first he arrived in Grand Rapids, he was told that there was no public spirit in the city. He found the statement was an error, for he discovered individuals "who were so full of civic spirit that they could not hold it all. They spilled their surplus into other men. Finally, one of these men became chairman of the Municipal Affairs Committee. Naturally he gathered about him others who had been infected, and then, with an organization through which they might express themselves, they began to be a power." Mr. Ihlder's account of the first civic revival, organized to secure an appropriation for a city plan, is instructive. It began, he says, "on a Monday evening. On the Friday before, a member of the committee visited Mayor Ellis to get his support for the proposed appropriation. The mayor was shocked at the idea. The council, he said, had practical matters to consider, such as the placing of half a dozen street lights over which there was a division of opinion. The revival closed on Sunday evening, a little over a week after the interview with the mayor. The next day, Monday, the appropriation was granted without a dissenting vote. Several of the aldermen took advantage of the occasion to express their unalterable conviction that we should plan for the future of the city."

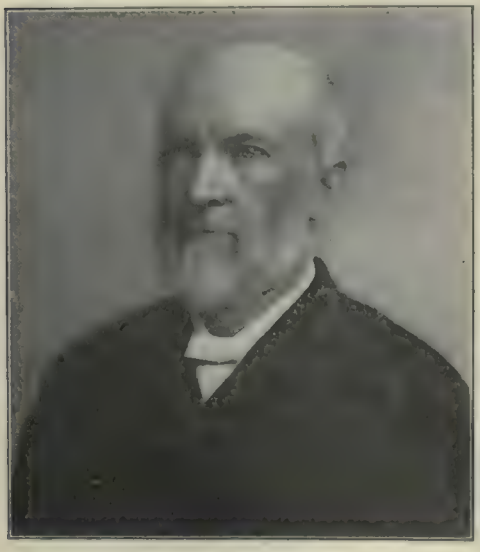
CHILDREN'S GARDENS

An illustrated report of the Fairview Garden School Association of Yonkers, N. Y., has come to hand. It contains an admirable history of the general school garden movement. But the most interesting portion is that which tells concretely of the Fairview Garden School, which opened about May 1, 1909, and was open after school hours, and all day Saturdays, and all vacation until October 1. 582 children had plots ten by sixteen feet, but a thousand children had applied, so that 418 were refused. It is interesting to observe that 382 of the garden children were boys and 200 girls; that about forty per cent. attended the parochial schools and sixty per cent the public schools; that the nationalities were varied; that Poles and Slavs were numerous; that Italians were few, but without exception fine gardeners. The average age of the children was eleven and a half years. It appears from the record that they worked in their plots every day for the first two weeks, and thereafter generally three times a week. There was no trouble about discipline in the garden, although, says the report, some of the boys represented a very "tough" element. The product raised was officially valued at $3,306. Each child owned what he



raised, and almost any morning during the summer one could see the children with vegetables in baskets, in little carts, in baby carriages, in wheelbarrows, and in flour bags, triumphantly bearing home the products of their toil. The report states that the health of the children was greatly improved, and that any tendency to juvenile theft was corrected through the experience of the value of property rights. "In dollars what does this save the city, the police courts, the protectories, the prisons, besides making a productive citizen out of one with criminal tendencies?" In a broad view the significance of this report is that it is typical of the record which this kind of work is making in many places.

RECENT MEETINGS OF SOCIAL WORKERS



GOLDEN JUBILEE AT ST. LOUIS

Fifty years of continuous work by the St Louis Provident Association were appropriately commemorated in November with the dedication of a substantial, well-equipped headquarters building, and a golden jubilee program divided into two meetings, one in the afternoon at the new building, 2,221 Locust street, the other at night, at which reports and histories were read, and addresses made by Francis H. McLean, field secretary of the Charity Organization Department of the Russell Sage Foundation, and several leading ministers of St. Louis.

The evening meeting took place with the same congregation in the Grand Avenue Presbyterian Church, in whose building, then known as the Pine Street Presbyterian Church, the first annual meeting of the Provident Association was held fifty years ago. Six of the first contributors, each of whom is now well past three score years and ten, are still living,

W. H. McCLAIN,
Manager, St. Louis Provident Association.

SAMUEL CUPPLES.
President, St. Louis Provident Association.

and several of them were present at the jubilee celebration, along with many sons and grandsons of these and other charter members.

Samuel Cupples, president of the association, told of its work, reiterating the principles which it maintains and to which it has adhered during fifty years.

"As is well known to most of you," Mr. Cupples said, "it is often found necessary to give temporary assistance pending investigation, to avoid inflicting on applicants unnecessary hardship and privation, and in such cases the Provident Association promptly and gladly gives emergent aid. It does not, however, exist chiefly to give out doles to those in distress. The aim of enlightened philanthropy is not to relieve by means of doles the distress that follows such causes as illness, poverty, misfortune, improvidence or drunkenness, but rather to build up character, to stimulate self-reliance, to encourage industry, and to destroy the causes that tend to produce dependence."

A retrospect of the fifty years' history pre-

A MONUMENT TO FIFTY YEARS' WORK.

The new building of the St. Louis Provident Association dedicated at the golden jubilee celebration

pared by the general manager, W. H. McClain, showed how many of the leading social movements of St. Louis have been originated and fostered by the Provident Association. Among these are the Pure Milk Commission, the Tenement House Commission, the Anti-Tuberculosis Commission, and the School of Social Economy. Just now another work—the Provident Association's care of the sick poor by trained nurses—has so developed that it will shortly be committed to the Visiting Nurse Association, which is to be organized on the nucleus of the corps of visiting nurses which the Association has maintained.

There has been rapid expansion in the last ten years in the training departments of the association. Its new building includes under one roof the laundry and sewing rooms, where unskilled women are taught; the women's lodgings for those without funds or friends in the city, the day nursery, and the cheap baths. In the same building are preserved the results of fifty years' investigation, records of over 70,000 cases. Offices for operating the bureaus of application, registration, investigation and relief are here and in another part of the city are the woodyard and men's lodging.

Francis H. McLean pointed out in his address that "everywhere there should be charity organization societies—real, not sham societies. The charity organization movement must become all pervasive.

"It stands first of all for a study of the unit, the family. It stands for the family betterment as a preliminary to social betterment. So do other social movements. It stands, furthermore, for the amelioration of those who have suffered most in the struggle.

"The charity organization movement, modestly starting as an agency to check the duplication of relief and to systematize the giving of relief, by the very nature of its extensive work with dependent families has become the greatest interpreter of social conditions which this country now has.

"In St. Louis the Provident Association has itself undertaken the industrial and other agencies—which form a roll of honor for the Provident Association. It has followed

the course which I believe every strong and effective society should follow, of seeing that the most needed work is done, by separate organizations whenever possible, otherwise by itself."

Mr. McLean expressed the definite hope that the society would organize districts, now its greatest lack. In conclusion he forecast the future:

"Only as we carry out our original purpose the next fifty years, will we retain the important office of interpreter. And if we do, then I can foresee, at the end of those fifty years, a near approach to that time when there are no hopeless streets, no hopeless homes, when childhood will be childhood and with all the birthrights of childhood, when manhood and womanhood will still struggle on, but with burdens less killing and with higher ideals; when the wealth of this country will be measured, not in dollars of materialism, but in the strength and beauty of man and woman and child, not of the richer homes, but of the ordinary home upon the ordinary street."

Four leading ministers, the Revs. William Wirt King, J. W. Lee, D. C. Garrett and W. J. Williamson, bore testimony of the value to them personally and as heads of churches of the work which the association does—"This is the church organized and united, working together as if it were one church," as Dr. Lee put it.

Mrs. Philip N. Moore, president of the National Federation of Women's Clubs, who has long been a leading worker in the Provident Association's work for women, presided at the women's meeting in the afternoon. This was preceded by the dedication service at which, in receiving the keys of the building from the building committee, Mr. Cupples reminded the audience that the day was the anniversary of the death of Richard M. Scruggs, president of the association for nearly twenty years, and the donor of the building.

"THE AGENCIES OF DEMOCRACY"

The annual meeting of the Associated Charities of Washington, D. C., was made a memorial to its late president, Justice David J. Brewer. There were addresses on his work in the church and in philanthropy, the latter by Justice Charles E. Hughes. "To one at all familiar with the work of the Supreme Court, it seems incredible that he should have essayed the tasks outside of that work he performed so successfully," he said. The work of organized philanthropy was recommended to those "who look with misgiving upon the indications of the currents of thought."

"To those who come in contact with that work it seems at times as though the difficulties to be surmounted were so great and the objects to be attained were so remote, that all possible efforts must fail. But as these discouragements arise we find a more skilful planning, a more thorough organization, a more determined intent to accomplish what may be possible by way of remedy.

"Now I am not speaking of those who are contemplating a reconstruction of society, or of those who think that human nature is going to be changed, or that the faults and vices of men are going to be, within a period which we can contemplate, sensibly reduced. Rather do I refer to those who are deeply conscious of the extent of preventable misery and loss, those who want to see wholesome childhood; those who want to see protection against unnecessary injury, who desire to have barriers erected against the spread of disease, who wish decent housing, abundant playgrounds, and every means which may be found practicable by which we may have in our communities a healthful and vigorous life. . . .

"That requires thorough and complete organization. Some decry it. But the waste from indiscriminate giving is so great, the faults to be remedied are so many, the pressure upon time is so heavy, that we must have in philanthropic work the most careful organization and men devoting themselves exclusively to that work with proper compensation. These are the agencies of democracy. . . .

"Philanthropy in democracy must not consist in the mere doling out of largesses by those who are prosperous to those who are looked upon with a pitying eye, or for the purpose of securing the contentment of the giver in his self-indulgence. We must have that true democratic feeling, that sense of brotherly relation, that honest appraisement of our fellow men as men of like passions with ourselves—mayhap of fewer opportunities, mayhap of equal powers—but men like ourselves, whom we desire to help to make the best of themselves, or to relieve in their distress because they are our brothers and we believe in equality."

WAYWARD GIRLS

The development of a plan to do preventive work among girls and young women in danger of becoming morally depraved, and an effort to raise $25,000 for a new home, were among the signs of growth on the part of the New York Probation Association noted by District Attorney Charles E. Whitman, the president, at its second annual meeting. The plan for preventive work includes the division of the boroughs of Manhattan and the Bronx into six districts, in each of which it is hoped to have a paid worker. The salary for one such visitor has already been provided. Over $6,000 of the $25,000 needed for the new quarters has been pledged. The principal aims of the association, as stated by Maude E. Miner, its founder and secretary, are to rehabilitate girls and young women who have recently fallen into evil ways; to study the extent and causes of the social evil, and to

undertake preventive measures. Many of the new recruits in the army of prostitution, she said, are mere children; a large proportion are mentally below par, and many are exploited by men who live upon the proceeds of prostitution. While the association regards it as important to combat the business of commercialized prostitution which is often controlled by men, and while it has aided in many cases in prosecuting men who live upon such ill-gotten gains, the association seeks primarily to save and restore young women brought to court on charges of soliciting and kindred offenses and found to be in need of friendship and assistance.

During the past year 387 girls and women were referred to the association by the courts, the district attorney's office, and other agencies. About one-third of this number were kept temporarily at Waverley House, the home maintained by the association near the Night Court for Women. Classes in sewing, cooking, and other branches are held for the benefit of those who stay at Waverley House pending their trial in court, or while awaiting employment, or transportation to their homes. The association secured 180 positions for girls and women during the year, and it endeavors to keep a friendly oversight over all for whom it finds employment. Relief is given when necessary, and in about one-fifth of all cases during the year medical care, including hospital and dispensary treatment, was provided. During the summer seventy-eight girls were enabled to spend two or three weeks or longer in the country, most of them at the farm conducted by the association at New Milford. The association was instrumental in securing the provision in the inferior courts act of 1910 providing for the establishment by the city of a suitable detention home for women arrested and brought to the Night Court.

Miss Miner criticised the practice of fining prostitutes, and deplored the fact that so many women convicted of soliciting and similar offenses are committed by the New York courts to the workhouse. During a recent six months period 1,620 women convicted of these offenses were fined, and 551 were sent to the workhouse as against only three committed to the State Reformatory at Bedford. While the state institution at Bedford has excellent facilities for training and helping those committed to its care, the workhouse, through no fault of the Department of Corrections, but because of lack of appropriation, is so overcrowded that it is often necessary to put four or five women in the same cell, and little can be done to segregate young women from those who are hardened in vice.

CONVICTS AS FARMERS

The last semi-annual conference of the Colorado State Board of Charities and Corrections brought out a most interesting report on the work which prisoners from the State Penitentiary at Canon City have done outside the institution for the past four years. Some 1,500 men have been employed on ranches and garden tracts leased by the prison, in constructing a water system for Canon City and on public highways anywhere from one to 150 miles from the institution. Few escapes have been made in spite of absence of bars or manacles, and most of the few who got away were caught or came back of their own will. About 100 miles of splendid mountain road, half of it blasted through solid rock, and the value of the farm products raised give back to the state more than the $225,000 for maintenance which it appropriated two years ago. On the other side, the men improve in many ways and most of them who are paroled go direct from the work camps with no prison mannerisms to forget. No depredations or misconduct have been charged against the camps.

In fact the whole report as given by the warden, Thomas J. Tynan, backs up convincingly his plea for a well-irrigated ranch of 1,200 acres. The 184 acres on which the penitentiary stands are not available for either farming or pasturage. With such a ranch as he plans, the warden believes he could relieve the state of all maintenance charges.

The state's niggardly treatment of the reformatory at Buena Vista was brought out by Warden Felix O'Neill at the same conference. The altitude and gravelly soil give scant return for the farm work, the building —which is a cell block—is not built along modern lines, and it lacks such essential elements of a reformatory as shops, laundry and baths.

MISSOURI LIABILITY COMMISSION

With his usual promptness Gov. Herbert S. Hadley of Missouri had no sooner returned from the meeting of the House of Governors at Louisville than he appointed a commission on employers' liability in accordance with the resolutions adopted by that body. The commission has twenty-eight members, including representatives of both political parties, employes, corporations, railroads, lawyers and others. It is organized into two committees: one on factory inspection, child labor and women in industry, and the other on employers' liability and workmen's compensation. Both party platforms in Missouri endorsed the principle of workmen's compensation and there is said to be good prospect of securing legislation at this session.

KENTUCKY CHARITIES

Lafon Allen, in speaking at the recent Kentucky Conference of Charities and Correction at Louisville, showed how the Kentucky Child Labor Association, of which he is president, has cut off the "amateur nights" in theaters for children under age performing for prizes. A series of prosecutions have established four propositions at law, he said, which effectually stop such plays. The propositions are that it

is illegal to employ children under fourteen on the stage at any time; that it is illegal to employ children between fourteen and sixteen on the stage after seven o'clock at night; that "amateur nights" are a violation of the law; that a copy of the statute must be posted in each theater. Amateur nights have troubled child labor reformers in many states and the Kentucky decisions will be learned with the greatest interest.

The ravages of tuberculosis in the mountain districts were brought out by Eugene Kerner, who stated that one person out of every five or six dies of consumption. Trachoma and other eye diseases are very prevalent also, as was shown by Dr. J. A. Stuckey of Lexington. The people are poor, the doctors far apart, and there are no public institutions for treatment.

The conference brought together workers in many fields and summarized progress made, such as, for instance, the splendid success of the Babies' Milk Fund Association of Louisville, and the three laws secured at the last session of the legislature providing for the indeterminate sentence, parole, and the separation of first and confirmed offenders. Round table meetings of charity organization society workers and juvenile court workers were not the least of the interesting features. Dr. H. G. Enelow of Louisville, who has presided at the conference for the past two years, was succeeded by S. A. Malin of Lexington as president.

IOWA CHARITIES

That there is great need for increasing the number of state institutions was brought out convincingly at the last Iowa Conference of Charities and Correction at Des Moines—the twelfth annual meeting. At almost all of the twelve sessions the conference has been told the need for a separate institution on the colony plan for epileptics, but as Dr. Murdock Bannister, a member of the Board of Control of State Institutions, pointed out, it has scarcely advanced beyond the stage of discussion. Nevertheless, there is some prospect that the Legislature which met this month will act. Ida M. Wines and other workers among women delinquents pointed out that Iowa has no provision whatever for delinquent women. It is an agricultural state without large cities and without many of the conditions found in congested districts, but a reformatory similar to the one at Bedford, N. Y., was urged nevertheless and shown to be needed. Other institutions for which a plea was made were a home and hospital for crippled children, a psychopathic hospital, and a larger number of playgrounds. The small cities of Iowa have lagged behind others of their class in the playground movement. Forest C. Ensign of Iowa City was elected president; A. T. Burnell of Des Moines and George D. Eaton of Clinton, vice-presidents; H. L. Houghton of Sioux City, treasurer, and Dr. George Mogridge of Glenwood, secretary.

SOUTH CAROLINA CHARITIES

Interest at the last session—the second annual—of the South Carolina Conference of Charities and Correction centered in the need of a state board of charities, in a paper which was read by Miss E. McClintock of the College for Women at Columbia. The effort begun last year to secure the passage by the Legislature of a bill creating such a board will be vigorously followed up during the present session. A good start was given by the conference to the movement to establish a juvenile court. To this the speech of Walter B. Wilbur especially contributed. The allied subjects of child labor and compulsory education were presented by John Porter Hollis of Rock Hill and Prof. W. H. Hand of the University of South Carolina. The officers for the ensuing year are A. T. Jamison, Greenwood, president; Prof. D .D. Wallace, Spartanburg, vice-president; Walter B. Wilbur, Charleston, secretary and treasurer.

OHIO HUMANE SOCIETIES

The recently organized Federation of Ohio Humane Societies held its first meeting in Cleveland. Of the forty-one societies in the state twenty-three have joined the federation and eighteen were represented at the meeting. The federation will endeavor to set standards of work and efficiency to which all will be urged to conform. Having efficiency and progress as an ideal, the papers read before this first meeting were clear and valuable to the members. As an immediate result of the meeting twenty-three societies will use uniform records, and a field secretary will be employed to stimulate the work of existing societies, to secure co-operation, and to organize new societies in counties where none exists.

TEXAS CHARITIES

With the recent meeting at Houston, Texas joined the states which hold annual conferences of charities and correction. Besides general papers of interest and profit, a number were peculiarly timely and appropriate, as, for instance, when A. J. McKelway urged the conference to work for a good child labor law now while its industries are comparatively undeveloped and practically no children are employed, and for an accompanying compulsory education law. Two subjects having strong local application were the discussions of tuberculosis and of prisons.

Tuberculosis patients swarm to Texas from all parts of the country because of its climate, and as a result there is a big and trying problem. Tuberculosis is responsible for more deaths in Texas than any other one disease, and yet the state is doing practically nothing to educate the people in preventing its spread. It needs an active, energetic educational campaign.

The possibilities of the Texas penitentiary

system under the law passed by the last Legislature—a law which followed the disclosure of serious abuses—was the subject of a carefully worked out paper by Charles Shirley Potts of the University of Texas. Under this law all lease contracts for convicts must terminate by January 1, 1914, and the prison commissioners are empowered to buy land, erect buildings ,and otherwise provide employment for the men as fast as their leases expire. Outside Texas it will be learned with astonishment that the new law does not entirely abolish the strap, though its use is limited to the lowest class of prisoners and only as a last resort. The number of lashes is limited to twenty, the size of the strap is prescribed, and a record of each case of corporal punishment is kept. More promising features of the law are the reduction of time for good conduct, and payment of prisoners. A prisoner whose conduct is such as to gain him a reduction of time will be paid ten cents a day wages for his full time in prison. Dr. Potts pointed out that the law does not provide for an indeterminate sentence and hoped that it might be brought about at the first revision.

As a result of the conference, and particularly because of an address by Hastings H. Hart of the Russell Sage Foundation, the United Charities of Houston will extend its work and establish a child helping department.

The next conference will be held in Austin, January 22-24, 1912, with the following officers: President Charles Shirley Potts, Austin; vice-presidents, Henry Cohen, Galveston; John L. Green, Fort Worth; Ed. McCustin, Paris; Judge E. P. Eylar, El Paso; secretary, J. P. Kranz, Houston.

BOOKS FOR SOCIAL WORKERS

LILIAN BRANDT, Contributing Editor

AGAINST THE CURRENT. By Edward A. Steiner. Fleming H. Revell. New York. 1910. Pp. 290. Price $1.25; by mail of THE SURVEY $1.35.

In his latest book Professor Steiner has given a vivid picture of his own childhood in a Carpathian mountain town, and a remarkable record of the influences that chiefly formed his mind. It is the picture of a sensitive, rebellious child, learning from his Magyar and Slavic playmates what it meant to be a Jew, (though he loved the Gentile children best—perhaps, his sister explained, because he was "brother by vaccination" to one of them) but learning also, from manifold experiences, what it means to be a member of the human family. A new teacher, a Hungarian Jew of liberal culture, gave him his first ideas of Liberty, Equality, Fraternity. Bohemian literature on the sheets of unsanitary "sugar paper" secured from a studious candy-maker, the reading being devoured after the sweet coating had been licked off, introduced him to the scientific view of the creation of the world; and discussions with the candy-maker made of him temporarily a confirmed sceptic.

Tragic experiences were shared by the child prematurely, in addition to the insistent tragedy of race hatred in which he lived. He saw his school teacher's anguish over the ravishing of his beautiful wife by a Magyar official and knew of his consequent suicide. A peasant girl whom he had helped to tend her geese went away to the city and came back in disgrace. He was taken to say good-by to the miller's daughter when she was dying of consumption, and to receive from his friend the candy-maker, on a death-bed of torture, the assurance that there was after all a God. He vaguely understood the broken hearts of the Jewish Adèle and her Gentile lover. When his oldest brother was fatally wounded in his first engagement for the Hungarian king, the little boy ran across fields and overtook the carriage in which his mother was starting on her sad journey, and with her in the far-off German city he received his first impression both of the horror of war and of the unity of mankind, seeing "Slav, Magyar, Jew and Gentile, one in death, so much alike that a Jewish mother scarcely knew her own child."

The Lutheran pastor who at one Passover supper, having faced a dozen mobs to save the Jews from violence, came into the house and sat in the hallowed place prepared for the Prophet Elijah, gave him a glimpse of "a Christian vision," and the incident no doubt had its influence in turning him later towards Christianity, as holding "in its spirit the solution of class and race problems." A broken Jewish soldier, coming home to die after serving in our Civil War, made Abraham Lincoln one of his first heroes. His face was turned steadfastly toward the new world by friendship with the children of a prosperous family who came to the town, seeking obscurity in the home country until the father's misdeeds in an American city should be forgotten. After running away for America, with an epileptic boy from the House of the Poor for company, and being arrested not far from home and lodged in jail as a vagrant, he was sent away to school, and childhood was over.

The student life in gymnasium and university, in Vienna, Pilsen, and Heidelberg, is touched only lightly, except for the pilgrimage to Tolstoi, which did much to strengthen the

conviction that national and racial barriers are but superficial and artificial.

It is a moving recital, and rings true, in spite of the wealth of unusual and dramatic incident. In thus writing the story of the development of his own mind and heart, with sincerity and frankness and vision, Professor Steiner is doing his greatest service to the cause which he avows as the passion of his soul, the promotion of the brotherhood of man. It is a new kind of "immigration literature." If other Americans whose early lives were passed in distant lands could give us similar records mutual understanding, and by consequence the "process of assimilation," could not but be hastened.

THE ECONOMIC POSITION OF WOMEN. Edited by Henry Raymond Mussey. The Academy of Political Science, Columbia University, New York. 1910. Pp. 193. Price $1.50 postpaid by THE SURVEY.

"In the field of production" should be added to the title of this volume to describe accurately its contents, for the position of women as consumers of wealth—which is still their primary economic function—is not considered. And this addition might be further qualified by "especially in the manufacturing industries," for it is the factory worker whose problems are discussed in the greatest detail, and whose case is chiefly in mind in the general papers. Saleswomen and school teachers are each the subject of a paper, but the great army of clerical workers is almost unnoticed. Public interest in wage-earning women has been first aroused for those who most need protection. Later it will extend to the rest, and there can be no doubt that the problem of increasing the efficiency of stenographers and clerks is one of the most serious in connection with women's work, the solving of which is perhaps as important for the general welfare as is the extension of protective legislation for the women in industry.

Within the natural limits as to scope, determined no doubt by the material available, the editor has handled his subject ably. The book begins with a historical sketch; next, some of the conspicuous problems are stated; a final section is devoted to the social action which the problems call for.

This collection of papers is remarkably free from the defects that are common to such compilations. There is an unusually consistent point of view, and the repetitions which occur are not objectionable, giving the impression of reinforcements and confirmations rather than of careless editing. The book gives an encouraging sense of a large number of persons thinking intelligently on these problems, investigating carefully, and experimenting sanely. It is interesting that most of the contributors are women: Helen L. Sumner, Mary Van Kleeck, Alice P. Barrows, Elizabeth B. Butler, Emily Greene Balch, Susan M. Kingsbury, Mary Kingsbury Simkhovitch, Florence Kelley, Alice Henry, Helen Marot, Sarah Louise Arnold, Mary Schenck Woolman, M. Edith Campbell, Josephine Goldmark, and Carola Woerishoffer. The only men who have a part in the book, aside from the editor (whose admirable introduction is no doubt only a small part of his contribution) are John Martin and Ernst Freund.

WHAT EIGHT MILLION WOMEN WANT. By Rheta Childe Dorr. Small, Maynard and Company. Boston. 1910. Pp. 339. Price $2; by mail of THE SURVEY, $2.20.

The eight million women are the members of the affiliated societies of the International Council of Women, of whom the American representatives, the members of the General Federation of Women's Clubs, number 800,000. What the author aims to do is "to show the instinctive bent of the universal woman mind in all ages, reflected in the action of the freest group of women the world has ever seen." The theme is not consistently maintained, and the book is a collection of popular articles on certain social problems in which women are or ought to be interested, rather than a descriptive or analytical account of the activities of the American club woman and her mental processes. Nor is there any analysis of the discrepancy (implied in the title) between the "collective opinion of women" on these problems, and the collective opinion of men.

"Facts" are handled ingeniously, but sometimes carelessly, and not infrequently statements are made, as of facts, which one would be hard put to it to verify; though on the whole Mrs. Dorr has evidently been at some pains to inform herself and to use her material with discrimination, and the presentation is generally clear and interesting.

ROADTOWN. By Edgar Chambless. The Roadtown Press. New York. 1910. Pp. 172. Price $1.25; by mail of THE SURVEY $1.39.

The underlying idea of Roadtown is "line distribution of population" so that the new city shall "fit the rail, pipe and wire civilization of today." Mr. Chambless proposes to lay the skyscraper down on its side and extend it out into the country instead of up into the air. In place of our many kinds of transportation facilities—street cars, subways, elevators, wagons, which most of us have occasion to know do not fit together any too well—he would provide in the basement of this indefinitely extended house a unified system of passenger and freight transportation.

His attractive picture of apartment house conveniences stretching out through the countryside, with unrestricted view for all, no narrow air shafts with noisy neighbors on the other side, household drudgery all but eliminated through pooling it at various places along the line—only to hint at the advantages he describes—receives plausibility from his insistence that the scheme involves great economies in construction, and the utilization of inventions which can be carried out best on

the "line" principle. Moreover, actual estimates of engineers are submitted, something not often found in schemes which most people please to call utopian. Still further, the author states that many inventors have donated to the plan the use of their inventions, among them the poured cement house by Thomas A. Edison and the Boyes monorail.

The earnest, persistent devotion of Mr. Chambless to his idea is noteworthy, and is enthusiastically praised by two "forewords," one by Julian Hawthorne, and the other by the Rev. John Haynes Holmes of the Church of the Messiah, New York.

JUST FOLKS. By Clara E. Laughlin. The Macmillan Company. New York. 1910. Pp. 377. Price $1.50; by mail of THE SURVEY $1.61.

The "folks" live near Hull House and are the friends of a probation officer of the Juvenile Court. She lodged with "Liza Allen, Fashionable Dressmaking" rather than at Hull House, chiefly because "she knew the attitude of the nineteenth ward toward what is regarded as the professional benevolence of the settlement." The *laissez-faire* theory of philanthropy announced in this and other allusions to Hull House is maintained throughout. When any one needs shoes or rent-money the little probation officer persuades her fiancé, a reporter, to get a story into his paper, or to "pass the hat around" in his office. The birth of a baby, only to die within a few days, in a family where none of the other children had any sort of chance, is presented as a wholly beautiful and poetic incident. The "charity organizations" never by any chance act either with ordinary intelligence or with common humanity.

Many of the characters are already familiar to magazine readers. Each one is a type, and is made so consistently "typical" as scarcely to be real. Liza Allen and Mrs. Casey are bottomless wells of philosophy and wit, and they speak chiefly in epigrams, which are frequently amusing, sometimes wise. The affairs of the various Caseys, Slinskys, Gooches, and all the rest, hold the interest, and the book may easily succeed in rousing sympathy for the very real problems it represents, and it may suggest to some people the fact that "the poor" are not a class apart, but are moved by the same passions and impulses as the rest of humanity, and have the same virtues and faults.

NEIGHBORHOOD ENTERTAINMENTS. By Renée B. Stern. Sturgis and Walton. New York. 1910. Pp. 288. Price, 75 cents; by mail of THE SURVEY, 84 cents.

This volume of The Young Farmer's Practical Library gives specific suggestions for increasing social pleasures in rural communities and so mitigating one of the unfortunate features of country life in America—the isolation and lack of facilities for recreation. In the first part of the book the possibilities of local improvement associations, clubs, societies, and social centers are discussed; in the second, home entertainments purely for pleasure, and festivals for Easter, Arbor Day, and other special occasions. The suggestions throughout are based on successful experiments, and are intended to be especially useful to the farmer and villager cut off from libraries, exhibitions, and daily contact with a variety of his fellows, but "who is striving to make the life of himself and his family broader and brighter, as well as to increase his bank account."

Contamination of the Air in Public Buildings By Dust.

Treatment of Floors the Logical Preventive.

THE AIR in public buildings, schools, stores, etc., usually contains a greater or less quantity of impurities. Such contaminations of the air may not only be injurious to the respiratory organs, but they can also become a positive menace to health, particularly as such dust in the air is almost invariably polluted with disease bacilli, some of them the germs of Tuberculosis, Typhoid Fever, Asiatic Cholera, Diphtheria, Yellow Fever, Pneumonia, and other ills equally dangerous.

The actual presence of these germs of disease in dust constitutes one of the greatest dangers of mankind, for these micro-organisms multiply a thousand fold in an exceedingly short space of time. Therefore it follows that if a person affected with any infectious disease should mingle with a throng of people in some public building, the effluvia from his infected body would shortly pollute the air with the germs of that particular disease.

In time these germs would multiply and mingle with the dust circulating throughout the building. When the room is vacated and quiet restored the dust and germs settle on the floors. If the floor surface is dry, any slight movement or air-current would be sufficient to whirl the dust into the air again. On the other hand proper treatment of the floor will hold all dust that settles on it and *destroy* all living germs.

Standard Floor Dressing is a preparation made for that particular purpose. It is the logical preventive of dust and the transmission of disease by dust. By keeping wood floors at just the right degree of moisture it catches and holds every particle of dust and every germ touching it.

They cannot rise into the air again because of the dressing, so that the sweeping of floors treated with Standard Floor Dressing will not create a particle of dust to pollute the atmosphere a second time.

This treatment of floors is not merely a precautionary measure for the prevention of disease, but it is a distinct benefit to the floors themselves. Standard Floor Dressing has a peculiarly beneficial action on the wood, for floors treated with the dressing will last for many years longer than those untreated, and moreover the wood will not crack or splinter.

Then again, because a dressed floor eliminates dust, the actual labor of sweeping and caretaking is materially reduced, and at the same time the cost.

Standard Floor Dressing is *not* intended for household use, but *it is* indispensable for the treatment of wooden floors in every public building, every school, college, hospital or store.

The application is simple and easy. Three or four treatments a year by means of the patent Standard Oiler will produce the sought for results, as the dressing does not evaporate, and the Oiler distributes the dressing evenly over the floor.

For the benefit of those who are combating the transmission of infectious diseases, physicians, and those in charge of hospitals and sanitariums in particular, we are making a remarkable offer. To demonstrate that Standard Floor Dressing *will eliminate* dust and *kill* disease germs, we will treat the floor in any one room or corridor in any hospital, sanitarium, school or public building.

To localities far removed from our agencies, we will send free sample with full directions for applying.

Physicians of national reputation have tested Standard Floor Dressing and pronounce it the ideal dust preventive. Our comprehensive book "Dust and Its Dangers," will be sent gratis to all interested, together with testimonials and reports of those who have used and experimented with Standard Floor Dressing. Sent on request.

THE COMMON WELFARE

CHILD WELFARE EXHIBIT OPENS

The most ambitious exhibit of social work and needs ever attempted, the Child Welfare Exhibit in New York, opened last week in the Seventy-first Regiment Armory, and will continue day and night until February 12. The exhibit has been in preparation for sixteen months, in addition to earlier planning and preliminary work, and has cost $70,000. It occupies at the armory one of the largest rooms under a single roof. The center is arranged as a court of honor with many seats, a speakers' platform and screen for moving pictures. The exhibits are arranged around the sides. The general scheme of display and the soft gray background are remarkably effective.

The sections, each of which was in charge of a special committee during the months of preparation, are on associations and clubs; churches, temples and Sunday schools; health; homes; laws and administration; libraries and museums; public and private philanthropy; streets, recreation and amusements; schools; settlements; work and wages.

The exhibit consists chiefly of facts, figures, and photographs, displayed on large gray frames after the customary manner of social exhibits. The more striking exhibit devices — such as the blinking electric light of the tuberculosis exhibit or the many compelling features of the congestion show or the budget exhibit—were excluded. There are some very attractive model rooms and other departures from the card displays. These have drawn the crowds. A careful estimate of the exhibit as a whole cannot be attempted at this time. The attendance is large and the programs are admirable.

The exercises on the opening night began with singing by one thousand school children, after which Borough President McAneny spoke in behalf of the city government whose officials, he said, were beginning to recognize that the municipal government should be the greatest of social workers. Mrs. J. Borden Harriman, chairman of the women's committee, urged the duty of mothers to look beyond the walls of their own nurseries and help neglected children outside; and Robert W. deForest, as member of the general committee of the exhibit, told of its scope and objects. He illustrated the method of preparing the exhibits by the work of the committee on law and administration, which had not only studied the New York system, but had compared it with the systems of other localities, and from this study had been enabled to offer a tentative program for improvement in New York.

The first five days of the regular afternoon and evening conferences were devoted to education. Superintendent Maxwell presided over the first conference, on the public school and the child, and the principal speakers were John Martin of the Board of Education and Prof. Frank M. McMurry of Teachers College. The paper by Principal James A. O'Donnell on Self-government and the Teaching of Civics, was practically illustrated by a group of school boys who enacted a meeting of the city Board of Estimate and Apportionment. The wider use of the school plant as a civic and social center was treated by Edward W. Stitt of the Department of Education, and graphically presented by charts in the education exhibit which showed the folly and extravagance of working the school plant only five hours a day on five days in the week.

The session on special school problems included the account given by Elizabeth Farrell, inspector of ungraded schools, of the work done for that number, anywhere from one to ten per cent of our school children, who are subnormal either through physical defect or mental handicap. She described the method of interesting and bringing out the intelligence of those of the 1,998 children in the ungraded classes of New York who were capable of development,

Minor in St. Louis Post-Dispatch.

A NEW YEAR'S RESOLUTION: "I WILL NEVER SMOKE AGAIN."

and urged that those who are found to be incapable, and who after school life is over now swell the number of our delinquents, should be permanently cared for by the city.

Quite as interesting as Miss Farrell's work for the handicapped was the open air school described by John Doty of Public School 21, where twenty delicate children are studying, eating, playing, and taking their noonday rest in the fresh air all winter long, and in all cases making the satisfactory gains in both weight and intelligence which are common to all open-air schools.

At the session devoted to vocational education, Mary Schenk Woolman outlined the work of the Manhattan Trade School in enhancing the economic value of young girls whose home conditions make a long course in industrial training impossible. Herman Schneider told something of the success of the Cincinnati public schools in providing half-time technical study in the schools for working boys, and in sending visiting teachers to give courses in factories.

The conferences on Sunday and Monday were devoted to different phases of religious education.

Throughout the week afternoon and evening drills and dances have been given in the large hall of the armory by girls and boys from five of the public schools and the Young Men's Christian Association. The band from the DeWitt Clinton High School and the chorus from the Washington Irving Hight School furnished music at the conferences.

JEWISH ATTITUDE ON IMMIGRATION REPORT

At the recent conference of the Union of American Hebrew Congregations, which drew to New York the leading Jews of the country in large numbers, the Jewish position in regard to the recommendations[1] of the Federal Immigration Commission was presented at length by Max J. Kohler of New York. Although he approved the demand for better boards of inquiry and for better distribution of immigrants by limiting the number admitted at any given port of entry, Mr. Kohler disapproved highly of the restrictionist policy evidenced in many of the other recommendations, which he characterized as the first step toward a return to the "Know-Nothing" policy of the sixties.

He challenged the conclusion of the report that there is an oversupply of labor in this country, pointing out that the commission's investigations were made in a year of panic and that at the present time the agricultural states are showing little or no increase in population, Iowa even showing a decrease. Farm and other forms of unskilled labor, he held, are actually needed in the United States and it is these forms of labor that the present day immigrant from southern and eastern Europe can supply.

The proposed effort to equalize race values by establishing percentages of each race to be admitted he felt to be impracticable, liable to give free play to race

[1] See the Survey for January 7.

prejudice, and unnecessary, because whatever the race admitted the problem of the alien in America, he said, is a problem of but one generation, on account of that marvelous assimilative power of American institutions commented on by James Bryce. The scientific investigations of the commission itself show how potent America is to make Americans, as even in physical characteristics the children of foreigners are found to be Americans and not aliens.

The proposition of a money requirement he deemed unnecessary and unfair if the alien offered a healthy body able to work. Literacy, too, as a requirement, he dismissed as unnecessary on the same ground, and also because it is a problem of but one generation, as the children of the illiterate foreigner show a larger percentage of literacy than do those of the native born.

Finally, he held that the recommendation to exclude men without families would both keep out of America the most fluid element in our labor supply and would also work great injustice on those men who come over alone in order to prepare homes for their families in the new world.

A further defect in the recommendations of the commission and a defect of the utmost importance, he held, was the neglect to provide that those emigrating from their native country on account of religious or political persecution should be relieved of any but the minimum requirements for admission.

The true solution of the immigration problem Mr. Kohler believes to lie not in a policy of restriction, but in a wide extension of the movement for better distribution of population carried on by the Jewish Industrial Removal Society which he held has placed some 55,000 persons where their labor is needed, as well as by the Federal Information Bureau of the Bureau of Immigration.

Our present law as it stands met with Mr. Kohler's approval, but he found much to criticise in its administration. The present administration has by free interpretation of the law constituted itself a law in itself, he said, and already practically adopted some of the present recommendations of the commission, such as the money requirement for entrance, and the tendency to exclude men without families. The medical test has also become more exacting than the law, as he understands it, requires and he charges that the boards of inquiry adopt unfair methods in passing on doubtful cases—both in treatment of witnesses and in not keeping written records as the law requires—and pass such careless judgments that fifty per cent of their exclusions are reversed on appeal. Within the last two years the percentage of exclusions of Jews alone has risen from .84 per cent to 1.86 per cent.

Secretary Nagle, of the Department of Commerce and Labor, in his reply to Mr. Kohler's criticism of the present administration, said that he believed that in the vast majority of cases the free interpretation of the law worked in favor of the alien. This he knew to be the fact in appeal cases, and he believed that as far as it could be done by a small number of men called upon to do too large an amount of work this was the case at

New York Press.

CHANGING STYLES

In China an imperial edict and in New York a decree of fashion are reducing hair. The two do not usually go together, for, as an investigation at the Child Welfare Exhibit found, the hair of Chinese coolies is transformed in damp East Side cellars into the most bewitching puffs and curls.

Davenport in New York Globe.

TO THE FARMS OR THE SLUMS?

the ports also. He believed that the great need of the Immigration Bureau was a quantitative and a qualitative improvement in its employes, and especially in the boards of inquiry.

TEACH PRISONERS THROUGH CORRESPONDENCE SCHOOLS

The system of instruction instituted by Anna Ticknor and her friends many years ago in Boston was probably the first attempt at thoroughly good teaching by mail. The various teachers were scattered throughout New England and the pupils were distributed all over the United States. The Chautauqua and other systems have followed, but as yet there has been no systematic use of such methods for reaching prisoners. A few of our best penal and reformatory institutions have allowed specially selected inmates to take advantage through correspondence schools of instruction in higher branches, such as mechanical drawing, mathematics and designing. The best prisons and reformatories have instruction in the common branches within the walls.

The English prison board is ahead of us in the correspondence school as a definite plan. The Home Office is to have courses given to convicts sentenced to long terms and to boys in the Borstal institutions, by means of the International Correspondence Schools. This decision is the result of an experiment with twelve inmates of one of the Borstal institutions whose records were admirable. Two of them are making great progress in navigation, algebra, geometry and trigonometry, to prepare to be navigators; another is taking up mechanical drawing. They are to be allowed to study languages by the modern method which uses the phonograph. There are also to be illustrated lectures to inmates of prisons on the industries of the country, as a spur to these young men to fit themselves for honest work on their release. The experiments will be watched with great interest by prison officials and if successful will surely find imitators in other lands.

COURSE FOR TEACHERS OF BACKWARD CHILDREN

The stand taken some years ago by the Training School for Backward and Feeble-minded Children at Vineland, N. J., that a public institution must do more than merely house and feed those in its care, has borne new fruit in a winter course of professional training for teachers in special classes of the public schools which will open February 7. The Vineland institution has become practically a laboratory for the study and solution of the social and scientific problems which fall within its scope. It has for eight years conducted a successful summer course for teachers, and from this has grown so great a demand that the winter course will be opened, covering a much longer term—until April 30—and both more extensive and intensive in its work.

The course is based on the realization by the superintendent, E. R. Johnstone, that the problem of backward and defective children in public schools grows more serious every year. They must be segregated in special classes, not only for their own sake, but even more for the sake of the normal children who are their associates. The results of special classes wherever established have exceeded all expectations. The missing link in the

thorough working out of a system for backward and defective children is the specially trained teacher, and it is this expert training which the institution plans to furnish.

The students will have opportunity to observe backward and mentally defective children in every phase of their home, school, and social life, and will receive definite instruction in method, theory, and practice.

The announcement shows a rounded program of lectures by Superintendent Johnstone, Dr. Goddard, the director of research, and Mrs. Nash, the principal of the school department. There will be opportunity to teach these children in the schoolroom and in vocational training classes. Individual children will be assigned for study and classification and students will carry on special investigations in the laboratory, where practical tests of mental capacity and the uses of various pieces of apparatus have been skillfully demonstrated. Membership will be limited to teachers already doing work in special or ungraded classes and those who contemplate taking up such work.

Details of the course, tuition charges, and other information can be secured of Mr. Johnstone.

THE CHOLERA IN CONSTANTINOPLE

Although the American College for Girls at Constantinople began the year most auspiciously with about 250 pupils in attendance and the construction of its new buildings well advanced, the success of its work is now seriously menaced by cholera. Emily Ray Gregory, professor of physiology and hygiene in the college, writes under date of November 25: "The cholera has come, and has now reached such proportions that the city day schools have been closed, and all schools national and foreign having boarding and day students have been requested by the Sanitary Commission to close their doors to day students for a week."

Such a situation is particularly difficult to deal with in Constantinople because of the ignorance and superstition of great masses of the population. A

Bradley in Chicago News.

BETTER FIRE APPLIANCES ARE NEEDED.

rumor which is said to be rife among the ignorant, that cholera victims are poisoned if discovered by the physicians, leads to the concealment of cases. The great need is for instruction in cleanliness and other simple means for the prevention of conditions that lead to cholera and similar diseases. The city government recognizes the fundamental importance of such instruction, both in hindering the spread of the disease at present and in preventing a recurrence of the epidemic, and has asked the co-operation of physicians, teachers, and the press in educating the public.

Professor Gregory, although her department has no endowment for the purpose, has entered bravely upon the campaign. With only a small sum which was given her recently by a visiting physician who saw the pressing need of such instruction, she has instituted two courses of lectures in Turkish, one at Stamboul and the other at Constantinople, and is making the prevention of cholera her principal theme. Without funds her efforts must of necessity be cruelly hampered, but the courage with which she has entered upon the fight, in face of the certainty that it must soon be discontinued if financial assistance is not forthcoming, may go far toward securing for the college an endowment for instruction

Minor in St. Louis Post-Dispatch.

DISGORGING.

in preventive hygiene, for which there is nowhere more urgent need. Borden Parker Bowne, 380 Longwood avenue, Boston, is president of the American College for Girls Corporation in this country.

NATIONAL CAMPAIGN FOR POSTAL SAVINGS BANKS

The campaign for a postal savings bank system was one of the three tasks which, at the beginning of last year, THE SURVEY urged as a national program for social workers to set themselves for 1910. Owing to the interest shown by President Taft the first step has been taken. A few banks have been opened. But the success which has followed from years of effort may be only partial unless a watch is kept to see that the system receives a fair trial. During the first week of January, newspapers printed meager telegraph reports from some of the offices giving the news of the first few days. Since then little has appeared about Uncle Sam as a banker. After two requests for fuller details, which the department at Washington ought at least to have, an answer to the second came from the secretary of the Board of Trustees of the Postal Savings System, saying: "In reply I regret to state that it will be impossible to furnish you with this information."

The news reports available seem to show that very fair results have been secured where the fact that the banks had been opened received sufficient advertising. In Nebraska City, Neb., it is reported that many patrons were turned away because of a lack of certificates of deposit of the larger denominations which, if true, shows that a slip was made in the preparations. At Deadwood, S. D., and Dover, Del., the public at large did not know that the bank had been opened. At Dover the reports state there were not even any signs in the office about postal savings. Satisfactory business seems to have been done at Port Arthur, Tex., where many foreigners made deposits; Brunswick, Ga.; Rutherford, N. J.; Ashtabula, O., and Olympic, Wash. At Pekin, Ill., there was quite a rush and 300 accounts were opened. Poor results were secured at Houghton, Mich.; Middlesboro, Ky., and in New England, where perhaps it was to be expected since the savings bank is such a well established institution in that section of the country. At Bristol, R. I., school children made many deposits, which was probably due to the interest taken by the local school authorities. Deposits by mail from all over Alabama were received at Bessemer, but these were returned. The local deposits were large owing partly to the interest of the president of the Bessemer Foundry and Machine Company who was himself the first depositor. In one instance a local bank had to raise its rate of interest to prevent a loss of deposits.

From the general tenor of the reports it seems that, though the postmasters of the offices selected in thirty-six of the eastern states were called to Washington for instructions, the department did not

take active measures to advertise the new feature of the service. The success or failure during the first week seems in several cases to have been due to the interest, or want of interest, of people in the cities selected who are in a position to influence others.

The interest of social workers, which led them to establish such organizations as the Provident Loan Society and the Penny Provident Fund, should make them see that the facilities offered by the postal savings banks are used. The many settlement, school, and church savings funds for children should serve as feeders and advertising agencies for the government savings depositaries. Stamp stations for the penny provident funds should be encouraged in the cities in which postal savings banks have been established. It should be fairly easy to ask the poor, the ignorant, and the foreigner to trust the government. Collections made at schools and churches can be deposited with the post office. This is done very successfully in Great Britain. The results of the first few days in Bristol, R. I., and Bessemer, Ala., show what can be done by active encouragement. If social workers, ministers, and employers suggest the use of the government banks their deposits will augment, so that the government will have no excuse for failing to extend the system as rapidly as possible.

Pittsburgh Gazette—Times.

PROMISING BUDS.

BOILER INSPECTION BILL PASSES FEDERAL SENATE

After years of persistent effort the Brotherhood of Locomotive Engineers, of Linemen and Enginemen, of Railway Trainmen, and of Boilermakers have succeeded in getting a bill for the inspection of locomotive boilers through the United States Senate. With the exception of inadequate inspection laws in a few states, the United States has hitherto almost entirely neglected the question of the prevention of boiler explosions, with the result that this class of industrial accident is more than three times as common in America as in continental Europe and England. At the last session of Congress a bill providing tri-monthly inspection of locomotive boilers, under the supervision of a general inspector having at least five years' practical experience as boilermaker or engineer, and setting a penalty of $1,000 for each violation of the law, was defeated by the continued opposition of railway companies, master machinists and boss boilermakers.

The present bill is the result of a compromise between the opposing forces. It provides for fifty inspectors who shall make such a number of inspections of each boiler as "are consistent with their other duties"; requires only that the general inspector and his two assistants "shall be selected with respect to their practical knowledge" of boiler making, and imposes a smaller penalty for violation. It is, however, an advance over the law for inspection of marine boilers—the only other federal legislation on the sub-

ject. It will be presented to the House of Representatives as H. B. 25,924, and it is hoped that its expected passage there will be followed by an effort to obtain uniform and adequate state inspection of stationary boilers.

FIRST AID IN PEACE AS WELL AS IN WAR

The American Red Cross has put on the road a special Pullman car contrived as a hospital-on-wheels for use at disasters and as a moving lecture room on first aid work. Besides cooking, eating and sleeping quarters for the staff it has a room twenty-six feet long which can be used as either emergency hospital or lecture hall.

For use at the scenes of accidents the car has an equipment of scientific apparatus, such as the Draeger helmet which is put over the head of a man entering a mine filled with poisonous gases and smoke, and the pulmotor for restoring respiration to asphyxiated persons.

The chief purpose of the car, however, is educational—to teach the essential principles and methods of first aid work to workmen in dangerous trades. Here it can be made the means of saving many lives. The Red Cross points out that in certain industries deaths from disease are insignificant in comparison with deaths from accident. In the registration area (comprising 55 per cent of the country's population) accidents in 1909 caused over 67 per cent of all deaths among steam railway employes between the ages of 25 and 34; over 61 per cent among miners and quarrymen and over 28 per cent among iron and steel workers. The accident death rate for the workers in all mechanical and manufacturing pursuits is 21.9 per cent.

These are the people the Red Cross is trying to reach with its first aid car.

Dr. M. W. Glasgow is in charge. Dr. M. J. Shields, another Red Cross first aid surgeon, has been detailed to the seven rescue cars of the United States Bureau of Mines. The first aid departments is under the direction of Dr. M. J. Shields of the army medical service.

ILLINOIS REPORT UPON INDUSTRIAL DISEASES

Effort to study and combat occupational diseases in the United States has lagged behind that of European countries. The report of the Illinois Commission on Occupational Diseases which has been submitted to the Legislature recommends legislative action. It should stimulate other states and the federal government aggressively to push forward investigations and secure laws needed to bring this country up to the standards set by others in protecting workers from injurious conditions of labor.

Although the scope of the Illinois inquiry included a wide range, special emphasis was placed upon lead as the most

RED CROSS FIRST AID CAR.

Available for emergency work at disasters, but designed chiefly as a traveling school to teach first aid methods to workmen in dangerous trades.

important industrial poison. The commission declares that in most cases the effects of this and other health destroying factors in daily work are easily preventable.

The membership of the commission comprises leaders in business and industrial interests of the state, public health officials, and other representative citizens. The report should lead to the passage of the bills proposed. A summary of the findings and the suggested legislation will appear in an early issue of THE SURVEY.

EDITORIAL GRIST

SOCIAL ASPECTS OF SUBWAY PLANS

JOHN MARTIN

Plans for the extension of rapid transit by subways and elevated lines in New York may be considered from various standpoints. Tenement dwellers, taxpayers, investors and real estate developers have differing and, sometimes, antagonistic interests in the matter. Social workers are special attorneys for the tenement dwellers. Primarily they are concerned to secure such developments as will make life easier and wholesomer for the thousands of families that are packed into diminutive flats, panting for air, stinted of sunshine, painfully scraping together the rent. Taxpayers are well organized and skilful in voicing their interests; real estate developers, before whom golden millions dangle from new lines in outer suburbs, are sleepless in urging their claims; and financiers, who scent promotion profits and increased values for their property in the present subway, are keenly alive to their own welfare. But tenement dwellers have few to guard their interests and to examine proposals with an eye single to the effects on their comfort and their rents.

Even city officials are apt to consider that their primary duty is to protect "the city" by securing the highest net money return for franchises, which may go to the relief of taxes. They forget, sometimes, that "the city" is the body of taxpayers in their corporate capacity—a body only 20,000 strong in New York city—and that the other 4,000,000 odd are not directly benefited by profits from municipal franchises which lower the tax rate a point or two, since, as was recently shown in THE SURVEY, economists are practically agreed that the tax rate has very little, if any, effect on rents.[1]

While therefore city officers are in duty bound to safeguard the interests of taxpayers as against franchise corporations, still more are they under moral obligation to represent, with unwinking vigilance, the inarticulate rentpayers, whose housing and health are the most important factors effected by rapid transit improvements.

What factors most affect the tenement dwellers in the matter? (1) A five-cent fare with universal transfers, and (2) the opening of large new areas to settlement. Consider these in turn.

A humble nickel is the highest fare that a wage-earner can pay for each of his double daily journeys. He cannot reside in any district to which, either on account of a fare graduated according to distance or on account of transfer to different lines, the total charge is over five cents. A double fare on account of transfer means to him at least thirty dollars a year extra—or two weeks' wages. As the joint committee of the Chamber of Commerce and the Merchants' Association says:

> To the multitude of individuals who will use the subway system a single fare, with transfers, as against a double fare, means a saving to them every year of many millions of dollars. It also means the fairly even spread of population all over the city. A double fare, with so-called independent and competing lines, means the concentration of population within the limited areas that can be served by one system or the other. No feature of the subway problem approaches in the gravity of its consequences the importance of making the city's subway system a means of distributing population rather than a means of re-concentrating it.

So much has been accomplished by the Committee on Congestion of Population. To-day commercial bodies lay stress upon the importance of scattering the city's population.

[1] "Who Pays the Taxes in Growing Cities? By John Martin. THE SURVEY. October 15, 1910.

There are two schemes of transit development under active discussion in New York—the triborough and the interborough routes. If the triborough line be built, independent of and designed to compete with the existing subway, as its advocates proclaim, then the underground transit of the city will be in two distinct parts and a ride on both parts will cost two nickels. If the interborough plan be executed, the underground system will be unbroken and a nickel will carry a passenger from any point on it to any other point.

Further, the interborough plan, in the words of the joint committee, "makes it certain that a single fare will prevail over all future developments of the system."

It is argued that, should the triborough line be constructed, the city would be able to compel the Interborough Company, by business necessity, to exchange transfers with the operator of the triborough system. That is a prophecy. No precedent justifying such an optimistic prediction is quoted. More likely, as Mayor Gaynor has pointed out, the operator for the triborough line, who must be secured by open bidding, will be the Interborough Company acting under another name; and even if an independent operator were secured a combination, by agreement with the Interborough Company, would be more probable than an active competition between them. And the double fare, a mine of wealth, would surely be retained. Competition as a means of regulating municipal franchises is outworn and discredited. Public service commissions are the modern devices for effecting such regulation. Monopoly is inevitable and indeed, under regulation, desirable. A bird in the hand is worth two in the bush. To the wage-earner the certainty of a single fare over the whole system is worth much more than the hope that the pressure of competition will compel an exchange of transfers between separate lines.

(2) The next great concern of the tenement dweller in the problem is that wide, unoccupied areas in the Bronx, Brooklyn, Queens and Richmond, the breezy expanses which stifling rentpayers are panting to gain, shall swiftly be brought into use, so that acres of new houses may offer space to the 150,000 persons added each year to the city's population, in order that greater pressure on existing accommodations may not force rents still higher. As was shown in the article above referred to, the competition of accessible new houses in the outer zone is the strongest economic force that restrains the elevation of rents all over the city.

The interborough plan would render available much more new land than the triborough plan, and especially as that plan was amputated in Brooklyn in the proposals of Mr. McAdoo. Further, the contracts for the triborough route thus far advertised by the Public Service Commission do not include a single yard of track into any undeveloped territory, and there is grave danger that, should the triborough route be decided on, the bifurcating limbs into Brooklyn on the south and the Bronx on the north, which alone would run into virgin districts, would not be built for many years on account of their cost. In order to show that the city's credit within the next five years would be sufficient to construct these extensions, the comptroller and the president of the Board of Aldermen predicate the use of one-half of the dock bonds that may be released from the calculation of the city debt. But the urgent necessity for improvement of the city's dock system will hardly permit such a division. Certainly it is risky to count on it.

When experts declared that the far-stretching limbs of the triborough route could not be built and the whole system operated on a five-cent fare, the project of paying for them by assessment on the land values they created was devised. That device would so reduce the fixed charges as to make a nickel fare unassailable. But, unfortunately, the legal provisions for such a scheme, drafted by the Public Service Commission, have proven defective and the commission has postponed consideration of the necessary amendments of the law. Therefore the building of the outlying links under the triborough plan would probably be long

deferred. By the construction of the abbreviated route the rents of tenement dwellers would practically be unaffected.

Further, as the hostile report of Messrs. Prendergast and Mitchel states, the interborough scheme "has really accepted the triborough's route and added a short extension to its own system northward to White Plains road. In Brooklyn it has again adopted the triborough routes, except Broadway, adding an extension of its present system outward along the Eastern Parkway to Buffalo avenue." These additions, which citizens formerly despaired of compelling the interborough to adopt, render its plans superior to its rival's with respect to the new lands to be brought into occupation.

Though tenement dwellers are not directly concerned with the financial costs of the competing systems, they are affected by one feature—the third-tracking of the Second, Third, and Ninth elevated lines and the adoption of elevated construction in Brooklyn and the Bronx.

An amazing feature of all the plans is the cool assumption that mile upon mile of new elevated track may be built, without the restriction, even, that, except for fifteen per cent of the route, a type of construction shall be adopted which will permit noiseless operation. In a decade or two the new streets traversed by the proposed elevated structures will be densely peopled. Then citizens will wonder why the city permitted, in 1911, a type of structure which sacrificed people to dollars. Cleveland is installing a type of subway which costs no more than an elevated structure. And the offer of the designer to put that type at the disposal of New York has been ignored by the Public Service Commission. Surely the elimination, not the multiplication, of elevated lines is the correct policy for the twentieth century.

The third-tracking of the elevated lines, which the Interborough Company asks to make a condition of its scheme, has been successfully opposed by social workers for several years. This plan, with its corollary of double-decking the elevated lines in some streets and building additional lines in other streets in the congested quarters on the lower East Side, would further sacrifice regions already hideous, and add noise, dirt, and darkness to rooms already hardly habitable. To assent to such proposals would be ruthlessly to sacrifice the welfare of Manhattan residents to the interests of the Bronx; and while easy access to the Bronx would be a boon to Manhattan, the price of that boon would be too high.

The provisions as to the length and financial terms of the elevated franchise, as accepted by the Public Service Commission, which Professor Bemis has skilfully exposed, are evidently so vulnerable that the Board of Estimate will easily find arguments for rejecting them. All the reports on the subject also prove that the Interborough Company's offer, irrespective of the elevated franchises, which are improperly coupled with it, should in justice to the taxpayers be altered in many details. Tenant dwellers are interested in the proposal to induce the Interborough Company to carry out its plan entirely on its own credit, because every dollar put into subways leaves the less to be expended on schools, parks, playgrounds, health, and recreation. Should no city money be required for the interborough plan, the wide margin to the city's credit after July 1 next would make it easy to satisfy the needs of the social service departments for more buildings and permanent improvements.

It remains, therefore, for the Board of Estimate to secure both important amendments of the contract and separate consideration of the proposals for third-tracking and extension of the elevated lines. If satisfactory adjustment of these points is made, an era of extended fast transit and restrained tenement rents will dawn.

THE COMING AMERICAN

MARION SHERWOOD KELLOGG

Three interpretations of America, two by Americans of very different outlook, and one by an Englishman for many years a resident of the United States, have a special interest in the light of the discussion of the possibility of an

American racial type provoked by Prof. Franz Boas's report to the Immigration Commission. Professor Boas held "the American-born children of the long-headed Sicilians, and those of the round-headed east European Hebrews, have nearly the same intermediate head form." The books, of course, have less to do with physical characteristics than with the type of mind and institutions of the new continent.

A. Maurice Low, in The American People, a Study in National Psychology,[1] writing as an English journalist long resident in the United States, maintains not only that we are a new race, but that of the races of the world only the American has a record from its inception, as it holds the peculiar position of having developed within modern times. As essential to an understanding of this development, Mr. Low traces historical forces and psychological growth side by side.

Taking the Puritan as the ruling factor, he regards him not as a mere transplanted Englishman. Coming from the settled life of a quiet English village into the wilderness of infinite spaces, infinite possibilities, infinite freedom, forced to fight even for existence, the Puritan in less than a generation differed greatly from the men of England, acquiring certain stern and definite traits, but big with humanity and with such an ideal of life as one might expect where the Bible was the real constitution of the state. Puritanism was as much a politico-social as a religious movement—"it was the sowing of the seed of democracy that has overrun the earth." Two main contributions of the Puritan to democracy, this author holds, are the establishment of Sunday as a day of rest and the founding of a system of popular education. Here the Puritan was three centuries ahead of his time, as these great economic and social needs were not generally recognized till generations later. Indeed, one may doubt whether they are fully recognized today, when child labor committees must struggle to safeguard the years of school-going in our manufacturing states, and when seven-day labor prevails in important industries.

To the new land came also other Englishmen—but to a very different environment and mode of life. The men who settled Virginia and South Carolina developed an economic system as unlike England's as those of the Puritan common-wealths of the North. With its foundation in slavery and the consequent demeaning of physical labor, the cultivation of tobacco and rice was made the basis of a feudal system that was structurally undemocratic.

But from the first, independence was in the air and the main business of colonial governors seemed to be to foster that spirit by attempts to suppress it:

> The American has always been a rebel. He is a living protest. His existence is a protest against usurped authority. To a rebel fighting is second nature. The American has always fought, against nature, against man, against government when that government sought to oppress him.

Religious persecution drove the Puritan to Massachusetts; political persecution drove the Cavalier to Virginia. And the love of freedom engendered by this persecution made Virginia and Massachusetts one when the time came for them to enter into their inheritance—liberty and national life. Mr. Low considers the American

> a blend of the Puritan and the Cavalier, to accept an inexact terminology so rich in contrast; a mixture of Massachusetts and Virginia; a product of the corn that ripened slowly under northern skies and the tobacco that sprung into life in the South. . . . It was tobacco that made Virginia so different from Massachusetts; it was Virginia that made the American so different from what he would have been had another Massachusetts taken root in the South.

But England was not to have the molding of the American race entirely to herself. In various sections of the country Dutch, French, Spanish, Swede held temporary supremacy, and each contributed of his life and character to a greater or less degree. The Englishman has assimilated, has dominated them all. English speech, traditions, and customs have prevailed, modified, Mr. Low believes, more by conditions of life in America

[1] The American People. A Study in National Psychology. By A. Maurice Low. Houghton Mifflin Company, Boston and New York, 1909. Pp. 446. Price $2.25; by mail of THE SURVEY $2.40.

than by infusion of foreign blood. One by one further newcomers have been absorbed—Scotch, Irish, Germans, Scandinavians.

The influence of a new untrammelled continent upon the English islanders, the conflict and balance between the types that developed in the North and in the South, the contact with mingled peoples which accentuated the changes due to environment—these are the main themes discussed by Mr. Low. To them he adds the characterization that the

> history of the United States is a study of a people always in flux. In the early days there was never a time when they were not "emigrants." They "emigrated" from Massachusetts to the other New England colonies, and then spread to New York; from Virginia they went to the Carolinas and further south; from New England they stretched to the middle West; from the South they bridged the Mississippi."

Today,

> "the man from Maine and the woman from Louisiana, the Californian or the Dakotan, are as one in language, in thought, in purpose, and the same ambitions animate both; both owe allegiance to the same political institutions; neither knows any country which means more to the one than it does to the other.

Through the leaven of democracy a new race has arisen that is scarcely more English than German, no more French than Scandinavian, but partakes of the characteristics of them all. What will be the result of the large Slavic, Latin, and Jewish emigration of today remains to be seen. Whatever its present economic and social reactions, we have no reason to fear—as Mr. Low reads our history—its effect on the development of American individuality.

After following Mr. Low's discussion, one turns with interest to a book by an American on The Spirit of America.[1] Passing over the question of racial type, Dr. Van Dyke attempts before an audience of Frenchmen a sketch of the American as he really is in contrast to the idea of him generally held abroad.

As the ruling traits of American character he discusses five elements: "the instinct of self-reliance, the love of fair play, the energetic will, the desire of order, the ambition of self-development." These characteristics he traces through the history of the country and its people—from the heritage they brought from older lands to the heritage they have made for themselves in the new. To these governing principles certain others should be added, less tangible, but no less important to a comprehension of the American,—"a strong religious feeling, a sincere love of nature, a vivid sense of humor, and a deep sentiment of humanity." Dr. Van Dyke lays much emphasis on the democracy and idealism of Americans, and sums them up as "a people of idealists engaged in a great practical task."

The book is made up of seven lectures given on the Hyde Foundation, an exchange professorship, at the University of Paris. The subject was chosen with the avowed object of promoting friendship and understanding between the two great republics, the purpose of the foundation. The impression received is of optimism and enthusiasm—of that intense belief in America that is one of the strongest characteristics of the nation.

As a foil to foreign misconceptions, due to the circulation of a tourist type of American abroad, coupled with the impressions of continental visitors who fail to note our less obtrusive faculties, the book deserves a place in the literature of international amenities. But as an interpretation to Americans of self-truths about which they themselves have misconceptions, it has less to offer. Its purpose is, of course, a more polite one than either the keen analysis of racial forces by our English critic, or the sharp criticisms and constructive suggestions imbedded in the 454 pages which Herbert Croly addresses to his fellow countrymen in The Promise of American Life.[1] For it is the fatalistic belief of Americans in America which, in its common form, arouses the ire of this third writer.

Mr. Croly's claim is that the nation is pervaded and bound together by an ideal National Promise—"the vision of a better future: the belief that somehow and sometime something better will happen to

[1] The Spirit of America. By Henry Van Dyke. The Macmillan Company, New York, 1910. Pp. 276. Price $1.50 net; by mail of The Survey $1.60.

[1] The Promise of American Life. By Herbert Croly. The Macmillan Company, New York, 1909. Pp. 468. Price $2 net; by mail of The Survey $2.13

good Americans than has happened to men in any other country." Against this passive and happy idea the book is a protest. For several generations Americans were "able to slide downhill into the valley of fulfillment." Economic abundance and political democracy gave equality of opportunity, which was exploited by the exceptional individuals it developed until today this fundamental principle of democracy is threatened by groups of men industrially powerful. Whether they are corporations or unions, Mr. Croly holds such influences equally undemocratic.

After an analysis of the development of American political and economic life, the author discusses the present situation and states his case for the ultimate triumph of democracy. He considers that what we need is the "transformation of the old sense of a glorious national destiny into the sense of a serious national purpose." To this end, and to meet changed conditions, he holds the country must carry through a program of wholesale political reconstruction and develop a national economy. He finds these needs recognized to some extent by political reformers, and includes in the book interesting chapters on Roosevelt, Bryan, Jerome, and Hearst, and their policies. Indeed, one characteristic of the book is that the author draws upon the views of these practical leaders, rather than upon the writings of academic students or the advocates of special social or economic dogma, who view American conditions with a background of European tradition and experience. Recognizing that until public opinion has been educated no radical changes can be made, Mr. Croly advocates the "association of certain very moderate practical proposals with the issue of a deliberate, persistent and far more radical challenge to popular political prejudices and errors." The book is a long one and not easy to read; but suggestive throughout. Its program of reform is too inclusive to set down in short space. A far-sighted, constructive foreign policy with respect to the American continents and the Far East, the development of federal power and responsibility, are the points on which he lays stress nationally. When it comes to state government, the commonwealths can afford to experiment as long as they have the national government to check or retrieve any serious errors they may make. Mr. Croly would centralize the departments of state government, so as to secure a more competent state organization to deal with such questions as keeping order, administering justice, managing asylums and prisons, and the organization of labor. To municipalities Mr. Croly would apply a doctrine of home rule by an efficient and responsible organization, considering that they have "unique chance of appropriating for the local community those sources of economic value which are created by the community, and . . . an equally unique opportunity of spending the money so obtained for the amelioration of the sanitary, if not of the fundamental economic and social condition, of the poorer people." In discussing public service corporations in cities, Mr. Croly recognizes the efficiency possible to regulated monopolies and advocates franchises restricted to a limited number of years.

Declaring "the complete emancipation of the individual" to be the desired end of these political and economic changes, Mr. Croly devotes the last chapters of his book to its discussion. Here he holds that the social education which would come through an attempt to realize the national purpose would in itself result in a corresponding growth and emancipation of the rank and file of Americans.

COHOES

The little factory city of Cohoes, N. Y., with its population of 25,709, bids fair to become well known. It has been selected as the first city in the state of New York for a postal savings bank, conditions in that city being considered by the postal authorities especially favorable. Can it be that the postal authorities have been studying tuberculosis death rates? During the past four years Cohoes on three occasions stood at the head of the list of cities in the state having the highest death rate from tuberculosis, and in the fourth year it was excelled only by its nearest neighbor, Troy. Evidently, more than one kind of saving is in order in Cohoes.

BOOKS FOR SOCIAL WORKERS

LILIAN BRANDT
Contributing Editor

THE JEWS: A STUDY OF RACE AND ENVIRONMENT. By Maurice Fishberg. The Walter Scott Publishing Company, Ltd. London. 1910. Imported by Charles Scribner's Sons. New York. Pp 578. Price $1.50; by mail of THE SURVEY, $1.64.

Dr. Fishberg's main thesis seems to be that the Jews are not a race, not an ethnic division, but a religious or perhaps a social organization. He makes it fairly clear that they tend strongly to become like the people among whom they live, since at present we find many very distinct types among the adherents to the Jewish religion. By this result, of course, the importance of the question as to the non-assimilability of these immigrants is very greatly reduced. If we accept the evidence at its face value and as being complete, the whole problem becomes a social one. Social workers and students in New York city will find some of the suggestions on occupation and education stimulating, to say the least. The distribution of occupations and the economic status of the Jews in Christian countries, in so far as they are determined by Sundays and other holidays, the use of specially prepared foods, etc., are striking examples of the weight the religious factor may have in social phenomena.

Considering the work from the technical side of mere book making, one must feel that while the author has clearly conceived his problem and has laid out an admirable scheme of main headings, the chapters are often ever flowing streams of data and observations without definite arguments and interpretations. Should a forceful teacher and writer take the matter as it now stands and recast it, a book of great power would doubtless result.

The author is an investigator of no mean ability and is at his best when dealing with the physical anthropology and pathology of the Jews. In this field he can speak with authority, but his presentation of the social and religious aspects of the problem seems to lack something in mastery and decision. This should not be considered as unpardonable by any means, and the book should certainly be read by all social workers and students. It constitutes a pertinent suggestion, furthermore, as to what may be accomplished by the application of anthropological methods to a social problem.

THE PROBLEM OF VOCATIONAL EDUCATION. By David Snedden, Ph.D. Houghton Mifflin Company. New York. 1910. Pp 82. Price 35 cents; by mail of THE SURVEY, 40 cents.

One of our foremost educators, the commissioner of education for Massachusetts, reviews in this little book the movement for the extension of organized vocational education beyond that which already has been developed for the learned professions, the army and navy, defective children, and Negroes, and sums up the present tentative conclusions of those who are most active in this movement.

In breadth of view, beginning with the brief outline of "the entire educative process," in logical ordering of material, and in charm of expression, the essay is a delight. For these qualities, and because it points out fundamental difficulties and clears the way for constructive advance, we shall expect to see it recognized as a classic in the literature of education.

"A considerable amount of actual participation in productive work" is considered by Dr. Snedden the *sine qua non* in producing vocational efficiency, and this "involves a pedagogy and administration fundamentally different from that found in most existing schools. It is at this point that the traditional forms of education practically break down; and it is in this respect that the problem of vocational education . . . presents its greatest difficulties."

How early specialization should begin, and to what extent the new demands of vocational training will reconstruct elementary schools, are not fully discussed, probably because there is still so little basis for definite answers to these questions. It is noticeable, however, that Dr. Snedden, viewing this new educational problem from the point of view of the educator, seems to assume that whatever adaptations are to be made in meeting it will be made in the educational machinery. He does not consider the possibility of a reconstruction of industrial conditions in certain respects, a modification, for example, of the "individualism of the American employer" which is one obstacle to achieving co-operation between school and employer.

It is a surprise to find, in Dr. Snedden's brief discussion of the problem of women in industry, the usual assumption that it is entirely a problem of young girls who, after a few years of wage-earning, will "devote themselves henceforth to home-making." As half (50.3 per cent exactly) of all the women wage-earners in 1900 were over twenty-five years of age, and almost as large a proportion of those engaged in manufactures, it is evident that this assumption is scarcely warranted.

THE WORKER AND THE STATE. By Arthur D. Dean, S. B. The Century Company. New York. 1910. Pp. 350. Price $1.20; by mail of THE SURVEY, $1.32

Another book which attempts a comprehensive treatment of the subject of vocational training has been written by the chief of the division of trade-schools in the New York State Education Department. His book traces the development of the new movement; considers the various methods which have been advocated or tried in the desire "to adjust our schools to the needs of our children and our industries"; and urges the working out

of a national system of industrial, agricultural, and technical schools in connection with the public school system, to the end that eventually it will be possible "for any one to receive instruction in any subject at any time."

In this book, too, the discussion of the proper training for women is perhaps the least satisfactory portion. Mr. Dean also disregards the 50.3 per cent who are over twenty-five years of age. Moreover, after showing to what extent productive toil is being eliminated from the home, he enumerates, as primary essentials in education for home-making, all the accomplishments needed by the competent housekeeper before this transition had progressed, which seems to be a failure to correlate the facts he himself has in mind with his theories.

While a reading of this book does not give the pleasure which adds to the value of Dr. Snedden's (and which is a desirable quality in however practical a book) it nevertheless deserves careful attention, as being the results of much observation and experience by a man who is working at the problem.

A Forward Step. By William Thum. The Twentieth Century Company. Boston. 1910. Pp. 235. Price $1.50; by mail of The Survey $1.60.

"Equal opportunity to obtain a general secondary and higher education," is the object of this book. Mr. Thum proposes, in chapters which originally appeared in the *Arena*, special high schools affiliated with municipal works and with selected manufacturing industries, where young men and young women could secure a regular high school course and at the same time earn enough to support themselves, by "five hours of efficient labor and three hours of satisfactory school attendance" daily for six years.

Whether they can or not can be determined only by experiment. Applications of this idea of co-operation between school and industry for trade education have been made in America, in Cincinnati and Fitchburg and perhaps a few other places, but the experiments have been too limited in scope to offer conclusive evidence as to their value for general adoption. More extended trial of the plan, under the most favorable conditions possible, could not fail to be valuable from many different angles.

The Labour Exchange in Relation to Boy and Girl Labour. By Frederic Keeling. P. S. King and Son. London. 1910. Pp. 76. Price 12 cents; by mail of The Survey, 15 cents. (Four weeks to import.)

Mr. Keeling's pamphlet is a description of actual experiments in employment work for children in England, Scotland, and Germany, and should be of great interest to those who are developing plans for vocational guidance in American cities. The principles advocated by Mr. Keeling are that employment work for boys and girls should not be carried on by a distinct organization and that it should not be controlled by the education authorities, but that the Labour Exchange, whose object is to organize the whole of the labor market, should have a clearly differentiated juvenile department, located in the same building with the department for adults, and maintaining the closest possible co-operation with education authorities, who should be represented on advisory committees for directing the work.

Registration of City School Children. By John Dearling Haney, Ph.D., Teachers College, Columbia University. New York, 1910. Pp. 155. Price, cloth, $1.50; paper, $1.15; by mail of The Survey, $1.60; $1.25.

In his own words, Mr. Haney, who is principal of a school in New York city, has "endeavored to trace the principles underlying the city school census, to discover the salient features of present systems of school censuses, to apply general laws to them, and to account for their failure or success." He emphasizes the possibility of "(a) an effective school census in contradistinction to a general census; (b) a current or continuous census as distinguished from a discrete census; and (c) an effective extension of the census of children beyond the purposes of mere 'compulsory education'."

The Primary Education of Crippled Children. By Douglas C. McMurtrie. Association for the Aid of Crippled Children. New York. 1910. Pp. 22. Price 50 cents; by mail of The Survey, 53 cents.

This is a well-argued plea for making the conditions of primary education for crippled children "just as normal as possible," by sending them to public day schools, "so modified as to be adapted to their special requirements"; leaving "as much of the responsibility as possible with the family—where it belongs"; and looking to private philanthropy for the special care and supervision which cannot be provided by school or family.

Wider Use of the School Plant. By Clarence Arthur Perry. Introduction by Luther Halsey Gulick, M.D. Russell Sage Foundation Publication. Charities Publication Committee. New York, 1910. Pp. 423. By mail of The Survey, $1.25.

Readers of The Survey hardly need further data than are given above, beyond the assurance that the title is accurately descriptive of the contents of the book. The chapter headings, and other interesting information, may be found on the last cover page of The Survey for December 31.

The Healthful Art of Dancing. By Luther H. Gulick. Doubleday, Page and Company. New York. 1910. Pp. 273. Price $1.40; by mail of The Survey, $1.52.

"A constructive treatment of one of the resources for the expression of the joy of life, a resource that is related to health, vigor and beauty," is Dr. Gulick's statement of the object

of his latest book, and the sentence adequately describes what he has done. He describes and interprets the movement for the introduction of folk dancing into everyday American life in the schools, on the playgrounds, and in the home. The text is well supplemented by many illustrations of dances actually enjoyed by peasants in many lands, by school children in England and America, and even by elderly business men in Providence, R. I.

COMMUNICATIONS

"COST OF THE CRANBERRY SAUCE"

To the Editor: On page 607 of The Survey for January 7, Mr. Lovejoy is made to say, "When filled these boxes weigh approximately fifteen pounds. Girls and boys not nearly five years old are seen sometimes carrying two or three boxes at a time," etc. Does not Mr. Lovejoy mean to say that empty boxes are seen being returned, two or three at a time, by children too frail to pick? Children not nearly five years old could scarcely carry burdens of forty-five pounds. Certainly such children would not be too frail to pick berries.

On page 610, A. J. McKelway appears to say: "The convention was dominated by five or six men of great ability, some of whom will be the peers of *any* members of the United States Senate when the new state sends its first representatives to that body."

Has the editor been on a vacation that statements as careless or as extreme as the above two cited should appear in one issue of the reliable Survey?

Robert C. Sanger.

New York.

To the Editor:—I am glad Mr Sanger called your attention to my statement, though I am sorry he had occasion to do so. It was based on one made by two of our agents, and my error was in using the words "not nearly" (five years old) instead of the words "not older than." You know I prepared this article under pressure and placed it in the hands of one investigator to check up. He did not note the error, nor did I, but I must assume the responsibility.

As to the ability of a five-year-old child to carry two or three of these boxes, I am assured by both of these men, whose veracity I have never had occasion to doubt, that they have seen children of this age doing it, though they tell me three boxes were unusual, while two were common. I particularly questioned how a child who could carry such a burden could at the same time be considered too frail to pick continuously. They answered that the carrying is frequently done by these younger children to relieve the monotony and rest them from the stooped and cramped condition in which the picking is done!

The daughter of one of the bog owners has written a letter in which she protests against the statements in the article. Without having seen our other publications or known how generally we have devoted our attention to the city and industrial phases of child labor, it is easy to understand how she and her father would be shocked by our apparently unreasonable attitude toward their rural work. The only question seems to be whether we shall eliminate from our program any attempt to correct abuses in agriculture, or whether as we find these we shall consider them.

The writer of this letter (although from a very different point of view) acknowledges, (1) the *padrone* system; (2) that on one or two mornings the child pickers may begin at 7 A.M. and as a matter of fact did work some evenings until 5:30; (3) that on other bogs work on Sunday is "unfortunately the custom"; (4) that the use of the word "peck" applies to a measure which is not a peck; (5) that young children do carry boxes of berries to the bushelman and that "these measures" are too heavy for them, and characterizes this work in one instance as "horrible"; (6) that there is overcrowding to the extent that a father and mother and two or three small children are assigned to one room, apparently about the size of a trans-Atlantic stateroom; (7) that checks for the work are used at the company's store, which in the case of her plantation may be conducted above reproach, but which is none the less the same system that in the mining and other industrial regions has proved a curse to the workers.

Her attitude appears to be identical with that of some of the best cotton manufacturers in the South, some of the best coal operators in Pennsylvania, and some of the best glass manufacturers who are shocked and offended by criticisms upon their industry, yet who would not tolerate in their own plant conditions we have found to exist in other plants.

Owen R. Lovejoy,
Secretary National Child Labor Committee.
New York.

TRANSIT: A SOCIAL SERVICE

To the Editor:—

Despite the frequent admonition that transit, not verbiage, is needed in the present transit embroglio in New York city, the importance of the lines contemplated for a comprehensive transit system for the metropolis of the New World and the fiscal and social principles involved necessitate further discussion.

The most important point to be emphasized is that transit lines and the cost of transit are economic wastes in the cost of production. The total estimated physical value of all transit lines in Greater New York, including the subway now owned by the city, is about $400,000,000. The annual expenditures for carfare on these lines is approximately $80,000,000, or one-fifth of the physical valuation of the lines and nearly one-half of the ordinary city budget. No one except a stockholder or director in one of the transit companies probably would claim that

this annual cost of transit is economic or necessary. It is a very serious item in the cost of production, mounting up to about one-fourth of the total wages and salaries paid in 1905 to the 464,716 wage-earners in shops and 63,586 office force and officials in the 20,839 factories of Greater New York. Even this enormous expenditure, however, with the low wages, long hours of work, concentration of factories and high land values, which with the other conditions inevitably means high rents, in New York has not afforded proper distribution of population.

It is financially impossible for any city, if the experience and testimony of engineers may be accepted, to provide transit to carry the factory and the office toilers to a central point, such as lower Manhattan, from six-story or even five-story tenements in the Bronx, and from five or even four-story tenements in Brooklyn and Queens, within a radius of fifteen miles, to offices and factories sixteen to twenty-five stories high. Yet this is the ulterior objective of the real estate developers and speculators who are so vigorously urging the construction of subways in every direction. The decentralization of New York city, and especially the distribution of factories, is imperative; and transit lines should be projected upon the basis of such action by the city and not upon the present calculation of new congested centers, that is a gradual spreading of areas with a density of 500 to 1,000 per acre. The routes proposed by the Interborough and Triborough systems alike are uneconomic and must fail to accomplish the object of distributing population with a normal density, throughout Greater New York. Both the proposed routes tend to create a long city instead of a round city, although the interborough is the worse offender in providing three distinct lines up through the Bronx as against the two proposed by the Interborough (Triborough).

The Bronx is pre-eminently the speculative borough outside of Manhattan, and the proposed routes would almost inevitably mean the continuance of five-and six-story tenements as the predominaing type in the Bronx. It is most uneconomic, moreover, to attempt to haul people the long distance from the Bronx to Manhattan to work, since there is an initial waste of from five to eight miles of subways throughout one of the most expensive territories in the world to tunnel the Island of Manhattan.

A second point which needs most careful consideration is the argument that the Interborough should be given the right to construct and operate extensions since this would give one fare for the entire city. No greater fallacy exists. There are at present five most important operating systems in New York city. The Interborough Rapid Transit Company, which controls and operates the subway and elevated lines in Manhattan, also through the New York City Interborough Railway Company operates a system of street railways, part of which is constructed in the Bronx and one on Manhattan, and most of the surface lines in Queens. The gross revenues of the Interborough Rapid Transit Company and the companies controlled by it for the year ending June 30, 1910, amounted to $30,785.599 or 38.76 per cent (nearly two-fifths) of the entire city railway revenues of the Greater City. The next important operating company is the Brooklyn Rapid Transit Company, which controls seven operating companies and a number of leased companies. This system includes the entire elevated and surface system of Brooklyn with several extensions into Queens, with two entrances into Manhattan over the Williamsburg and Brooklyn bridges, and substantially the entire street railways of Brooklyn. The gross revenue for the Brooklyn Rapid Transit Company was $21,348,498 or 26.88 per cent (over 1-4) of the entire street railway revenues of the Greater City. The Metropolitan Street Railway is the next important system with lines owned or leased which cover most of Manhattan as far North as 155th street. The gross revenues of this company in this year were $13,217,177 or 16.64 per cent of the total street railway revenues of the city. The fourth important operating system or street surface railway, the Third Avenue System, consists of the Third Avenue Railway proper and a number of subsidiary railways in Manhattan and the Bronx and some running into Westchester county. The total revenues of this system for this year amounted to $8,061,704 or 10.15 per cent of the entire street railways revenues of the city. The fifth group is the Hudson and Manhattan Railway Company, the Second Avenue, a number of lines in Brooklyn, the Coney Island and Brooklyn Railway Company, and surface lines in Richmond, the total revenues of these various companies being (1910) $6,007,992 or 7.57 per cent of the entire revenues of the railways of the city.

There are, all told, thirty-three companies operating street railways in the city, sixteen steam roads, one freight road, two short electric roads operating as summer lines, and twenty-two of the companies are accounted for in the four systems first mentioned. These facts indicate that the claim that universal transfers can be secured by allowing the Interborough to have its extensions is absolutely fallacious.

The real transit situation confronting New York city is as follows: The provision of transit has been regarded for many years as purely an opportunity for mulcting the public for private gain. Out of 1,200 miles of tracks now being operated approximately 1,150 miles are under perpetual franchises. There are also about 200 miles of tracks on 400 different streets under perpetual franchises. Many of these were secured by bribery and other illegal methods.

It is generally recognized that the provision of transit in New York city or any other city is a social function, and that a socialized service cannot be obtained from any company no matter how many Public Service Commissions are appointed, if the injustice of the past, the bribery of the Legislature, the cupidity of holding companies, the legal genius of corporation

lawyers shall be made a perpetual charge upon the users of transit lines. New York city today faces a crisis much more serious than that of merely investing $100,000,000 or $200,000,000 in transit lines. It is frankly called upon to determine whether immoral franchises are permanently binding and have legal sanction, and as to the compensation which should be given to the owners of all lines as well as the Interborough, the operating company of the "city-owned subways." The most important thing to be accomplished is the immediate forfeiture of the franchises of these companies, wherever possible, and the condemnation of franchises with a very small return where forfeiture or condemnation without compensation is not legal.

Valuable as it would be to have universal transfers, this, as indicated, will not be achieved by allowing the Interborough to hold up the city for another fifty-four to sixty years or for any shorter period; it will be achieved only by the city's gradually securing practical control through ownership of every line of transit in the city. The amount of compensation that must be paid by the city for franchises will depend upon the present values of these franchises, and prospective value. These values should be computed for only a limited period, since 999 year leases are morally indefensible and legally questionable. The best way to reduce the value of the franchises, however, is for the city to construct transit lines, so as to reduce the franchise values as far as possible of every operating company in the city. This cannot be designated confiscation but merely the reasonable exercise of business sense on the part of the city to rescue the citizens from the results of illegal grants made to street railways in the past, and to ensure to the citizens the opportunity to avail themselves of the wealth of space in New York city and of territory which may be hereafter incorporated within the city limits. In the present transit-situation New York city is grappling with a dead hand of past injustice. Since the existing companies have shown that they will not be reasonable and refrain from exercising the rights illegally and immorally given them under franchises, the city must use the club of a competing line and force through economic suasion the moral action, which the law might deny.

New York. BENJAMIN C. MARSH.

CALENDAR OF CONFERENCES

CHANGES.

The proposed Alabama Conference of Charities and Correction will not be held this year.

See new dates of National Conference on City Planning.

INTERNATIONAL (PREVIOUSLY ANNOUNCED).

International Congress on Tuberculosis. September 24-30. Rome, Italy. Secretary-general, Professor Ascoli, Via Lucina, Rome, Italy.

International Association for Labor Legislation, September, 1912. Zurich, Switzerland. Secretary, Stephen Bauer, Basle, Switzerland.

International Prison Congress (Quinquennial). London, 1915. Secretary, F. Simon van der Aa, Groningen, Holland.

NATIONAL (NEW).

Council of Jewish Women (Executive Committee), January 30. Louisville, Ky. Sixth Triennial Meeting of the Council. December, Philadelphia, Pa. Executive secretary, Sadie American, 445 Central Park West, New York City.

National Consumers League, February 7. Pittsburgh, Pa. General Secretary, Mrs. Florence Kelley, 105 East 22nd street, New York city.

General Federation of Women's Clubs. Council Meeting, April. Memphis, Tenn. Convention of the Federation, June 1912. San Francisco, Cal. Corresponding secretary, Mrs. Frank Shiek, Wheatland, Wyo.

National Peace Congress, May 3-5. Baltimore, Md. Secretary, Theodore Marburg, 12 Mt. Vernon Place West, Baltimore, Md.

National Association for the Study and Prevention of Tuberculosis, June 21-22. Denver, Col. Executive secretary, Dr. Livingston Farrand, 105 East 22nd street, New York city.

Conference of Neighborhood Workers, June. Boston, Mass. Corresponding officer Albert Kennedy, South End House, 20 Union Park, Boston, Mass.

NATIONAL (PREVIOUSLY ANNOUNCED).

American Society of Sanitary and Moral Prophylaxis, Second Thursday in February and April. New York, N. Y. Corresponding officer, James Pedersen, M.D., 20 West Forty-second street, New York city.

Federated Boys' Clubs. Annual Meeting February 18. Fall River, Mass. Executive secretary, Arthur B. Leach, Room 308, 35 Congress street, Boston, Mass. Annual Conference, June, Brookline, Mass.

Religious Education Association, February 14-16. Providence, R. I. Secretary, Henry F. Cope, 105 Michigan avenue, Chicago, Ill.

National Child Labor Committee, March. Birmingham, Ala. Corresponding officer, Owen R. Lovejoy, 105 East Twenty-second street, New York city.

National Association for the Study and Education of Exceptional Children, March or April. New York city. Corresponding officer, Waldemar Groszmann, Plainfield, N. J.

Convention of the Young Women's Christian Association of America, April 19-27. Indianapolis, Ind. Secretary, Lois J. Viele, 125 East Twenty-seventh street, New York city.

American Federation of Arts, May. Washington, D. C. Secretary, Leila Mechlin, 1741 New York avenue, Washington, D. C.

National Conference on City Planning, May 15-17. Philadelphia, Pa. Secretary, Flavel Shurtleff, 19 Congress street, Boston, Mass.

National Conference of Charities and Correction, June 7-14. Boston, Mass. Secretary, Alexander Johnson, Ft. Wayne, Ind.

National Probation Officers Association, June 5-14. Boston, Mass. Secretary, Roger N. Baldwin, 903 Security Building, St. Louis, Mo.

National Women's Trade Union League, June. Boston, Mass. Corresponding officer, Mrs. D. W. Kneffer, 5,273 McPherson avenue, St. Louis, Mo.

National Federation of Remedial Loan Associations, June. Boston, Mass. Secretary, J. T. Exnicios, 914 G street, N. W., Washington, D. C.

Conference on the Education of Dependent, Backward, Truant and Delinquent Children. June. Boston, Mass. Secretary, Elmer L. Coffeen, Westboro, Mass.

National Conference of Poor Law Officials, June 7. Boston, Mass. President, Dr. Robert W. Hill, State Board of Charities, 105 East Twenty-second street, New York city.

American Academy of Medicine, June 24-26. Los Angeles, Cal. Secretary, Charles McIntire, M.D., 52 North Fourth street, Easton, Pa. Subject: Medical Sociology.

American Medical Association, June 27. Los Angeles, Cal. Secretary, George H. Simmons, M.D., 535 Dearborn avenue, Chicago, Ill.

National Education Association of the United States, July. San Francisco, Cal. Secretary, Irwin Shepard, Winona, Minn.

National Fraternal Congress, August 21. Mack-

inac Island, Mich. Secretary, C. A. Gower, Lansing, Mich.

American Society of Municipal Improvements, September 26-29. Grand Rapids, Mich. Secretary, A. Prescott Folwell, 239 West 39th street, New York city.

American Hospital Association, September 19-22. New York city. Secretary, J. N. E. Brown, M.D., Toronto General Hospital, Can.

American Prison Association, September. Omaha, Neb. Secretary, Joseph P. Byers, 13 Central avenue, Newark, N. J.

American Board of Commissioners for Foreign Missions, October 10-13. Milwaukee, Wis. Secretary, Cornelius H. Patten, 14 Beacon street, Boston, Mass.

National Conference of Catholic Charities, September, 1912. Washington, D. C. Secretary, William J. Kerby, D.D., Catholic University, Washington, D. C.

STATE AND LOCAL (NEW).

New Hampshire Conference of Charities and Correction, February 1. Concord, N. H. Secretary, Mary P. Remick, Concord, N. H.

Massachusetts Civic Conference, March 1-2. Boston, Mass. Secretary, E. T. Hartman, 3 Joy street, Boston, Mass.

Kansas Association for the Study and Prevention of Tuberculosis, May. Topeka, Kas. Secretary, J. L. Everhardy, Leavenworth, Kas.

New York State County Superintendents of the Poor, June 20-23. Thousand Island Park, N. Y. Secretary, C. E. Weisz, 36 Bay 20th street, Bath Beach, N. Y.

Maryland Conference of Charities and Correction, November, Baltimore, Md. General secretary, H. Wirt Steele, 15 East Pleasant Place, Baltimore, Md.

Minnesota Conference of Charities and Correction, November. Duluth, Minn. Secretary, Eugene T. Lies, Associated Charities, Court House, Minneapolis, Minn.

Conference of Probation Officers, November 14-16. Watertown, N. Y. Secretary, Arthur W. Towne, State Probation Commission, Albany, N. Y.

South Carolina Conference of Charities and Correction, November. Columbia, S. C. President, A. T. Jamison, Connie Maxwell Orphanage, Greenwood, S. C.

Kentucky Conference of Charities and Correction, November. Lexington or Covington. Corresponding secretary, Linda Neville, 618 Main street, Lexington, Ky.

STATE AND LOCAL (PREVIOUSLY ANNOUNCED).

New York Child Welfare Exhibit, January 18-February 12. New York city. Secretary, Roy Smith Wallace. Room 5,105 Metropolitan Building, New York city.

Connecticut Conference of Charities and Correction. April. New Haven, Conn. Secretary, Charles P. Kellogg, Waterbury, Conn.

New Jersey Conference of Charities and Correction, April 2-4. Princeton, N. J. Secretary, J. Byron Deacon, 1701 Chestnut street, Philadelphia, Pa.

Arizona Association for the Study and Prevention of Tuberculosis, May. Bisbee, Ariz. Secretary, John W. Flinn, Prescott, Ariz.

Canadian Conference of Charities and Correction, May 8-12. Hamilton, Ont. Secretary, F. M. Nicholson, Parliament Buildings, Toronto, Ont.

New York City Conference of Charities and Correction, May 9-11. New York city. Secretary, John B. Prest, 287 Fourth avenue, New York city.

New England Conference on Street Cleaning, June. Springfield, Mass. Corresponding officer, Carol Aronovici, 55 Eddy street, Providence, R. I.

Northern Baptist Convention, June 13. Philadelphia, Pa. President, Emory W. Hunt, Denison University, Granville, O.

Sagamore Sociological Conference, June 27-29. Sagamore Beach, Mass. President, George W. Coleman, 348 Congress street, Boston, Mass.

Stony Brook Assembly, August. Stony Brook, L. I. Director, J. W. Jenks, Cornell University, Ithaca, N. Y.

Pennsylvania Association of Directors of the Poor and Charities, October 10-12. Indiana, Pa. Secretary, L. C. Colborn, Somerset, Pa.

Ohio Conference of Charities and Correction, November. Toledo, Ohio. Secretary, H. H. Shirer, 805 Harrison Building, 21 S. High street, Columbus, Ohio.

Missouri Conference of Charities and Correction, November. Kansas City, Mo. Secretary, W. T. Cross, State Board of Charities and Correction, Columbia, Mo.

New York Conference of Charities and Correction, November 14-16. Watertown, N. Y. Secretary, John A. Kingsbury, 105 East 22nd street, New York city.

Pennsylvania Conference of Charities and Correction, November 14-16. Pittsburgh, Pa. Secretary, Fred S. Hall, 1533 Real Estate Trust Building, Philadelphia, Pa.

JOTTINGS

School Hygiene Congress.—The fifth congress of the American School Hygiene Association at the New York Academy of Medicine, February 2-4, has a programme of much interest to the public as well as to members. Besides the more technical aspects of the association's own work, there are papers by hygiene, open air kindergartens, contagious

Monday Club Dance.—The New York Monday Club has accepted an invitation of the University Settlement for an entertainment and dance at the Settlement the evening of January 30. This is in accordance with new plans recently formulated for adding purely social features to the club's activities which have hitherto been largely confined to literary programmes. The club is seeking to increase its membership among the social workers of Greater New York and hopes to promote mutual acquaintance and good fellowship along with its studies of conditions and methods.

SOCIAL FORCES

BY THE EDITOR

THE SELECTION OF IMMIGRANTS

On the main subject the Immigration Commission has spoken clearly and its recommendation should become law. There must be effective restriction and selection for the purpose of maintaining American standards of living. In reply to the demand for a more rigorous selection of immigrants we hear two mutually contradictory assertions. One is that there are not enough immigrants to do any harm—after allowance is made for those who return. The other is that we have no standards anyway,—at least that there is no one who has a right to speak for them, as we are all immigrants of a first, or a later, generation. Both assertions are untenable. There are, in fact, American standards, transplanted in part by those who founded our republic, developed in part on our own soil, influenced by the reaction of other standards in other nations, and yet distinctively American:—standards moral, political, and economic; standards unique and precious, worth fighting for; worth, if need be, dying for; worth preserving at all hazards for ourselves and our children, and yet not selfishly for our sake and theirs only, but also as a sacred duty towards mankind; and these standards are gravely imperilled by the annual addition of an unsifted million of newcomers whose standards are different from ours.

We do have a right to assert vigorously the value of our national heritage, and, though it may seem old-fashioned to say it, we do have a sacred duty to transmit it unimpaired—which is not to say unchanged—to our posterity. To some extent this heritage is one of race. Its creators gave it to us with their blood. It has been enriched by many crossings of races, but biologists tell us that mingling within limits is beneficial, beyond those limits productive only of a mongrel and degenerate breed. Let no one read into this expression of national responsibility for American standards a shred of bigotry or prejudice against any of the peoples of the earth. Modern social ideals are neither provincial nor sectarian. It is precisely because of a passionate attachment to the true interests of humanity that social workers may look with profound distrust upon the demand for cheap immigrant labor. Genuine humane sentiment is not inconsistent with the maintenance of community and national standards.

Employers of the exploiting type make no mistake, from their own point of view, when they demand cheap immigrant labor. They can figure it out with great precision. They know that as a rule this labor is less skillful, less intelligent, less efficient, less inherently desirable, than the native labor or the earlier immigrant labor from more closely related peoples. But there are great compensations. It is the very best labor in one particular. It can be exploited. That is the whole disagreeable truth in a nutshell. Lower wages, longer hours, crowded living quarters, fewer claimants in case of death or injury from accidents, less trade union "nonsense," fewer trade disputes, less sympathy from the disinterested public for the laborer's side when there is a dispute, less public concern generally as to what is happening in the mill

when the laborers are foreigners—such are some of the considerations which throw the balance in favor of immigrant labor. The wages demanded are enough lower to give an ample margin for more effective supervision. The general tendency of improved machinery is to decrease relatively the demand for skilled labor, thus permitting the profitable employment of fresh supplies of entirely unskilled, but physically strong, immigrants. Out on the railways of the Northwest the first object for which immigrants will strike is for the privilege of working twelve hours instead of ten, and the next is for the privilege of working on Sunday. In this instance employers, paying by the hour and not having expensive mills in operation, resist the demand, for the labor of the eleventh and twelfth hours is relatively unproductive. The men are already exhausted. To laborers of a higher standard the leisure for physical recuperation would be worth more than the small addition to their wages. To these men the money is more important. Here we have a simple, but perfect, illustration of that conflict of standards to which the nation as a whole cannot afford to be indifferent.

It is then in the ultimate and in the very immediate interests of the oppressed and struggling everywhere that America should maintain her standards. She may give generously from her surplus. She may enlighten by her example. She may throw her influence and if necessary exert her might against oppression. But one thing she may not do: extinguish the light with which she is to enlighten the world. To lower our own standards is the only treason. To reduce the position of our workingmen to that of the communities from which our immigration is coming is to destroy, perhaps forever, the very power to serve.

There should be no opposition or rivalry between the policy of selection and the policy of distribution and assimilation by every practicable device. Both are essential. No restriction which is at all likely to be adopted will sensibly diminish the need for such aid both by philanthropy and by government. Good hard thinking as to how best to assimilate those whom we already have and those who are certain to come even under a policy of much more strict selection is of the utmost importance. Except for the Educational Alliance, the Industrial Removal Society, and the Society for the Protection of Italian Immigrants, there has been almost no instructive experiment and scarcely any clear thinking on this subject. Let these experiments by all means be greatly extended, but let us be modest about calling any of them as yet a "true solution of the immigration question." Under the conditions of actual life we shall have to deal in partial solutions, among which, as we have intimated, the recommendation of the Immigrant Commission as to restriction deserves prompt and favorable consideration.

The illiteracy test is crude and unsatisfactory but it is practicable and humane. As a rule ambitious illiterates desiring to migrate can overcome this disqualification, and the fact of their having done so will augur well for their future success in the land of their adoption.

February 4, 1911.

THE COMMON WELFARE

JANE ADDAMS'S MESSAGE TO CHILD WELFARE EXHIBIT

The final conference of the second week of the Child Welfare Exhibit in New York was held in the large hall of the armory where 500 singers in the People's Choral Union, led by Frank Damrosch, gave a program beginning with the Star Spangled Banner and ending with the Hallelujah Chorus. The singers were seated so as to form a background for Jane Addams, the only speaker.

Miss Addams began her brief talk on the Spirit of Youth in the City Streets with a parable from Tolstoi about nine laborers who cheerfully undertook the support of a tenth man, a flute player, because his simple playing gladdened their hearts and lightened their toil. But the flute player, recognizing his commercial value, went off to the city, learned to be a great technician and played no more to laborers to lighten their toil but to those who, for the most part, never labored at all.

This, Miss Addams felt, is what has happened to art and recreation in the world; it should be the city's task to bring them back once more to the people who need them. It should be the task of society, too, to order the lives of its members so that, to draw from Tolstoi again, each one should have a healthy share and no more of muscular labor, of labor requiring manual skill, of labor of the mind, and of co-operative labor carried on with and for the benefit of the whole community. In this way each would be able to develop all his faculties and his capacity for usefulness and happiness in life.

Miss Addams's address brought to an end three days' sessions on recreation, which covered club work by Howard Bradstreet, the Scout Movement by Dan Beard, Camp Life by George M. Heathcote, and a very interesting series of slides illustrating the municipal camping possibilities of Harriman Park shown by E. Stagg Whitin.

How the city of New York intends to fulfill this duty was the theme of Charles B. Stover, commissioner of parks, who announced that in spite of the inadequate financial equipment of his department he confidently expected to open ten "field houses" as recreation centers in the parks of New York next summer, and to open as parks all green plots covering the aqueduct system throughout the city. He announced the holding on January 25 in Carl Schurz Park of the first municipal dance in New York, and told of the extension of park and recreation pier band concerts last summer. It was regretted by many that the exhibit has nothing on the Chicago field houses which are the most highly developed thing of the kind in the world.

Arthur Farwell, supervisor of municipal music, described the folk dancing instituted on the piers last summer, which culminated at the end of the season in the first municipal dance festival for children. Mr. Farwell urged the extension of dance festivals and pageants as one of the best means of providing pleasure and of stimulating moral and aesthetic development in large masses of young people.

John Collier's ideals for the moving picture were no less high. Since the formation of the Board of Censorship of Moving Pictures, of which Mr. Collier is secretary, the manufacturers have shown a positive eagerness to improve the grade of their pictures. The great problem now is not the shows, but the dark and unventilated rooms in which they are presented, which Mr. Collier felt should be the subject of a municipal investigation. The real possibilities of the moving picture will never be fully brought out in their commercial use, he held, but rather in their adoption throughout the public school system as the most vivid and convincing, as well as the cheapest, way of teaching both science and morals.

Housing was discussed by three experts—the regulation of tenements by law by Lawrence Veiller; the model tene-

Thomas in Detroit News.

HOW ABOUT THE PRISONER'S FAMILY?

The commission appointed by Governor Warner of Michigan has recommended that the men in the State Prison at Jackson be employed in industry and road building and wages be paid their families. This is the plan at the Detroit House of Correction where the prison-made goods are sold in the open market under what is known as the state account system. At Jackson, under the contract system, neither prisoners nor their families receive pay for their work.

ment as a good financial and moral investment by E. R. L. Gould, and the possibility of relieving congestion by the London plan of "garden cities" in the suburbs by Grosvenor Atterbury.

Benjamin C. Marsh criticised our tenement law on the ground that it makes congestion possible and requires too little sun and air, and urged that the law be amended so that in outlying boroughs no tenement can be built higher than four stories. Other steps he suggested toward creating decent homes for young families in the suburbs were better transit facilities, recreational opportunities, the building of suburban factories, and above all the taxing of land values to prevent the holding of land for a speculative rise.

The education of both parents and children was the subject of the last session on home life. Anna Garlin Spencer showed how the patriarchal family had been replaced in modern life by the individualistic family, father and mother standing alone with no supporting background of relatives and family traditions. Such a background can nowadays be furnished by society alone, and the state is attempting to do this by standardizing the family both by the practical education of parents through the public school system and by such efforts to protect the health of the offspring as are embodied in the law which now exists in two states for the physical examination of men before marriage.

COST OF FOOD ON FARM AND TABLE

The main theme of the seventy-ninth annual meeting of the New York Agricultural Society at Albany January 17-19, The Development of Our Agricultural Resources and the Relation Between this Problem and the Cost of Living, indicates the vitality and purpose of an organization more than three-quarters of a century old. For a long time it has been dormant, but during his two years' presidency of the society Commissioner Raymond A. Pearson of the State Department of Agriculture has stimulated its work and influence to a marked degree. He was re-elected president and his record in office is being urged on Governor Dix as ample reason for his reappointment as commissioner.

The fact that the meeting was held in co-operation with the State Department of Agriculture undoubtedly helped in securing the large attendance, which included many members of the Legislature, but the program was one to challenge interest. Governor Dix made the opening speech.

President Pearson in his annual address called attention to the fact that the present is a turning point in agriculture, since existing wastes are being realized. The annual waste of plant food is estimated as $20,000,000 in the state and $10,000,000 in New York city alone. The farmer in the state, however, is beginning to secure better prices for his produce, he asserted—a statement that no city consumer will dispute. In December ninety-seven sections of the state reported an upward tendency in farm values, twelve reported stationary values and one reported decreasing values. Mr. Pearson enumerated twenty-one "agricultural virtues." Among them are conservation of fertility, thorough cultivation, production of clean milk, keeping of farm business accounts, providing home comforts, and employment of labor throughout the year.

George K. Holmes of the United States Department of Agriculture declared that "for every dollar that the consumer pays

to a retailer in the general average for his potatoes, fruits, poultry and dairy products, the farmer receives fifty-five cents, the railroads seven cents and the middlemen forty cents." He averred that it is "a safe inference that the poorer people pay nearly twice the gross profit that the more well-to-do people pay." To eliminate the series of middlemen who intervene between producer and consumer, Mr. Holmes advocated co-operative marketing by farmers and co-operative buying by consumers.

As a means of helping farmers to get a greater return for their products while reducing the cost to the consumer, the committee on marketing, transportation, and grievances suggested legislation requiring the state commissioner of agriculture to disseminate information about agricultural labor and markets; and giving the commissioner supervision of commission dealers whom they would require to keep public records of all sales with the dates, prices, names, and addresses of shippers and purchasers. They also urged "that a system be organized by which producers and consumers may be brought into closer business relations."

FARM SCHOLARSHIPS FOR JEWISH CHILDREN

Twenty Jewish boys and girls are spending this winter in agricultural colleges at the expense of the Jewish Agricultural and Industrial Aid Society of New York, as a result of a competition among the children of Jewish farmers throughout the country. The scholarships are part of the educational work of the society, which is an offshoot of the Baron de Hirsch Fund.

The plan was first tried two years ago and has grown steadily in popularity. Seven scholarships were awarded the first year, thirteen last year and twenty this. Connecticut led with nine scholarships, New Jersey had six, New York two, and Massachusetts, North Dakota, and Wyoming one each. Seven of the twenty are girls, two of them the wives of young Jewish farmers. The award is by a competition, including a brief essay in English upon some agricultural topic selected by the competitor, who must satisfy the authorities of the college to which he is accredited of his fitness to pursue the course with profit.

May in Detroit Journal.

DUST AND DEATH.

A campaign of publicity has awakened Detroit to a realization of the close connection between dirty streets and pneumonia and other dust-borne germ diseases.

The earlier scholarships have already borne fruit. Upon returning home from college, the students went to work with zeal and energy to put life and spirit into the farm. Barns were whitewashed, cows placed on proper rations, and more milk produced on less feed. Milk is weighed and a record kept of each cow's yield not only as to quantity, but as to quality. Those who took courses in general agriculture got to work on crop rotations, fertilizers, pastures, and the general improvement of the farm. Poultry was a favorite course with girls as well as boys. Most of the girls, however, took courses in household economics and upon their return set to work to improve the appearance of their homes, planted flowers in the front yard, and delighted home palates with their cooking, baking, and preserves.

SAVINGS BANK INSURANCE TRIED OUT FOR TWO YEARS

State savings bank insurance in Massachusetts was two years old on November 1. By its second annual report which was given out recently, the premium income showed gains in both banks writing insurance, the increase in the Whitman Savings Bank being 113 per cent and that in the People's Savings Bank of Brockton 150 per cent. Expenses, on the other hand, remained prac-

Morgan in Philadelphia Inquirer.

GOING UP.

The Philadelphia Young Men's Christian Association is making a whirlwind campaign to raise a building fund of one million dollars in two weeks. Over half a million was secured the first seven days. An elaborate committee organization is in charge of C. S. Ward, the Y. M. C. A. "national booster," who will go next to Atlanta and Charleston, and later to Minneapolis, Cincinnati and Rochester.

tically stationary, taking less than twenty per cent of premium receipts from policies written in the twelve months. The number of death claims jumped from one, in the initial year, to nine—the amount, from $500 to $3,622; but the mortality rate remains low, as is usually the case in new insurance companies. After paying expenses of conducting the business, meeting death claims, and setting aside the required amounts for reserve funds, both banks declared three classes of dividends. On monthly premium policies, which during the current fiscal year will reach their first anniversary, the dividend is one monthly premium; on those reaching their second anniversary, one and one-half times the monthly premium; and on those reaching their third anniversary, one and two-thirds times the monthly premium. This showing is made upon rates considerably below those of the industrial companies.

Insurance in force on the last day of the fiscal year amounted to $1,367,363, or about a thirty-seven per cent increase. The number of policies was 3,318, and the amounts average $412.10 as against the previous average of $393.79. This higher figure, together with the fact that fifty-eight per cent of the policies are of the twenty-year endowment class where premiums are higher, would seem to indicate either that the league's educational campaign has been very successful, or that the class of people benefiting by the plan is more provident and prosperous than are the average holders of industrial policies in the big companies. The number of policies which were terminated during the year ran up to fifty-eight per cent of the total number issued in the twelve months; the number forfeited by lapse reached thirty per cent of the year's issue,—an increase of five per cent over the first year. The lapse rate, however, is still less than half the average lapse rates of the industrial companies.

CORONER AND JURY DISAGREE ON NEWARK FIRE

The presentment of the grand jury of Essex county, N. J., on the factory fire at High and Orange streets, Newark,[2] offers a striking contrast to the coroner's verdict. The coroner found that the loss of twenty-five lives was not due to "a criminal act, either of omission or commission on the part of any individual or individuals, whether as private citizens or public officers," but was an unavoidable accident.

The grand jury's presentment, on the other hand, censures the superintendent of the Anchor Light Company who tried to put out the fire before notifying the fire department, and the captain of the engine company across the street for investigating conditions within the building before turning in a general alarm. The jury also seriously questions whether the fireman who did not mount to the fourth floor with the engineer of the building to help some of the inmates get out on the fire-escapes, should be retained in the fire department, criticises the force of the hook and ladder truck for failing to raise a ladder at the north end of the building, and the factory inspectors who never reported the locked door at the foot of the stairway to the fourth floor.

Having made these specific criticisms of individuals the presentment proceeds to recommend lines of improvement in the laws regulating fire protection. These recommendations include requiring the Bureau of Combustibles to report to the

[2]See THE SURVEY for January 7.

factory and building departments dangerous conditions in buildings; a material change in the present state law for the erection of fire-escapes "in view of the fact that in case of fires on lower floors the fire-escapes at present required become absolutely useless to the upper stories"; the fire-proofing of stair wells by means of brick walls and fire doors, the installation of fire-alarm systems and of bi-weekly drills of all employes in factory buildings.

DEATH OF DR. MÜNSTERBERG

Emil Münsterberg, president of the Department of Public Charities in Berlin, Germany, who died January 25, was widely recognized as the foremost authority in the world on charitable administration. He was well known in this country. In 1906 he made a tour of our principal eastern cities and later gave us his Impressions of American Charity in a series of thoughtful articles in *Charities and The Commons*, then the name of THE SURVEY. In 1908 he made a brief visit to New York to deliver the principal address at the twenty-fifth anniversary meetings of the Charity Organization Society. Through these visits and the articles in *Charities and The Commons* and the *American Journal of Sociology*, he became the chief interpreter to the present generation of American charity workers of the Elberfeld system of relief. This system, based on the principle that public assistance should be given in the home in all but an irreducible minimum of cases, and administered not by a few paid officials but by many "neighbors" or volunteers working under the supervision of trained experts, is the model for charity organization work in America, though it has developed here along lines somewhat different from those followed in Germany. His visit to America resulted in a plan for a united charities building in Berlin, patterned after the one in New York, which probably would have been erected next fall.

Dr. Münsterberg was born at Dantzig in 1855. While still a young man he became an expert on charity administration. In 1887 he published an article on the English charity system, followed at intervals by others on Russia, Switzerland, Italy, Belgium, and the United States. In 1887, too, he published a book on Germany charity, *Die Deutsche Armengesetzgebung und das Material zu ihrer Reform*. In 1892 he was commissioned to reorganize the relief work at Hamburg and almost at the beginning of this large task he and his band of "honor" assistants were called upon to administer relief during an epidemic of cholera.

In 1896 he was made secretary of the National Conference of the German Society of Relief and Charity (*Deutscher Verein fur Armenpflege und Wohlthatigkeit*). The reports of this body, issued at irregular intervals, contain many of his writings. Collected in annual volumes they form a frequent and notably complete survey of charitable administration in many countries. He was both founder and editor, and at the twenty-fifth anniversary of the New York society presented its library with a souvenir set especially bound for the occasion. In 1897 he wrote *Die Armenpflege*, the standard German work on this subject, which has run into several editions. He was the compiler of the *Bibliographie*

Plaschke in Louisville Post.

HELP!

The campaign for a new Y. M. C. A. building in Louisville has been going on vigorously for some time. The social value of such a center for boys has been emphasized as sound reason for seeking contributions from all the people of Louisville.

Briggs in Chicago Tribune.

THE SAME TO YOU AND MANY OF THEM!
The very best sort of a New Year's toast—pure water drunk from an individual glass.

des Armenwesens and a frequent contributor to German periodicals.

His presidency of the Berlin Department of Public Charities dates from 1905.

Dr. Münsterberg was a man of large vision and experience as well as a trained and efficient executive. The many charity workers who met him during his visits to America have treasured a memory not only of a delightful companion, a scholar and expert in charity, but of one who had in notable degree the German trait of thoroughness and found time, with all his affairs, to do all things well. The attention to minute detail which he gave to every kind of public and private charity in America was all but disconcerting to those he interviewed, and led perhaps to the feeling that his report would be a collection of innumerable petty facts. The articles in *Charities and The Commons* were to some, therefore, a surprise in the breadth of Dr. Münsterberg's grasp of our organization and methods, and of the peculiar problems due, on the one hand, to enormous immigration and city crowding, and on the other, to the jaunty progress of a rich and democratic nation.

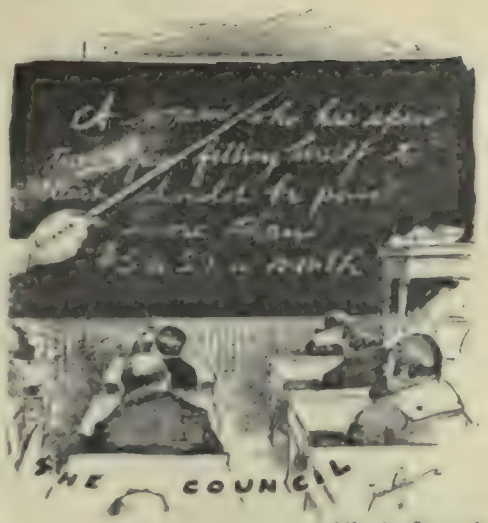
Dr. Müunsterberg's daughter Elsa was for some time a resident of Greenwich House, New York. Prof. Hugo Münsterberg of Harvard is a brother.

FRANCIS GALTON: EXPLORER OF MEN

With the death of Sir Francis Galton on January 18 in London there disappears one of the few remaining members of that extraordinary group of Englishmen of which Charles Darwin was the recognized chief. Galton, a cousin of Darwin, was born in Birmingham in 1822, was graduated from Trinity College, Cambridge, in 1844, and two years later began his active exploring work in Africa, from which his first reputation was gained. For many years that field occupied his time and attention and it was not until 1869, when his Hereditary Genius appeared, that he began his extraordinarily varied series of studies in the application of statistical methods to biology, psychology and sociology. In 1874 he published English Men of Science, and in 1883, Inquiries Into Human Faculty. In 1889 his Natural Inheritance appeared, and in 1892 the study of Finger Prints.

During all this period, and up to the time of his death, he was an active student of individual psychology and during his later years gave particular attention to the problem of eugenics.

It is quite impossible at this time to estimate with confidence Galton's permanent value and service. His most striking characteristic was the fertility, amounting to genius, with which he blazed the way in applying new methods to old problems. It is more than possible that his permanent reputation will rest not upon new truths or generalizations established by his hand, but upon the extraordinary amount of research by others that has been stimulated through the suggestions first offered by Galton and along lines first hinted at by him.



While the results of the application of statistics to mental factors and the study of individual psychology based thereon have thus far not borne out the hopes of its sponsor, there can be little doubt that the consequent widespread interest in the

transmission of mental traits as well as of physical characteristics will yield results of permanent value.

The suggestiveness of the work of Pearson and his school, which owed its initial stimulus to Galton more than to any other man, is recognized on every hand, even though much difference of opinion may obtain as to its ultimate significance. If he had done no more than initiate the interest in eugenics along with all its possible sociological bearings Galton's fame would be secure.

Always impatient of scientific convention and constantly reaching out for new fields of inquiry, he was in the latter half of his life as typically an explorer in biological science as he had been in earlier years in the geographical field.

It is given to few men to think new thoughts. With the appearance of each new product of Galton's mind there was left the impression not only of freshness of treatment, but of absolute originality of idea, method and suggestion.

Atlanta Journal.

A LESSON FOR THE CITY FATHERS.

Many interests in Atlanta have united in a concerted effort to secure from the City Council an increase in teachers' salaries. The rate of pay is held to be inadequate with the present cost of living. In some cases it is actually lower than it was years ago.

ANNUAL MEETING OF CONSUMERS' LEAGUE

Perhaps the most significant feature of the twelfth annual meeting of the National Consumers' League at Pittsburgh February 7 and 8 will be the address on The Living Wage by the Rev. John A. Ryan of St. Paul. Father Ryan is an active member of the league's committee on minimum wage boards and has expressed the hope that a bill for the creation of such boards may be introduced in the Minnesota Legislature before February 7.

John Graham Brooks, president of the league, will preside at all the sessions, and will deliver the presidential address the evening of February 7. The vice-president, Mrs. Frederick Nathan, will speak on The Need of Protective Legislation for Women and Girls. The local committee has secured the co-operation of twenty-five women's organizations in and around Pittsburgh, and a public session for women, in co-operation with these organizations, will be held on the afternoon of February 8 in the Chamber of Commerce. This will be addressed by Mrs. Nathan on the question, Would the Ballot be of Value to Working Women? Headquarters will be at the Fort Pitt Hotel and the public meeting the evening of February 8 in the Chamber of Commerce.

EDITORIAL GRIST

HOMEWORK: A VICIOUS CIRCLE

FLORENCE KELLEY

There are two points upon which the public needs to act in relation to tenement work, as set forth in the valuable article by Miss Watson elsewhere in this issue. We never can know the extent of such work, and for want of knowledge we cannot safeguard either the children of the tenements or the buyers of the goods; we cannot keep the homework system and escape its inevitable consequences and accompaniments.

The time is ripe for the sweeping prohibition of the abominable system. In the interest of the children and of the public health, it should be abolished by law without further waste of time. It

Morris in Spokane Spokesman-Review.

THE TWO WIDOWS.

The expose of the pension system now running in the *World's Work*, and the talk of pensions for government employes and their dependents, has brought into sharp focus the contrasting fate of the families of men who served in the army and of men who served in civil positions. Even the members of the Life Saving Corps, engaged in an extra-hazardous occupation, are not provided for.

spreads disease broadcast. It robs children of their childhood and their school life. It promotes congestion of population by keeping young homeworkers within walking distance of the factory. It encourages manufacturers to stay in congested districts in order to be near the cheap homeworkers:—a vicious circle injurious to everyone involved in it.

Every effort to restrict or regulate homework has ended in failure in this country and in Europe. The only rational thing left to do is to abolish it outright exactly as cows, goats, chickens, geese and pigs have been banished from the tenements.

THE UNITED TOWNS OF BOSTON

ROBERT A. WOODS
South End House

Guizot tells us that the proper subordination of general and local governmental powers is the last and highest development in the evolution of popular government, and John Fiske says that the federal union is the one political contribution of America to the world.

A broad and substantial movement—cumulative effect of many earlier strivings—is coming forward in Boston for the thoroughgoing application of this distinctive method of American democracy to the administration of the city.

Municipal expansion both in America and in Europe has thus far taken, with occasional superficial modifications, the form of annexation. The Boston suburbs, possessed of ancient traditions and excellent local administration, have never even been touched by "Greater Boston" agitations in the past. Now, however, a "Real Boston" is beginning to emerge from the confusion of interests involved in the efforts of forty different cities and towns to meet the outstanding common problems of a great urban community. The proposed form of metropolitan administration, instead of being fastened down upon the towns, is to grow up out of them. It is even suggested that local autonomy should be restored to the various districts within the city limits, which in most cases still retain a strong and definite sense of their local identity. To complete the project of a federal, rather than in any sense a consolidated, administration, there is a dream, which a gradual evolution might well bring true, of a sort of downtown District of Columbia. In this way the taxing power over the business section of the city would no longer be vested in the tenement-house and immigrant population of the city, as an endless source of demoralization among them. It would be in the hands of a metropolitan council broadly representative of the entire population of the whole urban community.

The two elements which have been responsible for most of the municipal reform movements in American cities, business men and social workers, take the active leadership in this project. Among both there is a keen sense of the need of all existing local pride and responsibility, and much more. The merchants live chiefly in the suburbs. To the social workers, the neighborhood is more and more their *metier*. On the other hand, the large coherent point of view and momentum is furnished by the recent union of various business organizations in a single Chamber of Commerce with 4,500 members, and the promising steps toward the federation of all the many local improvement agencies.

The reality of the enterprise was made clear by the disclosure that as soon as the committees of the newly formed Chamber of Commerce came at their work of advancing the broad economic interests of Boston,—including city planning, housing, transit, industrial education, and public health,—they nearly everyone immediately encountered the impossibility of accomplishing total results through two score administrative fragments. Equally based on facts is the conclusion of the settlement worker, who sees the more enterprising young people of his local community, as fast as they are educated to citizenship, moving out beyond the city boundary; while the less progressive go the easy way of machine politics, cheap contracting or saloon keeping, which is made vastly more tempting through the inordinate power which an ill-balanced electorate thrusts upon the settlement neighborhood.

The proposed federation will undoubtedly have to gain strength by successive steps. The proposal is that at first it shall have only advisory powers. Next it will undoubtedly have certain new phases of metropolitan administration assigned to it. After that, it will tend to absorb the functions of the existing state-appointed metropolitan authorities. The united towns of Boston cannot, in any case, seem so vague as the United States of America was a hundred and thirty years ago. And the obstacles which have confronted the greater Boston in the way of sturdy local self-sufficiency may in the end prove to be stepping stones toward the truly organic type of democratic municipality.

EDUCATION AND STATE RIGHTS

LEONARD P. AYRES
Russell Sage Foundation

"Every foe of economy, every friend of federal interference in the business of the several states," says the New York *Sun* of January 12, rejoices in the triumph of the Federal Bureau of Education and the defeat of the enemies of the movement to extend its force of workers.

Kessler in St. Louis Times.

HIS POSITION ON THE CHARTER.

The proposed new charter for St. Louis has been approved and condemned on almost as many grounds as the proposed subway extensions in New York. The resulting confusion of the voter is well shown by the cartoonist.

The occasion thus editorially referred to was the debate in the House of Representatives on January 7 over the proposal to appropriate funds to create a field force for the bureau. The principal sponsor for the measure was Congressman Herbert Parsons of New York. The most conspicuous and active opponents were Congressman Tawney of Minnesota, who attacked it on the ground that it would result in interference in the business of the states, and Congressman Mann of Illinois, who argued that it would be an "opening wedge" leading to the creation of a great and immensely expensive department.

The matter under debate was the plan of the United States commissioner of education to establish in his bureau a field force of consulting specialists in ten branches of educational work. For this purpose he has asked Congress to appropriate $75,000—$30,000 for salaries of ten specialists, $20,000 for traveling and contingent expenses and $25,000 for additional clerical and editorial force in the central office.

The idea behind this movement is that there is no way in which the real interests of the public can be better promoted than by increasing the amount and im-

proving the kind of education which the people get; that this improved education can be promoted more effectively by the federal government than by any other body; and that the way in which the government can help is by securing and disseminating accurate, pertinent information telling just what is being done in different lines of educational endeavor in different localities and with what measure of success.

The commissioner's plan, which is now before Congress, for this gathering and dissemination of information provides for the employment of specialists in the ten following subjects:

school administration, industrial education, education for housekeeping, statistics and accounting, rural education, school hygiene, school architecture, commercial education, secondary education, wider use of school plants.

These specialists will study, investigate and collect information in these several fields. This material will be collected, organized, and printed in pamphlet and book form, but the work of writing and preparing matter for publication will not constitute the chief function of the new force. Its principal duties will be to consult with local educational authorities who are constantly seeking information, counsel, and assistance in these fields and who at present have no source from which they can get this sort of help.

In short the new force will constitute a national clearing-house of educational information. It will gather facts from all possible sources and render available to each locality the experience of all.

There are not the slightest grounds for Mr. Tawney's statements that the new force will interfere with existing state and municipal offices of education. No such interference is contemplated nor would it be possible under the organic act creating the Bureau of Education. The object of the new field force, like that of the existing bureau, is service not power.

In the discussion before Congress it was argued that it is needless to employ agents for personally gathering and making available information, as the work can be done at less expense through pamphlets and other publications. The trouble with this argument is that it is not sustained by the lessons of experience. The policy of placing able men actually in the field in order to get definite results has been adopted by practically all agencies that have been successful in securing enlightened public action.

The brilliant success of the Southern Education Board in bringing education in the southern states to a higher level of efficiency has been secured through the services of the able men it put in the field. The trustees of the Peabody Fund have adopted the same methods. In the field of social service the Playground Association of America, the National Child Labor Committee, the Hookworm Commission and the Russell Sage Foundation may be mentioned as agencies that depend for results on the services of able men doing field work.

In very different fields the life insurance companies and political organizations have learned just the same lesson, which is that the interest and co-operation of communities can be secured only through personal contact. Documents alone, no matter how ably written, are inadequate. Personal leadership is essential.

These are the reasons why the commissioner of education asks for a field force of consulting specialists whose services will be available for the study and analysis of local problems, and who will be able to help schoolmen in the same effective way that the Department of Agriculture aids agriculturists.

These specialists will be men familiar with educational theory and practice and having special knowledge and recognized standing in their several fields. It will be their duty to master the past and current literature in their specific lines and each man will acquaint himself with what has been and is being accomplished everywhere in his particular line of work and with what measure of success.

The action of the present Congress will decide whether or not that body believes that we should have in Washington a national bureau available as a central clearing house of information and in which the experiments and experiences of the different states and cities shall be

recorded and made available through specialists who can give really expert advice, information, and opinion when called on to do so.

If gathering and making publicly available the results of experience in education is a violation of the rights of the states, as Mr. Tawney argues, then the federal government is guilty of the most unwarranted sort of interference in compiling and publishing the census, in maintaining its Departments of Agriculture and Commerce and Labor, and in supporting such bureaus as those of mines and weather.

It is idle to argue that the government may study the farm but must not regard the welfare of the farmer's child. It is unreasonable to suppose that it may aid in perfecting the machine but must make no provision for the welfare of the operator. The argument is no longer tenable that fish, and clams, and insects may properly be studied at an annual cost of millions of dollars, but that to make generally available the existing information about the welfare of children is an unwarranted and dangerous blow against popular self-government.

GOVERNOR DIX AND STATE INSTITUTIONS

With all that Governor Dix says in his message to the New York state Legislature in behalf of economy in public expenditures THE SURVEY, it is needless to say, is in hearty accord. The governor's words are not perfunctory. They have the ring of conviction and of purpose. Neither is this commendation by THE SURVEY perfunctory. If Governor Dix can succeed in actually preventing extravagance, corruption, and waste in the expenditure of state funds, he will have performed a social service of the very highest order. The waste or the misuse of the resources belonging to the commonwealth is a hindrance to the proper performance by the state of its social duties. Governor Dix no doubt realizes perfectly well that this will be a matter of extreme difficulty; that many of these expenditures are made pursuant to statutes which can be abrogated only by consent of the Legislature; that, as in the case of the unnecessary and expensive publication of the session laws in local newspapers and in the employment in connection with the Legislature itself of a large number of supernumeraries, the putting into effect of business principles in these branches of the public business is a matter of almost hopeless difficulty. Every good citizen, regardless of party affiliation, should uphold and strengthen the governor in such efforts.

By reason, however, of the difficulty of correcting these real evils, and of the failure of many promising efforts in this direction, it is more than likely that the impetus toward economy and retrenchment will be turned toward the state's large expenditures for charitable and correctional work. The state does expend large sums of money in the maintenance of its charitable institutions, its hospitals for the insane and its prisons. The business administration of them should be in complete accord with sound business principles. It is not easy to say what these principles are, nor how they should be applied. What may at first sight be thought sound business methods may not be readily applicable to a group of institutions diverse in character, scattered over a state, and established each to accomplish a specific purpose. THE SURVEY, however, not only would not oppose, but is in hearty sympathy with the belief that the moneys expended for these institutions and for all the social work of the state should be paid out with scrupulous economy, and with complete regard for sound principles of business management. Here again, however, the force of tradition, of inertia, of routine, and of statutory requirement is very great; and to detect abuses and extravagances will be no easy task, and to correct them will be still more difficult.

All these facts are likely to suggest to the legislators and to the governor the curtailment of the newer enterprises to which the state is committed, or the refusal to consider additional work which has been and is being urged upon the state. It is much easier to refrain from

additional expenditures, however meritorious, than to discontinue long-standing extravagance, however destitute of merit.

The state cannot go backward. It must go forward. The obligations resting upon it are clearly defined and must be met. The number of the insane, the feeble-minded, and the wayward increases from year to year as fast as the general population—possibly faster. All these classes must be provided for. To stop new construction means further overcrowding. The greater part of the constructive work in which the state is now engaged has been carefully thought out, has been planned on conservative and economical lines, and should not be interfered with.

In particular, the two enterprises which the state has undertaken and carried on in parallel lines, the development of Letchworth Village at West Haverstraw, and of the New York State Training School for Boys at Yorktown Heights, should be provided for. The state has no institution for the care of the feeble-minded nearer New York city than Rome, Syracuse, and Newark. Epileptics must be sent the expensive journey to Sonyea, Livingston county. The absence of adequate accommodations at these institutions leaves many scores of mentally defective in homes, where they are an undue burden and interfere with the economic efficiency of the household; in poorhouses, where their presence is forbidden by law; and in orphan asylums, where they are a detriment to the other inmates, who cannot themselves receive suitable training. Meantime, those who remain in the community at large contribute far more than their due proportion to the ranks of the criminal, the prostitute and the vagrant.

For the New York State Training School for Boys the argument is equally cogent. The state is sending its juvenile delinquents to an institution built nearly sixty years ago, and which, in construction and equipment, violates every principle of modern reformatory work. The state is in the position of a manufacturer who continued to use a factory which had long become obsolete and seriously damaged the raw material put through it. The House of Refuge on Randall's Island should be abandoned, as has been the policy of the state for the last eight years, at the earliest possible moment; and the New York State Training School for Boys should be developed on the cottage plan.

Besides the development of Letchworth Village and the Training School for Boys, the state is already committed, through the selection and purchase of sites, to the development of an additional state hospital for the insane at Lake Mohansic, Westchester county, and a state farm for women. The State Conference of Charities and Correction and many charitable and civic bodies have very strongly urged for several years the establishing also of a reformatory for misdemeanants and a farm colony for vagrants. A clear case has been made out for each of these institutions, and, in our judgment, the state will not be able to delay their establishment much longer.

Of the six propositions submitted to the voters of Oregon by the state Legislature last fall only one received the approval of a majority of the voters, that one being the proposition to establish an additional hospital for the insane. We have not the slightest doubt that a large majority of the people of New York will strongly uphold the legislation of the governor pursuing a vigorous and constructive policy in dealing with charitable and correctional interests.

THE PITTSBURGH STREET PLAN

CHARLES MULFORD ROBINSON[1]

"City planning", said the Pittsburgh Civic Commission in 1909, "should be the forecasting and provision for securing such physical facilities, equipment

[1]As a colleague in the field work of the Pittsburgh Survey, Mr. Robinson made a quick diagnosis of the civic improvement needs of Pittsburgh in the summer of 1908. His work as civic adviser to Los Angeles, Denver, Columbus and other cities gave national background to his findings. He outlined certain main elements in the situation and recommended an intensive and comprehensive investigation by a commission, calling in outside experts in city planning and engineering. He is, therefore, in an especially favorable position to review the first report of the Civic Improvement Commission on what might be called the ground plan of the city.

and development of a city as are necessary to promote and accommodate the business, communication, transportation, health, comfort, and pleasure of its citizens. City planning, as undertaken by the Pittsburgh Civic Commission, means the city useful, convenient, economical, and healthful, as well as the city beautiful."

The commission secured the services of three authorities on city planning to prepare the report on Outline and Procedure from which these words are taken, and then retained the services of Frederick Law Olmsted, one of the three, "to make a study of a comprehensive main thoroughfare system for the center of the city and to the principal residence and manufacturing districts and the surrounding boroughs"; also to present a report "upon the locations of the main public buildings and grounds of the downtown section." This report by Mr. Olmsted is now being issued in printed form by the commission. It is interesting, both on account of the city for which it is made and because of the man who made it, but especially is it interesting because it is perhaps the most extended, thorough, and concrete report yet submitted in the United States on the question of street readjustments.

Persons who have even passed through Pittsburgh on the train know the roughness of the topography, and can realize to some extent the difficulty of the problem of creating there a convenient street system that will accommodate "business, communication, and transportation." Those who know Pittsburgh itself know how much more complicated the problem is made by the development which the city has already had, and particularly by the natural crowding of the business center into a narrow gore at the junction of two great rivers, its landward or eastern side bounded by hills through which egress can be had through a single gap and only along the edge of the rivers, of the valleys of which the railroads have already made use. To the north and south the inward and outward travel is borne by bridges, which obviously can be increased in size and number as the need arises. The main problem, therefore, is that raised by the necessity of providing sufficient communication between the business center and the populous region lying east of it. To this problem and its ramifications Mr. Olmsted's report is largely devoted. The result is a comprehensive street layout, of which the main interest to persons who do not live in Pittsburgh is its concrete illustration of what a city plan report can, in a practical way, do for a city.

As a great deal of the report is printed in the following pages, with an introduction by Mr. Olmsted himself, attention need here be called to only a few of the main suggestions, choosing especially those of wide, and in some cases of general, application, or those not included in the long quotations from the report.

Most interesting from the former point of view is the chapter devoted to street widths. In the course of this Mr. Olmsted points out, what a great many persons are prone to forget, that the width of vehicles is not necessarily fixed. In fact, as he shows, the tendency, especially now that the motor truck has made its appearance, is toward an increase in the size of the vehicle unit, and therefore in proportioning the width of our main thoroughfares according to the number of streams of vehicles we wish to accommodate, it is advisable to be somewhat generous. He shows also that in Pittsburgh with its many hills, no great boulevards of the type usually found in flatter cities could be carried for any considerable length without enormous expense. Such thoroughfares, he suggests, must make provision for handling anticipated future street traffic, not by a general and continuous widening, but by occasional pieces here and there.

There are, he remarks, two special forms of street development used in hilly cities all over the world, of which Pittsburgh needs to take account in its suburban development. These are: first, the street designed to give access to frontage on one side only, usually the up-hill side, the street running on the side of a hill and perhaps supported by a retaining wall; and, second, the two-level street, in which a longitudinal bank

or retaining wall is introduced into the middle of the thoroughfare, so as to adapt it to the topography and bring it nearer to the natural surface of the property which abuts it on either side. One whole chapter is given up to a discussion of the need of accurate and comprehensive surveys. These are necessary for the proper development of any city, as a basis for the layout of the streets, sewers, and all public works, and as a means of avoiding extravagant mistakes, misfits, and reconstructions. But in Pittsburgh the need is especially urgent. As Mr. Olmsted says, perhaps no city of equal size in the world is compelled to adapt its growth to such a difficult complication of high ridges, deep valleys, and precipitous slopes.

Study of the street plan necessarily involves consideration of various local points which make more definite and spectacular appeal to public interest. Such are the civic center where the public buildings are to be placed; the waterfront, the market, and the development of "The Point."

Three purposes are to be served, says Mr. Olmsted, in the proper development of the Pittsburgh water front. These are the improvement of commercial opportunities, the relief of traffic, and the provision for recreative and aesthetic enjoyment.

For his suggestion that a market be developed on Liberty avenue between Third and Fourth streets, it is not as easy to feel enthusiasm. No doubt the new site is better than that now occupied, but Mr. Olmsted does not make clear his reasons for considering it necessary to establish a market at all in this general locality. His own statements regarding the market situation seem, indeed, to the writer a sufficient reason for disapproval of an attempt to establish a large central market in the congested business heart of Pittsburgh.

A final section of the report is given up to notes on parks and recreation facilities. Here, as in the sections devoted to street planning, the general, rather than the particular, is of most interest to readers who do not live in Pittsburgh. It is to be noted, however, that that city belongs to the class in which the topography is so dominating a feature that it must affect the size and distribution of the local parks to an unusual extent. The city and its contiguous boroughs are subdivided into hilltop and valley communities, close together it may be, but nevertheless isolated one from the other by almost precipitous hillsides from one hundred to three hundred feet in height. These communities are sometimes very small and frequently very irregular in shape. For these reasons the large neighborhood recreation center, which is the efficient and economic unit for Chicago, is not well adapted to large sections of the Pittsburgh district. In the latter the isolated communities require local parks. Mr. Olmsted finds opportunities for meeting these, and various other, park needs of the district at low cost, in the park and parkway development of the various runs. He suggests also that considerable use may be made of the steep hillsides, not indeed as playing fields, but as sites for interesting footpaths and for seats and terraces that shall command wide views.

With reference to an improved entrance to Schenley Park, two plans are submitted. Each of them has much to commend it and would effect a very great improvement in present conditions and in the setting of the Carnegie Institute. The presentation, however, of these schemes suffers the inevitable lack of force and persuasiveness which results when alternative projects are submitted, the reader becoming confused by the advantages and claims of each. But this is a matter affecting the presentation, rather than the execution, of the plans, and it is the execution alone which is ultimately important. This may be even better because alternative projects are submitted.

In fact it must be said in closing that Mr. Olmsted has made a very thorough, conscientious, comprehensive, and interesting study of the needs of the Pittsburgh district on the special lines on which he was asked to report. He had an unusually difficult subject, but that very fact may well have proved a challenge to his spirit.

PITTSBURGH

CIVIC FORCES AND CITY PLAN

FREDERIC LAW OLMSTED ALLEN T. BURNS
CHARLES MULFORD ROBINSON
(Editorial Review)

Sketch for Municipal Building located on slope, east side of proposed Civic Center. Open area in front to be created by decking over Panhandle tracks and freight yards.

THE intensive study of certain primary elements in city planning, presented by the Pittsburgh Civic Commission, in their report which comes from the presses this month, has more than local significance. The following pages are of direct practical interest in any city,

Where there is water frontage on a river;

Where there are hills to be seamed with streets;

Where congested, old thoroughfares are to be broadened to make way for increased traffic and wider gauged trucks;

Where an intelligent, structural layout should be provided for future city growth.

SCALE

THE PITTSBURGH CITY PLAN

THOROUGHFARES, CIVIC CENTER AND WATER FRONT

FREDERICK LAW OLMSTED

The report on Pittsburgh — Main Thoroughfares and the Down Town District, if it has any distinctive character as compared with most other recent reports on city planning, must depend, I think, for such distinction upon the fact that it concentrates attention mainly upon a single one of the basic problems of city planning, and upon the probability that the somewhat more intensive study which this permits may help to carry the mind of the reader to a juster conception of what real city planning will mean when it once gets fairly established.

A full conception of city planning, as we shall come to know it, has yet to be formed. It is a matter of such appalling magnitude and complexity that as yet we have hardly got beyond the stage of scratching the surface here and there and learning to recognize the momentous truth of its unity: the truth that no matter where anybody may sink a shaft or what particular vein he may start to follow, each and all are dealing with one enormous aggregate of values and obstacles; the growing conviction that we must learn to develop these resources on a reasonably consistent and harmonious plan which shall take account, in every shaft and heading, of all the main elements of value and all the by-products that are economically attainable.

To continue this mining simile a little further, there is need, in the first place, of driving exploration shafts and tunnels, of boring deeply, of taking innumerable samples and making innumerable analyses, as a basis for planning a more far-sighted and economical development. This is the scientific department of the problem. There is need, in the second place, of continuing the present workings without intermission or delay, even though we know that the present heterogeneous plans are wasteful, and even though we be now struggling to harmonize and improve them; for on the prosecution of the present workings the income of the property depends. This is the operating department of the problem. Finally there is need for arousing the public to an understanding of the aims, the current results, and the future prospects in both departments, in order to get financial support for pushing the work: the department of publicity and promotion.

At the present stage of things a report on city planning must be regarded mainly as a prospectus, a means of getting the public ear and educating the public mind to the opportunities for decrease of operating cost and improvement of output, which would be offered by a comprehensive and scientific guidance and control of operations throughout the whole field.

A prospectus must appeal to the imagination; it should also afford some ground for reason to follow where imagination leads. Some of the recent prospectuses in this field have relied largely upon pictures, others upon glowing descriptions, still others upon pregnant-looking diagrams and plans; some have emphasized the size of the field and the opportunities for consolidation, others have laid stress upon the gains to be made by applying greater skill and science; some have dealt chiefly with recognized staple articles of the present stage of development, like transportation; while the majority, perhaps, have thrown the main stress upon by-products, such as civic beauty.

Unfortunately the latter have not always made it clear that civic beauty really is to be regarded as a by-product of civic utility. In emphasizing its great value and importance they have too often left the impression upon the man-in-the-street that, in spite of their formal disclaimer of such a purpose, they practically involved a proposal to obtain beauty at the expense of utility.

In a well ordered municipal life civic

beauty should be as clearly the by-product of utility as with individuals happiness should be a by-product of healthy living. The world holds that the man who makes the immediate pursuit of personal happiness a main object in life has entered upon a dangerous course; that if in so doing he seriously neglects the primitive basic conditions of healthy living he is bound to defeat his object; and that an efficient, healthy, useful life is apt to attain happiness as a by-product. It is not as generally acknowledged that civic beauty in its most healthy and normal development is the nearly inevitable by-product of the most absolute civic utility, of efficiency and fitness; and that in so far as it is anything else than an expression of perfect utility, it is something superadded thereto and in no sense to be substituted for it or to compete with it.

The particular prospectus now under consideration has been drawn on the assumption that the citizens to whom it is addressed have sufficient intelligence and business ability to understand and to be influenced to action, not so much by pictures and generalities as by a somewhat detailed exhibition of the kind of investigations and conclusions that are involved in dealing with one of the most essential branches of city planning, even though but a limited portion of the field could be so traversed.

It is the transportation system that makes the modern city possible, and upon its design more than upon any other controllable factor of the city's physical make-up the cost of living depends, since it greatly affects those chief items of the domestic budget:—rent and supplies. Leaving aside land-rent, which in the city may be but an index of the difficulties and cost of transportation to more distant competitive land, a very large percentage of the cost to the consumer for building materials, for food supplies, for fuel, and even for clothing and other less bulky necessities, is represented by the cost of transportation and of the transfers incidental to a complicated system of transportation and distribution. The cost of the long rail haul and the long water haul have already been reduced to such a degree that it is, as a matter of fact, the terminal charges and the cost of hauling and transfers within the city itself that seem to offer the greatest possibilities of further economy.

Neither the railroad managements nor the people seem yet to be educated quite up to the point of undertaking a fair and frank co-operative study of the plant, equipment, methods, and costs of railroad terminal facilities in a city, and of the opportunities for increased economy and efficiency through better planning and a better relation with local means of transportation by rail and by wagon; although a number of recent reports, notably that of the Metropolitan Improvements Commission of Boston, show a drift of opinion in that direction. The local railways, for the most part confined to locations in, under, or over streets, are, as a matter of city planning, inextricably related to the street plan, and provision for them cannot be disregarded in any system of main thoroughfares; but the special problems of the traction system in Pittsburgh have been intensively studied during 1910 by Bion J. Arnold, under commission from the municipal government, and the results of that study are included in a report separate from the one now under consideration.

It is therefore the main thoroughfares between different parts of the city, and especially between the center and the outskirts, that are the principal subject of my Pittsburgh report. The chief aim of the report is to assist in selecting the means by which to remove existing or clearly predictable causes for excessive cost and inconvenience of street transportation, due either to heavy grades, to bad location, to inadequacy and congestion, or to other causes of delay, so far as it appears reasonably practicable, from the engineering and financial point of view, to secure such relief.

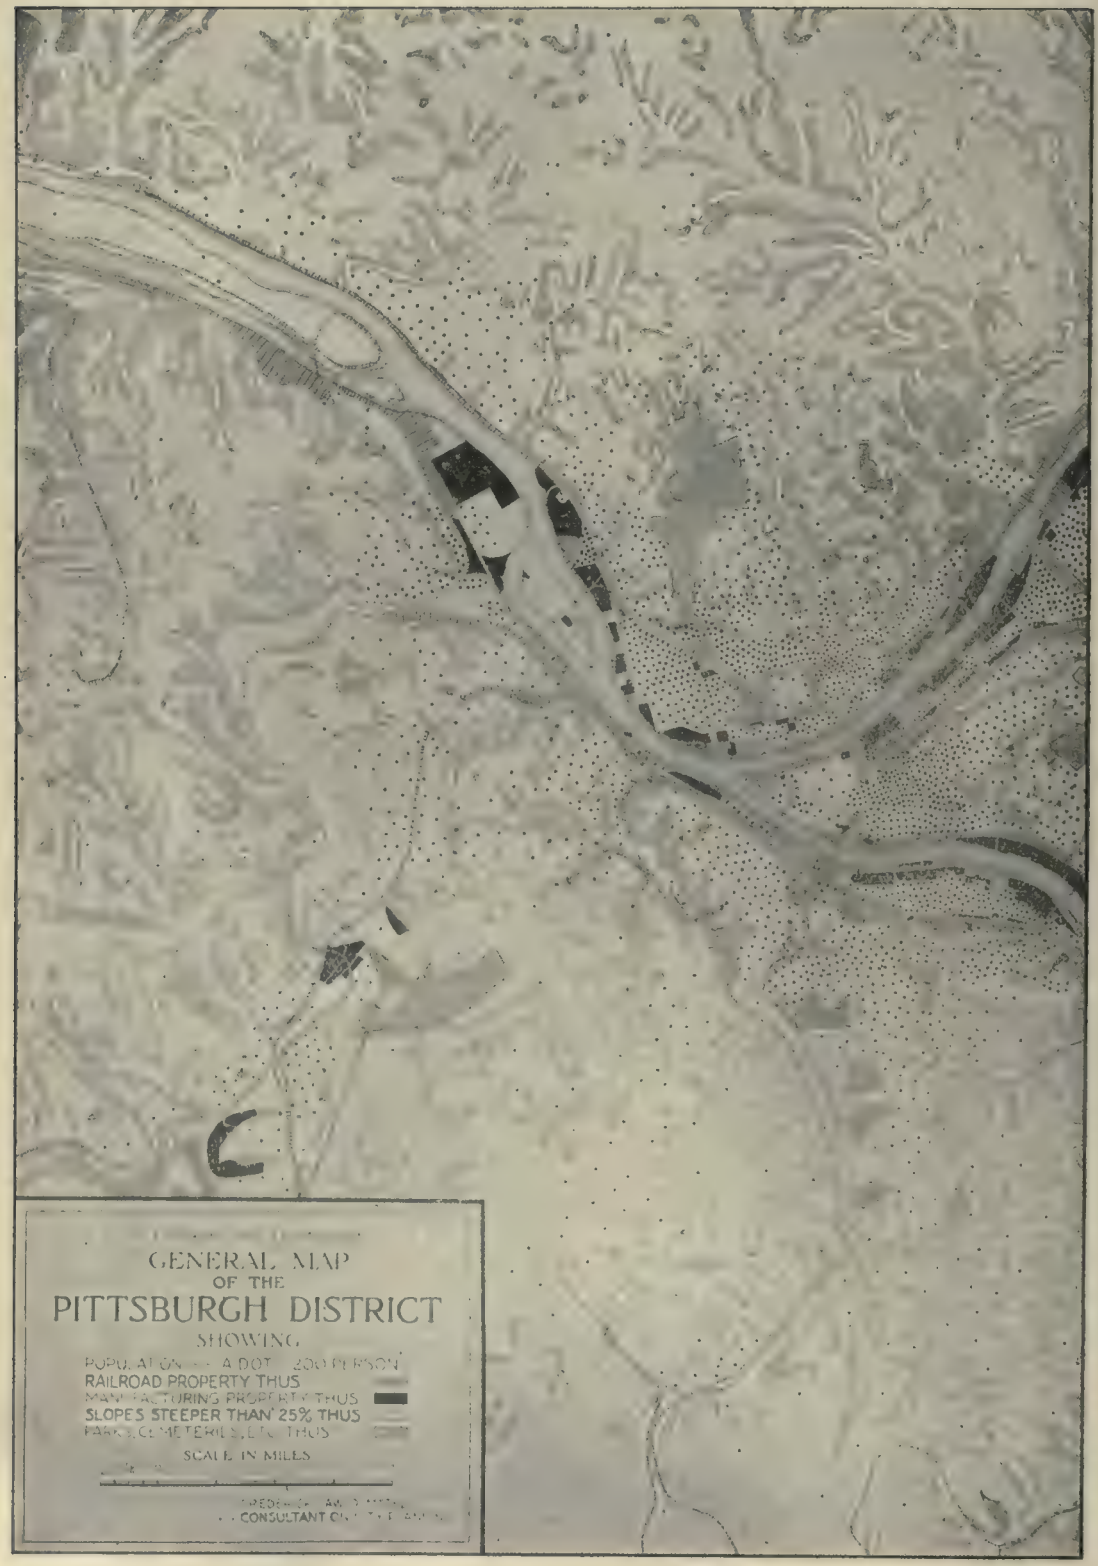
The difficult and vitally important city planning questions involved in the lay-out of new local streets in relation to the peculiar topography of Pittsburgh, such questions as cost of construction, of maintenance and of teaming, such as influence upon size and shape of lots and upon design and cost of buildings, and such as the general amenity of different

types of subdivision, are scarcely touched upon in the report and only in an incidental way. Similarly, the important matter of parks and playgrounds is dealt with only as an incident, and largely because of its reflex influence on the main thoroughfare question.

In the heart of the city, on which the thoroughfares converge, economic conditions seem to make any extensive replanning wholly impracticable. A few marked improvements in the system of main circulation seem still practicable and are discussed at length, while three other closely related matters are also discussed in some detail. One of these is a site for a much needed city hall and civic center. The second is a proposed development of the public water front in such a manner as to provide a wide belt thoroughfare, to give better wharf facilities for water transportation, and to make more available the great aesthetic and recreative value of the water front. The third is a proposed relocation and reorganization of the downtown retail public market, shifting it from a cramped site where it obstructs important channels of street traffic to a neighboring larger site with railroad connections.

It will be seen that the point of view throughout has been primarily economic. Too close insistence on this point of view may sometimes involve a limitation to a narrow outlook, or imply timidity, or shackle the imagination, but to use it as a consistent test of worth does not of necessity have any one of those evil effects, and certainly makes for sanity.

To give a mere list of the scores of specific recommendations which constitute the body of the report, or a summary explanation of the most important of them condensed within the limits of this article, would hardly concern the general reader.[1] The following excerpts are drawn from the discussions of general questions, explanatory of specific proposals, with the idea that in their broader aspects they will be of interest in other cities where similar factors must be dealt with.



[1] Part I contains recommendations as to improvements in the down town district. Part II contains general and specific matter relating to main thoroughfare improvements in Pittsburgh and the surrounding districts. Part III contains detailed recommendations for securing comprehensive topographical surveys and maps of the Pittsburgh district. Part IV contains a brief discussion of the subject of local and rural parks with special relation to Pittsburgh conditions, illustrated by a few specific recommendations. Part V contains three detailed reports on special subjects: one on The Hump Cut, one on The Market, and the other, first submitted in the spring of 1910 by Colonel T. W. Symons and Mr. Olmsted, on The City and the Allegheny River Bridges.

THE MAIN ARTERIES

The heart of Pittsburgh is the Point district, bounded by the two rivers and by the steep hills to the eastward, within which, as elsewhere, the basic problem is that of the means of transportation, specifically the problem of the street plan. There is a daily circulation of inward and outward travel to be borne by a limited number of main arteries, of which those leading to the chief tributary districts are bridges. It is clear that the bridges can be enlarged or increased in number at any time when the volume of travel justifies the expense of reconstruction.

Considering the fact that Pittsburgh is a world capital in the steel bridge industry, that its busiest quarters are sundered by three of the world's big rivers, and that it is traversed in every direction by ravines which demand the construction of mighty viaducts, it is a striking and rather shameful thing that it does not possess a single bridge over its rivers that is notable among the bridges of the world, either for its beauty, for its perfect engineering adaptation to its purposes, or for its size, strength, or amplitude. In fact, the bridges of Pittsburgh, compared with those of other cities, are rather unusually limited in capacity and lacking in the qualities of impressiveness and beauty.

It is a case of the cobbler's children going barefoot: when a man sells shoes at wholesale in every quarter of the globe, it is time for his own family to be well shod. Pittsburgh can afford to have, and owes it to herself to have, the best possible bridges. No time, or pains, or reasonable expense should be spared in planning future bridges, whether they be on new locations or to replace existing structures, to get the best designs that the highest engineering skill combined with the highest artistic ability can produce. Bridge-builders everywhere should be enabled to think of Pittsburgh not merely as a source of cheap raw material for bridges, but as an all-round leader in the bridge-building art.

To the eastward, where the most active growth of the city has been taking place, the arteries consist not of bridges over open rivers, but of streets, very limited in number by reason of the form of the land, and so situated that the cost of securing greater capacity will increase by leaps and bounds with the rise of land values and the erection of new structures. The first step in planning improvements for the heart of the city therefore must be to consider the possibilities for improvement in the eastward arteries.

There are only three places where such arteries could ever have been laid out, even if the wisest foresight had been exercised in the early planning of the city when all was free and open. These three places are around the north edge of the hills along the Allegheny, around the south edge of the hills along the Monongahela, and through the gap in the hills followed by Fifth avenue and Forbes street.

The northerly route is followed by Penn and Liberty avenues, by the Pennsylvania Railroad, and by Grant boulevard clinging to the hillside above the railroad. All the teaming and surface traffic of a very large region must be carried through the throat on the lower level. It is important also to note that the only street which passes through the heart of the city with more than village dimensions, that is to say the eighty-foot Liberty avenue, leads directly to this throat and then chokes down to a fifty-foot street. It may safely be said that increased capacity for east and west general traffic north of the hills can be secured only by a radical widening of Liberty avenue or Penn avenue. Upon the whole, the latter seems the more advantageous route. A traffic square at the angle in front of the Union Station, where the broad part of Liberty avenue ends and the narrow part begins, would furnish a good cross-connection, and, fortunately, such a square can now be formed with the destruction of but few buildings, and those of relatively little cost.

The street along the Monongahela, Second avenue, although it might, by proper planning at the start, have been made of great importance and value, cannot at the present time be greatly widened without the most serious difficulties. For much of its length it is pinched between railroads and industrial plants.

The only remaining natural outlet to the east is that occupied by Fifth avenue and Forbes street and the block between them. Neither street is nearly wide enough for the traffic it will be called upon to bear, but the widening of Fifth avenue would be so costly as to be almost prohibitive. For many reasons the widening of Forbes street into an ample main thoroughfare seems to be the best solution of the problem here presented.

The intersection of Forbes street, widened with Sixth avenue extended, is likely to become a traffic center of the utmost consequence. Sixth avenue, crossing Fifth avenue and Grant street, leads toward the Union Station and all the northeast part of the business district and to the North Side bridges; a new bridge and tunnel are likely to lead from this very intersection to the South Side and the South Hills; from this center a good connection is readily obtainable with Fourth, Third, and Second avenues and the southern water front; and Diamond street can be widened at moderate expense so as to continue Forbes street right through the heart of the business district.

The importance of the Forbes street route to the eastward and of its future traffic burden will be better realized, when it is understood that at Soho a direct extension could be made on easy grades from the widened Forbes street to Fifth avenue, the street which can more easily be widened beyond that point; and further, that a little to the east a new and greatly needed street might branch off to the right from Forbes street where the latter turns inland. This new street would continue along the side hill above the river, and would provide the only possible convenient outlet from the city to all the upland regions south and southwest of Squirrel Hill. Thus, the western portion of Forbes street, when widened, would carry the great bulk of all future street traffic between the heart of the city and the whole district from East Liberty to the Monongahela river and all the country east and southeast of that triangle.

It would be difficult to overestimate, on the other hand, the value to the future convenience and prosperity of the city, of carrying the Forbes street improvement westward,

straight through to a junction with Liberty avenue in the heart of the city on the line of Diamond street; it is a peculiarly fortunate thing that this is the only east and west line in the midst of the business district where a wide street can still be put through without destroying any considerable number of costly modern buildings.

When Diamond alley was widened in part from twenty feet to fifty feet, not long ago, the improvement was of much importance, because it added one more street large enough for general business in a locality where there was a great demand for business frontage, and where the original lots were of very excessive depth. But the improvement was a distinctly local one, and contributed little to the solution of the general traffic problem. But the peculiar relation of Diamond street to the general system of main traffic lines demands a much more courageous action for the benefit of the whole city. In connection with the widening of Forbes street, it should be converted into a thoroughfare at least equal to Liberty avenue. A glance at the map shows the convenient and equitable location of Diamond street, and its importance as a thoroughfare to supplement Liberty avenue in handling the traffic of the Point district. It also makes clear that the Diamond Square Market site should not be occupied in any way that would perpetuate the obstruction offered by the present use of the square to through travel. The need is not for a mere mitigation of the present conditions by opening little archways through a new building on the Market site, but for a radical clearance. The space was originally set apart as an open public square, and the complete occupation of it by revenue-producing buildings was a diversion of the square from its original purpose, in general accordance with a short-sighted policy which has done much to produce the congested conditions prevailing in the city today.

It may be necessary to provide elsewhere for the market, and a site is suggested in the block between Third and Fourth streets on Liberty avenue, with the great advantage of rail connections. On account of the character of the surrounding country, an exceptionally large proportion of market supplies come to Pittsburgh by rail and must continue to do so. It is highly uneconomical and adds needlessly to the congestion of the streets, to unload the market supplies from the railroad a mile away, as is now done, and haul them by team through the heart of the retail district.

Coming, as it does, directly opposite the Sixth street bridge, Market street ought to be a very important crosstown connection; and because the buildings are generally small and old and most of the lots so deep as not to be seriously injured by curtailment, a widening is suggested throughout its length.

SOUTH SIDE FROM WATER STREET WEST OF WABASH RAILROAD.

THE WATER FRONT

Within the interior of the Point district, Diamond and Market streets widened, supplemented by the existing Liberty avenue, appear to be the only thoroughfares of metropolitan dimensions which it is reasonable to provide for. But around the borders of the district there is much that ought to be done.

In its water front Pittsburgh has a great public asset which now lies undeveloped, both from the point of view of transportation and from that of recreation and civic beauty. As a transportation factor, its primary use is for the transhipment of water-born commodities. The actual amount of river freight is at present relatively small; but it is potentially important, and one of the reasons for its lack of growth is the neglect of Pittsburgh and other river ports to provide for the quick, convenient, and economical handling of river-born traffic at the public wharf.

At river ports throughout the world, the first primitive step, beyond the mere dumping of stuff and passengers on the natural shelving banks or river bed of mud or gravel, is the paving of the slope, as at Pittsburgh, still leaving the goods to be dragged up and down the bank by main force. But among the live modern river cities of Europe, wherever a real water competition with rail service has been desired, even though such competition be limited in its range, the day of the primitive or mud-bank type of shore has long gone by, and the public wharf has been reconstructed into one of the many well-recognized types of com-

THE PITTSBURGH RIVER FRONT.
Looking northeast from Ninth street bridge.

mercial embankment providing an up-to-date equiqment for handling freight and decent, attractive conditions for passengers. This development of the public wharf properties in Europe has kept pace with the activities of the railroads, making for the steady and intelligent improvement of terminal facilities. Indeed, in many European river ports, the improvement of the water terminals has rather forced the pace for the railroads.

In contrast to this active aggressive spirit, Pittsburgh, like most American river towns, where she has not actually turned her water front over bodily to the railroads, has left it in a most inefficient primitive condition.

But the value of Pittsburgh's water front lies not merely in its use as a wharf, however much improved. A second lesson to be gained from the varied experiences of other river cities is that, in reconstructing the commercial water front on modern lines, there is generally opportunity to construct a wide marginal thoroughfare for the relief of traffic congestion in the adjacent streets. Sometimes such a water-front thoroughfare becomes a busy avenue of retail trade and general travel, but more usually its peculiar value lies in diverting some of the the main streams of heavy teaming from the older interior streets, where the retail trade and office business tend to concentrate and where the passenger travel is most dense. Especially with an isolated and restricted business district like that of Pittsburgh, made up almost wholly of narrow streets and connected with the rest of the city by a series of bridges and of bridge-like gaps in the hills which wall it in, becomes of the utmost importance to secure the formation of a wide-circuit street connecting these outlets together, so that not all the travel is forced to filter slowly through the midst of the business district.

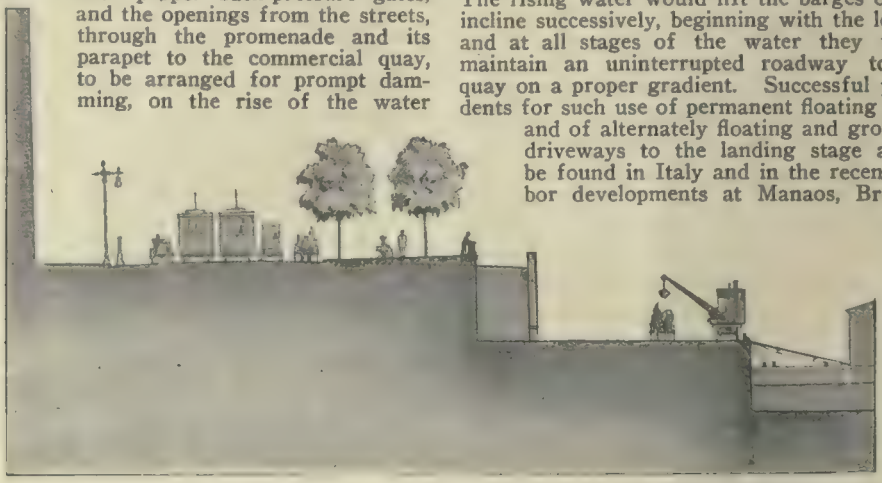
A third undeveloped asset in the Pittsburgh water front is its value for recreation and as an element of civic comeliness and self-respect. One of the deplorable consequences of the short-sighted and wasteful commercialism of the later nineteenth century lay in its disregard of what might have been the aesthetic by-products of economic improvement; in the false impression spread abroad that economical and useful things were normally ugly; and in the vicious idea which followed, that beauty and the higher pleasures of civilized life were to be sought only in things otherwise useless. Thus, the pursuit of beauty was confounded with extravagance.

Among the most significant illustrations of the fallacy of such ideas are the comeliness and the incidental recreation value which attach to many of the commercial water fronts of European river ports, and it is along such lines that Pittsburgh still has opportunity for redeeming the sordid aspect of its business center.

Wherever in the world, as an incident of the highways and wharves along its river banks, a city has provided opportunity for the people to walk and sit under pleasant conditions, where they can watch the water and the life upon it, where they can enjoy the breadth of outlook and the sight of the open sky and the opposite bank and the reflections in the stream, the result has added to the comeliness of the city itself, the health and happiness of the people, and their loyalty and local pride. This has been true in the case of a bare paved promenade, running along like an elevaed railroad over the sheds and tracks and derricks of a busy ocean port, as at Antwerp; in the case of a tree-shaded sidewalk along a commercial street

with the river quays below it, as at Paris and Lyons and hundreds of lesser cities; and in the case of a broad embankment garden won from the mud-banks by dredging and filling, as at London. Pittsburgh has an unusual opportunity to secure this incidental value for recreation in the treatment of its river front. Immediately across the Monongahela are the high and rugged hillsides of Mt. Washington and Duquesne Heights, and below these are the lesser but still striking hills along the Ohio river from the West End to McKees Rocks. The outlook over the river, with its varied activities, to these hills immediately beyond, would be notable in any part of the world. Furthermore, the rivers and the hills are the two big fundamental natural elements characteristic of the Pittsburgh district. Thus, any provision close to the heart of the city whereby the people can have the enjoyment of these mighty landscapes is of peculiar importance.

It does not diminish the essential grandeur of the situation that the river swarms with barges and steamers, that it is spanned by busy bridges, that the flat lands along the rivers are crowded with railroads, buildings, and smoking factories, and that the hillsides are crowned with houses. It is a spacious and impressive landscape, in any case. But for the people to get the good of it two things are needful. A locally agreeable place must be provided from which the scene can be enjoyed; and the landscape must be treated with the respect which it deserves by the elimination of certain features which are merely indicative of neglect, waste, and abuse, and which have no economic justification. Especially is it desirable that the precipitous hillside rising to Mt. Washington, now largely an unfruitful waste, a place of raw gulleys and slides mingled with some painful advertising signs, should be treated with respect as a vital part of the great landscape of the city. It should be protected from defacement and its earthly portions reclothed with the beauty of foliage.



WATER FRONT.
Down river from Sixth street bridge.

The accompanying illustrations are suggestive of the sort of thing which might be done by Pittsburgh with its remaining public water front, and in time, let us hope, with portions of the water front which have passed into private hands; but the actual details of the treatment to be adopted can be properly worked out only in connection with the comprehensive plans for flood protection with which the Pittsburgh Flood Commission is now grappling. The technical problems involved in the control of rivers are among the most complex and baffling with which the engineering profession has to deal. Nevertheless, the experience of hundreds of cities and the work of thousands of engineers has developed certain types of treatment, one or more of which, with suitable local modifications, will pretty surely appear in the final solution of the Pittsburgh problem.

First, there should be an amply wide water front street, presumably formed by extending Water street and Duquesne Way over the upper part of the present sloping bank. Second, the outer sidewalk of this street should become at most points a tree-shaded promenade, of such width and with such equipment of benches and other features for public recreation as the circumstances permit, so arranged that the people using it will neither be in the way of the transportation activities nor be annoyed or endangered by them, and so designed that the people can enjoy to the full the natural beauty of the river valley and the always

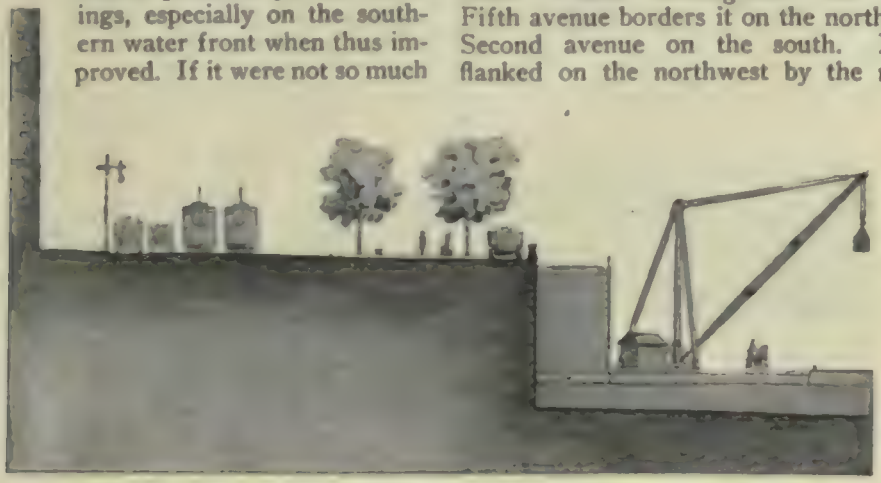
interesting activities of which it is the stage. Third, there should be, next the water, a commercial quay, substantially level, of adequate but not unnecessary width, accessible from the streets by inclined roads of reasonable gradient, parallel with the river, in place of the present excessive slopes.

In the first typical section here given is shown one such arrangement. Here the level of the promenade is such that its solid parapet rises above the maximum flood level. This is of a type adopted for rivers that are subject to occasional excessive floods, as at Pittsburgh. It assumes the embankment to be made watertight; the sewers and drains to be provided with proper back-pressure gates, and the openings from the streets, through the promenade and its parapet to the commercial quay, to be arranged for prompt damming, on the rise of the water above the danger level. Thus would the entire business district be protected from floods, not only on the surface, but also in the basements. The quay shown on this section is supposed to be at a level just above ordinary navigable stages, and to be equipped with power cranes for direct loading and unloading between steamers or barges tied up at the quay, and wagons upon it. Provision could also be made for a freight track running in alongside the cranes for transfer between cars and vessels, if thought desirable, in addition to the facilities provided on railroad property. Alongside the quay, floating landing-stages for packets and so forth, reached by gang-planks or bridges, would be provided, as at present, but in a more decent and commodious style.

SUGGESTED WHARF SECTION: LOWER QUAY AND INCLINE FIXED.

This section is of a type tested by practical experience and is clearly a great improvement upon the present primitive conditions. But it is open to two objections: first, that the quay is flooded at intervals, although so designed as to suffer no injury, and to be put out of commmission only when the river is practically closed to navigation by the height of the flood; and, second, that at low water, that is to say "pool full," it is not at the most convenient height.

An alternative section is therefore suggested, which has less precedent behind it, but which might prove better adapted to the Pittsburgh conditions. In this the fixed level of the commercial quay is replaced by a continuous landing stage formed of long floats or barges of permanent construction, moored against the wall and free to rise and fall with the changing level of the river. The approaches to the floating quay for wagons would be, as in the case of the fixed quay, by descending inclines parallel with the river, just outside the main wall; but in this case the roadway would be a line of barges, which would rest on a fixed incline during low water. The rising water would lift the barges off the incline successively, beginning with the lowest, and at all stages of the water they would maintain an uninterrupted roadway to the quay on a proper gradient. Successful precedents for such use of permanent floating quays and of alternately floating and grounded driveways to the landing stage are to be found in Italy and in the recent harbor developments at Manaos, Brazil.



A great advantage of the floating quay is that in this type of construction the bed of the river may be excavated to its full depth back to the face of the flood wall itself, and that the space necessary for the commercial quay is secured on the floating structure outside of this line without materially reducing the prism, or section, of the flood discharge. It would therefore be possible, with this design, to secure more ample width for street, for promenade, and for commercial quay, and at the same time have more space in the river for the passage of the floods.

Whatever may prove to be the best details of the river-front treatment, it is clear that it can and should provide an ample thoroughfare, a clean, pleasant tree-shaded promenade, and a convenient, up-to-date wharf with easy access to and from the streets.

There is no serious difficulty in providing for such an improvement from the junction of the two bridges at the point to Ninth street on the Allegheny and to Smithfield street on the Monongahela. If the Baltimore and Ohio passenger station is removed from Smithfield

street it will be possible to continue the new water-front street and promenade east of Smithfield on a viaduct just outside of the present Water street, rising over the Baltimore and Ohio freight yard, and the grade entrances thereto at Grant and Ross streets, and connecting along the line of the Panhandle (Try street) with the proposed Second avenue bridge over the railroad and thence with Forbes street and Sixth avenue.

It is probably impossible for Pittsburghers who are familiar with the present neglected aspect of the water front, and who are not familiar with the finer European quays, to form any conception of how fine a situation will be created, for public or private buildings, especially on the southern water front when thus improved. If it were not so much

SUGGESTED WHARF SECTION: FLOATING LANDING STAGE AND ADJUSTABLE INCLINE.

to one side of the main streams of passenger travel, the river frontage between Smithfield and Ferry streets would offer a most admirable site for public buildings in the down town district.

A CIVIC CENTER

The location of a civic center, where the city offices can be grouped in a convenient and dignified manner, ought to be such as to connect with the main transportation lines. It ought, if possible, to embrace the county buildings. It ought, if possible, to occupy land which is not of such high cost as to preclude the setting apart of the open space which is so requisite to the highest dignity and beauty of public buildings. All these advantages are embraced to a high degree in a locality now so unpromising and unattractive that it is hard not to feel an unfair prejudice against it.

The locality in question lies to the east and southeast of the present county buildings. It embraces a bit of low ground occupied by the little Panhandle station and local freight yard, surrounded, except for the county buildings, by vacant lands and cheap buildings, at various higher levels, mounting on the east to the commanding ridge that dominates all this part of the city. Through this locality the Forbes and Diamond street thoroughfare and the South Hills and Sixth avenue thoroughfare will pass. Fifth avenue borders it on the north and Second avenue on the south. It is flanked on the northwest by the noble and distinguished architecture of the court house and the jail—masterpieces of Richardson, priceless examples of the work of one of the few great artists America has yet produced. To the west a new county building is about to be erected.

It is proposed that the central area of low ground, occupied by the railroad, be decked over at about the level of Fifth avenue, and that a great public square with gardens be laid out thereon, somewhat after the manner of the celebrated public gardens built over the railroad at Princes street, Edinburgh, or, in a smaller way, Park avenue, New York. Below, the structure would simply be a station and freight yard of permanent construction, with sky-lights and

ventilators, at suitable locations, piercing a flat roof of adequate strength. The cost of construction would be less than the cost of an equal area of land independently acquired for an open space in connection with a civic center in any locality that could reasonably be considered.

Along the east side of this square or garden, in the form of a gradually rising terrace, would run the approach of the new South Hills bridge, ascending gently from Forbes street; and on the east side of this again, as though terraced on the hillside, would be the principal municipal building culminating in a tower which would spring from the highest level at Bluff street. The pronounced and unnant and impressive works of man in the city—the steel works, the bridges and viaducts, the jagged sky-line of office buildings. To build a city hall and civic center of scholastic formality, appropriate in the placid conditions of Paris, would be to lose a great aesthetic opportunity.

In the neighborhood of the proposed civic center a number of street improvements ought to be made, most of which are related to the propositions above described, but all of which are independently desirable,—the elimination of the grade crossing of Second avenue with the Panhandle Road at Try street; the grading and widening of Sixth avenue to the dimensions of a main thoroughfare, the natural route from the Union Station, the

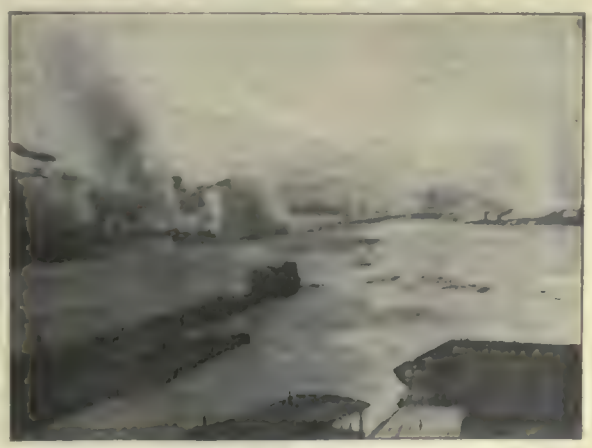
PRESENT CONDITION OF CIVIC CENTER SITE.

symmetrical differences in elevation, the slanting grade of the approach to the great South Hills bridge, the irregular and picturesque form of the site and of the existing county buildings, all seem to demand a certain informality and picturesqueness of design. These peculiarities of the site ought to be welcomed because they are eminently characteristic of the city and of the mountainous region in which it is set. Throughout the city and its surroundings the one pre-eminent quality of an agreeable sort is the bold picturesqueness of the landscape, the deep ravines, the lofty hills, the precipitous declivities, the plunging prospects from hilltops into the river valleys; and a similar quality of forcefulness, activity, and bold, irregular adaptation of means to ends, is to be felt in all the more domiadjacent freight yards, and all the Allegheny bridges to the districts fed by Fifth avenue, Forbes street, the South Hills bridge, and Second avenue; the extension of Grant Boulevard; and the much discussed elimination of "The Hump," the hill which hunches the central east and west avenues of the business district.

Between the Point district and the South Hills there is now urgent need for a thoroughfare connection of adequate capacity and on reasonable gradients. The South Hills country is sparsely developed as yet, but, being comparatively free from smoke and very near to the business district, it offers unusually desirable opportunities for homes, and it must soon be thickly settled. The need for a good thoroughfare to this region

will then be of far greater importance even than now.

Two plans for such a traffic artery are being considered—one by a new bridge to Carson street (probably from Ross street) and thence by a low-level tunnel to Bell Tavern in the bottom of Sawmill Run Valley; the other by a high-level slanting bridge and tunnel starting from Forbes street at Sixth avenue and reaching Washington avenue, in the South Hills, about at Haberman street. The former, at a distance of two miles from City Hall, reaches the bottom of a valley only a hundred feet above the Point district and some two hundred and fifty feet below the main residential areas of the South Hills region; whereas the latter, at the same distance from City Hall, reaches, at an easy grade (not over 3½ per cent) a point fully three hundred feet above the Point district and only fifty feet below the residential areas to be served.



It is reasonably clear that the end to be attained in this thoroughfare scheme is the *most direct* access possible on *easy gradients* to the *higher levels* of the South Hills country. For there can be little doubt that, even when building space is at a much higher premium than it is now, the overwhelming majority of the population will be found on the hills rather than in the narrow valleys. There are certain general tendencies which are observable, both in America and in Europe, in cities which have a large area of hill-top land separated by deep valleys. The hills are generally preferred for residential purposes, and the earliest roads or trails often follow the ridges, plunging down and climbing up again steeply to get from one ridge to another. The main roads in the second stage of development are apt to seek the valleys for the sake of good grades, with a corresponding development of the most active urban growth in the valleys and on the lower slopes, the hilltop development being retarded by lack of transportation facilities. Nevertheless the continued attractiveness of the uplands slowly builds them up, and as the wealth of the community grows there is an inevitable tendency to reduce the obstacles to ready connection between one hill district and another by raising the levels of the bridges which cross the intervening valleys. Bolder and bolder viaducts are built, until finally there is a complete and more or less independent highway system on the upper levels, and the major part of the residential district comes to be there too.

Obviously, therefore, every opportunity should be utilized to gain grade in the approach to the South Hills District by starting at a high elevation and wasting no distance in level stretches, if the most efficient thoroughfare artery to this district is to be secured. The best permanent means of reaching those upland districts, whether on one side of Sawmill Run or on the other, is not by a tunnel debouching in the bottom of the valley—say at Bell Tavern. This follows from the fact that the tunnel *can* reach a much higher level at a good gradient and with a shorter distance. And from this higher outlet point, a viaduct, high in the air above the Bell Tavern, would give direct access to the uplands of Beechview and Mt. Lebanon and southward, while streets of easy gradient would reach the uplands east of Sawmill Run. The high level tunnel, furthermore, will reach all the areas served by the low level, or Bell Tavern, route, and in addition can reach the other and more important lands on the hills which *cannot* be reached via the Bell Tavern route within a reasonable distance.

THE POINT

At the opposite end of the business district from the proposed civic center is another spot where the civic pride of Pittsburgh should lead the city to make liberal expenditures for other than the economic ends which justify the street improvements which are the main burden of this report,

At the end of the Point, where the two lines of water-front improvement would join, is a considerable area of public open space. Here is the spot where the Ohio river has its birth: here was built the fort which broke the peace of Europe and around which turned the frontier struggles of the war that gave America to the English-speaking race. It is here that all the most inspiring associations of the city are chiefly concentrated. Poetically, this spot, at the meeting of the rivers, stands for Pittsburgh.

DOWN THE RIVER FROM POINT BRIDGE.

Because the eastward drift of the business center has followed the eastward drift of residences, and the growth of business has not yet expanded back to fill the void; because the Point is left pocketed beyond freight yards, visited only by the throngs who use the old Point bridge; it seems to be rather forgotten and disregarded by most Pittsburghers. But its historical and topographical significance can never be altered, and it is to be hoped that the city will rise to its opportunity and nobly form the Point into a great monument.

The North Point bridge is about to be rebuilt; the South Point bridge is very narrow and some day must be rebuilt in its own turn. In the placing of these bridges, in every feature of their design and of the design and decoration of their approaches, the monumental element ought always to control.

WIDTH OF THOROUGHFARES

In considering the economical widths for the main thoroughfares of a city, so many complex factors are involved that no exact and indisputable conclusions can be reached; but there are certain facts and principles that ought to remove such decisions from the realm of purely arbitrary whim and custom by which they are now generally settled. Practically every main thoroughfare even of the most compact type, must provide for car tracks in the middle. Without allowing any clearance on the outside, a space not less than eighteen feet, and preferably more, should be allowed for the actual cars on straight runs.

In Pittsburgh, the gauge of the car tracks was originally made to conform to the prevailing local gauge of vehicles on the mistaken theory that it was desirable to have the smooth tracks used by wagons, and this has resulted in the almost invariable conformity of the wagon gauge to that of the tracks, regardless of the size or character of the vehicle. With the added fact that Pittsburgh pavements are prevailingly bad, and that the form of rail is such that it is very difficult for a wagon to turn out when it has once got into the track, the teamsters in Pittsburgh are more inveterate in the habit of driving in the car tracks, and less ready to turn aside for cars or other vehicles than in most cities. The severe and constantly repeated strain of the horses which is required to wrench heavily-loaded wagons free from the track is, in the aggregate, a serious economic loss, and the delays not only to the street cars but to all forms of wheeled traffic caused by the conditions described are incalculably great. But even good pavements and the use of a grooved rail would not cure the trouble in Pittsburgh streets as now laid out, because almost universally, there is not sufficient room for a vehicle to pass between the cars and another vehicle standing or slowly moving next the curb.

In every street vehicles must be free to stop for loading and unloading, and on a busy thoroughfare the space next the curb is so much used in this manner as to become merely a series of sidings into which slow-moving vehicles can turn from time to time, in order to clear the main passageway. The result of the conditions above described is that practically the whole wheeled traffic in Pittsburgh streets is inevitably concentrated on the eighteen-foot width where the cars run. The extent to which this reduces the average speed of travel and the total capac-

LIBERTY AVE.—A SIX LINE THOROUGHFARE.

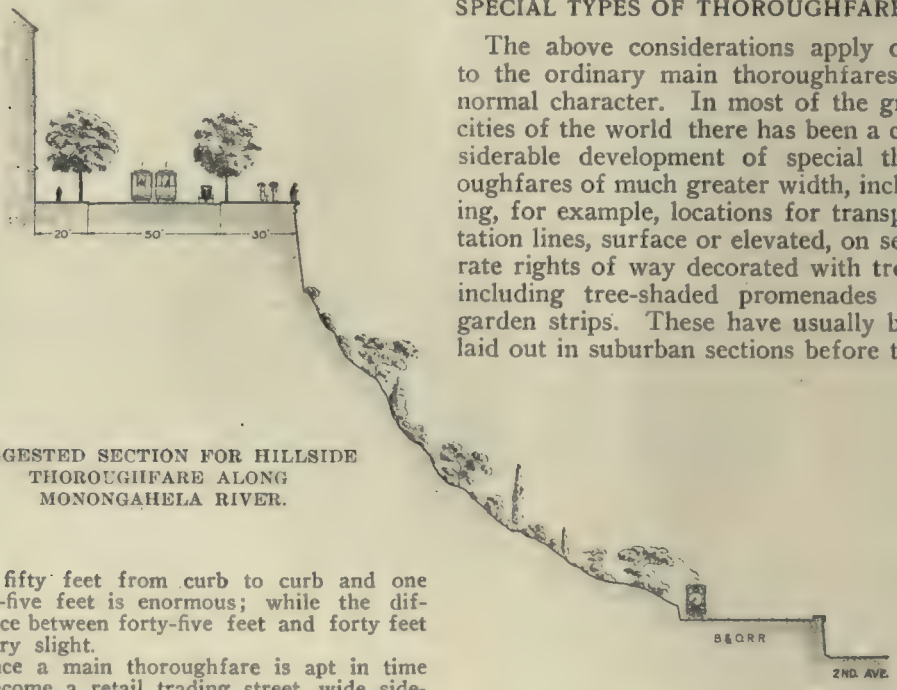
iy of the thoroughfare has been strikingly illustrated for Pittsburghers by the contrast of the former sluggish congestion of traffic on Smithfield street, with the sparse appearance and rapid movement of the same traffic since the "one-way" regulations have made it possible to get one free line in each direction for moving vehicles separate from the cars. The same striking increase in capacity is to be secured, without the grave inconveniences and drawbacks of the "one-way street" regulations, where the space between the cars and the curb can be made wide enough for two lines of vehicles, instead of just enough for one or for one and a half, as is usual in Pittsburgh.

FIFTH AVE.—A FOUR LINE THOROUGHFARE.

It is very difficult to determine just what is the most economical allowance of width. There is much variation in the widths of the vehicles themselves, and the necessary amount of clearance varies with the average skill of the drivers and with the effectiveness of the police control. The width of the line is plainly determined by the widest vehicles in it rather than by the narrowest. In Pittsburgh the customary width of the heavier and wider wagons is now controlled by the practical necessity of fitting the wheels to the railway gauge of five feet two and one-half inches, and the widths are considerably less than prevail in New York, Boston, and other reasonably well-paved cities where the wagons are not fitted to the car tracks. About seven feet over all is now the ordinary maximum in Pittsburgh, a few auto trucks and delivery vans exceeding that figure slightly, and an occasional three-horse team occupying over eight feet. In New York and Boston, wagons measuring from seven to eight feet from hub to hub are common, and they sometimes considerably exceed eight feet.

Just as in the case of steam and electric railway equipment, the tendency is constantly in the direction of heavier, wider vehicles, for the sake of operating economy due to large units; and, with the steady increase in the use of motor vehicles for business purposes this tendency is likely to be greatly accelerated. There is every reason to expect that motor trucks will gradually increase in size until a limit is fixed by the public authorities in order to protect the pavements, and for the sake of standardizing the lines of travel in relation to the street widths. But, in the interests of economy of operation, the limit should be as high as practicable, probably not less than eight feet.

If eight feet be allowed for each vehicle, plus only a foot of clearance, the cars and one row of vehicles on each side between them and the vehicles standing at the curb would require fifty-four feet between curbs. A



EAST OHIO ST.—A TWO LINE THOROUGHFARE.

Of the 530 miles of main thoroughfares within a radius of seven miles of Pittsburgh's City Hall, less than one and one-half per cent have room for passage between cars and standing or slow-moving vehicles at the curb.

wagon backed up to the curb on a busy street will seriously discommode travel, at that, and the clearance allowed is very small. A width of fifty-four to sixty feet between curbs is, therefore, highly desirable in the main thoroughfares.

As a matter of fact, with the widths of vehicles which now prevail in Pittsburgh, if standing and slow-moving vehicles are compelled to keep in contact with the curb, it is possible to keep open a line of travel on each side of the car tracks, with only occasional blockades, where the width between curbs is fifty feet or, at a pinch, even forty-eight or forty-seven feet. That is to say, the difference in traffic capacity between a thoroughfare fifty feet from curb to curb and one forty-five feet is enormous; while the difference between forty-five feet and forty feet is very slight.

SUGGESTED SECTION FOR HILLSIDE THOROUGHFARE ALONG MONONGAHELA RIVER.

Since a main thoroughfare is apt in time to become a retail trading street, wide sidewalk space is important. It is a common rule to make the distance of the curb from the property line one-third the width of the roadway. In this connection, it is interesting to note the standard widths adopted in European cities. The standard in London is forty-eight feet between curbs, and eighty feet between buildings for secondary avenues, and 100 feet over all for principal arteries; and 140 feet over all is proposed for two great main arteries, the cutting of which through the midst of the city is being considered. In German cities of the second size, such as Leipzig, Frankfort and Hanover, the standards are as follows: for strictly local streets, thirty-three to forty-seven feet; for secondary thoroughfares, fifty to eighty feet, and for main thoroughfares, eighty-five to 118 feet. A Prussian law, in force since 1875, apparently drawn up to meet the requirements of Berlin with its heavier traffic, lays down the following dimensions for the laying out of new streets and for the alteration of old ones: local streets, forty to sixty-five feet; secondary thoroughfares, sixty-five to ninety-five feet; main thoroughfares, over ninety-five feet.

A total width of ninety feet, with a fifty-four-foot roadway, and eighteen-foot sidewalks, is a satisfactory minimum for meeting the practical requirements of an ordinary main-traffic street; a width of one hundred feet is preferable, and eighty feet may be regarded as a rather niggardly irreducible minimum.

SPECIAL TYPES OF THOROUGHFARES

The above considerations apply only to the ordinary main thoroughfares of normal character. In most of the great cities of the world there has been a considerable development of special thoroughfares of much greater width, including, for example, locations for transportation lines, surface or elevated, on separate rights of way decorated with trees; including tree-shaded promenades and garden strips. These have usually been laid out in suburban sections before they were much built up; or, if within the built-up districts, on the sites of old fortifications, canals, or other abandoned engineering works. The latter opportunities are lacking at Pittsburgh, except in connection with the river banks. In the suburban localities of Pittsburgh, so much of the available building land is topographically divided into narrow strips that it would be cut to pieces in an exceptionally uneconomical manner by any boulevards 150 to 300 feet in width, the type usual in flatter cities. Each must be laid out as a problem by itself, the principal objects in each problem being to select a tolerably direct line on reason-

able grades, and so to fix the side lines of the location that it shall be possible to meet the immediate needs by constructing an economical suburban road where it does not already exist, and ultimately to convert it into an ample urban thoroughfare with the minimum of cost and inconvenience.

As a general rule, any width to be secured for aesthetic purposes in connection with Pittsburgh suburban thoroughfares, over and above that needed for handling the expectable future street traffic, must not be in the form of a general and continuous widening. But occasional pieces here and there may be taken for park purposes, as, for instance, a steep sidehill adjacent to the line and unavailable or difficult for building, or a narrow ridge on which the thoroughfare runs, may have at one point so little available building land fronting upon it that the whole can reasonably be parked for a short distance. thus keeping open the distant views.

There are two special forms of street, developed here and there in hilly cities all over the world of which Pittsburgh needs to take account in its suburban developments. In many instances, and for long distances, existing suburban thoroughfares that must be enlarged and improved, and others that must be laid out, are compelled to run along the face of hills so steep that a street of level cross section, even though limited to eighty feet, would leave the land on one or both sides so far above or below the grade as to destroy its value for building purposes. In such cases it is often practicable to make use of one-sided streets or two-level streets. The former are designed to give accessible frontage on one side only, usually the up-hill side. The property on the opposite side is reached by the next street, which is laid out correspondingly nearer in order not to make the lots too deep. The width of such a one-sided street may be curtailed without reducing its thoroughfare capacity, because it is freed from local business all along one side. Bluff street, though not a thoroughfare, is an excellent Pittsburgh example of the one-sided street, and illustrates the great attractiveness which such streets often possess. In a two-level street a longitudinal bank or retaining wall is introduced in the middle so as to adapt it to the topography and bring each half of it nearer to the natural surface where the abutting property fronts upon it. Such a street must normally be wider than a single thoroughfare of the same capacity, the saving in construction and in the development of abutting land more than counterbalancing the cost of extra width.

Whatever radical changes may be made to improve the present, or safeguard the future, condition of the thoroughfare system in regions that are now rural, there remains a huge problem within the district where the street system has already crystallized into substantially its final form. Here increased capacity can, for the most part, be secured only by local improvements and widenings of existing thoroughfares.

STREET WIDENING AND THE LAW

Pittsburgh, in common with other cities in Pennsylvania, has a remarkable power, which is of the utmost importance in connection with the intelligent control of its street development, but of which it has not hitherto taken adequate advantage; a power that appears to be denied to the cities of every other state in the Union, although effectively used in some other countries. Pittsburgh may legally lay out a street in anticipation of a future need, and yet postpone entering upon the land for construction or for opening it to the public. Until the city legally enters on the street, the owner of the land has the free use thereof, and he receives payment only when the opening takes place; but if in the interim he shall have erected any structure within the limits of the proposed street, he will receive no compensation therefor when the street is opened. Although similar laws have been declared unconstitutional in other states, this provision has been sustained in Pennsylvania, and the power has been effectively exercised in numberless cases since the middle of the last century The procedure is to establish a building line, set back a certain distance from the street line, and to permit no new buildings to be erected in front of that line, but to pay damages only when the power to prevent the erection of a new building is actually exercised.

Fortunately, in Pittsburgh the building up of the street frontage with solid blocks of stores, apartments, and business structures, has at most points followed rather slowly after the earlier wave of detached dwelling houses, and a large proportion of the streets which are destined to be the main arteries of the huge future city are still lined by buildings which are set back at various distances from the street, leaving front door-yards between them and the sidewalk. Outside

of the down town district and a limited area in East Liberty, it is therefore possible to provide for the ultimate widening of these streets without the destruction a set-back becomes inconvenient and undesirable, and one by one the buildings are either extended to the sidewalk by new additions, or new buildings are erect-

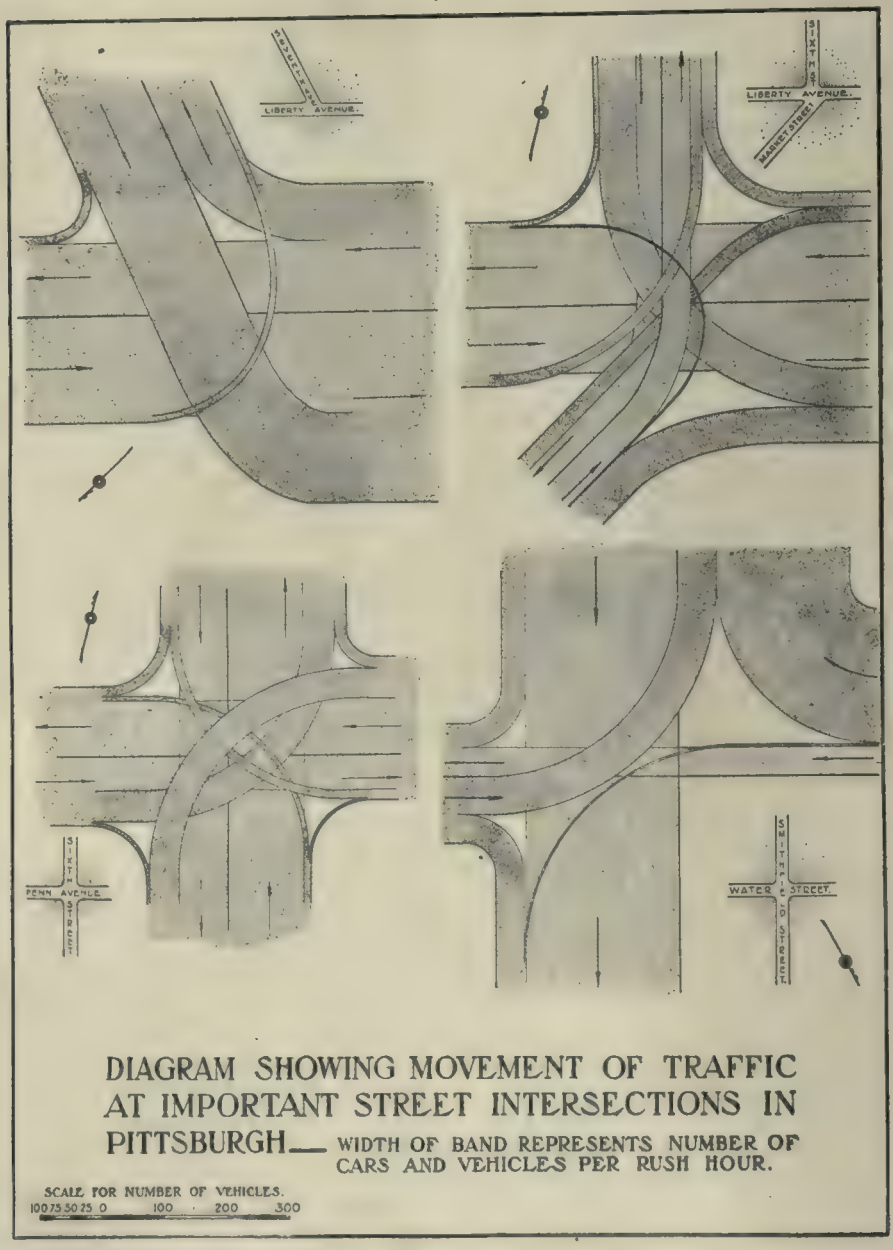


DIAGRAM SHOWING MOVEMENT OF TRAFFIC AT IMPORTANT STREET INTERSECTIONS IN PITTSBURGH— WIDTH OF BAND REPRESENTS NUMBER OF CARS AND VEHICLES PER RUSH HOUR.

of many valuable structures, provided the preliminary steps are promptly taken.

As traffic increases and the lots come to be used for business purposes, such ed on the sidewalk line. Since the individual lot owner cannot move the street as a whole up to his building, he has to extend or move his building to the street.

His immediate purpose is thus served, and ultimately the whole row of buildings is thus advanced in response to changed conditions. But at just about the time when this process is fully completed, the volume of traffic flowing over the street is apt to have become so great that everybody recognizes the street to be too narrow for the increased traffic it has now to carry. The very advancement of a few buildings to the sidewalk line is a sign which points directly to the growth of travel and indicates that ample width will soon be needed in that thoroughfare.

If the street is one likely to have a considerable amount of through travel, it would be reasonable at once to lay it out wide enough to handle such travel; and the cost of the land taken for the widening would be charged, at least in part, to the abutters, who get, by the change, what many of them already want and what the rest will soon be wanting—direct frontage on a busy sidewalk.

A still wiser course of procedure would be to determine on the widening of these future main thoroughfares before any buildings have been advanced to the sidewalk line, and to establish building lines far enough apart to leave room for all probable future requirements; but to make no physical widening of the street until the growth of travel or the demands of the abutters call for shifting the sidewalks over to the established building line and enlarging the roadway to correspond. This is the invariable practice in Washington and in most well-conducted European cities.

It it the plan to some extent in New York, where just recently the sidewalks of Fifth avenue have been moved back against the building line on the space formerly occupied by stoops areaways, and dooryards. Pennsylvania avenue and Sixteenth street, in Washington, are both laid out 160 feet wide from building line to building line, although Pennsylvania avenue is an important business artery, and Sixteenth street is a residence street without heavy traffic and with no commercial business. On the former the wide sidewalks are in immediate contact with the fronts of the buildings, as is proper for a business street, and the roadway, with car tracks in the middle, is more than wide enough to carry all the traffic that can ever be concentrated on it. Whereas, on Sixteenth street, the traveled portion of the street, including sidewalks and the space for sidewalk trees, is only eighty feet wide, and the remainder is occupied by front dooryards forty feet deep, which the householders are at liberty to fence and use almost as freely as if they owned them in fee simple. At the same time all the householders are protected against the premature action of any individual lot owner who might see a possible advantage in being among the first to bid for a commercial business by building a flat-house with stores under it out upon the sidewalk line forty feet in advance of the other houses. This is the sort of thing that is happening every now and then in Pittsburgh on streets where the great majority of the owners would prefer to have the set-back continued for some years longer. In Washington this crowding forward cannot be done; but when a reasonably large proportion of the owners on any street, or any block, are ready for the change, the front yards are abolished and the sidewalk is moved over into contact with the buildings. If a single owner wants to put in a store long before his neighbors are ready to give up their front yards and long before the city is ready to widen the street to increase its traffic capacity, he is of course at liberty to do so; but he must not move forward of the general building line. What he usually does is to abolish his own front dooryard and substitute an extra wide piece of sidewalk paving in place of it, sometimes using the space for outdoor stands, or show cases, to attract trade. He may even be permitted to erect light temporary structures, such as awnings, on the space between his main building and the present sidewalk line, under which, in good weather, he can do a very good business.

Philadlphia has applied this principle to street widening, as, for example, in the case of Chestnut street. Existing buildings covered most of the space between the building line and the street line, and the exercise of the power with the consequent accruement of damages occurred in each case only when the original building was torn down by the owner and he was required to set the new building back to the new building line.

The same principle is equally applicable to those cases where the existing buildings are mostly or wholly back of the new building line; the damages becoming due in such a case only when a building permit for the erection of a new structure encroaching on the designated open space is actually withheld.

The advantages of such a method of procedure, in the case of those highways where all, or nearly all, of the buildings are now set back from the street and where a widening will ultimately be needed, are obvious and very great. In a large percentage of cases, where the street is still mainly residential, the majority of the abutters would welcome the establishment of a building line for their own protection from inconsiderate neighbors; just as the majority of people will pay higher prices for lots in a neighborhood that is protected by properly drawn restrictions for setbacks,

BELLEFIELD.
Four Mile Run from Schenley bridge.

etc., imposed by a land company. In a great many such cases abutters could be induced to waive any claims for damages on condition that the building line should be applied to the whole street. Furthermore, the actual net damages to be paid would be distributed over a long period, and a considerable proportion of them, in many cases, could properly be assessed on adjacent benefited property owners.

When the actual physical widening of the street takes place, through absorbing the restricted zones on each side of it, the damages for land-taking will be comparatively small, because at that time most of the abuters will want nothing so much as that very widening, if only to bring the sidewalks in contact with the fronts of their buildings. But regardless of its clear financial advantages to the city of reducing its total payments for street widening, and especially in distributing the burden of that cost over a long period without running up a large bonded indebtedness and interest charges, the fundamental argument for this method of procedure is that it avoids the absolute dead loss to the whole community resulting from the destruction of valuable buildings. It is not practicable to avoid this in any other way and still accomplish the result of widened thoroughfares. Theoretically it could be done by a direct widening of all the highways in the ordinary manner if it were to be done promptly; but there are comparatively few cases in which there would be enough immediate advantage in the increased width to make the proposition attractive; and it is obvious that any such wholesale immediate action would involve a sudden and enormous financial burden which it is utterly impracticable for the city to assume.

If, after the gradual piecemeal process of widening at moderate and distributed expense has been begun, the city thinks it would prefer to have the process over and done with promptly, it is just as able to complete the widening immediately, by wholesale condemnation, as if the gradual process had never been entered upon. If the city begins on the gradual process it can always change to the other when it feels rich enough, or when the buildings on the old lines have become few enough; and in the meantime the erection of new and costly buildings, obstructive to the proposed widening has been prevented at comparatively slight expense. If the city does nothing pending such time as it can afford to make the widening at a single operation, the cost of the operation is liable to mount at least as fast as the city's ability to pay for it, and the time will never come.

There is, then, one course of action which overshadows in permanent importance and in urgency all other things that Pittsburgh could do at the present time for the improvement of its main thoroughfare system. That is to establish new building lines, at a suitable distance apart, along all of its present and prospective main thoroughfares which there is any prospect of being able to widen.

URBAN DISTRICT PROCEDURE

It is obvious that the flow of traffic moves regardless of the artificial boundaries of the city and the surrounding boroughs, and that if an efficient system of thoroughfares is to be envolved for the Pittsburgh industrial district it will be necessary to disregard those boundaries in planning it. This has been done in the preliminary studies which have resulted in this report, and the nceessity for it must control the form of any permanent organization for preparing final plans and executing them. If these duties are to be entrusted to officers of the city, and its boundaries remain unchanged, those officers must have authority from the Legislature to deal with territory beyond the boundaries of the city, as is the case in a limited way, in Wisconsin cities.

The simplest and most logical procedure, if the boundaries of the city and of the boroughs are to remain substantially unchanged, would be to establish a common agency for dealing with the general problems of city planning for all of

the municipalities and the related parts of the country outside of them. The constitution of Pennsylvania apparently prevents the formation of a special metropolitan board for the Pittsburgh industrial district, but general authority might be obtained under which the county could establish such a board. If the difficulty should be met simply by extending the boundaries of the city, it is important that the new boundaries should include not merely those areas which are now seen to have close physical relations with the city, but a great extent of territory within which the beginnings of urban or suburban growth have started, or are likely to start, during the next generation.

Whether the duty of planning and providing for the main transportation lines is made a city affair or a county affair, those who are charged with it should be free to go as far in any given direction as the demands of the traffic lead them. They should neither be limited by arbitrary boundaries in those directions where scattering but connected urban development may reach out furthest from the center, nor compelled to extend their operations to an arbitrary boundary in those directions where such development falls short.

In all this work a thing of greater consequence than any specific improvement, a thing of vital import to every taxpaying citizen of the present and future city, is the making of comprehensive and accurate topographical maps. It is only on the basis of such maps that all municipal engineering, and indeed much other work directly managed by the city, can be planned and carried out with proper economy and efficiency. It is only on the basis of such maps that improvements in the city—details of city replanning—can be most economically determined. And in the outlying districts, where the future city is being built, such maps are absolutely essential to an intelligent planning or control which will avoid the heavy penalties that follow haphazard city growth, especialy in such a hilly region.

Proposed plan for treatment of educational, civic and park district where the Carnegie institutions, the Soldiers' Memorial Hall, various clubs, etc., are located, near the entrance of Schenley Park. This district is treated at length in the report and two possible plans are offered.

COALITION OF PITTSBURGH'S CIVIC FORCES

AN EXAMPLE OF THE PROGRESS AMERICAN CITIES ARE MAKING FROM AGGREGATIONS OF PEOPLE TOWARD ORGANIC COMMUNITIES

ALLEN T. BURNS
PITTSBURGH CIVIC COMMISSION

Pittsburgh, as a whole, is divided into three parts. One of these the South Siders inhabit, the second the old Pittsburghers, and the third those who in their own language are called Alleghanians, in ours North Siders. Would it be truthful to carry the parody further? Do all these, like the people of Caesar's Gaul, differ from one another in customs, institutions and laws? Are these three parts of Pittsburgh further divided, not into clans and tribes, but into neighborhoods, sections, localities which compete, contend and vie with one another? Does Pittsburgh thus lack a united front to face the inroads of a hostile Caesar, the ambitious and selfish designs of some present day, native Orgetorix, or the call to promote her own progress and common welfare?

So far as this parallel fits not only Pittsburgh's physical divisions, but also her civic sectionalism, local instead of communal interests, neighborhood instead of municipal spirit, she illustrates the typical problem of American cities. They have not distinguished between growth and overgrowth, between unification and enlargement, between development of united civic forces and increase in territory and population. Overgrown children only slowly gain command of their rapidly increasing powers and faculties and so become correlated, effective personalities. So cities, the local bodies politic, have grown so rapidly that they have been unable to weld into a working municipal unit their increments and diversities of population, interests and activities. The story of every American city is one of only gradual and partial achievement of civic self-consciousness, self-direction, self-command. American cities have not yet fully "come of age." They are still only "in process" of becoming correlated, effective individuals.

Cities are accustomed to represent themselves by supposedly appropriate personalities. But generally these characters possess anything but the sturdy, assertive qualities requisite for imperial civic achievement. They are decrepit old men, Father Knickerbocker, Father Penn, Lord Baltimore, Moses Cleveland, Father Pitt. Is it significant that such personifications are considered fitting? When cities reach their real majority may they not rightfully adopt new symbols? These new personifications will be rugged, powerful youths, dauntless, wise, and beautiful maidens. Across the breast of each may justly be inscribed a watchword of municipal intelligence comprehending the needs and interests of all citizens, a motto of a wise and determined purpose to attain civic justice. No city will rest till she may fairly image herself similarly to ambitious Chicago's robust empress of the prairies, the maiden "I will."

Pittsburgh with other cities is on the march toward this amalgamation of all elements and forces into a single corporate organism, a municipal personality. The march has been long, but is a record of triumphs over unusual forces of division and disintegration. To understand this progress one must know or review the factors that have set the problem. It is not unlike, and so possibly its statement will throw light upon the problem of other American cities.

The most considerable feature of the process is Pittsburgh's enlargement, growth in territory and population. In annexing new territory and welcoming prospective immigrant laborers, Pittsburghers have not stopped to ask whether past additions to the body politic have been well digested and assimilated. Size and bigness have been, in common with other cities, the first thought. But weight

and bulk are no more a sure sign of power in cities than in boys. In both overgrowth often goes with gorging beyond the assimilative possibilities. That the result is failure as yet to incorporate healthfully all her civic forces is no surprise.

To be concrete, here are tasks of integration which Pittsburgh has faced, due to natural growth, annexation, and immigration.

Total Increases in Pittsburgh's Population U. S. Census.

These figures state the size and frequency of the meals Pittsburgh has swallowed and tried to digest. "Daddy" George ascribes the success of the George Junior Republic to the slow increase in the number of its citizens. He designedly allowed the community to grow at such a rate that at the end of ten years its population was only about 150. He has stated that this rate of growth was thus controlled because at no faster a rate could the republic assimilate new citizens and integrate them into its workings. Larger communities also need to study the limitations of their digestive powers. The city problem as here presented recognizes that there is a rate of growth beyond which the city does not integrate new elements into its body politic.

But bulk and number are not the only, if even the more difficult, factors in the problem of Pittsburgh's development of organic unity and power. Divisive and mutually repellent forces have been almost controlling at times. Pittsburgh has had to overcome a sectionalism in all forms.

As already mentioned, the very topography has tended to divide the city. No city in America, if in the world, has had such physical obstacles to overcome in securing free communication and access between its different parts. Rivers, hills, gorges, cliffs, and precipices cut the land into separate districts. The residents of one section have had great difficulty even to enter any other except the central business district. The natural barriers have been strengthened by such antiquated institutions as toll bridges on the main thoroughfares, a street car system with no through routes, and almost no transfers. This has meant a ten-cent carfare between most sections of the town. As mutual acquaintance, friendship, and understanding must underlie all co-operation, the prerequisites of municipal unity have been extremely difficult.

All "orthodox" Pittsburghers ascribe to Scotch-Irishism the vanishing, but still persisting, individualism of the city. Past failure in public spirit and in discharge of citizenship is explained, even palliated, by the plea that the people, being Scotch-Irish, could not have been expected to fuse, unite, and work for common ends. However true the explanation—and the writer as Scotch-Irish resents and rejects it—there have been many evidences of unusual "hanging together" or "flocking-apartness."

A few illustrations may be given. No field of effort has been more typical than the charities of the city. Pittsburgh has been so rich in the number of philanthropies as to claim to excel any other city of her size. Each wealthy family is said to have had a philanthropy which it especially fostered and promoted. And

regardless of the values of correlation and co-operation learned so well in their business, Pittsburghers persisted in wasteful duplication and rivalry in the virtue "that faileth not." Some thirty hospitals and dispensaries still compete with one another for support, both governmental and private, and even for patients to the extent of undercutting rates of rivals. Fifteen agencies employ independent visiting nurses with no districting of the city or correlated work. Attempts to form a city-wide nursing organization have failed, because of the refusal of present agencies to merge. In the past even the heads of settlements have been unable to find a medium for mutual council and co-operation.

Let the reader remember that this is a presentation of the situation out of which Pittsburgh is growing. But the extreme individualism of the old situation is seen in the fact that of all the large cities of the country Pittsburgh has been the last to organize an associated charities. Many were the unsuccessful attempts to bring the various agencies into this most effective of modern philanthropic institutions. And even now single charities refuse their co-operation or good will. Church federation is tabooed, and any suggestion of it in the ministerial union kills the project which smacks of it.

Yet some citizens state that this individualism has been the city's only political salvation. For the dominating machine of Pennsylvania has never run as smoothly here as in the City of Brotherly Love. Politicians have fought so much more among themselves that once in a while the public has come into its own through the disagreements. The Magee-Flinn falling out, the Flinn-Bigelow feud, the rival Browns, the Oliver-Flinn enmity have repeatedly made one faction ready to side with the independents and thereby enhance the latter's chance of success.

This territorial divisibility and unusual individualism have reflected themselves in the customs, civic organizations, and political institutions of the community. The names of the old boroughs annexed from time to time have persisted and are used almost as though they still designated separate governmental entities. In order to understand conversation or municipal questions one must know the names: Bloomfield, Lawrenceville, Oakland, East Liberty, Allegheny, Try Hill, Birmingham, West End, Beltzhoover and Allentown, as well as one knows the principal streets. And annexation of new territory has been by compulsion, not consent.

Nor are these mere names. The old community celebrations have continued. The sections have their own picnics. Lawrenceville long had its own Fourth of July celebrations because East Liberty did. The question of uniting for more effective observance was scarcely considered. The local names must be kept alive! Residents of the old city of Allegheny still resent the loss of identity suggested by the designation, North Side. Under the most of these local names have been organized energetic civic bodies. Each has been interested primarily and mainly in the improvement of its own community; hence the saying: "Any ward can be bought for a new sidewalk or a pair of wooden stairs." Local improvement has been the test of discharge of official duty. The street paving schedule has been the pork barrel of the annual budget. If the hill people "got theirs" their solid vote has been secured.

Recently one civic organization advocated that a city street in its district be given to a corporation. The officers of the society admitted that the policy was bad for the city as a whole, but was for the immediate benefit of the locality. This also suggests the precedence given personal business interests over municipal loyalty which has postponed the day of effective citizen co-operation in Pittsburgh as elsewhere.

Consequently it is not surprising that Pittsburgh has been the hot bed of flourishing ward politics. As in most other cities the councilmen, who still are chosen by wards, thrive through catering to local needs while indifferent or negligent where weightier concerns of the whole city are at stake. Note whole sections

of well paved streets, while these same streets with most other main ones have been given in perpetuity to the street car monopoly. But in addition to this common evil of ward councilmen, the very schools are controlled by independent ward boards. Sixty-one of these manage or mismanage the children's heritage, each in its own devious and peculiar way. There is not enough similarity and uniformity to permit admittance to high school upon certificate of graduation from grammar grades. Even justice is so diverse an interest that each ward choses its own local magistrate. Before him can be brought a case from anywhere in the city. His only concern need be that he pleases his "constits." Let him "soak' 'the fellow outside his district and his next election will be sure.

Somewhere it was written: "A house divided against itself cannot stand." "Old Abe" taught the nation the lesson through the stress of civil war, and Pittsburgh has paid her price in charitable waste and inefficiency, civic supineness and enmity, political crime and shame. Has she learned her lesson? She is a city ripe for Franklin's proverb: "We must all hang together else we shall all hang separately."

Pittsburgh has learned her lesson. Above all sectionalism, above all personal ambitions and pride, above past rivalries and enmities, Pittsburgh is rising to her task of united self-assertion for the commonweal of all. She is coming of age, she is attaining her majority. She will be typified by any one of her self-reliant, independent, strong-armed, clear-eyed, self-sufficient mill workers. They have made her industrial supremacy, she from them and for them is building her civic pre-eminence. This civic unity and consequent efficiency is appearing in all the fields in which her past sectionalism appeared and in others besides.

Popular gatherings and celebrations mark and express this growth of community feeling and spirit. Annual play festivals bring together the children of all sections and nationalities, whose interpretation of their varying lives and customs by games and dances increases mutual admiration and respect. The sesquicentennial of 1908 brought together in procession the fourteen principal nationalities in the city. It was arranged by the Chamber of Commerce, composed of business men who thus refuted the charge that business cannot be alive to the human element existing and indispensible to a city's growth. The participants in the fête vied with one another in displaying their worth and service to the community. "Romans lay your sewers" read one sign in the procession. Thus all caught a glimpse of their essential interpendence and common interests.

A year ago a demonstration, said to be the largest and most unique in the city's history, occurred. It was a mass meeting to protest against the spread of vice and to endorse the graft prosecutions. Three thousand citizens rallied when old residents predicted that not more than a corporal's guard could be stirred to express their civic interest to the extent of attending a downtown meeting. The gathering was of such a character as to be known generally as a town meeting, a revival of the days when all citizens took the time and interest to assemble to decide their community questions. This meeting is taken as the way mark of a new epoch in civic activity in Pittsburgh. The sequel justifies the statement.

Territorially Pittsburgh is recognizing her essential unity. The annexation of Allegheny in 1907 was compulsory, to be sure, yet a necessary step if the common community problems of health, police, transportation are to be adequately handled. The boundaries of the logical administrative area have not yet been made the boundaries of the city. But this expansion is considered seriously and may even be consummated within a year. Mayor Magee, in his inaugural of 1909, struck the note of one community, one government. He advocated the incorporation of a territory twenty miles in length inhabited by nearly a million people. Leading citizens of Pittsburgh are organized to effect this end through the present Legislature. There is serious opposition by the boroughs to be annexed. This opposition is based on criticism of

present city politics, yet recognizes the reasonableness, obligation, and necessity of union if the highest municipal life is to be secured.

The growing recognition of community of interest is seen in the nature and scope of municipal improvements now to the fore and in the method of their study. Annexation of all territory within what are termed the natural city boundaries is prominent among these. But the arguments for annexation are that municipal functions and activities must be performed for the whole territory if they are to be performed efficiently for each part. In this idea the Pittsburgh Civic Commission has lead. Its first important work was to retain Bion J. Arnold, John R. Freeman, and Frederick Law Olmstead to outline the investigations necessary to group the physical problems of the urban community. Their report covered transportation, thoroughfares, parks, water supply, sewage disposal, smoke prevention, and building regulations. Each subject was treated from the viewpoint of the needs of the whole district. Detailed studies have followed the preliminary report. Transportation, water supply, and sewers are being planned by the city for the entire community, irrespective of artificial legal boundaries. And Mr. Olmstead has just completed for the Civic Commission a report on a comprehensive system of thoroughfares to knit and connect more closely every section of the greatest industrial community of the country.

Thus physical barriers to solidarity are being broken down. The hills are being pierced with tunnels, ravines are being spanned with viaducts, bridges are being freed from tolls. The growing united demand of the citizens upon the street car company is: "One city, one fare, through routes, universal transfers." Thus will intercourse be promoted, separation overcome, and sectionalism destroyed.

To turn to the field of organized effort, the new co-operation in Pittsburgh finds a striking illustration in the Associated Charities. In little more than two years 105 philanthropic agencies, besides twenty-five churches, have become allied and represented in this philanthropic clearing house. Two notable secondary results have come of this union: a children's bureau for the correlation of all children's agencies, and a health conference to secure co-operation, instead of rivalry and competition, among the medical charities. Likewise, the settlements have united for conference and common action on such matters as concern all.

The fraternizing power of the common meal is being utilized. Workers in charities, education, and civics have united in a club meeting once a month for dinner, social intercourse, and only as much "shop" as is necessary to fool these serious people into thinking they are not being frivolous. The Hungry Club is a weekly lunch club of men. Any citizen is welcome to attend. There is no membership as yet. It has at each meeting a discussion of a current and urgent public question. Thus the function of a city club is being partially discharged. And the attendance has become so large that a committee is at work studying the possibilities of a permanent city club. So prevalent has the eating and talking together practice become, that the credit men, the Chamber of Commerce, the builders, and the real estate dealers are all utilizing this method and are generally discussing, not matters of trade, but public affairs. In fact, civic interest is so widespread that every propaganda organization has fewer available speakers than can meet the demand for civic information. Churches, clubs, brotherhoods, unions, and schools have been infected, as it were, with civic fever and fervor, and the newspapers have large spaces filled each day with accounts of "uplift meetings." A recent issue appeared with this headline: "Plans for Civic Uplift are Widespread. Dozen meetings held with view of obtaining improvement of conditions." And this report will be outdone in a week by sixteen meetings at least in one day.

The Pittsburgh Civic Commission has taken a unique way to promote this civic education. It has organized committees in each ward for the purpose of holding special meetings, spreading civic intelligence, and co-operating with all bodies to promote the understanding of public

questions. These committees have helped create an effective demand for budget reform. They are acting as the local committees for the new charter movement.

The most promising and significant evidence of the passing of the old individualism and sectionalism on the one hand, and of the integration of this new civic solidarity on the other, are the merging and co-operation of various commercial and civic bodies. Instead of every individual idea forming a new organization about itself for its own advancement, advance is being made by methods to harmonize, unify, and correlate all the good impulses of the community. In 1907 the two big rival commercial bodies became one, the old Chamber of Commerce and the Merchants and Manufacturers' Association formed the new Pittsburgh Chamber of Commerce. Since that time the organization has commanded the loyalty of the leading business men. In 1908 the Allied Boards of Trade organized. Board of Trade is the rather unusual name used by each of the fifteen local civic bodies whose original purposes were to secure improvements for their respective sections. They now have a means to pool issues, and are finding that each community is best served when progress is city-wide in its demands and results. With this body other organizations, which from their beginning have been city-wide in scope, are allying themselves, such as the Civic Club and the Civic Commission.

By working together these bodies are learning the strength of union. For special campaigns, organizations which have considered themselves rivals, or the one much superior to the other, have formed co-operating committees. The budget conference is one of these with more inclusive representation than has the Allied Boards of Trade itself. Its purpose is to secure proper presentation and discussion of city appropriations both within councils and among private citizens. The Civic Club of Allegheny County, the Chamber of Commerce, and the Civic Commission have merged their housing committees for the purpose of co-operating with city authorities in securing an advanced standard of sanitary regulation of dwellings. While men's organizations have been sticking to their claim of isolated superiority in municipal affairs, within the last month the Federation of Women's Clubs has brought together representatives of the most influential civic organizations and effected their united co-operation to secure a new school system in place of the antiquated ward schools.

The most important united action at present is the move for a new city charter. This is a direct outcome from the mass meeting of a year ago. That meeting called on all civic bodies to appoint representatives for recommending a new form of municipal government. All organizations quickly responded, formed a committee, threshed out all differences of opinion, and adopted a charter plan which was the consensus of all delegates. The plan has received the unanimous approval of the seventeen co-operating organizations. The latter have sent their representatives back to form a committee to remain permanent until the Legislature grants this united demand. This joint committee is now conducting a vigorous educational campaign for a charter which will make every elected official the representative, not of a section, but of the whole city.

Such is the progress which is being made in the coalition of Pittsburgh's Civic Forces. It is a progress in process, not completed. The centripetal forces are overcoming the centrifugal. In place of disunion and dissension harmony and co-operation are coming. The task of fusing and welding discordant, repellent elements into one organic, effective body politic is well underway. Against greater odds than have faced any other American city, Pittsburgh is attaining the power needed by them all. She is advancing from a disorganized aggregation of individuals to a self-reliant, self-directing community. As she undertakes the remaining problems of municipal progress she may justly be typified by a mighty mill worker. In the light of past achievements and as the city faces future tasks the fitting watchword for Pittsburgh the Powerful is the motto "I Can."

PRISONERS WORKING OUT-OF-DOORS.

Putting in cement foundations for a new building; laying tiles on a new barn—a plain, practical but sightly barn, such as a good farmer would build for himself; adding a story to the old cell-house.

A PRISONER SURVEYING FOR A NEW BUILDING

WITZWIL, A SUCCESSFUL PENAL FARM

FRANK A. FETTER
PROFESSOR OF ECONOMICS, CORNELL UNIVERSITY
MEMBER NEW YORK STATE BOARD OF CHARITIES

In this day, when imposing prison architecture has lost its novelty to the student of penology, a simple farm used as a penal labor colony in the Canton Berne, Switzerland, has visitors from all parts of the world. Edmond Kelly of New York, author of The Elimination of the Tramp,[1] visited Witzwil in 1906 and wrote in the visitors' book: "The best of the labor colonies I have seen; far ahead of those in Belgium and Holland." Edith Sellers, an English authority on European social work, wrote in 1908: "The best of its kind that I have visited." Because of the present active discussion of the plan of farm colonies in America, and especially in New York state, it is perhaps worth while to report the impressions gained last summer at Witzwil in repeated visits made to discover the secret of the unique success this institution has attained.

The Witzwil farm consists of 2,000 acres of level moorland, a part of a tract redeemed from the waters of Lake Neuchatel a generation ago by an intercantonal drainage enterprise. It is still flooded at times of very high waters. Good gravel roads traverse the fields. No fences, walls, or signs tell the visitor when he has entered the prison grounds. Here and there may be seen substantial farm houses, each with a large, plain, practical barn. A paid farmer lives with his family and four working prisoners at each of these outposts ("courts") where about thirty cows are kept. In the center of the farm is a group of buildings including the director's (warden's or superintendent's) house, a cellhouse, and large barns and workshops.

After this land had been drained it was owned and cultivated by a large private agricultural corporation. The company did not prosper; its property came into the hands of creditors, and drainage assessments due to the Canton Berne were in arrears. To collect a bad debt the canton took the land. For the first few years the cantonal workhouse nearby supplied the labor needed, while old buildings were being repaired and new ones erected. In 1895, however, Witzwil was made a penitentiary farm under separate management. Since then other buildings and new roads have been made, and a large area of pasture lands in the Simmental Alps has been acquired for summering the young cattle.

This farming enterprise in which most of the work is done by prisoners has

[1] The Elimination of the Tramp. By Edmond Kelly. G. P. Putnam's Sons, New York. 1908. Pages, 111. Price, $1; by mail of THE SURVEY, $1.06.

BUILDING A ROAD.

The men in white blouses are employes—there are no idle guards at Witzwil.

proved to be a good business investment for the canton. There has been expended by the canton, all told, for land $200,000, for building material $100,000, and other cash advances (net, after deducting the so-called rents paid to the canton), $50,000, a total of $350,000. The present worth of the whole plant (land, buildings, stock, cash fund) is at a low estimate $550,000, an average gain for the time the institution has been in full operation of over $13,000 a year.

An inventory valuation is somewhat a matter of opinion and the rise in the price of lands accounts for part of this increase. But let us look at the account for 1909, which is fairly typical. In any comparison we must take account of the peculiar practice of the canton in giving a nominal, or apparent, cash appropriation to be used for new construction, but charging rent for land and buildings on the basis of four per cent rental, sometimes to an amount exceeding the appropriation. What would American institutional managers think of that? Last year Witzwil paid to the canton a net cash sum of $1,000 (excess of the rental above its appropriation) and expended a net sum of $7,000 for materials in new construction, paid all expenses of the institution, including salaries and insurance, and laid away a reserve of $9,000 for building a railroad on the grounds. In 1908 it paid the canton $1,000 and expended $10,000 for new materials. In 1907 it got from the canton about $1,000 net but expended $24,000 for new materials. While the care of the 200 (sometimes over 250) prisoners is without cost to the public, the actual outlay on new buildings and equipment has amounted to a good return on the investment in grounds and buildings. Yet this has been done without the lease or the contract systems of labor, and with no injurious competition with, or protests from, free labor. Within the last year the land has at length been brought fairly under cultivation, so that it would seem that the results in the future would be still more favorable.

In view of such facts and figures, the interesting question is, how was it done? The most obvious answer is, by good management. Otto Kellerhals was but twenty-four years of age when he entered upon this work in 1891, becoming director, in full charge, in 1895. He was a practical Bernese farmer boy with an education. Graduated at the cantonal agricultural college at Berne, he attended the famous institute in connection with the University of Halle, Germany. He was versed in the new agricultural science and he knew how to put good theory into practice. He is a quiet, plain man who reads widely and works with his hands. He thinks, schemes, dreams of Witzwil, but he finds time to go out wheeling with his four boys. His wife takes charge of the institution in his absence and is at all times a helpful coworker in the administration.

The answer to our question, however, must be found not alone in the director's ability, but in his use of it, in his spirit and in his plans. Light was thrown

on these by a remark of Mr. Kellerhals: "A superintendent should manage his institution as if it were his own farm. The buildings are for use, not for show. They should be just what a good farmer would put up; the workshops and machinery should be just what a manufacturer would choose for the same purpose." This proposition may sound like a truism; but would not its application work a revolution in many an institution? It is not only that buildings and equipment have been in practice too expensive and elaborate, but also that many officials and citizens hold the very different theory that a penal institution is a place where labor ought to be wasted.

Consider, for example, Director Kellerhals's policy as to the use of machinery. Here we saw a row of American mowing machines, there an automatic potato digger built on the farm; here electric motors in the machine shops, there an automatic bread-mixer enabling one prisoner to do all of the baking for the institution; here the best laundry machinery, there a model creamery through which passes the enormous product of the farm. These things were far more remarkable because of the exceedingly slight use made of labor-saving machinery on private farms in Switzerland. It was a sight to delight an American, but not so the Russian prison official who was that day making a study of Witzwil. In the Russian prisons, as he said, everything is done by hand. The hand-work policy is followed on principle in the otherwise excellently managed prison system of Prussia. In visiting other Swiss institutions I had just been hearing various arguments (not needing to be repeated here, as they are not unknown in America) in favor of excluding machinery from institutions. It is evident that Director Kellerhals is not uttering a truism or practicing a commonplace in Europe. He does not cherish the official fear that the prisoners will be without occupation. "There is always work here," he said, "there is never any labor to waste"; and he ran over a list of plans he has in mind for the improvement of the great estate in the next few years. This does not mean, as I understand him, that all these things could be done profitably with free labor; it means that he believes in using in the most productive way open to him the labor force put into his charge by the state.

In its variety of occupations and products Witzwil is a challenge to any other institution of its size anywhere. Convicts have helped draw the plans of the buildings, and have built them all with a minimum of supervision, and out of the raw materials. Structural steel, iron plates, and steel rods are bought in straight, plain pieces to be cut and shaped in the Witzwil shops to many uses. The cellhouses are of cemented stone, without steel in the walls, yet only one man has ever dug his way out. The doors are of heavy wood, and all hinges,

THE NOON HOUR AT THE GRAVEL BANK.

Two miles from the institution but there are no bells, chains or stripes—and but few escapes.

OTTO KELLERHALS, THE DIRECTOR.
He thinks, schemes, dreams of Witzwil, but finds time to go wheeling with his four boys.

locks and grates were forged by prisoners. All plumbing, wiring, tinning, roofing were done by convicts, even the making of the lightning rods. The convicts made all of the furniture that is in the cells and in the offices. They made all the stoves out of flat iron plates. They make all the field tools, rakes, hoes, shovels, picks, baskets, brooms, brushes, boxes, barrels, besides a number of complex farm machines. Most remarkable of all, they make excellent wagons and carriages in various patterns, not merely assembling the parts, but with the exception of the springs forging all of the metal parts: tires, rims, steps, in the blacksmith shop from plain rods, and shaping the woodwork in some cases from logs cut in the forest. These things are not made to show what can be done regardless of expense; a careful cost-account is kept of every article to determine what it pays best to do.

All these and the other industries are, after all, but auxiliary to the main industry of farming. Five-sixths both of the gross and of the net industrial receipts are from agriculture. Yearly there are sold $20,000 worth of cattle and hogs, $12,000 worth of milk, and $40,000 worth of other agricultural products, and through the winter 400 hogs and 800 neat cattle are kept. Agriculture is the paramount interest and—here is another feature of the Witzwil system—everyone is helping to farm. When the weather is fine the shops are all but deserted, and so far as possible, every one, free or convict, from the director to the last prisoner, is out in the fields. It is the Witzwil policy to have the tailors and the shoemakers make hay when the sun shines, for so they are worth more to the institution than making clothes and shoes. "Besides," said the director with a smile, "the days they pitch hay they need no other exercise." On the other hand, almost any work pays on bad days rather than to have prisoners idle in their cells. At such times the shops the busy places. In the trades of basketry, hat-weaving, saddlery, woodworking, iron-working, tailoring, shoemaking, book-binding, etc., the number of working days per month, as shown by the official figures, is twofold to manifold as great in the winter as in the summer. Other large labors are so far as possible crowded into the winter and early spring months, an adjustment favored by the mild winter climate. Such labors are house and road building, drainage, peat-cutting, forestry, and melioration of the soil.

Is the unusual variety of industries at Witzwil due to a superior quality of the inmates compared with those of other institutions? No evidence of such a fact appeared. To Witzwil are sent men sentenced for the first time for felony (the English word most nearly corresponding) for less than three years, whether they are young men or old. Many have served time in minor institutions or have been convicts in other countries. A large proportion have been chronic drinkers. Only ten per cent have had more than primary school training. When a skilled man comes, his skill is used, not wasted. The surveying for the new buildings, roads, and new railway, is being done by a convicted engineer, and the complicated calculations of materials and costs are being made by a convicted

banker, a victim of the American panic of 1907—at least that revealed his peculations. Switzerland has not as yet put the indeterminate sentence into practice, and the average term of the Witzwil inmates is short. One-half of them serve less than six months, four-fifths, less than a year, and only one in twenty serves over two years. A more shifting and unpromising labor supply would hardly be found in any American prison or penitentiary.

On its material and financial sides Witzwil is in many respects a model. What as to its equipment and agencies for reforming the prisoners? Here, it must be confessed, something is lacking. Not only is there no school for the almost, or quite, illiterate prisoners (many of whom are young), but the intellectual stimulus in other ways falls short of good modern reformatory standards. But this said, the criticism is about spent. The conditions of physical health are so excellent as to make a citizen of the state of Sing Sing feel very humble. The simple, dry, light cells, built in one story along a central hall, and with outer windows opening directly to sun and air, are architecturally and hygienically much superior to those at Elmira. The food is bountiful and varied, and the clothing, both in winter and in summer, excellent for its purpose. There is no prison pallor on any face in Witzwil. Some motive to ambition is given by grouping the prisoners in three classes with three grades of wages, small sums each month which are sent to the prisoners' families or kept until the sentences expire. The different classes have also differing privileges, including for the more trustworthy that of living at the farm houses in semi-liberty. Punishment plays a small part; tempers keep sweet better out-of-doors. There are ten solitary cells which I inspected, but none of them had been occupied since weeks before the time of my visit.

Whatever merit of a reformatory nature Witzwil has consists in its teaching of the hard lesson of regular toil under healthy physical conditions. The spirit of work, so far as I saw it, is remarkable. This is fostered partly by the policy of giving responsible tasks to prisoners without oversight, and partly by another noteworthy policy, that of keeping no idle guards at Witzwil. The paid employes all work with the prisoners, setting an example of industry. The combined moral and financial advantages of this plan are self-evident; every guard earns his salary in the increased product, and as the convicts come they are put to work under good paid workers from whom they learn. It may well be that Witzwil is a better practical school of agriculture and the trades than some reformatories with a showy educational equipment.

An essential part of the Witzwil system are the homes, in the neighborhood, for unemployed men. The little colony of Nusshof, belonging to the institution, can give employment to ten liberated convicts at a time, until they can again get a foothold in the world. Tannenhof, conducted by a private society, at the border of the Witzwil farm, can house and give work to forty men at a time. It shelters many former inmates of Witzwil, and is a haven to which they later

MAKING SHOES AND CLOTHING.

The baskets, tables, benches, chairs and the building itself were made by prisoners.

return when hard pressed by temptation and by unemployment.

With the large liberty enjoyed by many of the prisoners, and with the nearness of the French border, ever in sight, there are on the average each year about seven escapes, and of these two are not recaptured. Most of the attempts are made by foreigners.

Many of the men in Witzwil are such as in America largely recruit the army of tramps. Most competent officials whom I consulted in Berne agreed that in the canton the tramp problem, as we know it in America, no longer exists! Other influences (especially the wayfarers' lodges) have helped to produce this desirable result; but Witzwil doubtless has done its share, along with smaller and less distinctive institutions shaped somewhat on the same lines. Witzwil teaches an impressive lesson in its proof that dissolute and untrained prisoners may be made industrious and self-supporting in an open-air prison colony, and it challenges America to a trial of the same plan. Witzwil has its lesson further for all American public institutional management, whether correctional or charitable, in its economic use of labor, in its union of agricultural and manufacturing industry, and in its outdoor work for adult men in an unwalled institution.

Could the plan of a farm labor colony succeed in New York as well as in Switzerland? When this question was put to Mr. Kellerhals he at once replied: "It should succeed better. In Europe land is dear and labor is cheap; in America land is cheap and labor is dear; and labor is the factor of production which the prison has in abundance."

A large state such as New York, with fifteen times the population of the Canton Berne and twice that of all Switzerland, would have the economy resulting from size in an institution. In a thoughful paper (not yet published), to be presented to the Swiss prison society, Mr. Kellerhals has shown that a larger institution could be more economically managed.

A further advantage over the Swiss institution could easily be had in New York with its precedents and present public opinion, by the application of the indeterminate sentence to habitual drunkenness and vagrancy. Such a change, favorable to the welfare both of the public and of the pitiable victims of vicious habits, would, by giving to the institution a more stable working force and a longer period for training, promote greatly its financial as well as its reformatory success.

Finally, Witzwil, remarkable as it is, can be surpassed in America, if to its economic merits can be added the best modern reformatory discipline. The opportunity awaits the progressive state that will found such an institution, and the able management that will guide it to success.

NEW INDUSTRIAL BUILDING NEARING COMPLETION.
Better machinery and equipment here will increase the economy of the whole farm.

THE HOUSING AWAKENING[1]

V

THE HUDDLED POLES OF BUFFALO

FREDERIC ALMY

Secretary Buffalo Charity Organization Society

The Poles of Buffalo live in a sort of social Sahara. Their infant death rate is excessive, and the proportion of Poles exceeds all others in the juvenile court and at the city poor office. It has recently been shown that ninety-six per cent of those under investigation earn less by $110 than the $634 a year which the Charity Organization Society of Buffalo stands for as the lowest tolerable budget which will allow the bare decencies of life for a family of five.[2]

It is not generally known, perhaps, that among Buffalo's 80,000 Poles there is not one settlement house, not one city playground (though land has now been bought for one), and but one day nursery; that, according to our Polish Survey, there are twenty teachers in parochial schools who do not speak English at all, or speak it too poorly to use it in teaching. The Polish community is almost bare of the modern social work so rife elsewhere in Buffalo. Such work could create a Polish opinion which would refuse to tolerate the huddled living which keeps the Poles down. It might reduce the Polish census; but is it better to have 80,000 near the foot of the ladder or 40,000 climbing rapidly?

Even as it is, the Poles are climbing. They have two daily newspapers; 4,000 families, representing 20,000 people, own their own homes; 5,000 of them have deposits in the savings banks, amounting to over $2,500,000; and they own taxable property worth $12,000,000. It is a wonderful record, under a heavy handicap of social neglect. They are thrifty, they are clean, they are willing, and they are neglected. They are raw material of the first value, undeveloped and wasting.

Nearly all the Poles live in small one-story and two-story wooden cottages. The new cottages are mostly two stories, with accommodations for six or more families, but the older type is a one-story cottage, so built that it is adapted to four families, though the owner is apt to occupy two of the rear apartments.

Today there are in Buffalo 80,000 Poles, which is one-sixth of the entire population, and their 15,000 cottages are all under the tenement law, which is administered by a Polish health commissioner, Dr. Francis E. Fronczak. He is new in office, but bids fair to be the best health commissioner Buffalo has ever had, even Dr. Wende not excepted. It is in his power to do much to release his people from the conditions which have held them down. Good health work means not only protection for the rich, but salvation for the poor who cannot, like the rich, escape from their surroundings. Dr. Fronczak has the opportunity to save more lives in Buffalo than even Dr. Pryor has saved through his tenement and tuberculosis work, or than the mistakes of a thousand doctors in private practice could destroy.

The tenement law has not yet been effectively enforced, but there have been good efforts. Twenty-eight years ago, in 1882, the tenement committee of the Buffalo Charity Organization Society secured some tenement ordinances, and ten years later the same committee made an elaborate report which led to new and more stringent ordinances in 1894.

[1] A series of articles describing housing conditions in typical American cities, large and small, East and West, and the efforts being made to improve these conditions. Published with the cooperation of the National Housing Association. I. Introduction, by Lawrence Veiller, THE SURVEY, November 19, 1910, price 10 cents; II. Socialists and Slums—Milwaukee, by Carl D. Thompson, December, 3, 1910, price 25 cents; III. The Awakening of a State—Indiana, by Alldon Fellows Bacon, December 17, 1910, price 10 cents; IV. Housing Reform in Cold Storage—Boston, by Edward T. Hartman, January 21, 1911, price 10 cents.

[2] See THE SURVEY, for June 4, 1910, pp. 370, 379.

Good work was done by this committee in enforcing these ordinances, and as a result Buffalo has no such serious structural conditions in its tenements as most large cities have.

Instead of now sowing, we are reaping. The sowing was done long ago by Dr. John H. Pryor, of later tuberculosis fame, and by William A. Douglas and Williams Lansing, who served later on Roosevelt's Tenement House Commission.

Photo by Hare

A PHILOSOPHER CARELESS OF APPEARANCE.

Our chief evil today is room-overcrowding, and here the city ordinances of 1894, which required 600 cubic feet of air for each occupant, were better than the present state law of 1901, which requires only 400 cubic feet. The ordinance is still effective, and is expressly not repealed, but the state law has practically supplanted it.

In 1905 Messrs. Pryor and Douglas of the tenement committee of the Charity Organization Society started another tenement crusade, and for a year or two the town was "tenement mad," as one of the newspapers put it. Revolting details of nasty plumbing were in the daily press. Dr. Van Peyma and George W. Gillette of the same committee followed up the work. The health commissioner, Dr. Greene, gave his full support, and in one year 200 buildings were altered or reconstructed. These were mostly in the Italian quarter for the poorer Italians have run to old hotels, warehouses, and abandoned homesteads, while the Poles have kept to cottages. As late as 1906 we found Italians living in large rooms, sub-divided by head-high partitions of rope and calico, with a separate family in each division.

The state law is certainly drastic. All new or altered tenements must be certified as O. K. by the Health Department, and without this certificate tenants cannot be compelled to pay rent, city water can be turned off, and any mortgage is immediately foreclosable. The city has turned off water several times, and has used the eviction clause with great success. In the old United States Hotel, which was converted into a tenement house, the landlord refused to make necessary, but costly, changes. We told the tenants to stop paying rent, and he could not evict them. The result was that radical changes were made with the tenants still in the building. The welter was indescribable, but there was no unnecessary delay.

As Dr. Pryor has said repeatedly, night inspection is far more effective than day inspection to detect overcrowding, and nothing less than night inspection is adequate. Moreover, until this year there were but three tenement inspectors in Buffalo, and even now there are but nine.

Photo by Hare

THE PRESSURE OF EXISTENCE.
Ten people in four rooms and six beds.

What can nine inspectors do in a city where the large tenement hardly exists, and where there are 15,000 tenement houses, under the three-family law, in the Polish section alone?

In 1902 we found one small two-story cottage in the Polish quarter, on Mills street, which housed sixty people. Of course it was photographed for the Sunday papers with its whole population standing in front of it. Nothing of this sort exists today, but as Mr. Daniels's Polish Survey has abundantly shown, the overcrowding is still serious and dangerous.

Counting little bedrooms, living-rooms, and kitchens (and they are pretty nearly indistinguishable), Mr. Daniels tells us that half the Polish families in Buffalo, or 40,000 people, average two occupants to a room. There are beds under beds (trundle beds, by the way, were once quite respectable), and mattresses piled high on one bed during the day will cover all the floors at night. Lodgers in addition to the family are in some sections almost the rule rather than the exception. Under such conditions privacy of living, privacy of sleeping, privacy of dressing, privacy of toilet, privacy for study are all impossible, especially in the winter season; and those who have nerves, which are not confined to the rich in spite of an impression to the contrary, are led near to insanity. Brothers and sisters sleep together far beyond the age of safety. It begins so, and parents do not realize how fast children grow, or how dangerous it all is.

What is the remedy?

Enforce the tenement law. Public opinion stands for it, and only public inertia stands in the way. Night inspection will prove the overcrowding, though mere day inspection will prove it also. These cottage tenements lack some of the evils of tenements elsewhere, for there are no dark rooms, but nevertheless they handicap life. The Poles will never come into their own in Buffalo until they stop this huddle. The word is not mine, but Mr. Veiller's, but it is descriptive.

To stop the overcrowding will of course raise rents. Two families in a cottage must pay more than four or six families in the same cottage. With the wages they get the Poles cannot afford the rents they pay now. If rents increase many will go back to Poland, as they did by thousands in the recent panic years. This would make a dearth of labor and raise wages. The employers will seek to bring in a lower grade of people, as in the steel plant at Lackawanna, just over the city line. If an efficient health commissioner insists on American conditions for these people, the standard of living will be sustained and the standard of wages also. If the high wages continue, the employers, and possibly some of the consumers, will not have pretty things to say of Dr. Fronczak, but the Poles will; and the community will owe him a debt it can never repay.

As I have said elsewhere, we want to give our foreign population an American fair chance, and then compel them, literally compel them, to live like Americans. We shall not have good citizens otherwise for our universal suffrage. The children of the poor do not need charity so much as they need opportunities. You cannot make a silk purse out of a sow's ear, and you cannot make an American citizen out of a tenement slum. The slum must go. If you spare the slum you will spoil the child.

HOME WORK IN THE TENEMENTS[1]

ELIZABETH C. WATSON

SECRETARY OF THE WORK AND WAGES COMMITTEE OF THE CHILD WELFARE EXHIBIT

Photos by Lewis W. Hine

THERE WAS A MAN LIVED IN OUR TOWN
AND HE WAS WONDROUS WISE,
HE WANTED FOLKS TO WORK AT HOME
AND SO HE ADVERTISED.

THEN WHEN HE SAW THE PEOPLE COME
IN CROWDS UNTO HIS DOOR,
HE SAID, "I'LL GIVE MY WORK ALL OUT,
I NEED A SHOP NO MORE."

(*From Sorrowful Rhymes of Working Children.*)

And so it came about, and grew and grew, until now there are thirteen thousand some odd tenement houses in New York licensed by the bureau of factory inspection of the State Department of Labor, in which work given out by manufacturers and contractors can be made or finished in the homes, where the labor of all members of the family can be utilized without reference to age or factory law.

Securing a license permitting a tenement house to take in certain homework is a very simple matter. The owner or agent renting the property files with the Department of Labor a personal application for a license. The department sends out an inspector to investigate the building. If it comes up to the sanitary regulations and there are no charges filed against it in the Health or Tenement House Departments, a license is granted that allows all families living in the house to take in work if they desire. The house may contain one or forty families. The number makes no difference. The license is for the entire house, and entitles all the tenants to do homework.

The law calls for two inspections of licensed tenements a year, but owing to the limited number of inspectors only one complete inspection is made, at which time thirty-five or more inspectors make a complete survey of the licensed houses. Only four inspectors are detailed regularly to this department for work the year round.

The law regulating this branch of industry is Section 100 of the labor laws which prohibits, except when licensed, the use of a room or apartment in a tenement house or of a building on the same lot with one for "manufacturing, altering, repairing or finishing" of

coats, vests, knee-pants, trousers, overalls, cloaks, hats, caps, suspenders, jerseys, blouses, dresses, waists, waistbands, underwear, neckwear, furs, fur trimmings, fur garments, skirts, shirts, aprons, purses, pocketbooks, slippers, paper boxes, paper bags, feathers, artificial flowers, cigarettes, cigars, umbrellas, or articles or rubber, nor for the purpose of manufacturing, preparing or packing macaroni, spaghetti, ice cream, ices, candy, confectionery, nuts or preserves.

But whether licensed or not, the law does not interfere with the making of any goods *not* specifically mentioned in it. There lies the rub, as witness this list of things not mentioned and therefore made, quite legally, regardless of conditions:

finishing gloves, making buttonholes, hat frames, millinery ornaments, chiffon hats, baby

[1]Some of the facts and figures from Miss Watson's report, and her adaptations from nursery rhymes, are shown at the Child Welfare Exhibit at the Seventy-first Regiment Armory, New York, which will continue until February 12.

bonnets, sleeve garters, rompers, Irish lace, silver brushes, dress shields, leather bows and buckles, all kinds of hemstitching, feather stitching and fancy hand work; embroidery of all kinds, such as on waists, dresses, silk vests, silk stockings, collars, underwear, table linen, chiffon gowns, infants' flannels, coats, sacques, knitting and crocheting of Angora hoods and mittens, slippers; making candle shades; stringing bead necklaces; crocheting gloves, mittens, silk rings; plaiting hat straws; making guimps, bibs, silver mesh bags; tag stringing; tying cords on fancy pencils, tying pencils on fancy programs; pasting labels on cigar and other boxes, cutting out embroideries; trimming all over and chiffon embroideries; beading slippers, nets and lace; setting stones in celluloid combs, artificial jewelry and hat pins; making passementerie; embroidering pillow tops; making maline bows of human hair; sorting and sewing buttons on cards, covering buttons, making kimonas, tassels, pompons, evening scarfs and countless other things.

Section 101 of this same law imposes upon the manufacturer the duty of knowing whether the house into which his goods are taken for manufacturing purposes is licensed or not. In order to furnish such information the bureau of factory inspection prints and sends out a Monthly Bulletin Relating to Tenement Houses. This contains the addresses of all licensed tenement houses; of houses not licensed, the application having been denied; and of houses for which the licenses have been revoked.

This is all very well so far as it goes, but as the law applies only to the things on the licensed list and has no jurisdiction whatever over the home manufacturing of any articles not on that list, work can and does go merrily and legally on in houses refused a license, or in which a license has been revoked on account of unsanitary conditions.

For instance, in one house in which the license had been revoked on account of unsanitary conditions, and in which there had been several cases of contagious disease, I found flower making, garment finishing, and fur work. Work requiring a license could not be legally done, but any work not requiring a license could be. No license was necessary to sort coffee, therefore it could be and was sorted.

The halls and stairways in this house were in unspeakable condition. A series of complaints had been filed against it in the Tenement House Department and the apartment of the family engaged in coffee sorting was deplorably out of repair and dirty. Bags of broken coffee were bought at a nominal price from a coffee factory in a nearby street, and taken home, where all the children of the family, plus a small cousin from a neighboring apartment, sorted the whole beans from the broken ones. The two little girls of the family, one aged nine the other eleven, were continually staying out of school and only attended enough days to keep off the truant list.

The child labor law prevents any child under fourteen years of age from being employed in any factory, mercantile establishment, restaurant and other places of business, but no law reaches the home-working child save the compulsory education law—and that has jurisdiction over his school day only. He may work from six in the morning until school opens, and from three on to midnight, with no respite, every school day, and all day long, as many days a week as he can conveniently remain out of school without be-

KEEPING BOYS ON THE STREET.

ALL THE KINGS HORSES AND ALL THE KING'S MEN,

CANNOT MAKE FRANCIE'S POOR EYES WELL AGAIN.

ing regarded as a truant and there is no law in our enlightened city to stop him.

The predominating home industries in New York are finishing clothing, making artificial flowers and willowing ostrich plumes. Children work in all three.

The following chart gives the nationalities doing homework:

Ten per cent is done by	Italians.
Ten per cent is done by	Germans, Irish, Americans, Syrians, Jews (chiefly Russians).
Fine custom made vests.	German.
Finishing clothing; making artificial flowers; willowing ostrich plumes.	Ninety-eight per cent is done by Italians.
Globe neckties, blouses and clothing for United States Navy.	Irish and Americans.
Kimonos, crochet, lace, embroidery and crocheted lady sacques.	Syrians.
Plaiting hat straw; all kinds of women's neckwear; fancy bows.	Jews.

Prevailing fashion and changing styles are such integral factors in the homework problem that it seems impossible, even with a very large force of inspectors giving thorough inspection, for the Department of Labor ever to adjust the license list to fit the exigency of the occasion. Last fall the fashion for beaded net and passementeries brought a new kind of homework into being, and the present demand for hand embroidery has made this comparatively minor trade grow by leaps and bounds. We have well established tenement trades almost before we know of their existence.

Thus "homework" is an unknown term best expressed by x. In fact, so little is known of it that the more we scratch about on the surface of the situation the keener our realization of the paucity of facts concerning it. The State Department of Labor tells us the number of houses licensed to take in certain specified work. But it knows nothing of the number of people in each of these licensed houses doing such work. It cannot tell us the number of houses in which such work is done without a license, nor has it knowledge of the quantity of work done not requiring a license. And no one knows or can estimate the number of children helping in this work. In fact, in order to know all this it would require an inspector for each house!

Yet for all our lack of definite information on the subject, we have some indications of the extent of homework. One of these indications is the "Help Wanted —Female" columns in the daily papers most widely read by the workers. These are full of advertisements for homeworkers.

In one paper, during a period of two weeks' time chosen at random, there were 205 advertisements for women to take work home—almost fifteen advertisements a day. Some of these, for crochet workers on babies' hoods and bootees, wanted a hundred workers at a time and continued their advertisement many days.

Some light has been thrown on the situation by following these advertising columns for three months. For instance, workers in the predominating trades in tenement houses, such as finishers of clothing, are never advertised for. Artificial flower makers to work at home are rarely advertised for (once in the three months, I believe) and home workers on willow plumes were advertised for just twice during the three months, although the willow plume trade was at that time in its busiest season. Absence of advertisements for workers in the predominating tenement trades indicates, significant-

JACK SPRAT HAD LITTLE WORK,

HIS WIFE COULD GET MUCH MORE.

SHE AND THE CHILDREN WORKED ALL DAY

TO KEEP THE WOLF FROM THE DOOR.

WHERE THE WHOLE FAMILY WORKS.

The father a hodcarrier, has been in America 24 years, works about eight months a year, $2.50 a day. The oldest boy (15) has working papers, earns $5.50 a week in embroidery shop. All except the babies work on willow plumes. The oldest girl (12) was absent from school 29 half days out of a term of 80. The ages of children range from 13 years to 2 months.

ly enough, that these trades are well established in the homes, the source of supply for such work is well known to the workers and the applicants for work are more than equal to the demand for workers. This gives manufacturer and contractor power to dictate the lowest terms—as we shall see later on in the history of the willow plume trade.

The kind of work done in different parts of the city depends wholly on the character of the factories in the neighborhood. Throughout the lower West Side we find artificial flowers, fancy feathers, finishing of clothing; on the lower East Side finishing of clothing; the upper East Side willowing plumes, and beginnings of flower making. Several kinds of work in the vicinity mean that there is no respite for home-workers—the slack season of one industry is supplemented by the busy season of another. In the Bronx are embroidery factories. Consequently we find the Bronx families cutting out embroideries, embroidered handkerchiefs and the like. Tiny children, four years old can cut out embroideries. As soon as they can manage little scissors they help separate the strips, even if they are unable to cut out the scallops. One small, pathetically weary looking child, probably five years old, on being asked how long she had been cutting embroidery, shrugged her little shoulders and replied, "O! Ever since I was."

Very small children can help pull out bastings in finishing clothing, sort and sew buttons on cards, and separate flower petals. Willow pluming is a little more difficult for little children, the complicated knot making it almost impossible for very small fingers; however during the past summer several children of seven years were found doing it.

With the exception of these trades, and the finishing of underwear, the character of work carried on in homes takes it out of the smaller children's hands, leaving it for mothers and older mem-

OVERCOATS TO BE FINISHED.

The load was so heavy that the man stopped frequently to rest, laying his burden against dirty stairways.

bers of the family. Small children cannot embroider, knit angora hoods or mittens. But girls of eight, nine and ten years can and do crochet lace, though lace making is a comparatively minor industry. Passementerie, beading nets, making millinery ornaments, and operative work, such as making kimonas and rompers, requires older, more experienced handling than a small child can give.

But even here the child is utilized in carrying work to and from factories and shops. (A very small child with a very big bundle of clothing—as big as itself—is a common sight in the tenement districts.) The physical results from these heavy loads are yet to be proved. Again, the children take entire care of the smaller children and babies and carry on the entire work of the household. Little girls of eleven and twelve do the family washing before going to school in the morning, or remain out of school to do it.

Last March, on a bitter cold day with snow falling, while visiting a tenement in which finishing was done, a little shivering group of children was found whimpering and huddling in the second floor hallway. The baby, a tiny scrap of fourteen months, was crying with cold, while the little mother (of seven) cuddled him in her arms, trying to forget her own discomfort in caring for him. A third child, a little girl of five, said they were locked out because the mother had taken the work to the boss. On returning, the mother was much distressed at finding her little family crying with the cold. Shrugging her shoulders, she asked: "What, I must do? I maka the coats, my man he no gotta job. He walk this day for work. I lock a children in, they burn up. I lock a children out, they cry. What I must do?"

And so the stories go on, a series of tales of neglect, overwork, undernourishment, the latter the result of several things—poor food bought in a hurry from the ubiquitous push cart, or the stress of work where every minute counts making it impossible for the mother to take time to prepare food properly and often has to leave it for the children to cook. Then, too, even if the family has nourishing food the children are often just too tired to eat.

The continuous indoor life, the lack of play time, the overcrowding and general demoralization of the home through its conversion into a factory, must eventually register, and if we find it impossible now to measure in exact terms the injury of this system on the child, we will reckon with it later on in his physical and psychological reactions.

One picturesque old Italian *nonna*

THIS LITTLE CHILD MADE LACES,
THIS LITLE CHILD MADE FLOWERS,
THIS LITTLE CHILD MADE WILLOW PLUMES
THIS ONE HELD BABY FOR HOURS,
AND ALL OF THEM WORKED IN A CLOSE, WARM ROOM
THROUGH THE GOOD, BRIGHT SUMMER HOURS.

A STRIKING EXAMPLE OF CONGESTION

A single room used as kitchen, nursery, boarding house, and workshop for six persons. The boarder is writing home to Sicily. The mother of the family alternates her work on feathers with amusing younger children.

(grandmother) in a family working at home, was asked if she liked America. With a shrug of her shoulders she replied: "Not much, not much. Good money, good people, but my country—my country—good air; much air, nice air down Italy. Blue sky, the water laugh in the bay." Then, spreading out her arms, hands up, with a pathetic gesture; "In my country peoples cook out of doors, maka the wash out of doors, eat out of doors, tailor out of doors, maka macaroni out of doors. And my people laugh, laugh all a time. And we use the house only in the night time to maka the sleep. America—it is *sopra, sopra,* (up, up, with a gesture of going up stairs). Many peoples one house, worka, worka, all a time. Good money, but no good air."

Some twenty-five years ago the New York Court of Appeals handed down the following — known as the Jacobs decision:

> It cannot be perceived how the cigarmaker is to be improved in his health or his morals by forcing him from his home with its hallowed associations and beneficent influences to ply his trade elsewhere.

This decision has blocked all legislation up to date.

How these miserable homework factories with their inmates working from daylight to six, eight, ten o'clock and even later in the night, can be defined as "homes" is beyond one's comprehension, and one must look through very rosy spectacles indeed to find the "hallowed" and "beneficient influences of a home" in which fur garments are stored in every conceivable corner and cranny of the living and cooking rooms, while all the members of the family toil from early morn to late night in order to earn enough to keep body and soul together.

What home influences can there be where a mother and three children, (the youngest just five), having been in this country, but four months and speaking no English, are making artificial flower wreaths (in an unlicensed house) at six

cents a dozen wreaths, day in and day out?

The table below of prices for work and the weekly incomes from it will show the compensation these homeworkers, victims of their own unrestricted competition, receive for converting their homes into factories.

To show the effect of home work at close range, the Work and Wages Committee of the New York Child Welfare Committee decided last May to make an intensive and comparative study of two groups of the same nationality, living under the same conditions, in new law tenements, subject to the same educational and civic influences, differing only in occupation—one group doing home work and the other not doing it. Willowing ostrich feathers, a typical homework trade, (in its busy season) was chosen for study.

Willowing consists of lengthening the short strands, called flues, of inferior feathers by tying on one, two or three flues until the feather has the desired depth and grace. The work is paid for by the inch and varies with the number of sets of knots to the inch.

Three years ago when the trade started, few knew how to willow, and fifteen cents was paid for tying one set of knots (per inch). The following season more workers were in the field and the price went down to thirteen cents an inch. Then it dropped to eleven cents (an inch), nine cents, seven cents, five cents and last summer (1910) the workers were receiving but three cents an inch while some of them in late summer were beginning to work by the piece. One feather fourteen and a half inches long, tied three times to the inch, brought its maker one dollar and ten cents. The woman who made it said "Pretty soon, the bossa, he want us work for nothing."

One plume bringing the set price of three cents an inch contained 8,613 knots. A woman and two children worked at it for a day and a third, tying at the rate of forty-one knots for a cent.

The neighborhood chosen for study was in the upper East Side, where the feather industry flourishes. In one block between Second and Third avenues there are eighteen factories or shops in which the older girls of the district work, and where the families living in the upper

WORK.	PRICE PER PIECE.	WEEKLY INCOME
Finishing coats	6c a piece	$2.40 to $3.00
Finishing pants	6c to 10c a pair	$3.00 to $4.20
Making violets	8c a gross up	$2.75 to $3.50
Making little roses	8c a gross	$2.75 to $4.00
Making large roses. (7 and 8 petals.)	10c to 18c a gross	$3.00
Making baby dresses. (Sewing up two sides, hemming skirt, making sleeves and sewing them in, gathering and binding the neck into a band, sewing on one button and making one button hole.)	45c a dozen	$3.20 to $5.00
Embroidering crepe de chine dresses. (It takes 10 days to complete one.)	$5.00 a dress	
Making kimonas (4 seams—2 sleeve seams, hemming and binding.)	4c a dozen	
Men's neckwear—		
Cotton string ties	5c a dozen	$2.75
Silk ties (Lined, turned and pressed.)	15c a dozen	$3.60
Sorting and mounting buttons on cards	2c a dozen cards	.25 a day
Embroidery and tucking shirtwaists (if material included) (Woman working from 5 o'clock in morning until 8 o'clock at night can complete one a day.)	$1.00 a piece	$6.00
Plaiting hat straw (Season trade only, lasting 4 months in fall and winter.)	10c a dozen yards	$4.00
Embroidering silk stockings	20c to 45c a pair	Girls average 12½c an hour
Muslin underwear (Running in ribbons, making 3 buttonholes and sewing on 3 buttons.)	15c to 25c a dozen	$3.25 to $4.20

Making Irish lace medallions	35c to 50c a dozen	?
Making Irish lace by yard—insertion	15c a yard	?

floors and in adjacent houses secured their supplies for home work. In one house (above one of these shops), occupied by fourteen families, we found twenty-eight children under twelve years of age busily plying this trade. The streets and stoops are full of ostrich feather refuse, the stairways are littered and the air full of feather particles. The houses are filled with homeworkers, regardless of license. During the summer 370 homes were visited in order to get the history of one hundred families *not* engaged in home work and not one-half of these houses were licensed.

To show how impossible it would be to inspect and license this trade properly the story of Fortunata must be told.

A group of Italian men stood around the door of No. 324.

"Yes, Fortunata live here." Then one cried at the top of his voice: "Fortunata, Fortunata," which promptly brought a stout, good-natured, rugged-faced South Italian woman carrying a black oilcloth bag fairly bulging with greens, peppers and their curious Italian squashes.

"She my girl, she my girl. She live upstairs. What you want? You Board of Health?"

On being told I was not the Board of Health, she said: "I take you upstairs to see her. I take you up." Then, turning to a little girl on the doorstep, in Italian: "Quick, *sopra* (up). *Sopra!* Tell Fortunata give her plume to her godmother. Go, Mara. A lady comes who will arrest her if she work on feathers."

Slowly she toiled up the stairs, I behind her. No use trying to speed beyond her portly figure. In the middle of the first flight she stopped, slowly wiped her brow, and said: "I big, big woman—takes me much time to go upstairs. My house way upstairs." Meanwhile she called at the top of her voice in Italian: "Fortunata, Fortunata, take the plumes into your godmother's. There comes a lady."

Reaching the first floor nothing would do—we must stop at a neighbor's and admire the baby. Meanwhile she explained to her neighbor that the lady was from the Board of Health, coming to arrest the children who worked on feathers, and that she wanted Fortunata to put the feathers away before we reached the apartment.

Slowly we climbed the second flight. This time we paused in the middle of the hallway where, with many gesticulations, she showed me the bad places in the plaster. "The boss he no care—house look bad." Later "the boss" we find is her own brother.

Laboriously we climbed the third flight, stopping at the head of the stairs to visit in the hallway, with all the neighbors

THE OLDEST FORM OF TRANSPORTATION.

White underwear to be ribboned. Several gross of garments were in the bundle.

And Make the Plumes that Pay.

who had come out to look over the "lady from the Board of Health, who had come to arrest them for making feathers." One of them even went so far as to say me no one ever made feathers in that house. In vain did I tell them I did not come from the Board of Health; I could not arrest them if they made feathers in their own homes.

Finally we reached the home of Fortunata. Four rooms clean as a pin, save for one little place by the front window where there still remained a few tiny remnants of the snipped flues of the feathers. After talking to Fortunata for some time we ask her if she makes feathers. Her mother replies for her.

"No, no! She no make feathers. Feathers hurt their eyes. I no let Fortunata tie them."

Turning to Fortunata, I said: "Fortunata, go into your godmother's and bring the plume."

She looked at me as if she were dazed. "Bring me your plume from your godmother's, Fortunata"—and she did.

When her mother saw her returning with the feather she said: "Senorina, you speak Italian?"

"I speak a little, but I understand more," and with that she put her hands to her side and rolled with laughter. Then we all laughed together, whereupon she patted me on both cheeks and said: "You very nice lady! You very nice lady! You very happy lady!"

A glance at the budgets of the families in the next column—particularly of the wages of the fathers—tell their own story and show why home work is necessary.

This budget is not small because the fathers are lazy. Some of them are city employes in the street cleaning department, others are carpenters, bricklayers, rock drillers, etc. Many of them are skilled workmen earning good pay by the day, but one woman summed up the whole situation when she said: "Everybody, all a people, they willow the plumes. It hurts the eyes, too, bad, bad. How we can help it? The man he no work, two days, three days, may be in one week, two weeks. Sundays he no work, no pay. The holidays, no work, no money. Rainy, snowy days, bad days, he no work. Well, what we can do? My girl, me, we maka the feathers. The children must have to eat."

Homeworkers.

" amount per week per capita for heating, lighting, clothing, insurance and emergencies	$3.24

So, to supplement the family income, the children work, tying these feathers, bringing all kinds of eye trouble and strain in their wake, remaining out of school—whenever possible.

The school records of the homeworking children show an average non-attendance of twenty-nine days out of an eighty-nine-day term, as against an average non-attendance of ten days by those not doing home-work. Six of the nonhomeworking children had perfect attendance records, while some of the homeworkers had been absent seventy

whole and three half days. One, a child of eight, although a resident in the district nearly three years, had never been in school at all and could scarcely speak English.

The family records of these two groups show a tendency to more deaths (of children) in the homeworking families—177 as against 104—and a larger number of deaths from contagious disease, which might be interpreted as an indication that the homeworking child's power of resistance is less than that of the non-homeworker.

What are we going to do about it? Are we ready to ask that all children be exempt from such work? Is the time ripe to say all such work must be eliminated from the tenement homes? And if so how shall we do it?

TEN LITTLE TEN'MENT KIDS STANDING IN A LINE,
ONE WENT TO PULLING THREADS AND THEN THERE WERE NINE.
NINE LITTLE CHILDREN, HAPPY BY THE GATE,
ONE WENT TO WILLOW PLUMES, THEN THERE WERE EIGHT.
EIGHT LITTLE CHILDREN GAZING UP AT HEAVEN,
ONE WENT DOWN TO TEND THE SHOP, THEN THERE WERE SEVEN.
SEVEN LITTLE CHILDREN ALL IN A MIX,
ONE WENT TO CROCHET LACE, THEN THERE WERE SIX.

FOUR LITTLE CHILDREN HAPPY AS COULD BE,
ONE SEWS ON BUTTONHOLES, NOW THERE ARE THREE.
THREE LITTLE CHILDREN WATCHING BABY COO,
ONE WENT TO CROCHET BOOTS, THEN THERE WERE TWO.
TWO LITTLE CHILDREN PLAYING ALL ALONE,
ONE GOT THE VIOLETS AND WENT TO WORK AT HOME.
ONE LITTLE CHILD ALONE CAN'T HAVE HEAPS OF FUN,
SHE WAS PUT AT STRINGING BEADS AND THEN THERE WERE NONE.

THE COMMUNITY AND THE CHILD

SOPHONISBA P. BRECKINRIDGE

Among the difficult and delicate tasks to which the community is now setting its hand, none is more compelling in interest than that of establishing a standard of child nurture, which shall be recognized by social agencies and public officials as one below which no family or group in which there are children shall be allowed to go. The idea of a king as representing the state in the capacity of father to the fatherless has been long recognized; and the functions of the chancellor as visitor of institutions in which orphans were gathered, as well as his power to act in accordance with the needs of the children in cases of marital discord, are illustrations of the same idea. In the past, however, the need of parental supervision from without was not realized in the case of families where the parents were alive and apparently competent. In fact, the failure to apply any effective standard of parental duty was so great as to give rise to a question concerning the existence of such a duty, except so far as it could be based upon and sanctioned by the moral law. In accordance with the "law of nature," the father has been regarded as liable for the maintenance, protection, and education of his children; but it has seriously been questioned whether this duty was imposed by the civil law, and its adequate enforcement has only recently been undertaken. It is significant that a modern writer speaks of the enforcement of parental responsibility as an entirely novel undertaking. In one of the first issues of the *Crusade,* Sidney Webb writes as follows:

> We must take note in passing, that any such notion as enforcing parental responsibility is an entirely new thing. Speaking not pedantically as a lawyer, but broadly as a historian, it is an innovation of the past half-century—almost, we may say, of the present generation. Our ancestors never thought of enforcing parental responsibility. A hundred years ago, if a father left his children half-starved, scantily clothed in rags, with the most miserable lodgings, overcrowded and indecently occupied, with every kind of insanitation, so long as the parish was put to no expense, no one took proceedings against him. Cruelty to animals was made an offense long before cruelty to children. There was no attempt to constrain a parent to keep the child in health, to provide medical attendance for it, to supply education or moral training—least of all any idea of enforcing upon the parent any fulfilment of the obligation to furnish the all-important environment of a decent home. With the not very real exception that doing a child to death too suddenly might (we may almost say theoretically) be treated as murder, there was, a hundred years ago, so far as regards children in their parents' own homes, nothing in the way of enforcement of parental responsibility.

So exaggerated was the idea of parental right, that the relation of the father to his child became very much like that of the man of property to his possessions. Not only was there a lack of enforcement of all obligations, but along with this went a full recognition of control. On the one hand, the father was free from any effectively enforced duty of support; on the other, he was entitled in law to the custody of the child's person and to the enjoyment of the child's earnings. Moreover, these rights were enjoyed by the father not only free from any interference by those outside the family group; they were subject to no effective control by the mother, who enjoyed no authority but only "reverence and respect." At the same time it is fair to say that the paternal standard of child-care was often no lower than that of public agents to whom children were entrusted; it was, for example, the plight of the children apprenticed by poor-law guardians which first brought the attention of the English people to the waste of child life in the early factories; and all students of the juvenile court movement are familiar with the wretched treatment to which child wrongdoers are often subjected even now by guardians of the law.

In the absence then both of control and of example, it is not surprising that the father of today finds himself amazed at the attempt of public agents to interfere with his treatment of his own children. "Can he not do as he will with his own?" Nor is it surprising that the community

February 4, 1911.

comes slowly to the conviction that parental affection and the "law of nature" are not always adequate safeguards of child life; and that only gradually have the true consequences of failing to meet the demands made by all children been realized. It may be pointed out again and again that neglect of education means incompetence, vagrancy, and crime; that neglect of recreation means the anti-social gang; that neglected physical needs mean stunted growth and consequent inefficiency and poverty; but the schools to which all children must go remain ineffective; wide stretches of the city wilderness lie unbroken by playgrounds; the halting attempts of the fourteen-year-old child to find a first job are made without guidance or help; and even the elementary decencies and needs of physical life are lacking to innumerable children.

It is not my purpose to discuss here any of the difficulties connected with the institutional care of children by public agencies supported by public taxation. It is rather to call attention to certain interesting methods of control over family life which are rapidly being developed. In the first place, notice should be taken of the legislation which aims to secure as good conditions as possible in homes where there is apparently no parental lack; that is, homes in which the parents are alive and not incompetent. This object is sought by embodying in express enactment the natural duty of support on the part of the father,[1] and by giving to the mother powers, rights, and duties concerning the child equal with those of the father.[2]

The families in which there is obvious parental lack may be grouped into three classes: first, very poor families in which the father is either dead or incapacitated; second, families in which the parents lack intelligence with reference to the needs of child life, but are willing to meet those needs when properly guided or helped; and third, families in which destitution is accompanied by filthy and degrading physical surroundings, immorality, drunkenness, and a resulting lack of child care and supervision.

With reference to the first group, namely, families which are simply poor, fairly definite theories of treatment have been worked out. If the father is dead or unable to support the family, and the mother is a fit guardian for her children, it is already recognized that the community is adopting a most wasteful policy when she is allowed to assume the duties of both breadwinner and caretaker. It has been demonstrated that what is saved by letting her earn is more than overbalanced by the children's loss of her care and companionship. But the application of this principle is extremely difficult. There is no need of further experiment to demonstrate the delicacy of the task of furnishing support from without the natural group, interesting evidence[3] may be found in the reports of such experiments as have been made, which goes to show that close supervision, wise and firm guidance, and rare insight are needed by those who administer the pecuniary resources of such a group without being naturally related to it.

The demand is irresistible that where the group has no other need than that of pecuniary aid, the community shall supply that lack, so that a good home may be maintained at public cost as a priceless public asset; and the provision of the California juvenile court law approves itself at once in theory when it provides that the expense of maintaining their own children may be allowed to parents out of the public funds at the discretion of the court, within the limits fixed by the law.[4]

When both parents are dead the relatives may be asked for contribution; in default of support by them and in the case of really homeless children a similar principle is recognized, namely, that the wards towards whom the state has the privilege of assuming the full parental relationship shall have created for them, so far as possible, the conditions characteristic of a good home. In this statement is embodied the doctrine para-

[4] McCartney juvenile court law, section 21.

doxically known as "boarding out" from institutions, which should rather be called "boarding in" good homes. For there are childless homes as well as homeless children, and the task of fitting them together, of bringing the child into a simple decent home in which those decencies of habit and life to which all children have a right may be supplied, is not beyond the ingenuity of the community. That this practice should be extended is another urgent recommendation of the Royal Commission on the Poor Law.[1] It is, however, no simple undertaking and requires intelligence, devotion, and real unselfishness on the part of those to whom the supervision of the children and of the adopted homes is entrusted. Already in Illinois our county officers are authorized to place children who must depend upon the county for care in homes rather than in the county almshouse, when this can be done "without expense to the county." It is only a question of time when a similar policy will be adopted even when additional cost is involved.

From the experiments which have been tried, however, two sources of difficulty become apparent: the first, a lack of that skill in handling family problems which is acquired only through familiarity with the difficulties of family life, and ignorance of the real force to be dealt with when the normal incentive of family responsibility is removed. Undoubtedly, for a considerable time to come, when poverty is the sole occasion for interference, reliance would best be placed upon the skilled private relief agency, from whom eventually a technique may be acquired and taken over by a public servant. Obtaining the material relief is simple; administering it is too difficult for our public servants, who at present are usually untrained, although they may be honest and willing.

In the case of families in which essentials of sound living other than material resources are lacking, but in which there are spiritual assets to be husbanded, the opportunity of the agent of the community to do delicate, permanent, constructive work, presents itself. Such cases are those of foreign families in which there is need of instruction as to the difference between the ambitions of the old and of the new country for their young people. The Italian father who puts his little daughter too early at work that she may earn the dowry so desirable as an assurance of a fitting marriage, the Polish father whose children are the victims of the peasant's "land-hunger," the children from any neighborhood whose precocious earnings go into the parlor furniture or a little better outward standard of living, these are all cases in which the representative of the best American standard of child-care has occasion to instruct the parent who is unintelligent, but not unfit.

In this group belong, too, the difficult cases in which the father maintains a casual attitude toward his family obligations; perhaps, originally, because of difficulty in finding work, or because during his boyhood he was allowed to become a casual worker at some blind-alley employment and he is now casual in all his relations to life. Here is a task requiring the utmost patience and endurance, to find the possible job, perhaps to put on the screw of prosecution on the ground of non-support, and certainly to bring to bear every available influence for the sake not only of the children who are the occasion for interference, but for the final dignity of the husband and wife.

In both of these groups, those who are poor and those who are unintelligent but willing, it may be said that the theory of treatment is well formulated; the acquisition of technique is the difficulty to be met and faced. In the case of degraded families, however, there is the added difficulty that as yet there is no adequate theory of treatment; no realization that the obvious basis for the policy of maintaining homes by public help is the supposition that homes are good and rendering valuable social service. Surely they should not be homes in which demoralizing conditions are making a healthy and decent life impossible for the children. Yet where shall the line be drawn? That we have at present no measure to apply, no test with which to try the value of homes may be illustrated by some interesting cases found in a

[1]Part VII, Vol. 2, pp. 88 and 92.

study of the families handled in a single district office of the United Charities of Chicago within the past year, in the treatment of which the county agent, the representative of the public, has had a part. Some of these cases had been under the care of various social and public agencies for a considerable time; but even when the home was so degraded that the child's physical and moral well-being was imperilled, it was only after extreme delay and hesitation that the child was removed, if at all. While the removal of the child is rightly regarded as the most serious step which can be taken in family treatment, the question should be raised whether the time is not ripe for serious action when the child's whole chance of a decent life is ruined by delay.

In one case two small children, a girl of three and a boy only a year old, were in the care of an aged, incompetent, but devoted grandmother and an indifferent, degraded father, in a squalid home in a rear basement, so unsanitary that the attention of the health authorities was solicited. A drunken uncle helped to make the home intolerable. During a period of ten years aid was given the family by the county and a private relief society, while the church, a children's protective agency, and a probation officer were at different times "at work on the case." After ten years, during which time the children's little bodies were infested and infected, the little girl's person violated, the boy's mind stunted, the relief agency not only refused further aid, but asked for drastic action by the children's court, and the family group was broken up. For the little girl there was no hope, and she was sent to an institution for the feeble-minded where she will receive what little training she can take. The little boy, whose mind was apparently so dull that he had not been able to learn either to read or to write, was boarded with a family in a rural community where he is making rapid progress in the new school to which he has been sent.

A similar history is related in the case of a violent, untrained, self-indulgent young Italian wife, who has divorced the father of her seven-year-old Andrew and three-year-old Maria and married the man who is now the father of her five-months-old boy. But both men are agreeable and both continue to be her companions. For two years the county and private relief agencies had contributed to her support. Finally the boy was sent to the Parental School, the baby to a children's home, but the little girl was left with the mother because, in the words of two interested visitors, she was "the sole restraint on her mother." Later, however, while the county was giving coal and the relief society paying rent, the little girl became so infected that it was necessary to send her to the county hospital; and at last after the two years of experiment, during which the child's body and mind had been in the gravest danger, the agencies involved wished to remove her from the home; but in spite of brutality, indecency, disease, and filth the court could not take this action, because the witnesses to certain overt acts absented themselves from the trial and refused to testify.

In another family, where there had been a history through fifteen years of begging, drunkenness, and immorality on the part of the parents, both the county and the private agency had given relief with pretty full knowledge of these conditions. Finally, the struggle was considered so hopeless that it was thought necessary to take the case into court and ask to have the family broken up. A chance was then given the children, when it was probably too late. The superintendent of the institution to which the little girl was sent writes:

> The disposition of Mary is not indicative that she is delinquent. So far she is merely dependent. I think it will take the united efforts of everyone concerned to save her from becoming delinquent after the miserable experience she has had in her home.

For homes in which there is such degradation the theory of treatment ought to be quite simple. It is, however, extremely confused and obscure, because of the attitude of the community at large and particularly of persons habituated to the legal mode of thought. As has been said, the control of the parent over the child has in the past been so com-

plete, so nearly like that of ownership, that, as in the case of a thing belonging to a person, the case must at present be very clear in order to justify interference. No "taking of property" must there be without due process—and no infringement of the parental right without evidence of criminal abuse or demoralizing influence which is not only incontrovertible, but of a kind extremely difficult to secure. Only recently is the idea gaining ground that this enjoyment of the parental relationship is a privilege to be exercised under strict accounting, and to be justified by adequate performance. When that idea does grip the community, as sooner or later it must, the forfeiture of the rights will go with the failure to perform the duties. Even now we are learning that the rights of the children are co-ordinate with those of the parent, and that when one or the other must suffer the right of the child to grow into decent and competent maturity must be upheld. The separation of parents and children is often the very last hope of the former as well as of the latter. Never, to be sure, should the separation be for a longer time than is demanded by the requirements of the children; but when there are immoral practices, obscene language, low associates, and demoralizing surroundings, the children should be lifted out bodily at the earliest possible moment, not hesitatingly, but with the same assurance and steadiness with which one would draw them from a dangerous bog or quicksand.

On no point, perhaps, do our judges need more education than on this. They draw their precedents largely from the cases in the books, and from controversies in which the parties, while they were often morally low, did not always live or let their children live among degrading surroundings. The very presence of the parties at the bar of justice was evidence of a pecuniary ability which might shut out all demoralizing influences except their own from the lives of their children. Such would be true in the cases quoted to sustain parental right.[1]

The children whom the community is most often called on to protect, however, are found in homes of poverty. If in these homes, amidst conditions of crowded city life, the parents are degraded, the children are without defence, unless protected by the strong arm of the law. From homes in which the safeguard supplied by decent living on the part of the parents has been removed, the children should be swiftly taken.

Although no definite standard of child-care has yet been formulated a device has been created in the establishment of the juvenile court by which a standard may be worked out and effectively applied. When the statute so defines "neglected and dependent children" as to include not only the "destitute, homeless, and abandoned," but "those who are without *proper* parental care"; gives to any "reputable resident of the county" standing in court for the purpose of calling attention to the needs of any group, and vests in the court power to determine whether the interests of the children in that group would be served better by leaving parents and children together or by separating them, the necessary machinery and authority are provided. There remains only the necessity of working out the full implication of the word *proper*, and of developing in the court the appreciation of the supreme importance, in determining the habits of any child, of the conditions surrounding the early years.

Undoubtedly many adjustments of the machinery of the court will have to be made, new parental checks in the shape of adult delinquency laws and other means of control devised; but these must be used with intelligence and courage; and this can be hoped for only when the burden of proof lies upon the parent to justify his right, rather than upon the child to claim interference and removal. The task of caring for the destitute home may be for the time safely left to the private relief society; the problem of the degraded home demands the strong hand of the state.

WHAT THE GOVERNORS ARE SAYING

SAMUEL McCUNE LINDSAY

Thirty-eight state legislatures convened in January. Twenty of these states have democratic governors and eighteen, republicans. Recent changes in the party in power, and the inauguration of democratic governors in many republican strongholds have aroused an expectation that a democratic program of state legislation might appear, especially in dealing with topics which the Democratic Party as a national organization has considered to belong in the domain rather of state than national legislation.

Each governor necessarily devotes the larger part of his message to purely local matters pertaining to his individual state. There are, however, many topics common to all the states, upon which recommendations should give indications of how the currents of public opinion are set. The appeal for economy and a warning lest income and resources will not be adequate to meet the demands upon the state's purse; the reform of employer's liability laws, the need for better corrupt practices acts, the regulation of public utility corporations, are among the topics common to nearly all of the recent messages to the legislatures, or inaugural addresses of the new governors.

In general, there is no evidence of a well defined program on these or other topics, which we might have expected as a result of the recent meeting of governors at Lexington. Minor and formal matters are presented with some uniformity, but the larger and more difficult questions of social welfare, in which readers of THE SURVEY are primarily interested, are treated so unevenly as to show the need of executive enlightenment. The annual conference of governors might with profit have one of its own committees report the results of meetings like the National Conference of Charities and Correction and the scientific societies which met recently at St. Louis.

It is apparent, from the utterances of both democratic and republican governors, that the present year is likely to be barren in matters of social legislation, and that reactionary principles are pretty widely in control. Governor Woodrow Wilson's inaugural address in New Jersey and the messages of Governors McGovern of Wisconsin and Osborn of Michigan are exceptions, though not the only ones, in that they take a longer look ahead and urge the more immediate and comprehensive treatment of the larger social problems.

It is always necessary for a governor to urge economy in the use of public funds, because the executive, rather than the legislature, usually assumes responsibility for the solvency of the state treasury. There is a difference, however, between a perfunctory recommendation, the sounding of a general alarm, and the real appreciation of what sound economy means and how it can be obtained. THE SURVEY will stand with good citizens everywhere, regardless of party affiliation, in upholding efforts to apply sound business principles to the expenditure of public moneys. In many states, however, the governors should realize that the growth of population, the increase of dependents, and the necessarily increasing burden of charitable and correctional work to which the modern state is unalterably pledged, necessitate the expenditure of large and increasing sums of money for the maintenance of charitable institutions, hospitals for the insane, prisons, and perhaps more particularly for wisely directed efforts to prevent the further increase of these burdens by removing the causes that give rise to them. Not always the curtailment of the newer enterprises or the refusal to consider additional work which the state ought to undertake is the wisest economy, but rather the discontinuance of longstanding extravagances, the unnecessary and expensive printing contracts for the benefit of local newspapers, and the employment of supernumeraries in so many branches of public business, are the kind of economy which will require much urging on the part of an efficient executive

and will not meet with eager acceptance on the part of the average legislature.

Governor McGovern recommends for Wisconsin a commission to investigate, through experts, the organization and business methods of the departments and institutions of the state government and its civil divisions, with power to supervise public printing and to co-operate with the statistical and economic investigations of the federal government in order to secure the information Wisconsin needs to meet her local problems.

The reform of the existing employers' liability law, including the restriction or abolition of the fellow servant defense and the assumption of risk doctrine, and in most instances looking to the adoption of the workman's compensation principle, is recommended by Governors Pothier (Rhode Island), Osborn (Michigan), Tener (Pennsylvania), Fort (message) and Wilson (inaugural address) (New Jersey), Deneen (Illinois), Foss (Massachusetts), Marshall (Indiana), who also asks for an industrial court with exclusive jurisdiction over accident cases, Carroll (Iowa), and McGovern (Wisconsin).

Questions of taxation play the usual important part, and in some cases are accompanied with a recommendation of the income tax amendment to the Federal Constitution, notably in the message of Governor Dix of New York which reverses the recommendation of his predecessor, Governor Hughes; and in the messages of Harmon of Ohio, Marshall of Indiana, Carroll of Iowa, and McGovern of Wisconsin.

The initiative, referendum and recall are presented fully with a favorable recommendation by Governors Deneen (Illinois), Osborn (Michigan), McGovern (Wisconsin) and Foss (Massachusetts), and the referendum alone is recommended by Governor Marshall (Indiana).

A very decided effort is widespread for better legislation to cover corrupt practices, and to increase the power of the people in primary elections, notably as found in the recommendations of Governors Harmon (Ohio), Wilson (New Jersey), Dix (New York), Marshall (Indiana) and Deneen (Illinois).

Among the miscellaneous recommendations that have attracted attention are those of Governor Harmon (Ohio), who advocates a single board of control for the state penal, reformatory, and benevolent institutions; of Osborn (Michigan), employing convict labor on roads and holding publishers responsible for dishonest advertising; of Pothier (Rhode Island), giving state aid to the extent of $200 per bed to hospitals providing for advanced cases of tuberculosis; of McGovern (Wisconsin), advocating better public care of indigent, crippled, and deformed children, and better provision for public health activities at the state's expense; of Deneen (Illinois), advising complete state care of the insane poor; of Shafroth (Colorado), removing mental deficients from state insane asylums and providing for a separate institution; of Dix (New York), concentrating the power of the lunacy commission in a single head; of Harmon (Ohio), suggesting better methods of employing convicts at useful labor; and of Baldwin (Connecticut), pleading for woman suffrage.

Liquor legislation seems to be less in demand and comparatively few recommendations are made. Osborn (Michigan) goes into the question quite fully, advocating higher license and stricter control of saloons; Kitchin (North Carolina) upholds the state prohibitory law and urges the abolition of "near" beer licenses; Marshall (Indiana) proposes to modify the local option law in the direction of greater home rule for the cities and towns and stricter enforcement by the elimination of exceptional club privileges.

Public utility commissions, with power to fix rates, are urged by several governors, quite forcibly by Wilson (New Jersey), Bass (New Hampshire), Pothier (Rhode Island), Deneen (Illinois), Osborn (Michigan), who would also include the regulation of express charges; Foss (Massachusetts); and the increase of the powers of the railroad commission to make effective a recent stock and bond law is urged by McGovern (Wisconsin).

The popular election of United States senators is pretty generally recommended by the democratic executives, and Governor Dix (New York) asks his Legis-

lature to petition Congress for a parcels post. Better enforcement of laws protecting woman and child labor is urged by Governors Osborn of Michigan and Dix of New York.

It would be rather difficult to predict the lines along which the legislative grist of the states as a whole will converge this year. The indications are that the measures of social reform in which readers of THE SURVEY are interested and are promoting through private efforts, which in many instances demand for their realization the sanction and active co-operation of the state, will not occupy a large place on the statute books of 1911.

A period of stagnation, or even of reaction, frequently offers the best opportunity for shaping up strong forces for the next forward steps, and such periods usually precede years of greater activity and progress. Therefore, there is no cause for discouragement or reaction on the part of social workers. The problems of democracy are slowly but surely on the road to solution in the United States, and the goal is neither uncertain nor unattainable.

COMMUNICATIONS

MINIMUM WAGE AND IMMIGRATION RESTRICTION

Following the Immigration Commission's report to Congress in December, THE SURVEY presented the range of its findings in a series of articles in the January magazine number,—the first rounded interpretation of this federal investigation put before the public. As a governmental policy, the commission recommended restriction; as a method, the exclusion of aliens who can not read or write. Its recommendations were reviewed favorably by Joseph Lee, a leading advocate of immigration restriction, and unfavorably by Grace Abbott, director of the Immigrant Protective League. This is the line of cleavage over the literacy test which has deadlocked legislation in the past, making strange bed fellows of the employing interests who want bars down for the purpose of getting cheap labor, and the various racial societies who want to keep America as a haven of refuge for the oppressed of other lands. As a possible method of federal immigrant control, which would strike at the economic sources of immigration and prevent its worst economic effects, without shutting out fugitive peoples, Paul U. Kellogg suggested that the Australian minimum wage idea be welded to our immigration policy. That is, to make naturalization papers for the incoming immigrant (like child labor certificates for the growing boy) the open sesame to a free labor contract in the congregate industries of the United States, and to prohibit the hiring of unnaturalized aliens for less than a living wage. A number of communications have been received on the subject but as yet no incisive analysis of its legal aspects. A lawyer whose work calls him into various matters affecting the alien writes that the scheme "would be in conflict with treaty provisions, international law and comity regarding international treatment between nationals and alien residents," and an economist that "the constitutional and administrative obstacles would seem insuperable." On the other hand, without committing himself unreservedly before further consideration, Prof. Franklin H. Giddings of Columbia University calls it "the most hopeful program and the one at the present time most worthy of serious consideration for the wise restriction of immigration."

TO THE EDITOR:

That is a very fascinating suggestion made by Paul U. Kellogg in THE SURVEY of January 7. It is likewise original, of course. Best of all, it has the merit of going straight to the root of the immigration problem. For, as the Federal Immigration Commission asserts, that problem is chiefly economic, and specifically connected with depressed standards of living and insufficient rates of wages. The question of the proper assimilation of immigrants will always be important, indeed, but it can be much more readily solved than the question raised by their injurious influence upon the living conditions of the whole body of unskilled laborers. Grace Abbott attempts to refute the findings of the commission on this point, with the assertion that the immigrant does not underbid the native worker, except unwittingly, especially when he is misled by labor agents or employers. It seems to me that this answer does not meet the difficulty at all. For, quite apart from the cases that she has in mind, immigrants must and do depress wages, for the simple reason that they increase the supply of a kind of labor that is already too plentiful, relatively to the higher kinds of labor. So that, even if every

immigrant were as alert, as shrewd to pursue his own interest, and as anxious to raise his standard of living, as the most intelligent and most ambitious native, the bad effect of unduly increasing supply relative to demand, would still be produced. As a consequence, the native, as well as the immigrant, must accept a lower wage than he would be able to command if the great mass of immigrants remained away, and the supply of their kind of labor *i. e.*, unskilled labor, were not thus increased. It is all a question of supply and demand: the supply of a certain kind of labor is excessive relatively to the demand for it, and relatively to the supply of other kinds of labor. And the only remedy is to reduce, relatively, the supply, either by elevating a part of it into the higher kinds of labor through industrial education, or by directly restricting the volume of the supply through the erection of barriers, artificial barriers if you will, against it. Since the first method will be unavailable, or at least ineffective, for a good many years to come, there is nothing left for a practical people, such as we Americans think we are, but to employ the method of restriction. And the exclusion of a large part of the immigrant section of the supply is a reasonable measure of restriction.

Here, again, Miss Abbott takes exception to the conclusions of the commission. People still leave Europe to escape "intolerable conditions," she says; consequently, the same reasons exist now as fifty years ago, for maintaining a policy of unrestricted immigration in the interests of the oppressed, whether the oppression be political or economic. She is undoubtedly right as to the principle, the essential facts of the situation. But she would probably admit that the amount of oppression which the present generation of immigrants escapes when it comes to America is considerably smaller than in the case of some of the earlier generations. I speak of Europe as a whole, not merely of Russia. Hence the hardship that would result from restriction is less, considerably less, than it would have been formerly. Moreover, and this is the dominant consideration, until recently unrestricted immigration was, owing to the different economic situation here, only less beneficial to America than to the oppressed immigrants. Hence there was no reasonable ground for keeping them out. Today, their arrival at the current rate has a distinct, and very great, evil effect. It means nothing less than the perpetuation and intensification of inhuman and unchristian planes of living for millions of America's inhabitants. In these circumstances our duty toward the oppressed of other lands must be subordinated to our duty toward our own oppressed population. And our duty of protecting and lifting up our own oppressed workers may quite properly be discharged by excluding outsiders until such time as we shall have put into effect some other solvents, such as industrial education. This is the deliberate view of one whose parents found in America a refuge from the "intolerable oppression" of Irish landlordism. But "charity begins at home;" and America's first duty is toward her own citizens, and the people who have already made her their adopted mother. Moreover, if immigration should continue at the rate which it has maintained during the last decade, only a small proportion of the newcomers will have materially bettered their condition; besides, the immigrants in many instances would be a source of strength to their own countries, and to movements for the betterment of conditions at home.

I seem to have got away from the subject upon which I intended to write; but I hope the digression is only apparent. For the aim of Mr. Kellogg's proposal is in effect restriction of immigration. For that reason the proposal is liable to the objections that may be raised against any other method of restriction. As a means of preventing the economic evils resulting from an excessive supply of low skilled immigrant labor, his suggestion is, as I have clearly intimated, fascinating in its novelty and possibilities. To prohibit by law the employment of any immigrant, within five years of his arrival, at less than a living wage, would, if the law were held constitutional and were enforced as well as the average law, solve the immigration question more directly, more effectively, and more satisfactorily to all the interested classes, than any other measure that could be devised. In a word, the proposal has all the advantages so briefly, but clearly, enumerated by Mr. Kellogg in his article. To me it seems to have the further merit of opening the way for general minimum wage laws applicable to citizen-labor, and enacted by the states as well as by the nation. Without such laws (in conjunction with other measures regarding industrial education and employment) I do not see how we are to get rid of the most obstinate and injurious factor in our socio-industrial problems, namely, insufficient means of living in a very large section of our population.

The practical questions raised by Mr. Kellogg's suggestion concern its constitutionality and its enforcibility. While I hesitate to express what is necessarily a valueless opinion on the former point, I cannot see any constitutional objection that is insurmountable. So far as I know, the constitutional guarantees that might be urged against the proposal all refer to citizens, not to aliens. True, the prohibition of a contract to employ recently arrived immigrants at less than a specified rate of wages, would limit the freedom of the citizen-employer as well as of the alien employe; and yet this freedom is already limited by our foreign contract labor law. If this is constitutional, why would not the proposed limitation be equally constitutional, especially since it does not forbid the employer to enter into a labor contract absolutely, but only to enter into a certain kind of contract? The fact that the alien had already become a resident would not seem to increase the constitutional rights and privileges of either party.

Concerning the feasibility of the measure, we see at once that if the wage limit were put high enough to be really effective and beneficial, a considerable proportion of immigrants would have to be deported. This would happen even if the law were made to apply only to those coming into the country after its enactment; for some considerable time would be required to convince all prospective immigrants that the majority of them would be compelled to return on account of inability to find employment at or above the prescribed wage. Nevertheless, it seems to me that this drastic measure would be justified if only it would secure the observance of the law. Assuming that this method of deportation is formally adopted, we have many reasons for thinking that a considerable section of public opinion would assist in carrying it out, and in otherwise enforcing the law.

If the measure were limited to corporation employments, as suggested by Mr. Kellogg, it would be less thoroughgoing, and in some ways less effective. On the other hand, it would strike at the worst phases of the situation that it seeks to correct, would be less harsh, and would receive much larger support from public sentiment. Most of us, I think, would prefer the measure in this form. But would it not be declared unconstitutional as setting up an artificial class distinction? It ought not to be so considered, for the distinction between a corporation and an individual is not artificial, and is recognized by law. However this is a detail that is of small importance as compared with the proposal itself.

To use the parlance of the day, Mr. Kellogg has, I think and hope, "started something" that ought to provoke varied and enlightening discussion. The lawyer, the social student, the economist, and the philanthropist can all find something in it that is particularly appealing,—or repelling.

JOHN A. RYAN.

The St. Paul Seminary.

TO THE EDITOR:

A few days ago I said at an immigration meeting in Buffalo that the courage and pluck which come from Europe are too valuable raw material to be refused because they lack there the education which they seek here for their children. The superintendent of education and the librarian of our Public Library agree with me, and these would not make a bad jury on this question. The next day, however, I had to confess that I was shaken by the findings of the United States Immigration Commission as reported in THE SURVEY, and the editor of THE SURVEY has asked me to explain myself.

The commission finds "an oversupply of unskilled labor" and desires a marked reduction of immigrants through a reading and writing test. If we have too many candidates for the opportunities of this country, it is time to form a waiting list. In the language of civil service reform, "the best shall serve the state." I am in favor of a competitive examination, but before we examine we must decide what we are examining for. Not for skilled places surely. Think how fifty senates would ring if we began importing foreigners for our higher places instead of keeping them at the bottom where of course they belong. But for places in the labor schedule I have never yet heard of a written examination. For unskilled labor we want chiefly brawn and character. Education in a peasant does not indicate character or native ability so much as opportunity which he will find here. Educated raw material is less raw, and so easier to digest, but what we are after is the best raw material. We would rather have the very best meats and do the cooking after we get them. A little cooking often keeps us from recognizing bad meat.

I am saying everywhere at present that public health is more important than public education, and that disease, public or private, is even more dangerous than ignorance. If we want health and muscle, why not test these by examination, just as we do for policemen and firemen? If we want agricultural laborers, or a diversion from the city to the country, why not prefer farmers and accept only those billed to country towns? Canada seems to do something of this sort. We are not holding an examination for clerks, and mere native intelligence cannot be gauged by literacy.

As a free trader I still question any restriction of immigration. The exodus during panics proves that supply and demand are effective; and we have left much undone in compelling immigrants to live like Americans. The Romans had sumptuary laws to check excessive and dangerous spending. We have anti-sumptuary tenement laws to check excessive and dangerous saving. Plenty of inspectors, inspecting at night, would do much to stop the huddling. This will raise rents and the cost of living. This will check the flood of immigration. This will raise wages and the standard of living.

I am one of the increasing minority who are tempted by the minimum wage law, and Paul Kellogg's alluring and audacious suggestion, in the same SURVEY, of a minimum wage law for recent or unnaturalized immigrants only would perhaps avoid the constitutional objection. He expounds it very eloquently, and I wish that some of the six social congresses which met last month at St. Louis could have discussed this proposition. It has many curious possibilities.

FREDERIC ALMY,
Secretary Buffalo C. O. S.

TO THE EDITOR:

Mr. Kellogg is ingenious in his proposal to place a restrictive tariff on immigrant labor. It seems to me more than likely, however, that if his plan were ever accomplished it would result in creating a privileged class and that consisting of the alien laboring man.

Assuming that the proposal is a constitutional measure, it does not seem logical that any device that would provide a minimum wage for the benefit of the immigrant before such legislation had been achieved for the native-born would be considered favorably by the community.

Though Mr. Kellogg's plan is obviously designed for the purpose of discouraging immigration by limiting the employment of alien labor, it is probable that the immigrants would regard it as a safeguard against their exploitation. The fact that the United States government held itself even indirectly responsible for the payment of $2.50 a day for the alien in any single industry would be advertised in the highlands and the lowlands, and I fear that processions of immigrants who have bought their steamship tickets would find it difficult to differentiate, particularly before they left the other side.

I hardly think that any great number of immigrants would be cautious enough to be deterred from travelling through fear of not being among those to receive that $2.50 a day, but the hope of being among the favored few would give it all the lure of a gamble. It is more likely that on the chance of obtaining so valuable a prize, the immigrants would be circling round the corporation tree that could drop such valuable plums. It is also conceivable that certain organizations known to connect up the pay envelope with their company stores might exercise ingenuity to discover ways and means by which the credit and the charges at the stores would correspond to the money paid. Some device to make the wages on the farm measure up with the mandatory wage of the corporation would have to be promoted, in order to equalize the charm of agricultural labor as compared with this well-rewarded corporation employment.

LILLIAN D. WALD.

Henry Street Settlement, New York.

TO THE EDITOR:

I think that a provision to keep out all immigrants (with proper exceptions) who have not made contracts calling for a minimum wage would, if it could be enforced, accomplish a good deal of the object which the restrictionists desire and which the commission has had in mind. That is to say, it would prevent the indefinite keeping down of our standard of living by the influx of lower and lower levels of foreign labor.

The difficulty would be in finding any way of enforcing such a provision. It would be difficult to tell whether a contract was genuine, and impossible to see that it was afterwards carried out and to deport the immigrant in case it was not. The immigrant coming in under such a law would be like those admitted during Secretary Straus's administration under the bonding clause. Few, if any, of these, I think, were ever sent back, and it would probably have cost more to find and identify one of them than could have been collected on the bond.

The same object, however, can actually be accomplished to a great extent by adopting the illiteracy test, one great advantage of which is that it can really be applied and can be so surely applied that very few cases will occur of an immigrant coming over to this country and having to be sent back.

The Liberal Immigration League, by the way, has sent out a circular letter in which it says that the immigrant will be required not only to read, but to explain selected passages from the constitution. This of course is a misrepresentation. There have been many illiteracy bills passed by the House and Senate, respectively, and several are now pending. Not one of them that I ever heard of contained such a clause, nor have I ever heard such a clause suggested.

JOSEPH LEE.

Boston, Mass.

TO THE EDITOR:

In your current issue Paul Kellogg's suggestions as to the Immigrant Labor Tariff are somewhat in line with the ideas advanced by Cavour many years ago.

This great Italian statesman suggested that under a "protective" tariff framed mainly for the benefit of the laborer, the government has the right to fix wages in the protected industries in order to see that the main object of the tax was assured.

Most of our unskilled labor is employed in the protected industries. The laborer is urged to vote for this tariff in order that he may personally profit by the law. His share may be withheld under our present system; but under a logically framed "protective" tariff act a government commission could fix the minimum wage from time to time and by so doing would prevent such wage falling below the standard.

New York. CHARLES H. ISRAELS.

SOCIAL FORCES

BY THE EDITOR

HOSPITAL AND UNIVERSITY

New York city has suffered under the reproach that its great hospitals have not contributed in a reasonable measure to medical education, and that its scientists have not sufficiently given of their special knowledge and skill to the care and cure of the sick. This has not been because hospital managers prefer darkness to light, nor because men of science are lacking in public spirit and humanity. The difficulty has been one of organization. There has been a lamentable maladjustment between resources and needs. Artificial barriers, originating in inherited customs and mutual misunderstandings, and perhaps even more in a lack of effective imagination, have kept science and disease from that struggle at close quarters on which the highest hopes of humanity depend.

These have been the dark ages in the medical organization of American hospitals. Thanks to the Carnegie Foundation we are in position to appreciate fully its defects. We are in position, however, also to appreciate that the light has been breaking into the darkness. Great physicians have at all times been found at the bedside of the sick poor, and young men have had great, even if not ideal, opportunities to learn under direction. The universities have had to run hither and thither in their determined search for material for clinical instruction, but the idea has gradually taken root that on the whole the patient's chances are not worse, but better, if the operating room connects with a laboratory.

At last, however, the visions of philanthropy and those of science have been brought definitely into focus. Through the alliance between the Presbyterian Hospital and Columbia University, and the gifts of Edward S. Harkness and an anonymous donor, we are to have an ideal hospital, with clearly defined responsibility on a great university for the support and direction of scientific and educational activities, with financial resources at the disposal of the university for the precise purpose of meeting that responsibility, and with every assurance that from other resources the managers of the hospital will meet equally what may be called its philanthropic responsibility. The hospital comes to the university with great resources at its disposal, such as the recent bequest of Mr. Kennedy, and the gift now made through Mr. Harkness to reimburse the university to the extent of $50,000 or $60,000 a year—the income on $1,300,000—for its expenditures in carrying out its share of the agreement. Even greater resources it brings in the established reputation and honorable history of the hospital, the devotion of its trustees and staff, its promise of a future of ever increasing usefulness. Yet with all these resources it comes acknowledging unreservedly and heartily that there are other and equally essential resources which must be sought in an institution of research and instruction.

A memorandum given out by Robert W. de Forest, vice-president of the Presbyterian Hospital and chairman of its building committee, and George L. Rives,

chairman of the board of trustees of Columbia, puts the essence of the agreement in the following terse sentences:

> The proposed alliance is based upon the belief that through it the hospital is most likely in the future to secure for its patients the best medical and surgical talent, and that the university needs such an alliance in order to enable it to give the best clinical instruction to its students and opportunities for advanced study.
>
> The fundamental principle of this alliance is that the university, in return for the privilege of making all nominations to the hospital staff, medical, surgical, and special, shall meet the expense of all scientific and educational work connected with the hospital.

In estimating the significance of this alliance it is to be noticed, first, that although not irrevocable it is permanent. Large permanent investments are to be made on the assumption that the plan is to succeed and that it is not to be lightly changed. Second, the university does not limit its own financial contribution to the expenditure of the endowment now given specifically for this purpose. The amount to be spent in the support of scientific research and professional education is to be determined year by year by the university and will no doubt increase as new opportunities are presented. Additional gifts will no doubt be sought and obtained as in other activities of the university. Third, all of the independent resources of the hospital will now be available for the care of the sick. Pavilions, wards, and beds may be endowed in the knowledge that what is given for such purposes will go farther than heretofore, because the pathological and bacteriological research which stands behind the treatment to be given to their occupants, and even oversight of surgical and medical treatment which they receive, are provided by funds already given by others.

This agreement, therefore, and the generous gifts, which although historically subsequent to the first stages of the negotiations may be considered an integral part of the plan, represent a distinct departure in the medical administration of New York hospitals, and a notable landmark in the development generally of the relations between the medical school and the hospital on this continent. The Rockefeller Institute has created its extraordinary model hospital, primarily to serve its original scientific purposes. Johns Hopkins University and Hospital in Baltimore have long stood as the closest approximation to an ideal relation between the two institutions, and the resulting contributions, both to social service and to science, are too well known to require rehearsal. There are several similar instances of affiliation, as at the University of Michigan and in Philadelphia. To these has now been added an example of sound organization, whether considered from the side of science or from that of philanthropy, different from the others because the conditions are different, and yet illustrating, as do the others, the principles on which progress and the greatest public service depend. Those principles should win wider recognition from the wisdom and foresight with which they have been applied in this instance.

We publish elsewhere the letter from Edward S. Harkness in which he sets forth the purposes of the gifts to which we have referred, and the conditions under which they are made. It would be difficult to find a clearer statement of the position which the medical schoo may legitimately occupy in the hospital, or a finer appreciation from one not a member of the medical profession of the "underlying province of medicine" and its real "mission to humanity."

February 11, 1911.

THE DOCTORS BLACKWELL, FIRST WOMEN PHYSICIANS

The Women's Medical Association of New York City paid honor to the memory of Drs. Elizabeth and Emliy Blackwell at a meeting held at the New York Academy of Medicine on January 25. All women engaged in the practice of medicine, which has been opened freely to their sex only in the last few decades, owe much to these pioneers in the fight for women's educational rights, who faced many trials and gave long years of service for the sake of their sisters-to-be in a noble calling.

ELIZABETH BLACKWELL.

Sixty-three years ago, at the solicitation of an invalid friend and much against her personal inclination, Dr. Elizabeth Blackwell, after many rebuffs at better known schools, secured admission to the Medical Department of Geneva University. Dr. Stephen Smith, one of her classmates, gave tribute to the elevating influence of her presence in the lecture rooms and told how she won regard from those prepared to scoff at her. Alice Stone Blackwell drew a deft picture of the personal traits of the two sisters, who though fully aware of the importance of the pioneer work they were engaged in, were modest and home loving folk. Mrs. Henry Villard and Dr. Gertrude B. Kelly spoke from the knowledge gained by years of association with them, while Dr. Abraham Jacobi praised the Philadelphia doctors who gave encouragement to Dr. Elizabeth Blackwell when she was seeking admission to a medical school, and to those who helped her during the first years of her struggle for a practice.

Dr. William H. Welch, in what was perhaps the speech of the evening, summarized the constructive work performed by the sisters in spite of the most disheartening obstacles here and abroad. He gave them great credit for establishing the New York Infirmary for Women and Children which grew into a hospital and medical college for women as well. The first nurses in the Civil War came from this infirmary, and the Ladies' Sanitary Aid Commission grew from a meeting called at Cooper Union by those in charge of it. The Drs. Blackwell established a training school for nurses, started a system of lay visitors to the homes of the poor, opened a playground in the yard of the dispensary, founded the first chair of hygiene in a medical school, and the first four-year course in medicine. Dr. Elizabeth Blackwell early recognized the importance of a campaign of moral education. Her writings were thirty years in advance of her time, but one of her

EMILY BLACKWELL.

books, The Moral Education of the Young, has been republished and is a recommended reference book on the list of the American Society of Sanitary and Moral Prophylaxis. The book is now out of print.

Dr. Welch's address showed clearly how these sisters were not only pioneer physicians, but forerunners of the large group of social workers of today.

END OF CHICAGO GARMENT STRIKE

Forced into submission by the impossibility of continuing longer the bitter struggle against hunger and cold, the 20,000 garment workers who were still on strike in Chicago against the concerns belonging to the two associations of clothing manufacturers decided on February 3 to return to work unconditionally, on whatever terms their employers would offer.

This means that they go back individually, and that each for himself must secure whatever redress he can for grievances at this time or in the future, and must make his individual wage bargain. The organized employers in these two associations have thus succeeded in denying to their employes the right of organization, and in defying the plea of the workers and the overwhelming sentiment of the public for arbitration.

Except for the 10,000 strikers from the Hart, Schaffner and Marx establishment who secured arbitration, and several thousand other workers who secured favorable agreements with Sturm, Mayer and Company and other companies,[1] the strike has been lost. Yet, even among the 20,000 starved into submission—and the word starved is used here in its literal meaning—the gain in spirit and in learning how to stand by one another through a long and bitter struggle will scarcely be lost.

The action which ended the strike was taken suddenly without bringing into consultation the joint conference which included representation from the Women's Trade Union League and the Chicago Federation of Labor as well as the national executive committee of the Garment Workers, the local union, and the strikers' committee. This conference, with Pres. John Fitzpatrick of the Chicago Federation of Labor as chairman, was put in charge of the conduct of the strike in November. Without the efforts of the first two organizations mentioned, the strike could not possibly have been maintained, and the failure to consult Mrs. Raymond Robins, representing the Women's Trade Union League, and President Fitzpatrick is held to be the grossest sort of disloyalty to the two persons who have done the most to help the strikers. As members of the joint conference committee of four who brought about the settlement with Hart, Schaffner and Marx, and who were exhausting every effort to bring about similar settlements with other concerns, it is pointed out, they should have been kept in council at every turn. It is held, further, in Chicago, that lack of loyalty should not too hastily be charged to the rank and file; but still deeper suspicion should be directed at the part which has been played throughout the entire struggle by some of the officers of the

[1] See THE SURVEY for November 19, December 10, 17, 31, 1910, and January 21, 1911.

garment workers—one especially, as has already been pointed out in THE SURVEY, and his immediate followers have all along been accused of attempting to secure personal charge at the sacrifice of the best interests of the rank and file of the organization. This official's position has been under serious question since the strike of the garment workers in Chicago six years ago.

That the strikers had reached their last ditch was plain. Despite the continued contributions of public-spirited citizens who would not see the strike settled on a basis of physical endurance, and despite the support which came from many trade unionists, including the Hart, Schaffner and Marx employes as soon as they had returned to work, the funds for relief slowly dwindled until abject want stared into the faces of those who had been for twenty weeks unconquerable in their spirit of loyalty to one another. Finally, it is reported that at their meetings on February 3 they said it was no longer a physical possibility to keep up the fight, and that they asked of their leaders if they would be thought to be giving up their union principles if they went back to work to relieve their distress. The local leaders and Pres. T. A. Rickert of the Garment Workers of America said that they would not be considered disloyal, and the strike was thus at an end.

LEGISLATIVE BODY URGED ARBITRATION

The Hart, Schaffner and Marx workers have chosen Clarence Darrow as their representative on the arbitration committee to adjust their grievances and wages and to suggest means for dealing with grievances in the future. Representing the employers is Carl Meyer. These two attorneys are to choose the third member.

Much pressure for arbitration was brought to bear upon the employers belonging to the Wholesale Clothiers' Association and the National Wholesale Tailors' Association by the legislative commission appointed on January 16, following the organization early in the strike of an impartial voluntary citizens' committee and of the aldermanic committee. The legislative commission was created through a resolution passed by the state Senate, providing for the appointment of five senators to investigate conditions surrounding the strike, the efforts at settlement made by the State Board of Arbitration, and the proceedings of this board and of the other committees which had sought to study the strike and find some solution for it. The purpose was not only to help settle the strike, but "to bring about such legislation as will make arbitration compulsory by law." A delay in the appointment of the commission occasioned much comment, owing to the fact that Secretary J. Mack Glenn of the Illinois Manufacturers' Association had hastened to Springfield just after the action by the Senate. It was openly charged on the floor of that body that his influence had been used to check or delay action.

The hearings before this commission, held in Chicago, directed especial attention to the records found in the central employment bureau maintained by the so-called "association houses." Thorough questioning with reference to secret markings on the cards in the catalog of

Robinson in New York Tribune.

In the *Tribune's* series of city nuisances, first place was given to dry street sweeping. Alternating wet and dry days in New York make the streets dusty as summer for frequent intervals, but the sweeper is not preceded by a sprinkler as in the months officially dry.

Cleland in Columbus Dispatch.

IDLE HANDS.

The plight of the man who is not only in prison but has nothing to occupy him has been discussed in many states. The Ohio Legislature has been urged to provide employment.

applicants brought out the practical admission that information was recorded bearing upon the union attitude of the applicant, and whether he was known to be an agitator. Repeated statements in the newspapers by the chairman of the commission denounced the employers in no uncertain terms for their refusal to submit to arbitration their differences with their employes. Equally strong were the statements of the citizens' committee, signed by Sophonisba P. Breckenridge; Anna E. Nicholes and Prof. George H. Mead of the University of Chicago. Progressive labor legislation is not unlikely to follow in the wake of the Chicago strike. With public sentiment stirred all over the state, the time seems opportune for a vigorous movement in behalf of the amendments which the Women's Trade Union League proposes to the ten-hour law regulating women's work. As already pointed out in THE SURVEY,[1] it is hoped that the law can be changed so as to include all branches of women's work—adding department stores and other mercantile establishments to factories, workshops, and laundries as now provided. The hours per week are to be reduced to fifty-four if another amendment is secured.

Another agitation concerns a proposed law to establish a minimum wage board. In Wisconsin, following an investigation by the Consumers' League of Madison, Prof. John R. Commons is preparing such a law for submission to the Wisconsin Legislature. The results of this investigation and the draft of the law are to be made available for the campaign in Illinois.

[1]See THE SURVEY for December 3, 1910.

A SUCCESSFUL EXAMPLE OF COLLECTIVE BARGAINING

Non-union men in the plant of the American Steel and Wire Company at Waukegan, Ill., demonstrated in the past fortnight the value of collective bargaining. At the same time they proved that men of different foreign nationalities can stand together when it is necessary.

The wire drawers at the Waukegan plant are Slavs and Swedes, the latter being in the minority. The men claimed that for some time the rods had come to the drawing department in such a condition as to retard its operation and so to reduce their earnings, since they are on piece work. They claimed that hooks had lately been installed above the frames at such a point as to endanger their eyes as they moved about at their work. There was also a misunderstanding about the scale of wages. So they appointed a committee of four Slavs and one Swede to secure an adjustment of grievances. The committee, fearing that Superindentent Waldeck might be unwilling to meet them, and feeling their lack of ability to use English, requested a local attorney to take up their grievances with the superintendent. Accordingly, a statement was sent the latter on Monday, January 23. No reply having been received up to Wednesday night 400 wire drawers went out on strike the next morning, January 26. On Saturday Superintendent Waldeck met the committee and granted all its requests, so that on Monday morning, January 30, one week after the original letter was sent, work was resumed.

The points raised in the strike were granted as reasonable and as intimately concerned with the welfare of both the company and the employes. Had there been a permanent committee representing the men and recognized as such

by the management, so that the grievances could have reached the superintendent directly, there probably would have been no strike.

CLOAKMAKERS BEGIN WORK FOR SANITATION

In January the eight inspectors appointed by the Joint Board of Sanitary Control, which was established by the terms of settlement in the New York cloakmakers' strike last September and which is made up of Dr. George M. Price and Benjamin Schlesinger representing the union, Max Meyer and S. L. Silver representing the employers, and Lillian D. Wald, William J. Schieffelin and Henry Moskowitz representing the public, began the investigation of conditions within the shops, the first step toward establishing a standard of sanitation. John L. Turner is in charge of the force of inspectors and the board is to have the general advice of Professor Winslow of the College of the City of New York, of C. T. Graham Rogers of the State Department of Labor, on the subject of ventilation; of E. L. Elliot, editor of the *Illuminating Engineer*, on lighting, and of H. F. J. Porter on fire protection. The investigation will last through the season of rush work and the results, which will be made public, will be used as a basis for securing legislation on sanitation, light, and fire protection.

The work of the Sanitary Board, however, is not to be limited to the inspection of shops. A campaign of education in sanitary standards has been begun with the mass meeting of cloakmakers at Cooper Union about a month ago. This is the first of a series of meetings and it is hoped that through them and through articles in Yiddish and American papers, the board will be able to rally to the support of its sanitary ideals the rank and file of the workers in the clothing trades. The money needed for the work of the board has been supplied by equal contributions ($1,000) from the union and the manufacturers' association.

JUVENILE COURT OFFICERS CLEANING UP LEXINGTON

A strong wave of moral reform seems to have swept over Lexington, Ky., and the end is not yet. During the past four months several women, keepers of houses of ill-repute, or procurists, have been arrested for harboring young girls and boys, and have been fined from fifty to one hundred dollars and in some cases a jail sentence was imposed. A systematic series of raids has been made on twelve gambling places and fifteen wagon loads of gambling paraphernalia have been secured. Fines aggregating $3,750 have been imposed, three have been sentenced to a year each in the penitentiary, and five cases are yet to be tried at the next term of court.

When the cases came up for trial in the Circuit Court the keepers of gambling places presented a petition in which they promised to refrain forever from participating in gambling if immunity from the charges filed against them were granted. Judge Watts Parker of the Circuit Court refused to allow any compromise in the matter, which is in the hands of J. Percy Scott, judge, and Lawrence W. Mahn, chief probation officer of the Juvenile Court. Mr. Mahn was recently elected president of the State Conference of Charities and Correction.

Morgan in Philadelphia Inquirer.

THE PIED PIPER OF TODAY.

Philadelphia contributed $1,030,000 in fifteen days for the Y. M. C. A. building fund. In five and a half years over $12,000,000 has been raised by C. S. Ward, the "National Booster" for the Y. M. C. A., in nearly a hundred of the larger cities of the country.

"IT'S YOUR MOVE."

Recent large gifts by Mr. Carnegie and Mr. Rockefeller have been seized upon by cartoonists and paragraphers as a "contest in philanthropy" in which the stakes were ten million dollars.

BALTIMORE CONFERENCE OF CHILD-CARING AGENCIES

The semi-centennial of the Henry Watson Children's Aid Society of Baltimore was fittingly celebrated last week by a three days' children's conference, with many speakers from without as well as within the city. The suggestion at the closing session that the seventy child-helping agencies which are co-operating through the Children's Bureau of Baltimore hold a general conference and exhibit next fall met with general approval. The work of the Henry Watson Children's Aid Society, which has been pushed forward with zeal and intelligence for more than half a century, and the new Children's Bureau of Baltimore organized last year, which was described by Louis H. Levin, were the chief local subjects discussed. Children's work in Baltimore, it would appear, is going forward in a promising spirit of co-operation.

The keynote of the conference was struck in the opening address on What Child-Caring Agencies May Do to Keep the Family Intact, by J. Prentiss Murphy of Philadelphia, who set a very high standard of obligation for those who presume to lay hold upon a helpless child and determine its whole future. High standards, too, formed the keynote of Dr. McKenna's address on the Catholic Children's Home Bureau. That the use of the family home for homeless children is not a modern invention he proved by quotations from the Church Fathers. High standards, again, were presented by Walter S. Ufford of the Washington Associated Charities, who urged specifically the supervision by responsible state agencies of all children's institutions, regardless of whether or not they receive public funds; and that this public supervision shall follow the child into its foster home.

Children's bureaus, national, state, and local, were discussed by Homer Folks of the New York State Charities Aid Association. The need for such agencies and the impossibility of standardizing children's work without them was strongly put, but Congress, he said, the state legislatures, and the county boards are all disposed to shift upon the other fellow the responsibility for their establishment.

Some very concrete reasons for a clearing house, such as a children's bureau would establish, were given by Edwin D. Solenberger from the experience of the Philadelphia Children's Bureau, which was created by the joint action of the Pennsylvania Children's Aid Society, the Philadelphia Society for the Protection of Children, and the Seybert Institution. Mr. Levin's address on the Baltimore Bureau completed the testimony of the value of a central agency, not only for registration—which of course is of great value—but in constructive work for the improvement of child-helping methods and for the benefit of the children.

Another session was devoted to the essential principles of juvenile court work, in which Judge T. J. C. Williams of Baltimore, Hastings H. Hart of the Russell Sage Foundation, Judge William H. DeLacy of Washington, and Brother Paul of St. Mary's Industrial School of Baltimore participated.

THIRD WEEK OF THE CHILD WELFARE EXHIBIT

To the social worker whose mind is apt to be concentrated on the discouraging aspects of the child problem, the conferences on museums and libraries at the Child Welfare Exhibit, New York, was in some ways the most interesting of last week's sessions. The speakers had been

in a position to watch the expanding of the child's mind in a favorable environment, divorced, to some extent at least, from the unfavorable conditions of its home life. John S. Billings, head of the New York Public Library, traced the growth of the children's library from the time when the first room was set aside for children in a Massachusetts public library, through the removal of a lower age limit in New York city libraries up to the present time, when no public library is built without a room set apart for children. Mary W. Plummer, director of the Pratt Institute Library School, which has one of the oldest of these children's rooms in New York, told of the effect on both mind and manners of such a room, furnished with the means of intellectual appeal through pictures and books, with story-tellers to stimulate interest, help concentrate attention, and arouse thought, and friendly librarians to encourage and assist. The Brooklyn Children's Museum, the only thing of the kind in the world—a house set apart in a beautiful park and full of everything that could interest the child in science or history, from a working beehive to a wireless telegraph station where a boy can experiment and make his own apparatus—was described by the director, Anna B. Gallup. At both the Children's Museum and the Children's Room of the Natural History Museum, which Agnes L. Roesler described, the child is allowed to handle the specimens he is studying, to listen to informal talks by the director, and himself to take part in discussions. Mary E. Fenton told of the work of the Metropolitan Art Museum in making the art of the centuries the possession of the public school child. All these institutions, as well as the Bronx Zoological Garden, about which Prof. N. L. Britton spoke, co-operate with the public schools by lectures, by conducting classes through the exhibits, and by lending collections of specimens. Other speakers on libraries and museums were Prof. C. E. A. Winslow of the College of the City of New York and Robert W. de Forest, who contrasted the intellectual resources of the city child today with the lack of them in his own youth. Professor Winslow's figures and a set of interesting slides of the public libraries gave a vivid picture of the vast numbers of children who avail themselves of these resources.

Jane Addams, John Elliot, and Robert A. Woods were the principal settlement workers who spoke at the conference on that phase of social work, and Mrs. Joseph Bowen told how the settlement spirit of neighborliness and protection of the child from evil influences had been spread throughout a whole city by the work of the Juvenile Protective Association of Chicago.

Four of the week's sessions were devoted to food and health. Dr. S. Josephine Baker told of what has been done and what remains to be done by the Bureau of Child Hygiene of the Department of Health. Prof. C. E. A. Winslow urged the introduction into the public school system of a sensible course in sanitation and hygiene, and Dr. Charles E. North of the Department of Health told something of the milk problem in New York and the efforts of the city to deal with it.

Midway between the discussion by Dr. Thomas Wood of food and hygiene for the child, and the care of the sick child which was treated by Dr. J. W. Ellis, Dr. Henry Koplik and Lillian D. Wald, came Dr. Ottolengi's talk on dental hygiene, the introduction of which into the public schools, he maintained, would prove one of the greatest single means of lessening disease and improving nutrition. Dr. Ira S. Wile, in his paper on the causes of infant mortality, held that the most fundamental of these causes was low wages, with its concomitants of room congestion and malnutrition. He summed up the cure for an excessive death rate among infants as real motherhood made possible by an improved industrial system.

Miss Van Blarcom's paper on *ophthalmia neonatorum*, with gonorrhea, together with the carelessness of midwives who do not apply the simple cure, as its cause, was closely connected with the discussion of sex hygiene by Dr. Prince A. Morrow and Dr. Richard C. Cabot. Dr. Morrow based his appeal for sex hygiene on the suffering and death that immorality brought to the innocent, and

the heavy burden of dependent or semi-dependent degenerates it brought upon the state. Though his appeal was upon the ground of health, it was the health of others, and as such it was fundamentally an appeal to the sense of responsibility. This element of moral responsibility did not, however, seem to Dr. Cabot to be sufficiently strongly brought out. He feared that the health problem in venereal diseases, which medical discoveries might soon find an easy way of solving, was in danger of thrusting morality and the sacredness of personality into the background. He urged the heavy responsibility on educators of bringing out this moral aspect of the problem.

At the sessions on child labor Mary Van Kleeck treated the subject of tenement house work, Zenas Potter, field agent of the New York Child Labor Committee, the subject of street work, and Phoebe J. O'Connell of the Alliance Employment Bureau, the problem of the girl worker. In Mrs. O'Connell's opinion the years between fourteen and sixteen were of so little economic value to either the girl or her employer that it would, in the long run, benefit the community to raise the minimum working age to sixteen. This belief, indeed, ran through the whole discussion of child labor. James Gernon, chief mercantile inspector, told of the difficulty of enforcing the law, and A. J. McKelway and Pauline Goldmark spoke of the economic wastefulness of child labor, the latter instancing the feather and the artificial flower industries. In these trades the work of children has not only reduced earnings (in the case of feathers, a job which formerly paid fifteen cents now pays three), but had so lowered the grade of work turned out that the United States can no longer compete with France. Mrs. Florence Kelley, as well as Miss Goldmark, urged the minimum wage as a means of preventing tenement work, and an extension of the New York child labor law so that it would specifically cover children working in the sheds of canneries, who are now by a legal quibble without the sphere of its protection. She also expressed the hope that the enormous expenditure for the present exhibit would lead to some definite results, and suggested as objects to be worked for improvement and better enforcement of the street trading law, and the establishment of a city department of recreation to provide a normal and happy use of that part of the child's day which is not spent on study.

NEBRASKA CONSPIRING TO "HEAD OFF THE SLUMS"

In the questions discussed and in the emphasis placed on preventive work, the State Conference of Charities and Correction, held the latter part of January in Lincoln, brought out strikingly the similarity of problems in Nebraska and in older commonwealths of the East. The program might have been given in almost any state. This was particularly true of the address by Prof. Lucile Eaves on the importance of playgrounds as a part of public education; by Mrs. K. R. T. Edhold on the responsibility of the community to prevent tuberculosis, and by W. E. Hardy on insanitary housing. Mr. Hardy urged that Nebraskan communities take warning from the larger cities of the country where congestion has gone further, and frame laws that will act as preventives.

Mayor Love of Lincoln in his address on public charities returned to Miss Eaves's theme when he said that prevention is more important than relief; that with public amusement to offset the saloon we shall ultimately be able to abolish the poorhouse. But since the poorhouse and other public charities are at the present time necessary, he urged that poor relief be not given in the present haphazard manner, but administered through organized charity. The Rev. A. F. Wheatley told of the placing-out system in the State Home for Children, now used so extensively that the buildings are growing too large for their occupants.

Following the addresses by E. R. Gibson and Margaret Carus on probation, State Senator G. F. King struck an unfamiliar note in opposing an increase of the probation system, on the ground that in Nebraska it would increase the tend-

ency toward lawbreaking, which in his judgment is a characteristic of the American people. His reason was that the average county judge is ignorant and incapable of using the probation system with discretion.

Other subjects discussed were the white slave trade, the securing of a state board of charities and a farm colony and reformatory for young men, extending the system of suspended sentence, providing paid probation officers, and establishing a system of state factory inspection, all of which were made the subjects of resolutions passed by the conference.

DR. ELIOT'S PLAN TO TEACH SEX HYGIENE

The annual conference of the American School Hygiene Association in New York last week was the occasion of a careful paper by Charles W. Eliot on school instruction in hygiene. This body of educators and physicians has left off discussing whether or not sex hygiene should be taught, and addressed itself to the method of teaching. This is perhaps no less significant of the times than the fact that the subject was presented by an ex-president of Harvard University in such way as to attract the attention of the whole school world.

Dr. Eliot finds only two objections to the teaching of sex hygiene in schools. The first is that it is an unclean subject about which we should continue our world-old conspiracy of silence. A sufficient answer to this objection is its universal failure, he said. The second objection is that such instruction should be given to children only by their parents. To this opinion Dr. Eliot would subscribe—and gladly subscribe because the talking over of such vital matters between mother and child would establish a new and stronger bond than ever—were it not for the fact that "the great majority of parents do not now possess the necessary knowledge or the faculty of expression," and for the number of families lacking father or mother. Therefore, he argued, school instruction in the subject is necessary. We have given up trying to teach reading and physiology at home; why cling to another and equally important subject which most of us do not even pretend to teach our children?

An exact outline for such teaching may not yet be made, but the general lines may be laid down with confidence, Dr. Eliot said. The first essential is prolonged teaching of natural history, beginning early with botany, going on to the elements of zoölogy, "both subjects being taught in the most complete manner possible with incessant illustration indoors and out-of-doors." With this should be associated geography, and in rural schools agriculture.

Based on this nature study should be demonstration of the various modes of transmitting life which is the highest and ultimate bodily function of every plant and every animal, including man. Demonstration of the various processes of producing plant life can be carried on with the greatest exactness, and to this a few years later can be added the animal world. Dr. Eliot said:

> These subjects if properly taught with collecting box, scalpel, microscope and paper and pencil are just as pure and innocent for children under thirteen as chemistry or physics are. There is nothing sensual or unclean about them, nothing which does not tell of order, purpose, adaptation, co-operation, and achievement. Through much of the botanical instruction and more of the zoölogy runs the thought that the transmission of life requires two individuals of different quality. Children should be made thoroughly acquainted with this principle before any sex emotions begin to stir in them.

Following the zoölogy should be physiology, in which the courses should be enriched by greater instruction concerning the "causes of disease, including the recognized contagions and the modes of infection," in which the venereal diseases should receive their proper place. Further, Dr. Eliot held that "all schools should teach explicitly in due season those elements of good manners and customs which have to do with health and the preservation of bodily and mental purity."

Finally Dr. Eliot urged the single standard of morals for men and women—a subject which he has persistently and skillfully presented before many kinds

of audiences the past few months. He said:

> Does anyone protest that this educational process will abolish innocence in young manhood and womanhood and make matter of common talk the tenderest and most intimate concerns in human life, let him consider that virtue, not innocence, is manifestly God's object and end for humanity, and that the only alternative for education in sex hygiene is the prolongation of the present awful wrongs and woes in the very vitals of civilization.

EDITORIAL GRIST

FATAL POSTAL ECONOMY

FLORENCE KELLEY

The federal government has undertaken the cost of maintenance in Washington, D. C., for five years of Albert Dewey Carter, a twelve-year-old boy whose parents live in Beaumont, Tex. The federal officials in the District of Columbia charged with caring for him during the years of adolescence seem to know nothing whatever of the boy's previous education or family history. He was brought to them from Beaumont by a police officer, at the expense of the government.

The cost of maintenance for five years of Albert Dewey Carter will not appear in the records of the Post Office. The burden is, however, placed upon the Federal Treasury by the action of the postal authorities in entrusting to this young child special delivery letters. He opened a letter and abstracted five dollars from it. His sentence is thus one year for each dollar entrusted to him.

The employment of a young child for the responsible task of delivering special letters containing money and other valuables was obviously for the purpose of saving money, which would have had to be paid as salary to an adult, uniformed letter carrier, duly appointed under the civil service requirements, at a salary fixed by law. Could anything have been more cruelly self-defeating?

The institution in which this twelve-year-old boy will spend the coming five years is the National Training School, made up of about 350 boys varying in age from this newest and youngest pupil to candidates for dismissal by reason of their approaching twenty-first birthday. The school receives offenders from any state which has no training school of its own, and from the District of Columbia, whence only those boys, white and black, are committed to it upon whom the beneficent resources of probation have been exhausted in vain by Judge de Lacy.

Such is the companionship into which this child is thrown in consequence of the attempted economy of the postal authorities.

The public is entitled to know whether other boys in this school are victims of the Post Office Department.

Every citizen who objects to having registered and special delivery mail thus treated with less respect than ordinary mail might well address a protest to Postmaster General Hitchcock. Every one who objects to this sacrifice of a child to a cruel experiment in false economy on the part of the richest government in the world should be heard from in unmistakable terms.

FRANCIS A. FOY: PRIEST PATRIOT, FRIEND[1]

HUGH F. FOX

What a baffling thing it is to try to picture such a man as Father Foy! Was it his training, his experience, his calling, or all combined, which made him so rounded and composite a character?

Father Foy began his career as a lawyer in South Jersey, and cut his political wisdom teeth as secretary to United States Senator Smith. The caution of the lawyer and the conservatism of the priest tempered wisely his discretion without checking his initiative. His wise head and warm heart balanced each other so thoroughly that sympathy and sanity were one with him, and though he was ever open-minded, his attitude was

[1]Father Foy died December 11, 1910, at the age of fifty-three.

eminently judicial. But he was an inscrutable sort of man. In spite of many years of close association and friendship with him, he remained something of a mystery. With all his good-fellowship in personal contact, he maintained a sort of detachment and reserve. I imagine that only those who came to him in deep sorrow, or great difficulty, really sounded the depths of his being.

Father Foy bore a personal part in so many matters of social welfare in New Jersey that it is difficult to find just the right niche for him. Perhaps he was most actively and constantly identified with the Catholic Children's Aid Society of New Jersey, which is doing the work of home-finding and child-placing for the Catholic institutions, and combines the functions of a Children's Aid Society and a Society for the Prevention of Cruelty to Children. He served as secretary of the New Jersey State Charities Aid and Prison Reform Association for four years, and was associate editor of the *New Jersey Review of Charities and Correction* which is its organ. He was the president of the New Jersey State Conference in 1908. Perhaps the trend of his mind is best indicated by the following passage from his address on The Value of the Conference:

> This conference is essentially a forum of the people, and as such it discusses questions of vital importance to the various communities and to the state. Social problems can be solved only by the social mind. The individual may help in these solutions, but his conclusions will be of no practical value until they have been incorporated into that community of thought which is ever striving for a clearer comprehension of social needs. And when this collective thinking has done its work—when the solution has been reached—there is no power in the world that can destroy the principle or proposition which embodies such a conclusion. Moreover, these solutions are dynamic in character, and will not rest until they have reached the stage of constructive reality. You will remember the years of debate and deliberation over the question of sheriffs' fees, the indeterminate sentence, and probation, juvenile courts, child-labor, and tenement house reform, and the supervision of charities. We cannot expect results without work, and time itself is an important factor in the solution of social problems.
>
> What we can all do is to apply ourselves to this work as opportunity may offer; and the object of these conference gatherings is to afford just such opportunities; for the expert who least of all is sure of his ground until it has been tramped on and tested by those who know conditions better than theories; for the worker whose methods must be brought to the test of a wider experience that they may gain in scientific value; for public officials and others whose duties in any wise touch on the safety and welfare of the people; and for the plain citizen whose routine of life must have many points of contact with the problems here discussed.

Father Foy stood for the spirit of research in such work, which he put upon the highest plane of humanitarian effort; and while he insisted upon economy and efficiency in the conduct of state institutions, he constantly urged that the state should make adequate provision for all of its wards, and that it should not merely build for this day and generation.

He was an active member of a number of the committees of the National Conference of Charities and Correction and of the American Prison Association, and was one of the leaders in the newly organized movement which resulted in the National Conference of Catholic Charities. He kept thoroughly abreast of the whole literature of social welfare and economics, but his attitude was that of a humble student who constantly seeks more light to guide his course. His wide knowledge and experience were recognized in his later years by the heads of the Catholic Church, who appointed him supervisor of catholic charities in the Newark diocese. While, however, he was a devout and faithful servant of his church, he was no less a servant of the whole community, for his sympathies were truly as broad as humanity itself. (Is it not a significant thing that the churches which are closest to the mass of the people, and which have the clearest understanding of human needs and weaknesses, should be so sane and tolerant in their views, and so particularly free from the theories of faddists or the vagaries of the cranks?)

The ministry of such a man as Father Foy has no end, for his works live after him.

UNEMPLOYED CROWD LODGING HOUSE

BAILEY B. BURRITT
Executive Secretary Committee on Criminal Courts

The Municipal Lodging House of New York was taxed beyond its capacity during the month of January for the first time since the opening of the new building in 1909. In many ways this is a model structure with accommodations for 700 persons. When the building was planned it was expected to accommodate for years to come all the persons in New York city in need of temporary shelter. During the last month, however, an average of about 125 persons each night have been turned away and accommodation has been given them in bare rooms on the Twenty-sixth street dock because there were no vacant beds in the lodging house. On January 15, of 982 persons provided with shelter, 286 were provided for on the dock. A comparison of the total census of the institution for the first twenty-one days of January for the last four years emphasizes the present overcrowded conditons. In 1908 this was 9,717; in 1909 it was 9,163; in 1910 it was 7,401; and in 1911 it was 16,995.

This high mark for 1911 is due in part to the Ashokam dam and other extensive public improvements which have attracted a large number of unskilled laborers, many of whom are without resources when work ceases for the winter; in part possibly to the increased cost of living, which is making it increasingly impossible for men to find a means of support whenever they are thrown temporarily out of work; and in part to the fact that the magistrates, for some reason, have committed to the workhouse as vagrants fewer than usual of the men taken to court by the lodging house authorities for refusing to work in the stoneyard maintained by the Department of Public Charities, and for giving fictitious names and addresses which make it impossible for the lodging house to investigate their need and eligibility. In the winter of 1909-10, 637 persons were taken to court, 443 of whom were committed as vagrants. During the present winter 724 persons were taken and only 374 were committed. Failure to commit such persons results necessarily in the breakdown of discipline at the institution, as lazy men soon realize that refusal to work involves no punishment.

The lodging house authorities are confronted with a baffling problem. Several needed changes, however, suggest themselves. First of all, it is evident that the municipal authorities must provide greater facilities for temporarily employing homeless men who are unemployed and without resources. When properly inmates of the municipal lodging house, such men should be required to do a fixed amount of work each day in return for the city's bed and simple meals. This work should not require more than a half day's labor by able-bodied men, which gives them an opportunity to seek employment during the other half of each day. At present the city provides a stoneyard where a limited number of men break stone. Such facilities should either be extended or other work provided. The feeling is growing that the city must soon provide more productive work than stone-breaking.

A second needed change is a more careful investigation of cases to determine the needs of persons applying to the institution. The real vagrant, who is interested chiefly in avoiding work, would then either avoid the lodging house or strong evidence could be produced to show that he is a vagrant. This would result in his commitment to a penal institution.

A third important needed change suggested by this condition of affairs is the establishment of colonies for inebriates and vagrants. Many of the men who appear at the lodging house are either habitual drunkards or vagrants who should be committed on indeterminate sentences to farm colonies. The successful operation of such a colony at Witzwil, Switzerland, was described in THE SURVEY for February 4 by Prof. Frank A. Fetter. Witzwil and other similar colonies demonstrate the practicability and utility of such institutions. A law passed by the Legislature of 1910 authorizes the establishment of a hospital and industrial colony for inebriates by the city of New

York. Such a colony should be established forthwith. Further, legislation and necessary appropriations should be secured during the present winter to establish a state colony for vagrants. Efforts have been made for the past two years to secure such legislation. The new Democratic Legislature has an opportunity which it cannot afford to ignore.

BOOKS FOR SOCIAL WORKERS

LILIAN BRANDT
Contributing Editor

PUNISHMENT AND REFORMATION. By Frederick Howard Wines, LL.D. Thomas Y. Crowell. New York. 1910. Pp. 370. Price $1.75; by mail of THE SURVEY $1.88.

On the cover this is called a "Revised Edition"; but the hopes aroused by that description and the publishers' announcements are not fulfilled. The book is a "new, enlarged edition", as is stated on the title-page, but the original text has apparently not been changed.

The additional material consists of a preface, in which Dr. Wines suggests that there is need for "a new and distinct foundation which should devote its energies exclusively to the solution of the problem of crime"; and two papers prepared in 1904, on the Treatment of the Criminal, and The New Criminology.

In the wealth (or flood, eruption, landslide, if you prefer) of literature on social problems which has been issuing in the last ten years, there has been curiously little of a general or historical nature. Punishment and Reformation has not been supplanted by any other book. In view of this fact a reprint was most desirable, if the first edition was exhausted. It must be matter for regret, however, that Dr. Wines could not have revised it by including an adequate treatment of the developments of the last fifteen years. Looking up Courts in the index (which has not been made to include the two additional papers, by the way), we find the sub-headings Assyrian, Ecclesiastical, Hebrew, Origin of; but not Domestic Relations, Juvenile, Night, Reforms in, and so on. Indeed, reading through the index and noting omissions gives a thrilling sense of the progress that has been made since 1895, and strengthens the conviction that it deserves a historian and interpreter.

BETTER TIMES. By David Lloyd George, M. P. Hodder and Stoughton, George H. Doran Company. New York. 1910. Pp. 326. Price $1; by mail of THE SURVEY $1.08.

This collection of public speeches by the English chancellor of the exchequer gives the liberal policy of social and fiscal reform, with its underlying principle of taxing unearned increment, in such a form that he who runs may read. The treatment of various problems, notably unemployment, is, perhaps for this reason, inadequate. We are reminded, too, of the criticism made in the English newspapers of the accuracy of some of Mr. George's instances of untaxed land drawing a large income. But the strength of campaign speeches is ability to make telling points in a vivid, colloquial style that will catch the attention of an uncritical audience; and that strength these speeches have to a high degree.

In his introductory note Mr. George makes the point that his program of social reform dates back to long before 1909, that is, that the proposals in the first budget were not simply an electioneering expedient to catch votes for the Liberal Party. Evidence of this appears both in speeches as far back as 1903 and also in the tone of personal sincerity, at times hotspur enthusiasm, in some of the later speeches. In view of this personal sincerity it is disappointing to note those compromises of principle in later speeches which "practical politics" demanded. At Newcastle in 1903, for instance, Mr. George says that sixty-five years is too high a mimimum for the old age pension, because "large masses of the working people would not live long enough to benefit by it." In April, 1909, on the other hand, he combats the suggestion that the age limit should be reduced from the still higher minimum of seventy years on the ground not only that it is financially impracticable, but that many are still able to labor at that age.

By far the most interesting of the collection are the speeches on the budget.

SUGGESTIONS FOR SOCIAL HELPFULNESS. By Rev. D. J. Fleming, M.A., M.Sc. Nateson and Company. Madras, India. 1910.

The suggestions are intended for native students of the Christian colleges in India going back to their villages, and are "written with the conviction that intelligent and effective community life is one of the real aims of education." Much space is given to descriptions by students of attempts they have made to pass on to their families and neighbors what they have learned, "rehearsing before them the news of the scientific world," taking pains to make their words "stand on the same footing," replacing superstitious explanations of natural phenomena by scientific ones, spending days walking from village to village to get signatures to a petition for a primary school, loaning good books in the vernacular to the villagers who can read, showing magic lantern pictures, teaching games of skill to replace those of chance, distributing quinine and getting ponds filled up in malarial districts, starting a crusade against rats, creating a desire for drains and helping to dig them, getting sick children into the hospital in spite of parents' superstitious fears, and doing many other things familiar and unfamiliar to social workers of the new world.

Practical outlines are given for studies by individuals or groups of many social problems, adapted to the condition of the country and with references to obtainable literature.

It is pleasant to have the author's assur-

ance that THE SURVEY has been a real stimulus and help in getting out this little manual for the use of Indian students."

WHAT DIANTHA DID. By Charlotte Perkins Gilman. The Charlton Company. New York. 1910. Pp. 250. Price $1; by mail, of THE SURVEY $1.10.

What she did was to solve the domestic service problem, for both mistress and maid, in a southern California town. Incidentally she released much genius which had been seemingly misplaced in household drudges, translating its possessors and their husbands and children from a state of discontent to one of happiness and efficiency; and she illustrated in her own life Mrs. Gilman's theory that a wife, mother, and housekeeper can easily be also a business man.

As a novel the book has slight merit. The personalities do not interest, in spite of the interesting emotions and ideas ascribed to them; and there are minor defects, such as changing the name of a character, which bespeak hasty writing.

The solution Mrs. Gilman proposes is "not that oft repeated, foredoomed failure called co-operative housekeeping"; for "the inefficiency of a dozen tottering households is not removed by combining them." She maintains, on the contrary, that "every family is a distinct unit . . . Its needs are separate and should be met separately." But "we are rapidly approaching an improved system of living in which the private home will no more want a cookshop on the premises than a blacksmith's shop or soap-factory. The necessary work of the kitchenless house will be done by the hour, with skilled labor; and we shall order our food cooked instead of raw. This will give to the employes a respectable, well-paid profession, with their own homes and families; and to the employers a saving of about two-thirds of the expense of living, as well as an end of all our difficulties with the servant question."

A saving certainly, but "two-thirds"?

COMMUNICATIONS

AN IMMIGRANT LABOR TARIFF

TO THE EDITOR:

From his breezy blitheness, from his ingenuous brushing aside of all "legal and administrative obstacles in the way," and from his vigorous, convincing suggestions of the terrible pressure of recent immigrant labor upon American wage standards, one is led to suspect the author of An Immigrant Labor Tariff (in your issue of January 7) of being either a gentle humorist or a trenchant advocate. Either he plays with us, or he disguisedly advocates a policy of complete exclusion of all alien labor.

He proposes a law compelling all corporations and contractors of corporations to pay $2.50 per day to each immigrant employe who has been in this country less than five years. Such a law, fairly administered, he seems to believe would both secure decent livelihood to immigrants then employed by corporations or contractors, and lead many more immigrants to seek country employment.

Hundreds of thousands of immigrant common laborers come into the United States yearly. The great majority of these are unprepared and unwilling to go to American farms. Further, American farms and farming communities prefer not to have most of these immigrants. On the other hand, the mass of these immigrants seek city employment and city corporations and contractors seek them. This has been so persistently true that corporate labor markets are already well supplied.

Taking labor conditions as they are in the United States, probably not 5,000 of the more than 500,000 alien common laborers annually entering this country would be employed at all by corporations or by contractors if they had to be paid $2.50 per day. This novel minimum wage plan, then, granting that its legal and administrative obstacles resolved themselves, would take away from immigrants the jobs they now seek, and would make it impossible for them to live here in city centers, which they wish to do. It would thus be virtually prohibitive of further alien common labor immigration.

Perhaps this conclusion may be more clearly demonstrated by assuming its opposite and then noting the *reductio ad absurdum* which follows. Grant that all legal and administrative obstacles were resolved and that the plan worked so that immigrant common laborers actually got their desired city jobs at $2.50 per day. More than half a million job-hungry immigrant common laborers enter yearly now. With assurance of $2.50 each per day, this number would double, treble, multiply indefinitely. But to assume a power to dictate almost doubled wages at the same time that a vastly increased labor supply is lured into the country is rather obviously to assume contradictories.

The plan, then, granting its feasibility, seems to promise practically complete restriction of all immigrant labor. But who cares to grant its feasibility? It is refreshing exercise for the imagination to endeavor to conjure up that social Sherlock Holmes who would suddenly and mysteriously appear among a thousand steel workers, point his shapely index at Jan Jansen, Olin Olsen or Luigo Palermi and say tragically: "You are an alien. You haven't been in this country five years. You are not getting two and a half per. Drop that billet and hike for Minnesota furrows or back to dull Europe for you." The federal government would have to subsidize a secret service big brother to shadow constantly each individual alien admitted after the passage of this law for minimum alien wage, or the law would be so dead a letter that even its fond parent could not recognize the remains.

Either the proposal is feasible or it is not feasible. If feasible, it effectually stops substantially all alien immigration of the present common labor class. If not feasible, it accomplishes nothing save to add to the gayety of nations by engrossing yet another wholly ornamental law. Its proposer certainly would not seriously advocate it in the latter case. If he believes it to be feasible and if he sees its then virtually prohibitive character, why does he wander after so strange gods? Why does he not favor the much simpler and readily feasible, even though sadly less original, plan of frankly prohibiting any further immigration of alien common laborers?

Possibly such a plan, rigidly enforced, would lift the blinding fog now enwrapping the American laborer and would give him chance again to locate his fixed stars and to get his industrial and social bearings. If common labor immigration were wholly stopped, even for a single decade, there might then be reason to discuss the desirability of legalizing a fairly high minimum wage for all American common labor—a hopeless ideal so long as the annual inflood of a near million job-seeking aliens continues.

The advocate of this novel panacea for industrial ills is resourceful and of infinite wit. Possibly he may insist that to get the full force and beauty of his scheme we must assume not only that "on analysis the legal and administrative obstacles in the way will resolve themselves," but that all economic obstacles will also considerately dissipate themselves and resign precipitately in favor of this "bristling idea." If thus he insists, let us withdraw quietly lest we disturb the Reformer's Dream.

WALTER E. CLARK.
Department of Political Science, College of the City of New York.

TO THE EDITOR:

The strongest paragraph in Mr. Kellogg's suggestive article, An Immigrant Labor Tariff, the one which all thinking men must endorse, is the assertion that cheap products are dearly bought by the nation if they are produced at the sacrifice of human happiness and decency. The various proposals for restricting immigration by tests have, as pointed out, distinct disadvantages from the standpoint of social justice—the immigrant who comes to us uneducated may never have enjoyed any educational opportunity. He may have qualities, pre-eminently character, which will make him a valuable citizen. Moreover, the children of such immigrants, under the advantages offered in America, do acquire education.

The proposition Mr. Kellogg advances, minimum wage for immigrants for the first five years of residence, is open to the objection that often it would prevent their getting work and would make of many such immigrants a public charge, involving serious hardships upon them before they appealed to public charity.

Is it not better to attack the whole problem from an entirely different side, *i. e.*, the side of numbers? Have we not a perfect right to determine how many immigrants we will receive each year and to designate specifically the number that may come from each country, giving preference to the hardiest races? Let us say, merely by way of illustration, that we will take only one-fifth of the number who came to us during 1910 and apportion that fifth not only to countries, but to specific sections of certain countries, such as the north, in preference to the south, of Italy.

The process of selection, by which we aim to receive only immigrants sound in mind and body as well as of good character, might well be revised from time to time in the light of experience. But superimposed upon all such selection should be the determination of the maximum number which we are willing to receive annually. The philosophy underlying such a proposition is that abundance of good land, other things being equal, makes for the happiness and welfare of the community more stoutly than any other single factor of economic activity. To continue to admit the present flood of immigrants is to hasten the day when our country shall be overcrowded. This means not only throwing away the inheritance of our children, but bringing measably nearer the trying social conditions which so many European countries are compelled to face.

THEODORE MARBURG.
Baltimore, Md.

CONVALESCENT MEN FOR NEWSBOYS

TO THE EDITOR:

The regulation of children in the street trades has been the subject of recent legislation in a few states and in several cities. Most important of the street trades, as far as children are concerned, is the sale of newspapers and periodicals. The dangers incurred in this occupation have been clearly demonstrated in your magazine. At present we are unable to control this type of work under our child labor laws, owing to a legal technicality which makes newsboys independent merchants. There is no reason why newspapers should have the privilege of virtually employing child labor, with slight restrictions, save that this work does not interfere with the child's school attendance, nor confine him indoors.

Our hospitals are continually turning out tuberculosis patients as "cured" or with "disease arrested." These men are sent home without means of support, though they are seldom capable of immediate self-maintenance. Occasionally there is temporary, outdoor relief from municipal, county, or private sources, but the ex-patients are expected to shift for themselves all too soon. The greater number of them return, logically, to their former occupations, where conditions so favorable to the disease as to have overcome healthy individuals in the first place, make short work of the convalescent.

Now the question I wish to raise is, why not do away with both of these evils at once, by letting the discharged tuberculosis patients take the place of the newsboys? Some such suggestion was made by Mrs. Florence Kelley at a meeting of the National Child Labor Committee, March, 1909, (see Supplementary Annals of the American Academy, p. 235, vol. 33.) but does not seem to have received further consideration. The outdoor work is just what the convalescents need to complete their recovery, and would not their substitution for the children solve the street trades problems as far as newspaper selling is concerned?

This program might be carried out by either a state or municipal licensing system, provided that the police power so exercised did not seriously interfere with individual or property rights. The jurisdiction of municipalities, as trustees for the public, varies with their charters. In most cases the fee to the property extends to the middle of the thoroughfare, and the public has an easement for traffic purposes. The decision has been rendered that "on the general question as to the rights of the public in a city street, we cannot see any material difference in the principle with regard to the extent of the rights, whether the fee is in the public, or in the adjacent landowner, or in some third person." (Barney *vs.* Keokuk, 94 U. S. 324, 1877, Dillon, Sects 689-99; quoted by Ernst Freund. Police Power p. 147.) The municipality has the right to regulate who shall sell on its thoroughfares. "It is not one of the purposes for which streets are established, to afford a convenient place to expose merchandise for sale" (Ibid p. 173 (*et seq.*) It has been held that peddling on the streets may be made dependent or licensed (Re. Nightingale, 11 Peck. 168) or entirely prohibited, (Commonwealth *vs.* Fenton, 139 Mass, 195; White *vs.* Kent, 11 Ohio, St. 550).

Surely property owners would have no ground for complaint as the pavement would not be blocked to any greater extent than at present. Indeed, instead of roaming youngsters, there would be responsible grown men at fixed stations.

The sales of newspapers would not be affected to a noticeable extent, as a remarkably small part of the street sales are made to transients, persons who do not buy from the same person, at the same corner, every day. The circulation managers estimate that only four per cent of the Milwaukee papers sold come under this head, and that most, if not all, of these would be sold to the same people at regular places, if no others were provided.

It would not be dangerous to the public health, for the patients dismissed from the hospitals would either be completely cured, or would have been taught how to protect the public from contagion if their recovery were not complete. Aside from these considerations, the open air would practically prevent danger of infection.

There are still some questions to be settled before this suggestion could be carried out. That licensing can be required is true, but would it be possible to add a restriction to the law favoring one class of applicants against another? This might be avoided if, without a specific clause in the law, the custom of licensing ex-patients were established. Is it justifiable, or even possible, to drive the present occupant of a corner out of business by refusing him a permit? Would it be possible for a state to protect such a monopoly? Would it not be manifestly unfair to give to one man a corner that would net him fifty dollars a week, and to another, a corner netting only fifteen dollars a week?

If these objections can be overcome and the plan is found to be feasible, two laws should be presented to the various legislatures in session this year: first, one forbidding children from engaging in street trades, at least in the business districts of cities; and second, one licensing this semi-dependent class. The public would receive better service, the children would be protected, and a large group of men made self-supporting.

Madison, Wis. ALEXANDER FLEISHER.

GIRLS AS NEWSBOYS

TO THE EDITOR:

In THE SURVEY for December 31, I find an account of the adoption in Hartford, at the instance of the Juvenile Commission, of an ordinance regulating street sales by children. From the last paragraph it might be inferred that the clause in the ordinance which requires the superintendent of schools to issue licenses regardless of the sex of the child was inserted by recommendation of the Juvenile Commission. This was not the case. The clause was put in by the committee on ordinances of the Common Council at the suggestion of the mayor.

The Juvenile Commission was unanimous in its judgment that no girl should be permitted to sell papers or other articles on the street. The commission was led to this judgment by a very careful investigation of the newsgirl conditions in Hartford made by Mary Graham Jones, a member of the commission and head worker of the Hartford Social Settlement, a close personal friend of many newsgirls for the last twenty years. Her investigation revealed facts so vile and revolting as to the demoralizing effect of newspaper peddling upon girls that the commission without hesitation took its position as opposed to this practice.

(Rev.) ROCKWELL HARMON POTTER,
President, Juvenile Commission,
Hartford, Conn.

WHOSE ARE THE STREETS?

TO THE EDITOR:

Your illustration of lower Fifth avenue at the noon hour, brings to mind all the foolish things that have been said and written about the invasion of this high-priced quarter by the garment workers.

Was it not plainly to be seen, when the new buildings east and west of Fifth avenue and on the avenue itself, at such streets as Eighteenth, were built, that they would be occupied in just such a manner? Then the factory law forbidding the eating of meals where the garments were made drove them out of the shops. Where were they to go? What provision was made to see that they had proper restaurants, rest rooms, or shelters? "Nowhere to go but out!" The street is their promenade as well as yours or mine, ladies and gentlemen. Under heaven, what law could prevent them using it?

If the great landowners did not want these harmless, hard-working people to wander in droves up and down this wide thoroughfare, crowding the fine ladies off the sidewalk and "killing" the avenue for retail trade, why did they not take steps to provide them with restaurants, reading-rooms, roof gardens (all these new buildings have flat roofs), and so on?

They have only themselves to blame. By illegal, repressive measures they have tried to drive these people off the streets, without giving them an alternative. And dearly have they paid for it in loss of trade and property values.

It is a wonderful sight to see them on a fine day, clear out to Broadway and Union Square. All are about of a size and mostly of one type. Little, flat-brimmed derby hats (where do they get them—you never see the like for sale?) Neatly dressed; starched shirts and collars, black coats. Many of them will be proprietors of shops in a year or two. They make wages that would seem fabulous at home, in Poland or Lithuania. Many of the rich men in the women's garment trades were journeymen only a few years ago.

New York.

TEACHING PRISONERS

TO THE EDITOR:

Much more effective than correspondence courses for the inmates of prisons would be an extension of school work within the prisons to include all the inmates who wish to avail themselves of it. The prisons of New York have well organized schools, but for lack of room they are limited to the most needy men. Their work might be enlarged to include all men in prisons.

All the prisons have large libraries which might be utilized for educational purposes along various lines.

The educational work needed in the prisons cannot be done by correspondence. It must be largely personal and adapted to the special conditions. It must be done under the direction of expert, and sympathetic teachers, fired with an altruistic spirit.

There is no more potent factor for social hygiene in the prisons than the schools. Their work should be extended until it reaches practically all the men.

There is probably no better school system to be found in penal institutions in any country than the one in operation in the New York prisons at Sing Sing, Auburn, and Clinton. The defect is in its limitation to less than one-third of the inmates.

A. C. HILL.

Albany.

DENTISTS AS SOCIAL WORKERS

TO THE EDITOR:

I note in your issue of THE SURVEY for December 31 a short article entitled Mouth Hygiene Mass Meeting. In this connection it may be of interest for you to know that the National Dental Association has a permanent committee upon this subject, of which Dr. W. G. Ebersole, of Cleveland, is chairman. For several years the association has been attempting to stimulate interest along these lines with some considerable degree of success.

In Cleveland there are clinics maintained in five or six schools, volunteers doing the work. In Cincinnati we have a clinic which is operated by paid workers, employing two graduate dentists and a woman who investigates cases, etc. In Dayton, Toledo and several other cities in Ohio, clinics are either operated or will be in a short time.

In addition, permanent "lecture committees" are at the disposal of the public. We address the school children and teachers, and hold exhibits similar in nature to those of the anti-tuberculosis movement.

I direct your attention to these facts in order that the public may know that this is a stable movement, which we expect to grow until free clinics are maintained as part of either the health department or public schools system of all municipalities.

SIDNEY J. RAUH.

Cincinnati.

REPORTING VENEREAL DISEASES

TO THE EDITOR:

Noticing in THE SURVEY for January 14 your article headed Responsibility Put up to the Department of Health, we beg to remind you that the organizations of women allied under the title at the head of this letter (The Women's Prison Association and Societies, Allied), at their meeting of October 14, 1910, passed the following resolution:

"Resolved, That health boards should place the venereal diseases upon the same status as all other contagious, infectious, and communicable diseases; should take the same measures against them, irrespective of class or sex, as are applied in the prevention of all other contagious, infectious, or communicable diseases, and should conduct in respect to them the same policy of instruction of the public as to the preventability of these diseases as is now conducted in respect to others." This resolution was followed by one demanding full and sufficient free, voluntary treatment of patients suffering from these disorders.

A printed account of the meeting referred to, with a full statement of the resolutions, was

sent to THE SURVEY immediately afterward, but no reference has been made to it, although it contained also reports of the workings of Clause 79 which were the first to be made public and were later substantiated by a SURVEY article; nor were the resolutions noticed. Assuming that you have not intentionally ignored the actions and resolutions which preceded the discussions at the December meeting of the American Society for Sanitary and Moral Prophylaxis, we ask you to print this letter for the sake of historical accuracy and completeness of record.

The Publicity Committee,

HOSPITAL AND UNIVERSITY[1]

ROBERT W. DE FOREST, ESQ.,
Chairman of the Building Committee
of the Presbyterian Hospital.

It has recently come to my attention that a basis of alliance has been suggested between the Presbyterian Hospital and the College of Physicians and Surgeons, the medical school of Columbia University, by prominent members of both institutions, subject to the settlement of details and to the approval of the governing boards of these institutions. This alliance is singularly in line with my own conception of the proper relations between hospital and medical school, and I should be glad to further it.

I have long been interested in that form of charity which has to do with the treatment of human ills, and latterly have become more and more impressed with the extent of the work that a hospital must do on the broadest scientific and practical lines, if it at all adequately uses its resources.

The scientific development of medicine has especially interested me recently, and I have become convinced that its real underlying province and mission to humanity lies more particularly in preventing disease than in merely curing it. All this has increased a growing desire I have had to contribute something which will materially increase the usefulness of a great hospital.

I am convinced that this scientific development can best be accomplished in the hospital and the medical school, and that the two are interdependent, the one on the other. The medical school constantly supplies the physicians and surgeons of the future, who in their early training must have every facility for practical experience and application, which they can only obtain at a hospital where they are taught by the practicing physicians and scientific men. The hospital supplies a vast amount of material for study and research, and should realize that, besides caring for the sick, it has a great obligation towards humanity to use this material both in the training of the younger men and in furthering discoveries in preventive medicine.

[1]For editorial comment see Social Forces, page 793.

I believe that the visiting staff of a hospital does better work for its patients and that its members are kept more up to date, if they include teaching in conjunction with their duties than otherwise; that the hospital and patients directly benefit thereby, the former through attracting a better class of internes and attendants because of the teaching facilities, the latter through receiving more careful attention and the latest methods of treatment.

I realize that one of the Presbyterian Hospital's greatest needs in its new hospital plant is a surgical pavilion supplying ample bed facilities and embodying modern appliances.

With these needs in mind, I shall be glad to provide the cost of the erection, upon a site belonging to the hospital, of a surgical pavilion containing 150 beds, and equipped with modern appliances; and, conveniently accessible to this pavilion, a complete laboratory for advanced research work.

It also gives me pleasure to offer to the hospital, on behalf of a donor whose name I am not at liberty to mention, money and securities which I estimate to be of the value of $1,300,000, in trust for endowment, the principal to be kept separate from other funds and the income to be used exclusively toward the support of the scientific and educational work connected with the hospital and referred to in this letter. As I withhold the name of the donor, I guarantee the payment or transfer of this endowment fund to the hospital.

This donor and I would like the privilege of placing appropriate tablets in the new pavilion stating in whose memory the building is erected and the work endowed, and I should wish the privilege of approving any building plans that may be determined upon and to have a voice in the selection of an architect, although I do not urge this last point.

Both of the offers above contained are made on the following understanding and conditions:

1. That the hospital shall admit to the wards students of the medical school to the extent and in the manner permitted by the most approved practice.

2. That the educational institution concerned may make nominations to all positions on the hospital staff, medical, surgical, and special.

3. That the persons occupying for the time being the ranking or foremost professorships in medicine and surgery in the educational institution concerned shall always be nominated to appropriate positions on the staff of the hospital, and that so long as they hold such offices in the hospital they shall have no official connection with any other hospital, to the intent that under this arrangement the hospital will secure in the treatment of its patients the greatest degree of medical and surgical skill which can be furnished by the school.

4. That the physicians and surgeons of various ranks and their assistants shall have as full privileges as reasonably possible, consistent always with the welfare of patients, of

instructing their students in the public wards and the various laboratories of the hospital.

5. That the departments of pathology and bacteriology may give teaching to students in the hospital.

6. That there shall be a director of the surgical research laboratory who shall teach in the hospital, and who shall always be on the active teaching staff of the school.

7. That the surgical department at the hospital shall publish an annual report of the scientific and clinical work of the year.

8. That the College of Physicians and Surgeons, the medical department of Columbia University, be the medical school with which the hospital makes this arrangement, so long as it is in a position to carry out its share of these conditions and complies therewith. Should it not be in such a position, or fail to comply therewith, another medical school of the first rank may be selected by the hospital.

9. That if the hospital shall not comply with the conditions named in this letter, and should such non-compliance continue after notice and reasonable opportunity to fulfill the same, the hospital shall forthwith pay and transfer to me, or to the donor whom I represent, as I may request, the whole of the endowment fund herein referred to. If this non-compliance should occur after my death, the repayment shall be made to any person or institution designated for that purpose in my will. After such default and until such payment, the endowment fund shall be held by the hospital in trust solely to make such payment.

The conditions imposed by this letter may from time to time be changed by mutual agreement. My own consent, if living, and that of the hospital shall be necessary to such a change; after my death the person or corporation thereto authorized by my will may consent in my place.

While the medical school will benefit from the gifts herein made, and this is expected and desired, its only right to such benefit must come through agreement with the hospital, the school itself having no right hereunder.

Should any of the details of this offer be inconsistent with the necessary basis of the management of this hospital, or should there be other details which in your opinion should be considered by me, I shall be glad to confer with you with respect thereto.

EDWARD S. HARKNESS.

New York.

JOTTINGS

Lincoln's Birthday Conference.—The annual Lincoln's Birthday Conference for Social Workers at Union Theological Seminary, Broadway and 120th street, New York, will be held on February 13. The general topic is Aspects of Religion and the Religious Life. In the morning Prof. George W. Knox will speak on What is the Religious Attitude; Prof. William A. Brown on What Has Religion Contributed to the Life of the Individual; and Prof. Thomas C. Hall on What has Religion Contributed to the Life of Society. All three of these speakers are members of the faculty of Union Seminary. In the afternoon, Jane Addams of Hull House, Chicago, will speak on the Religious Aspects of the Social Ideal; the Rev. Harry E. Fosdick of the First Baptist Church, Montclair, on the Social Workers' Need of Religion; and the Rev. Henry S. Coffin, of Madison Avenue Presbyterian Church on Unitas, Veritas, Caritas, which is the seminary motto. Luncheon will be served at noon.

Child Labor Traveling Exhibit.—The collection of original photographs, charts and other material which the National Child Labor Committee has exhibited from time to time at national and state conferences is being prepared for constant field use. Elizabeth M. Dinwiddie, who will have charge of the exhibit, is prepared to fill engagements with women's clubs, churches, public libraries, public schools or other institutions in any city.

The material has been gathered at great expense, and is being thus prepared for wider public use in response to many urgent requests from those who believe that an ocular demonstration of the extent, nature, and effects of child labor will awaken the people of their city to an intelligent interest in the subject both locally and nationally. Inquiries should be addressed to Owen R. Lovejoy, secretary National Child Labor Committee, 105 East 22d street, New York.

The One Everlasting Witness of the Great War

Richmond in Ruins 45 years ago.

Copyright, 1909, by Patriot Publishing Company, Springfield, Mass.

In the last half century the men who fought in the Civil War have grown old and many of them have died. The torn-up battlefields are covered with cotton and wheat. The guns have rusted, the fortifications have rotted away, the ruined cities have come back to more vigorous life; even the bitter feelings that caused brother to fight brother have faded away.

But there is one witness that will never grow old—that is as clear today as it was fifty years ago. And thereby hangs the most amazing story of our history.

$150,000 Worth of Photographs to You for the Value of One

THE name of Mathew Brady should be blazoned high in our history, for Brady was the famous photographer who followed the armies and navies through the mighty conflict which tried this nation fifty years ago. Four years of hardship brought him 3,500 photographs. One set of these he sold to the U. S. Government for $30,000. This set was buried in the War Department. General Grant said it was worth $150,000. The other set was lost for nearly fifty years, until recently it was found again, and now it has been put in such form by the REVIEW OF REVIEWS that it is within the reach of every American home.

This is the one witness of the war that will never die. It will be true for all time, for a camera cannot lie; it will tell you the story of the war you never heard before, for under the protection of the Secret Service, Brady and his camera penetrated the most unexpected places—prison and battlefield, fortress and camp, hospital and wars ip—even to the grim scene of execution which was the end of the great tragedy.

Review of Reviews Company

13 Astor Place **New York, N. Y.**

12 Photographic Reproductions Free

Send only 10 cents for Cost of Mailing

The whole story is too long to tell here. We have put it all in a handsomely illustrated book which we will send you free if you send the coupon at once. At the same time we will send you 12 reproductions of these unique photographs which you can frame and keep. They are valuable in themselves and will give you some idea of the wonderful interest of the complete collection.

"The Survey 12-3"
Review of Reviews Company
13 Astor Place
New York, N. Y.

Send me, free of charge, the 12 reproductions of your newly discovered Brady Civil War photographs, ready for framing and contained in a handsome portfolio. Also send me the story of these photographs and tell me how I can get the whole collection for the value of one photograph. I enclose 10 cents to cover the cost of mailing.

SOCIAL FORCES

BY THE EDITOR

HEREDITY AND SOCIAL WORK

For now these many years social workers have been putting ever increasing emphasis on the social value of environmental changes. The typical and essential features of all well-considered programs of social work have been improved housing, the control of infectious disease, recreational facilities, a shortening of the working day, and a high standard of living. We have put our faith in organized industry, organized charity, organized education, and organized religion.

Has the time now come to shift the emphasis? Must we learn again old proverbs? Blood will tell; Like begets like: You cannot make a silken purse out of a sow's ear. Is there wisdom for our generation in the two-hundred-and-fifty-year-old saying of Sir Thomas Browne, quoted in a modern book on heredity?

> Bless not thyself that thou wert born in Athens; but among thy multiplied acknowledgments, lift up one hand to heaven that thou wert born of honest parents, that modesty, humility, and veracity lay in the same egg, and came into the world with thee.

Heredity in the modern view appears to be a collective name for that which the individual has in common with his ancestry and his posterity, because of his relationship to them. The child, we are told, is not so much produced by his parents as by the common stock of which they and he are alike offspring. These common elements which make up the heredity are now believed not to be modified by the life of the individual. That is to say, individual life may be profoundly modified by environmental influences, but these changes do not, so far as positive proof has been adduced, affect the heredity of the offspring. What parents give to their children is a three-fold heritage:—first, a definite character which they have themselves inherited; second, a social tradition beginning in earliest infancy; and third, an economic environment determined by income, by place of residence, by judgment in the selection of occupations, and by other similar factors within their control.

The controversy as to whether the progress which is achieved by an individual as the result of his own experiences and the influences operating upon him is or is not transmissible to posterity by direct heredity, is in one sense merely academic, since it is admitted that such modifications, if not directly inherited, are at any rate passed on by what we may call a social inheritance. "Unlike the beasts that perish," says J. Arthur Thompson, "man has a lasting external heritage, capable of endless modification for the better." Thus the doctrine that acquired characters are not transmissible is by no means necessarily pessimistic. Confidence in the possibility of enduring social progress may even be strengthened by the reflection that in the stream of inheritance degeneration and abnormality must be at least as perishable as any hardly acquired virtue or increase of normal capacity. Shortness in Mendel's pea stalks is no more dominant in the nature of things than tallness, and all the potentialities of progress persist where there is nourishment on which they may feed. When we add to this that in the external herit-

age—the social tradition and the economic environment—there are two excellent fighting chances to relieve the individual from the terrors of his individual heredity, we find ample basis for that militant optimism which underlies the philosophy of all social work.

These academic aspects of the problem, however, interesting as they are, concern us less than certain practical issues which it involves. Modern humanitarianism undoubtedly keeps alive many weak individuals who in an unmitigated struggle for existence would perish. It may be argued that insane and feeble-minded, alcoholic and syphilitic, congenital criminal and pauperized parasite, are more numerous in our modern communities than they would be if public relief were less developed and private generosity were less lavish than they are among us. Are we in this way perpetuating the grievous social burdens of disease, alcoholism, criminality, and pauperism? Are we breeding from the unfit as no stock breeder would think of doing, and interfering with the normal processes of social evolution?

These are not new questions, but they gain new significance from current scientific discussions and experiments. An eminent psychiatrist expresses the opinion that much the greater number of the pronouncedly insane brought the seed of their malady with them into the world. Their insanity, to adopt Weissmann's distinction, lay in the germ-plasm and not in the body-plasm of their bodily structure. An entirely favorable environment might have prevented its development in them, but if they had become parents there would have been in the heredity of their descendants an identical danger which another equally favorable environment might or might not overcome. This is not the place to promulgate or to reject such doctrines. It is a place to consider social policies in the light even of their possible truth.

This persistence of heredity for which biologists contend is the more worthy of attention because it but fortifies the common sense view of the ages, which social workers have perhaps of late tended to ignore. This is the view that mental and moral character as well as physical character is inherited; that some children are born good just as some are born strong. It is Heine's dictum that a man should be very careful in the selection of his parents. This might be confused with the saying of Oliver Wendell Holmes that the education of a child must begin with his grandfather. Modern biology gives more support to the first paradox than to the second. The selection of parents determines heredity. The education of grandparents influences the external heritage. Both are important, but if Heine's advice is followed then it may not matter so much whether it is your own grandparents that are educated or some other grandparents whom you adopt. Foster homes of the second anterior generation cannot guard your heredity, but they may be competent custodians of your external heritage.

Society must care for the insane, the diseased, the criminal, and the pauper. Society must improve the economic and social environment of those whose lives are narrow and whose environment is but a denial of opportunity. The assumption of these responsibilities carries with it the obligation to guard against every foreseeable evil consequence. We do well to proceed cautiously where experts are divided; but we cannot long refuse the challenge of those who warn us that heredity also is a social fact.

THE COMMON WELFARE

THREE STATES CONSIDER MINIMUM WAGE BOARDS

All but simultaneously bills are being introduced in three states, looking toward adapting the Australian minimum wage idea to American industrial law. They come from three fairly distinct sources. Early this month, the Massachusetts State Federation of Labor introduced a bill providing for a state commission to investigate the subject. At the meeting of the National Consumers' League in Pittsburgh last week, the Rev. John A. Ryan of St. Paul's Seminary announced a measure shortly to be introduced in the Minnesota Legislature to establish "industrial boards for the protection of wage-earning women and minors"; and on Tuesday of this week, Representative Carl Stern of Milwaukee, a republican, at the instigation of the State Consumers' League, introduced a bill to create minimum wage boards, the provisions of which are not yet to hand.

Like the boards which for eighteen years have been in operation in New Zealand, the Minnesota bill would provide in each trade a joint wage board representing the employers, the workers, and the public. This is to be empowered to fix minimum time and piece rates which shall be compulsory upon all employers alike within the trade. The bill has been drafted at the instance of Father Ryan, whose book, The Living Wage, created a profound impression on its publication several years ago and whose paper before the National Conference of Charities and Correction at St. Louis last May[1] was described by a non-believer in minimum wage boards as "so fair minded and showing such a candid appreciation of the opposing argument as to make converts if anything can, and incidentally to do the more immediate service of raising the whole plane of the discussion."

The immediate object sought by the proposed legislation is such public control of the depressed trades as shall prevent any establishment or group of workers from continuing at a level below that of subsistence or self-dependent well-being, or sinking to such level, and thus sucking down, like an undertow, the standards of all competing establishments and all employes in the trade group. In 1910 the National Consumers' League adopted wage board legislation as its slogan throughout the United States for the next ten years. As result of an enactment of the British Parliament which went into effect January 1, minimum wage boards have been created in four English trades

The minimum wage board is doubtless the most striking invention in governmental forms which has come to us from the new commonwealths of the South Pacific since the Australian ballot. The reaction of American public opinion upon it will be watched with interest. The outlook is that these measures will be regarded as more radical than was child labor legislation ten years ago, will be considered a more serious departure from customary law and contract relations by many who would favor attempting to secure the same ends by other methods. They apparently lack the sentimental appeal to public spirit of the child labor campaign, but are likely to find compensating support among unions of women workers (whereas child labor laws were at the earliest stages sometimes opposed by the men's unions); among women's clubs and suffrage organizations generally. They will, on the other hand, doubtless provoke an even stronger commercial resistance because of the vaster bulk of underpaid labor involved.

The Minnesota bill would empower the State Board of Arbitration to establish industrial boards for "any trade or branch of work in a trade employing women or minors," either on its own initiative or when requested by twenty-five persons affected. The boards are to consist of representative members (three to ten persons representing the employers and an equal number representing the workers—women and minors), and

[1] See THE SURVEY for September 3, 1910. Price 25 cents.

appointed members, not exceeding one-third of the total, appointed at large by the Board of Arbitration. At least one appointed member and at least twenty-five per cent of the full membership shall be women. The board may on its own initiative investigate and consider industrial conditions in the trade which it represents, and shall report on any pertinent matter referred to it by the governor the Legislature, or the State Board of Arbitration. Its powers with respect to wages are given at length on page 866.

Other provisions in the Minnesota bill would enable the State Board of Arbitration to make regulations as to the compensation, organization, meetings, and proceedings of the industrial boards. The representative members of the latter are, so far as practicable, to be "elected by the respective classes (employers and workers in the trades) that they represent;" the State Board of Arbitration may nominate representative members from the respective groups where there is failure to elect; and if these refuse to serve, may nominate outsiders; it also appoints the chairman and secretary of the industrial boards.

The industrial boards may themselves create district boards (the representative character of which is safeguarded by further provisions), may refer to them matters for report and recommendation, or delegate to them powers or duties other than that of fixing minimum time rates or piece rates. The district industrial committee may, however, recommend such minimum rates, and no variation or cancellation shall have effect in the area of the district committee unless it has been so recommended, or unless an opportunity has been given it to report and for its report to be considered. The law would empower the state Bureau of Labor Industries and Commerce, to investigate all complaints concerning the observance of orders issued by the State Board of Arbitration and take necessary steps to secure their enforcement. The bill provides $2,000 annually for expenditures.

CHILDREN'S BUREAU BILL PASSED BY THE SENATE

The Senate on February 14 passed the bill creating a federal children's bureau. It is now before the House and the National Child Labor Committee is urging every person in the country who is interested in the welfare of children to telegraph or write his congressman in favor of it. But two weeks remain before adjournment and only prompt action can hope to secure favorable action in the House.

It was most appropriate, therefore, that the Child Welfare Exhibit in New York closed last Saturday with a final constructive demand for the children's bureau.

The National Child Labor Committee, aided and abetted by every important children's organization in the country, and by many others, including the national bodies of club women and organized labor, has kept the matter constantly before Congress for four years. During that time its special agent, A. J. McKelway, has rallied an encouraging body of supporters in both houses. Probably the bill creating the bureau has a clear majority today, but it has been impossible to get it to a vote. Last session it died on the calendar. But there have been enough powerful opponents to prevent its passage. Some of them fear results which might follow the investigations the bureau is expected to make. Others object to the creation of any new government bureaus. Still others take a stand for economy, urging that the proposed initial appropriation of $25,000 will be but the first small drop in a very large bucket. The combination of all these elements has kept the bill from having a chance.

The campaign for the children's bureau, as brought out at the Child Welfare Exhibit by the chairman, Owen R. Lovejoy, Senator Robert L. Owen of Oklahoma, Mrs. Florence Kelley, and A. J. McKelway, is based on the theory that the federal government should give the country adequate, unbiased facts upon which, when needed, state and local legislation may be based. It should, it has been suggested, study infant mortality, child labor, delinquency, dependence and allied subjects on a national basis, and prove an extremely valuable extension in child life of what the census does for the whole population, and what other departments, notably the Department of Agriculture, do for busi-

ness of various sorts. If government investigations and reports have business value there is little question nowadays of the propriety of making them; but if they have only the remoter elements of mere human values they must be established against the opposition of many who have not yet learned their importance.

On motion of the chairman, Owen R. Lovejoy, a rising vote for the bureau was taken, which proved to be unanimous.

COURTS AND PROBATION INADEQUATE IN NEW YORK

The final week of the exhibit opened Sunday night with an address by Prof. George W. Kirchwey of Columbia, on the principles—protection and prevention not punishment—underlying the juvenile court system, and the inadequate equipment of the New York court for carrying out those principles. At the Monday session Chief Justice Russell told of the extension of the New York Children's Court under the provisions of the Page law. Judge Franklin C. Hoyt read a paper on juvenile court work and the lines of probable development in the future, urging, with Professor Kirchwey, the need of numerous branch courts throughout the city. Judge Robert J. Wilkin spoke of some aspects of the work of the Brooklyn court and urged that the public keep itself informed of conditions in courts and prisons.

The work of the Washington Juvenile Court was described by Judge William H. deLacy, who brought out the need of infinite patience on the part of the judge and probation officer who desire to make a good citizen of a delinquent child, a task in which the Washington court is greatly helped by the power given it to deal with delinquent parents. Judge Harvey H. Baker of Boston gave a thoughtful account of the work of the juvenile court in a city community of medium size, urging the importance of constant co-operation between judge and probation officer.

The workings of the probation system in New York were clearly outlined by Arthur W. Towne, secretary of the State Probation Commission. He dwelt also upon the excessive use of the fining system in New York city, which, he held, simply penalizes poverty, and which is due in great part to the inadequacy of the city's probation system. Homer Folks, president of the commission, spoke still more vigorously of the lack of proper probation in New York and urged that with a little more economy along other lines of expenditure—for instance, cutting out ten of the eighty-five automobiles now used by city departments—the city would have little difficulty in replacing the two probation officers now employed, by the fifty that should be employed to look after the 12,000 children brought annually before the Children's Court.

A study of juvenile criminality made by Dr. M. G. Schlapp showed an increase within the last twenty-five years. Figures taken from several reformatories indicated that a large majority of their inmates are subnormal, and from this fact Dr. Schlapp reasoned that pre-

THE HOPE OF THE FUTURE.

The *American* holds that "the abuses that have crept up through the ages, under the influence of isolation and individual selfishness, can be corrected and wiped out only by the power of co-operation and intelligent organized philanthropy," which were demonstrated in the Child Welfare Exhibit.

ventive medical and psychopathic work in home and school, beginning with the compulsory registration of the feeble-minded, would in time lessen the number of children brought to the court.

REFORMATORIES MORE SCHOOLS THAN PRISONS

At the evening session the subject was reformatories. Mrs. Joseph Allen of the Hudson Training School for Girls spoke of the greater need for commitment in the case of girls on account of the greater moral danger to them than to boys of bad environment.

Hastings H. Hart showed how since the Children's Court had taken the reproach of criminality from the child, the reformatory had become a school instead of a prison—a point which was also brought out by Rabbi Schulman in his description of the Hawthorne School of the Jewish Protectory, to whose alumni boys are proud to belong. Dr. Hart's subject was reformatory construction, and he showed by an interesting series of slides how the cottage system everywhere is tending to displace the old congregate institution.

Philanthropy and the Child was the subject of the Thursday conferences. Some light on the institutional life of dependent children was thrown by Ludwig Bernstein, superintendent of the Hebrew Sheltering Guardian Society, in his account of the new educational system about to be adopted in their home. In contrast to the institutional system, Charles Loring Brace told of the widespread work of the Children's Aid Society in the fifty years of its existence in providing homes of adoption for 26,000 destitute children. Under the subject of Home Relief both Secretary Robert W. Hebberd of the State Board of Charities and Mrs. William Einstein of the Widowed Mothers' Association, pointed out that the support of private relief societies by the public is inadequate, and urged that power be given the city to pension widows, the pension money to be administered by private relief societies.

THE LAST OF PHOSSY JAW"

At the suggestion of President Taft the Diamond Match Company gives to the nation the free use of the most widely used substitute for white phosphorus. This is the last step in a long and successful effort to remove most of the possible objections to a law prohibiting matches made of poisonous phosphorus.

Two years ago the United States, as now, was almost the only country of commercial importance which allowed the use of this worse than deadly poison to the match workers.

Through the efforts of the American Association for Labor Legislation, agents of the government visited the match factories in 1909 and found many cases of the dread necrosis or "phossy jaw," which rots the teeth and jawbones and requires mutilating operations. The report of the investigation, which was written by John B. Andrews, secretary of the American Association for Labor Legislation, enlisted the interest of President Taft who asked that a bill to stop the danger be prepared.

As it happened, a single company, big enough to be known as the match trust, owned in this country a patent that robs phosphorus of its perils.[1] Therefore the passage of such an act seemed to give that company a monopoly control, to which there was strong objection. The smaller companies, though anxious to do away with white phosphorus after the recent disclosures had enlightened the public of its dangers, were slow to come to terms with the Diamond Match Company when it offered to license companies to use sesquisulphide. The original terms suggested were such as almost to make it impossible for all the companies to agree. Objections were made to limitations upon the number of matches to be packed in a box, to a requirement that all the companies petition for a revision of the tariff on matches, and to provisions which tended to limit the number of matches each licensee could produce. These objections were finally met, and eight companies executed stipulations giving to them the right to use the patented process. This, however, did not still the objections of all, and as a result the Dia-

[1] Making all Matches Safeties, by James P. Heaton, THE SURVEY for December 3.

mond Company transferred its title to the patent to three trustees.

Even this concession did not remove all the objections. The president then wrote to the trustees suggesting that the use of the patent be made free to all. The owner of the patent agreed to do this. The Diamond Match Company gave up its title and submitted to its licensees the alternative of either joining with it in presenting the patent to the nation or of having the sums they had paid for their rights in the process refunded. Some have united in making the present and some have asked to have their money back. This act marks the end of a long campaign. The Diamond Match Company, by successive steps in response to publicity, has at last made every possible concession since it has nothing more to give. It remains to be seen what further objections will be made to the Esch bill, which proposes to make all matches safeties, and to add the United States to the ranks of the nations which have joined hands in a worldwide fight against poisonous phosphorus. The bill is now before a sub-committee of the Ways and Means Committee of which Congressman Dalzell is chairman. He is being urged from all sides to report it promptly in order that action may be taken at this session.

"LET THERE BE LIGHT" IN BROOKLYN TENEMENTS

A carefully planned campaign to bring more light and better ventilation into Brooklyn tenements opened Monday evening with a mass meeting at the Academy of Music, at which addresses were made by John J. Murphy, tenement house commissioner; Frank H. Mann, deputy commissioner for Brooklyn; Chief Magistrate Otto Kempner; Lawrence Veiller, secretary of the National Housing Association; Jacob A. Riis, and Frederick B. Pratt. Theodore Roosevelt, who as governor of New York signed the present tenement law for New York city, has agreed to help in the campaign.

The movement was initiated by the Tenement House Committee and the Committee on the Prevention of Tuberculosis of the Brooklyn Bureau of Charities. A large number of Brooklyn organizations have endorsed the movement and agreed to help. These include the Central Labor Union, the District Visiting Nurse Association, the Woman's Municipal League, a number of churches and settlements, several political organizations, and many others.

Dean in New Orleans Times-Democrat.

UNDESIRABLE CITIZENS.

The New Orleans Board of Health has proposed measures to exterminate the house fly, which Dr. Woods Hutchinson has called the most dangerous of wild beasts. The mosquito which carries yellow fever has been ostracized in New Orleans, and if the house fly is successfully sent about its business the city may achieve something of much greater value than the Panama Canal Exposition which it lost to San Francisco.

The committee announces that there are 49,000 absolutely dark interior bedrooms, and 123,000 illegally lighted rooms in Brooklyn tenements.

Its plan of procedure, following the publicity given by the mass meeting, is to cut the city into small districts, each of which will be given to some neighborhood organization to make visits and report to the owners of tenements. The owners will thus be urged by their neighbors and associates to make improvements, and it is believed that the publicity which the committee hopes to secure will act as a strong moral impetus toward improvement. The joint committee in charge has adopted as its slogan, "Let there be light."

THE DISTRICT LEADERS' BILL

The committee on criminal courts of the New York Charity Organization Society has called upon all individuals and organizations interested to help in defeating Senate bill 79, introduced in the

Legislature by Senator Christopher D. Sullivan. The bill is held by the committee to be a direct attack for sinister political purposes on the important reforms effected in the minor courts of New York city by the Page law.[1]

Senator Sullivan's bill threatens to throw the magistrates' courts into the hands of the political district leaders by abolishing the Page law provision by which magistrates are appointed by the mayor and making the office elective by districts. The committee finds it difficult to see how judges who must look to their district leaders for their first nomination as well as for subsequent nominations can be free from political influence in their work. Furthermore, this bill would operate indirectly to abolish the Domestic Relations Court, the night courts, and any other specialized court, for the higher courts have held that a judge elected by a district cannot sit in courts outside of that district.

The bill appears to the committee a bold attack upon the courts by dissatisfied politicians whose interests have suffered by the reforms of the Page law.

As one step in an organized movement to fight this bill and other similar attacks against the Page law which perhaps may be expected with the regularity of similar attempts to amend the tenement-house law, the committee has voted to take no steps to defend the constitutionality of clause 79 of the Page law, and not to oppose any bill for the repeal of this clause which may be introduced in the Legislature. Clause 79 (regarding prostitutes) is the only portion of the Page law on which social workers and agencies have held differing opinions. The committee hopes by this action to avoid further controversy over a single clause and to unite all interested in the integrity of the minor courts in a solid front of opposition to bills which would injure their administration.

VILLAGE CONFERENCE ON RURAL SOCIAL ADVANCE

A social conference was held at the opening of winter in the little township of Rowe, Mass., representatives of whose five hundred inhabitants, scattered over twenty-six miles of farm lands, met to consider the special problems of a rural community. The grange, the library, the school, and the church all took part in the conference, which was opened by an address from the minister of the Unitarian Church, Margaret B. Barnard, who preached on the general subject of the Social Problems of the Country Town. She pointed out the need of greater cooperation, of more careful study of economic conditions in an agricultural community, and of clean, safe amusements for young people. At the regular opening session Prof. Roland W. Guss urged the introduction of agricultural courses into country schools, "not so much that the school shall make farmers as that it shall stop unmaking them."

A special effort was made to interest the Italian settlers, for whom a separate meeting was held.

At the supper which closed the conference the Rev. Elmer S. Forbes, secretary of the Department of Social Service of the Unitarian Association, urged that a plan of organization for social improvement should follow as a consequence of the enthusiasm awakened by the conference. Such an organization should concern itself with the details of material improvement of the village, such as good roads, watering troughs, and clean streets. It should plan recreation fitted to teach good manners and good morals to the young people. It should further concern itself with improving education and health, devoting especial attention to the elimination of tuberculosis. Charles M. Gardner, master of the State Grange, closed the meeting with a speech congratulating Rowe for inaugurating from within its own group of citizens a social movement which ought to be taken up by the two hundred rural towns of Massachusetts at this time, as the movement back to the soil is making the country districts of constantly increasing importance.

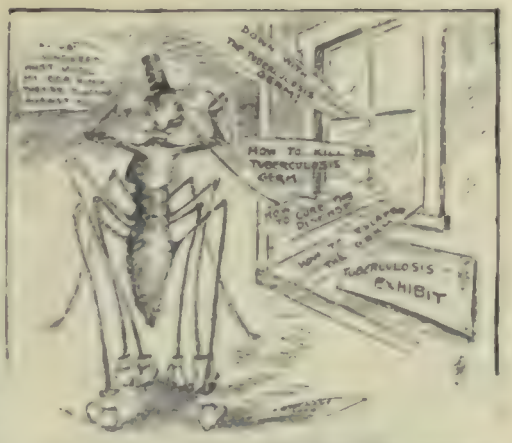
CHRISTMAS RUSH LESS THIS YEAR



The large attendance at the recent annual meeting of the Consumers' League of the City of New York indicated the growing influence which this body has with the shopping public.

That this influence has made itself widely felt in the betterment of mercantile conditions was shown by two specific statements in the annual report of the president, Mrs. Frederick Nathan: first, that a careful investigation of the New York department stores during the last Christmas season revealed the fact that the ten years' campaign for early Christmas shopping had been effective to such an extent that there was a marked decrease in the number of shoppers in the evenings of the week before Christmas; second, that the principle of the consumers' responsibility for and interest in the conditions under which merchandise is made and sold has become so firmly established that during the past year New York firms, in order to draw shoppers to their stores, advertised in one case that no sweatshop made goods or products of child labor were sold in the store, and in another that the firm's interest in the welfare of its employes was so great that when obliged to keep open evenings before Christmas two shifts of workers were employed.

In view of the fact that investigators have found inadequate arrangements for fire-escapes in many department stores, the league is interesting itself in this phase of the protection of working women.

The president's report pointed out forcefully the necessity for legislation providing for a limited working week of six days for women in mercantile establishments. The common occurrence of Sunday work during rush seasons in all departments, and in the auditing departments throughout the year, has led the league to a realization of the need of securing one day of rest to department store women.

An incident of the meeting was Mrs. Nathan's frank announcement that actual violations of the labor law are common in many of the best known department stores, and that the Department of Labor has found it necessary to bring prosecutions against one-half of the members of so respectable a body as the New York Retail Drygoods Association.

SOCIAL SERVICE COMMISSION FOR WISCONSIN CHURCHES

The Wisconsin Federation of Churches and Christian Workers has decided to create a social service commission to consist of fifteen members. Those already named are the Rev. W. G. Humphrey, Charles J. Galpin, Prof. S. W. Gilman, Prof. R. C. Chapin, Pres. W. O. Carrier, Rev. R. H. Edwards, J. G. Rosebush, and M. S. Dudgeon. These nine members are empowered to elect the remaining six.

The functions of the commission are to increase the acquaintance of the people of the churches with the facts of the leading social problems, to serve as an advisory committee in matters of the relationship between the churches and social betterment movements, to investigate any moral, social, and industrial conditions of an aggravated nature, to represent the federation at hearings of legislative committees in support of, or opposition to, proposed legislation. This is the first state social service commission in the United States.

EDITORIAL GRIST

COMPULSORY PLAY-GROUNDS

WILLIAM E. HARMON
New York

A bill has been introduced in the Legislature of the state of Washington entitled House bill No. 81, providing for the inclusion of small parks and playgrounds in all future land sub-divisions within or adjoining the limits of cities of the first, second, and third classes.

According to the best available information, this is the first attempt based on sound economics, arbitrarily to combine parks and playgrounds with street plans in private real estate development. It is based on the theory that as streets of liberal width give correspondingly greater value to abutting land, so do parks and similar open spaces give increased value to contiguous property. That there must be some municipal restriction put upon land sub-divisions destined to become a permanent part of the city in which they are located is an already accepted principle in many sections of the country, but it remained for this progressive western state to carry along its logical lines of development.

It is highly important, from the point of view of true economics, that no undue burden be placed upon practical work in the field of realty development, or home building on a large scale, for in the end this burden must be borne by the buyer. Under the provisions of this bill, land can be laid out and permanent open spaces established without taking a penny out of the pockets of the operator, or adding a penny cost to the ultimate consumer of the land.

If the areas of land segregated are properly distributed, so that the adjacent lots have either a front or rear exposure upon the open space, the added value to such lots will compensate for the land given up to public use. This can be demonstrated by reference to an article on the subject published in THE SURVEY for December 11, 1909.

If further proof be required, it will be only necessary to note the excess prices asked for lands fronting on parks in growing sections of the city over neighboring lot prices. Then compare this excess with the original, or wholesale, cost per square foot of such land, and in the average instance it will more than equal the original, or wholesale, cost of the property. If the park area opposite the lot be only equal to the lot itself, it is self-evident that such land could have been taken from the owner without any loss to him.

In sub-dividing real estate, the private operator always assumes an important financial responsibility, and in the fear of failure usually skimps his open spaces in order to have as much land as possible to offer the public. Had he large experience in this work, he would realize this policy is not profitable to him, while very injurious to the community. Most realty developments are in charge of men of limited experience, and the operator

Cruft in Kansas City Post.

"WHY NOT?"

The *Post* puts the pertinent inquiry as to why women's hours of work should not be limited to nine. The Kansas City branch of the Association of Collegiate Alumnae has joined other Missouri organizations in petitioning the Legislature to set up nine hours as a maximum working day for all wage-earning women.

is not to be condemned from the fact that his primary responsibility to his financial constituency obscures the more remote responsibility to the community.

Even if the Washington bill operated as a handicap to speculative or land-operative profits, it might well be justified from the point of view of the public weal, but with this commendable bill no such problem is encountered.

The present method of acquiring parks and playgrounds by condemnation entails enormous waste of public funds. Under this law the extension of cities can proceed with a normal relationship established between housings and open areas, without cost to the taxpayer, the land operator, or the home buyer.

It is to be hoped that House bill No. 81 will be speedily incorporated into the statutes of the state of Washington, where it may stand as an example of a legal enactment in which private rights and public welfare are both conserved.

IF THE RED CROSS RAN OUR PENSIONS

FREDERIC ALMY
Secretary Buffalo Charity Organization Society

The United States government can do large things well. It can build a great canal or a great dam with economy and efficiency; but its chief relief work is so poor that it would be a disgrace to a modern relief society. Our government undertook to pension all disabled veterans of the Civil War who were in need. Through wholesale methods, and the exploitation of politicians, it has spent for these veterans sums that seem literally beyond the dreams of avarice, and yet everywhere we see on the one hand, brave soldiers in want, and on the other hand, thousands of men and girls who never saw a battle but are drawing pensions. The pension appetite hath "grown by what it fed on."

In 1866 there were 126,722 pensioners; in 1909, forty-four years after the war, there were 946,194, although at least three-quarters of the soldiers of the Civil War were dead. Those who give doles to many have never enough for any. Is it strange that the relief is still inadequate, and that a bill for vast increases has just passed the House of Representatives? Our pensions have risen prodigiously from $28,000,000 in 1878 (thirteen years after the war) to $165,000,000 or more than three million dollars a week, in 1908. Can we believe that the great increase which is now contemplated will give more relief or will it only give more pensions? Can the government show now a single veteran who receives generous, intelligent aid such as is being given, for example, to the victims of the Cherry Mine disaster? Would that the National Red Cross, which administered the aid there, could be put in charge of our pension relief also. Nothing could be more fitting, or more effective.

At the Cherry Mine, as elsewhere where the Red Cross has been in charge, many women would claim aid as the widows of one man, and all the other fakes, so successful in the Pension Bureau, were attempted, but through vigorous inquiry a limited fund was made to yield relief averaging $3,540[1] for the family of each victim. This relief, moreover, is being most intelligently administered. If the Red Cross had followed the rules of war pensions at the Cherry Mine, the result would have been as inadequate as with our war pensions. Incredible as it seems, pensions are paid to all who served ninety days in the war, whether they are rich or poor, stalwart or disabled; and as young widows of old soldiers get pensions for life it is almost necessary to put a guard around the Soldiers Homes to keep the women out. Women have made old soldiers drunk in order to marry them, and this a grateful country rewards.

It is the old story of the abuses of rule-of-thumb relief without the "insulting stigma" of investigation. Although the pension roll is presumably a roll of honor its records are not open to public inspection! A reform on this point is one of the three demands made by the *Worlds Work* in its current articles on the Pension Bureau. We have often seen public outdoor relief reduced two-thirds

[1] THE SURVEY, Vol. 24, p. 796.

in a single year by the investigations of a charity organization society, to the confusion of politicians and willing paupers, but to the great advantage of disabled families who were starving on meager aid. A similar reforming of our war pensions is badly needed.

The contagion of relief is also familiar to students of this subject; especially where the appeal is to the public treasury, which to the imagination of the poor seems inexhaustible. Men who have never thought of public aid ask for it because their neighbors do.

The theory of the pension lobbyist is that if anyone does not get enough all should get more. That way madness lies, with national dishonor and national bankruptcy, and this madness is already very near. We are paying a pension roll which amounts to ten dollars a year from every family in the country, with wretched results; but to oppose a vast increase is "unpatriotic." The present system is giving us a roll of cowards in our legislatures rather than a roll of heroes on our pension lists. Is there any more stigma in a protective investigation for heroes of the Civil War than for Carnegie medal heroes, or for the innocent victims of the San Francisco earthquake who receive Red Cross aid? We boast of our national generosity and forget that "he does not give best who gives most, but he gives most who gives best." When relief is extensive rather than intensive it becomes expensive and also inefficient. Deserters, and widows who were born long after the war, are stealing aid from living veterans who have a too scanty pittance for old age. The dollar-a-day bill, which is now proposed, would give thirty dollars a month for life to every veteran, rich or poor, sick or well, and would give the pension agents another lease of life. It would do this at the cost of the indigent disabled veterans, and of every good cause in the country. To vote for such a bill is cowardice.

It is not amiss to quote here three great sayings of Grover Cleveland, who as president reformed many pension abuses:

"Public office is a public trust."

"I had thought that the pension roll was a roll of honor."

"It is a condition and not a theory that confronts us."

DR. JANEWAY

Edward G. Janeway, who died on February 10 in his seventieth year, was both a great physician and a public-spirited citizen. He has been best known perhaps as one of the foremost diagnosticians of our time, and that in itself is a public service. In this character, moreover, his wonderful skill and insight were at the disposal of uncounted individuals who could not have paid for expert medical advice. During the nearly fifty years of his professional life in New York city he held many hospital appointments, being connected at different times with the Charity, Mt. Sinai, and Presbyterian Hospitals and the Hospital for Ruptured and Crippled. Until very recent years he gave time also to teaching, leaving his last position, as dean and professor of medicine of University and Bellevue Hospital Medical College, only in 1905. From 1875 to 1882 he was health commissioner of the city, and he served on various special boards concerned with the public health, such as the advisory committee of the Chamber of Commerce during the cholera of 1892.

With the social movements for the prevention of disease which he saw develop in his later years he had the greatest sympathy, and was often ready to help particular measures of social importance by giving them his endorsement. He was intimately identified with the tuberculosis movement from its beginning. He had rarely missed a meeting of the New York Committee on the Prevention of Tuberculosis in the eight years since it was organized, and he served on many of its sub-committees. He was a member of the executive committee of the last International Tuberculosis Congress, and was president of the National Association last year.

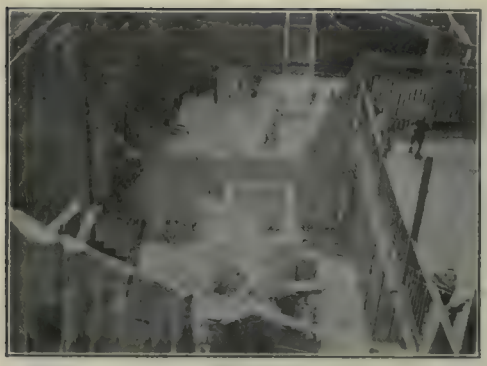
HAPPY DESPITE THE SLOP-SINK.

THE HOUSING AWAKENING[1]

VI.

NEW TENANTS AND OLD SHACKS

ROGER N. BALDWIN
SECRETARY, ST. LOUIS CIVIC LEAGUE



So far as the housing problem of decent living is concerned, St. Louis was quite asleep until very recent years. We had been told by an eastern authority that we had no tenement-house evil, for we had no tenements over three stories high, we had regular streets, an alley through every block, and plenty of vacant lots, and sunlight, and air (and smoke). We were flattered by the distinction of an almost unique type of one-story three- or four-room brick dwelling with its neat little yard, quite characteristic of thrifty German South St. Louis.

Some people disagreed, however. They inspected our east end, particularly the tenements occupied by immigrant peoples. They found a sea of frame shacks and brick houses, two and sometimes three on a lot and one or two on the alley rear—flimsy structures of one and one-half to three stories, poorly lighted, without plumbing, all served by yard vaults (many unsewered), and many of them crowded around the four sides of a court, entered only by covered passageways from the street or alley. The surface-drained yards were filled with garbage piled against rotting fences, heaps of ashes, and flying waste paper. There was no city collection of ashes or paper, and the garbage-wagon irregularly picked up only the garbage placed in receptacles convenient to the driver's fancy.

The investigation made by the Civic League in 1907, as a result of the agitation on housing, disclosed the facts that in a selected, but typical, district of forty-eight blocks, in which lived 13,223 individuals, there were only sixty-six bath-tubs and 204 water-closets, and that so few tenements got city water from anywhere except the common yard hydrant that they could be counted on the fingers.

The storage of decaying fruit and rags, and bakeries in rear rooms was a common feature in a district which knew no regulation, no

[1] A series of articles describing housing conditions in typical American cities, large and small, East and West, and the efforts being made to improve these conditions. Published with the co-operation of the National Housing Association. I. Introduction, by Lawrence Veiller, THE SURVEY, November 19, 1910, price 10 cents: II. Socialists and Slums—Milwaukee, by Carl D. Thompson, December 3, 1910, price 25 cents: III. The Awakening of a State—Indiana, by Albion Fellows Bacon, December 17, 1910, price 10 cents: IV. SOME TYPICAL BACKYARDS.

education in the decencies of living, nothing but the chaos of a helter-skelter construction of frame and brick shacks, renting monthly at an average of $3.50 a room, largely to the foreign-born families living in overcrowded two- to three-room "apartments."

The Civic League made a careful study and a most readable report, widely distributed. It recommended definite remedies: abolition of all privy vaults, exterior toilets and sinks; general reconstruction of old tenement houses by simple plumbing, proper and accessible water supply, and condemnation of unsafe and insanitary structures; a general ordinance covering new construction and the maintenance of tenements; prohibition of bakeries, butcher-shops, sweat-shops, and the storage of fruit and rags in stables and tenements; a bill and an appropriation for the collection of ashes and rubbish by the Street Department.

That was two and one-half years ago. The law governing the construction and maintenance of new tenements has been passed, and on the whole is working well in apartment houses as well as in the few new east end structures.

But that is all. All other efforts have met either determined opposition or ineffective action. The bill to abolish privies and substitute water-closets, interior or exterior, so aroused the real estate men and landlords, that at one of a series of public hearings before the House of Delegates in the winter of 1910 the house chamber was packed to the doors with seven or eight hundred landlords—largely Jewish immigrants—who attempted to hoot down the advocates of the bill. The labor unions and social workers were on one side, the real estate men and reactionaries on the other. "Privy vaults could not be abolished." It was an unreasonable and confiscating cost, an impossibility to secure a non-freezing water-closet for use in yard compartments—and it hurt the pocket! The newspapers, for the most part, declined to print material on the agitation, and only the fact that the overcrowded public hearing broke up in a riot secured any effective publicity.

The bill to promote the reconstruction of old tenements with water on each floor, lights in the halls, prohibition of the use of cellars for living, stipulation of the number of windows per room, etc.—all of this much-needed regulation still slumbers in the pigeon-holes of a reform Assembly.

But the leaven works. Following the agitation for legislation came the National Conference of Charities and Correction and more publicity. One newspaper waged war in the cause of the bills. Housing experts viewed the littered alleys and filthy courts, the few, but unique, rear sheds on the alley, choked with heaps of week-old garbage, the stench of which of a summer's night permeates the entire east end of the city. Housing experts crawled through dark passageways into foul cellars, damp with yard drainage, yet half filled with stored fruit. No inspection, no regulation—a mere living for the benefit of landlords.

And experts heard the interesting tale that the worst district of town was the property of the Board of Education! Inquiry brought out the facts of a peculiar system of land tenure by which the board (and many other owners) for years has rented its property on leases forever renewable, to persons who in turn rent it out, and whose advantage it is to make no improvements, since a revaluation every ten years is the basis of the price paid

OLD DWELLINGS.

St. Louis slums are of every kind. The outside drain in the picture in the lower right corner is found in most tenements.

on the renewed lease. What these experts thought and what they freely said was boldly published.

Interest in improved housing is belated, but it is acute. Settlement workers who do not see a health inspector from one month's end to another, whose pleading with public officials has brought nothing but excuses, but who insist earnestly and continuously on the relation of their own efforts to the larger work of the city's obligation, know that a solution must be near at hand.

We are to be congratulated on our street and alley arrangements, on our new tenement law, on our lack of high dwellings, but we still have our 10,000 privy vaults and our acres of shacks—a vast deal to be rid of—and an aggregation of new tenants from across the sea who will need, for the art of decent living, more than the ministrations of the gar-

bage-man and the health inspector, even were they to visit daily.

This educational work for a cleaner city and a more wholesome home life must be based, however, on a comprehensive code of regulation, which will show the city's appreciation of a standard of decent living.

WHERE THEY HOARD GARBAGE.

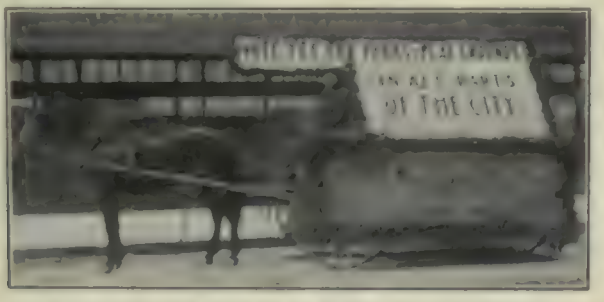
GRAND RAPIDS GETS RESULTS

JOHN IHLDER

The progressive element among the people of Grand Rapids, Mich., has found a way to get results. For years progressives and even conservatives, knew that the city needed important improvements. But the very fact that there were several needed stood in the way of getting any of them; for each had its special advocates who feared that if any other were put through the cost would be used as an argument against the adoption of theirs for years to come. So year after year proposals which would have commanded a majority of votes, if put before the people purely on their merits, were defeated by the combined strength of those who are against every improvement that costs public money, with those who wished something else to come first.

The municipal affairs committee of the Board of Trade made the first attempt at solving this problem three years ago, when it induced the government to appropriate money for a city plan. A commission appointed by the mayor, aided by John M. Carrère and Arnold W. Brunner, prepared a report which made a careful survey of the city's needs and indicated the best way to meet these needs. With this as a guide, the municipal affairs committee called a conference of officials and representative citizens as the climax of its second civic revival—the first had secured the appropriation for the city plan report. At the conference the committee proposed that all efforts should be concentrated on securing one improvement, that when this had been placed fairly before the people and adopted or rejected, another conference should be called and another improvement decided upon which should receive united support. This proposal received the unanimous endorsement of the conference. The committee then presented a list of needed improvements, and after debate the conference decided unanimously (only one man not voting) to concentrate all efforts on securing a bond issue for a water filtration plant.

The campaign ended in victory at the municipal election last spring. There had been two previous attempts to secure pure water for Grand Rapids, which had ended in failure. Four days after the election the committee called another conference, to which it invited officers of the district or neighborhood associations, the trades and labor council, and the real estate board. This conference decided unanimously to concentrate all efforts on securing at the fall election a bond issue for an extension of the park and playground system, as recommended in the city plan report. The campaign began immediately. The Park Board, which had with difficulty been restrained from putting the proposal before the people at the spring election, took an active part. During the summer Grand Rapids has long had band concerts in present parks. Last year many of the concerts were given in districts which have no parks, and between numbers park and other officials and citizens made addresses advocating the bond issue, illustrated with lantern slides which emphasized their points. All the organizations which had been represented at the conference, with one exception, formally endorsed the proposal. A number of business and professional men subscribed money for the equipment and supervision of a playground as an earnest of their desire to help, and the city government was induced to provide money for the equipment and supervision of three other playgrounds.



As election drew near the Park Board became even more active. It had in its superintendent, Eugene Goebel, a man who had already commended himself to the people by the results he had achieved on a small appro-

priation. Mr. Goebel showed that he is a persuasive campaigner as well as an efficient park superintendent. Upon him in the last weeks fell the burden of the detail work. He conducted meetings, secured endorsements from organizations in every part of the city, and waged a continuous publicity campaign through the newspapers, by means of a wagon which constantly traversed the streets, and by great posters on the billboards.

Meanwhile the municipal affairs committee had reorganized the Grand Rapids Playground Association so that through its dollar memberships it might reach every corner of the town, had assisted in getting out literature, and had secured options on a considerable part of the land recommended by the city plan report, so that if the bond issue carried there might be no danger of prices taking a sudden boom. Aid from without was given by Graham Romeyn Taylor, who made three addresses just before the election.

In all this campaign there was only one serious setback. The district organization in that part of the town which most needs parks and playgrounds, and which has now its last opportunity to get playgrounds without destroying buildings, listened to an alderman who advised against the bond issue, and recalled its endorsement. In this district, which contains over 12,000 inhabitants, there remains only one tract of seven acres which is perfectly suited to playground purposes. This is almost in the center of the district and has already been platted for building. After several rebuffs the municipal affairs committee finally secured an option on it. Then the district organization voted against the bond issue and the owner, who had been treated in the same way by the aldermen the year before, withdrew the option. This set-back lost the ward, but at the election the bond issue carried by a large majority.

The municipal affairs committee has issued a call for a third conference, which shall decide upon the next step to take in making Grand Rapids all that the city plan report says it may be.

CAMPAIGNING FOR PARKS AND PLAYGROUNDS IN GRAND RAPIDS.

CIVIC IMPROVEMENT

CHARLES MULFORD ROBINSON, Contributing Editor

TOWN PLANNING BY CHARTER

The pending new charter for the city of St. Louis makes provision for city planning. It creates a Board of Public Improvements, to consist of five members appointed by the mayor, which is to select the heads of the Departments of Engineering, Construction, Streets, Water, Buildings, Parks and Public Utilities. Besides the general duties under the old charter, various powers are given the board, including that "to make a plan for the harmonious development of the city." It is interesting, with this authority in mind, to read over again the list of departments which would be called upon to co-operate in the preparation of such a plan.

A CALL TO THE ART IMPULSE

In the *Village Magazine* there is an editorial addressed to the "Art Student who has Returned to the Village." It contains these words that are widely applicable "Oh, all you students that I have loved, whose work I have enviously admired, who are now back home grubbing at portraits, though they are not your specialty; or designing billboards, though they are not your divine call; or acting on the committee to paper the church and buying bad paper to please them; or back on the home newspaper that will not often print your short novels; or singing in the old choir for no salary at all; or composing advertisements in the real estate office and neglecting your

lyrics; or taking charge of the Sunday school orchestra and curing them of the Moody-Sankey habit—Greeting, and God-speed to you! If you have any cherished beauty-enterprise, undertake it where you are. You will find no better place in all America."

SMOKE CLOSED THE SCHOOLS

The Women's Organization for Smoke Abatement in St. Louis, backed by the Civic League, has been making a carefully planned crusade since the opening of the new year against those industrial plants, which by belching forth thick clouds of black smoke make life uncomfortable. Six hundred pupils in one of the public schools had to be dismissed at 11 o'clock on one of the darkest days, while at other schools within the smoke belt pupils were entertained with stories by their teachers during the time it was too dark to study.

The city was divided into 160 inspection districts each of which was patrolled daily by two women together, who watched all offenders twenty minutes to be sure that the condition observed was not merely temporary. The papers day after day published smoke pictures. The president of the board of public improvements created a special temporary force of 200 smoke inspectors. In the period between December 6 and January 14 the inspector of boilers and elevators took up almost as many cases as it had in the previous seven months.

NEW JERSEY TRIES COMMISSION

The commission government idea has struck New Jersey. The climax of the campaign was reached on January 24 when a state convention assembled at Trenton. Over 100 delegates from twenty cities, six of which were represented by their mayors in person, attended. A committee composed of one representative from each city in the state interested in the problem will meet shortly to draft a bill which the Legislature will be requested to pass. Much of the interest created is due to the addresses which John MacVicar of Des Moines has been delivering throughout the state.

ALUMNI SOCIETIES AS CIVIC CLUBS

Since local university alumni associations are often more interested in having a good time themselves than in community recreation, it is well to note how much the Harvard Club has done for Syracuse. Under its auspices Sunday band concerts in the parks were started, which were later taken over by the city. The club initiated the indoor Sunday concert now held with much success in the Central High School, and this winter it suggested a new form of municipal recreation which has been promptly put into effect by the officials. This is a public skating rink on the Erie Canal. The city has provided a cloak room and an attendant and has strung large arc lights over the canal for several blocks. Thus the people have, in the very center of the city, a free skating rink of much greater length than is usual in rinks to which admission is charged. This work is the more interesting because it is the first which Syracuse has undertaken, at least in recent years, in the direction of winter playgrounds.

AN EFFECTIVE SOCIETY

A pamphlet sent out by the American Scenic and Historic Preservation Society, describing its objects and accomplishments, is of interest for the remarkable record which it contains. The society is not very much in public evidence; but in doing its work quietly it seems to have performed it none the less effectively. It is always ready to co-operate with other agencies to secure things which it believes are desirable, without seeking to appropriate all the credit. During the last decade members of the society have made personal gifts aggregating $2,347,200 for public parks, statues, tablets, and the preservation and restoration of historic buildings. The society has been chiefly instrumental in the creation of seven state parks and largely responsible for an eighth. It has done much to secure appropriations for these parks, is the custodian of five state properties, and was the leading factor in establishing Washington's Headquarters Park in New York city at a cost of $235,000. The list of old buildings it has saved or restored, and of historical sites it has secured and marked, is very long.

AKRON'S CHAMBER OF COMMERCE

The Chamber of Commerce of Akron, O., is representative of that type of commercial organization which takes a broad civic interest in the community's progress. Its year book contains reports of committees, among which that on city improvement tells what it has done to secure a park for the city. It co-operated with the Park Commission in bringing to Akron Howard Evarts Weed, the Chicago landscape architect, to make city plans. It has interested itself in securing additional land around the new high school, in the care of shade trees of the city, in a yard improvement contest, and in various other matters for the betterment of Akron. The housing committee shows that it is largely responsible for an increase of eighty-three per cent in building permits issued during the last year, and in the effort to provide houses for the rapidly growing working population. There is also a municipal committee which has prepared a building code and concerned itself with questions of street paving, traffic congestion, flood control, and street lighting. There is no more encouraging sign than the evidence given by such reports as that from Akron of the broadening interest of business men in civic progress.

SUCCESS IN VILLAGE IMPROVEMENT

In the annual report of the Massachusetts Civic League, the statement of the committee on Village Improvement is included, which is signed by Parris T. Farwell, chairman. It attempts to answer the important question as

to what is the secret of success in village improvement work. The answer of the committee may be summarized as follows: First, the organization that would maintain a useful and permanent existence must be democratic. Second, the range of activities should be as comprehensive as possible. Third, the improvement society should never think that its work is done. Societies "that have charge of playgrounds, schools, and home gardens will find work each year to do, progress and improvement to make, new groups of children to provide with instruction and guidance. Even in the matter of trees, streets, and parks, it is not likely that in any town, as yet, there remains nothing to be done. Moreover, there are always likely to be unexpected events needing the attention of such organizations. A society on the watch can deal at once with unexpected forces, unforeseen enemies that threaten the beauty or comfort of a community. It can also take advantage of unforeseen opportunities. In growing communities, also, it is possible for an improvement society to study the development of the town and plan for its proper laying out, for some system, instead of the haphazard method too often employed in the location of public buildings, and in the mapping out of streets. It can enlist the interest of the whole community in planning for the development of the town under expert guidance, and can follow the working of the plan for years to come. In fact there is no end to the work of a society of this kind. And there will be no question of the continuance of a society which realizes that however good a town is it can be better still, and however beautiful it is it can become even more beautiful. It should also realize that if care is not taken the community will become speedily less beautiful."

PLAYGROUND SUGGESTIONS

Rochester, N. Y., has a pretty good playground system. Some of the grounds are under the jurisdiction of the Park Board, and some are controlled by the Board of Education. In addition there is a Children's Playground League, which has existed in recent years for the express purpose of maintaining a playground in a congested area. The space, surrounded on all sides but one by tall buildings, is very small, but it is crowded with children. It made a great impression on the visitors to the Playground Conference held in Rochester last spring. The directors of the league, in sending out their appeals for subscriptions this winter, have issued the reports of the supervisors of this ground in the form of a little leaflet. The reports contain interesting statements that may be suggestive in other places. In putting the grounds in order in the spring, when on account of the national convention it was desired that they should be even more spic and span than usual, the boys of the playground did all the necessary painting of the apparatus, fences, and shelter, inside and out. The girls washed the windows, made new curtains, and dusted all the books, with the result that a number of the delegates to the convention said that the playground was the neatest they had ever seen. Fridays during the summer were celebrated as flower days. Friends sent fresh blossoms, cut from their gardens, and the little poor children of the nearby tenements stood in line for a long time awaiting their turn to receive the bouquets, which were taken home and cherished as few flowers are. The great annual event is a band concert given by the park band. For this occasion the bare walls of the surrounding buildings are hung with flags and bunting, while hundreds of Japanese lanterns are strung from wires overhead. The children sing the songs they know, and there is dancing and a grand time. Last summer some women who had not forgotten their own childhood sent dolls to the playground. The first ones, says one of the supervisors, "were kept as playground dolls, and their time was fully taken up until they succumbed to the attention given them." After that unfortunate event a circle of King's Daughters prepared dozens of dressed dolls, so that the yearnings of the playground's little girls were more than satisfied.

PARK SYSTEM OF KANSAS CITY

The latest report of the park commissioners of Kansas City is a beautifully illustrated and unusually interesting pamphlet. Its excellence is due to the fact that it marks the closing of an era in the development of the remarkably complete park and boulevard system of Kansas City. Nearly twenty years ago, following a study of local conditions, the commissioners presented a plan which seemed to the community stupendous, and in the judgment of many good residents impossible of accomplishment. The year 1910, says the latest report, sees "the realization of that plan, in general and in detail, to a degree that is perhaps without precedent in such public work." As a matter of fact, the first plan has been augmented and elaborated to an extraordinary extent. In this respect the following figures are striking: The boulevards designed in the plans of 1893 totaled 9.85 miles; in 1910 28.64 miles have been built. The parks designed in 1893 covered 323.45 acres. Those accomplished in 1910 total 2,118.23 acres. With these statistics before one, it is interesting to read that the park and boulevard system "met with strong opposition" in the first few years. "Legal obstacles blocked the way. Enactment by state Legislature, which was expected to give power, did not stand in the Supreme Court. Charter amendment was found necessary, and that had to be decided in the courts." The large taxpayers did much to oppose, but the people as a whole were interested and the work went on. In sharp contrast to the early opposition to parks and boulevards has been the later approval. The greater part of the park land as it exists in 1910 cost nothing. So complete and elaborate, however, is the Kansas City

EDWARD J. WARD.

In charge of social center extension in the University of Wisconsin.

park and boulevard system, that it represents an expenditure of ten millions of dollars. But conservative real estate men, in formal estimate, have computed that the increase in value given to property by the creation of boulevards is a quarter of a million dollars more than the entire cost to the taxpayers of the entire system. Now the city is acquiring miles of boulevards which cost the park commmission nothing for original dedication and construction. Another interesting effect, the report claims, has been the elimination of the problem of congestion. "There is no present indication that the next generation will have to deal with that problem. Centers of congested population, growing more aggravated yearly, were abolished to make room for parks and boulevards. It is a notable fact that other centers of the same character did not take the places of those thus removed. The marked influence of the park and boulevard movement has been to scatter our population." Finally, the report points out that the population of Kansas City increased 51.7 per cent in the decade 1900-10. Among the twenty-five cities of one hundred thousand or more population, it was third in this respect. The two cities which surpassed it were Detroit and Denver, and the deduction is advanced that "the cities which have done most to improve conditions of living have gained most in numbers." Indeed, the report claims for Kansas City that "probably no other city in the country can show so large a proportion of its population, so many of its people of moderate means, living in such attractive environments."

SOCIAL CENTERS IN WISCONSIN

The noteworthy extension service through which the University of Wisconsin brings its advantages to the very doorsteps of the people received additional value last summer, when Edward J. Ward was secured from Rochester to undertake the work of social center promotion in Wisconsin. In the extension division of the university, of which Prof. Louis E. Reber is director, a department of civic and social center development was created. Through this Mr. Ward's work as adviser reaches local communities. Among those which have already been stirred by his efforts are Oshkosh, LaCrosse, Stoughton, Stanley, Madison, and Whitewater. But naturally a large part of his time has been devoted to Milwaukee, where conditions and cooperation were opportune for rapid progress.

Previous experience has well qualified Mr. Ward for the position which he now occupies. His former work as supervisor of playgrounds and social centers under the Rochester Board of Education is well known to readers of THE SURVEY.[1] Under his leadership the school buildings were put to use as evening social centers; and recreational gatherings, lectures, discussions, civic clubs, free motion picture entertainments, and other occasions revived, under modern city conditions, the social spirit of the "little red school house."

The social center idea, however, is far bigger than the school buildings. It brings into wider use any public place or building—park, playground, city hall, library—which may serve to spread the "get together" democratic spirit among all the people. In Rochester the Common Council chamber in the city hall has been used by a non-partisan organization whose Sunday afternoon meetings have done much to foster civic intelligence and public spirit. Similarly, a meeting recently took place in the council chamber of the St. Paul city hall, at which Mr. Ward was the principal speaker, instituting a series of discussions of municipal topics under the auspices of the City Club, the Social Service Club and the Women's Civic League. Milwaukee has perhaps gone a step beyond other cities by housing the Institute of Municipal and Social Service in the council chamber.

MILWAUKEE'S RECREATION MOVEMENT

Broad social spirit characterizes the demand for public recreation in Milwaukee. Instead of waiting to secure more playgrounds, the people realize that the spirit of play and rec-

[1] THE SURVEY for August 7, 1909.

reation may find expression in many occasions and places of which playgrounds are only one type. To develop the municipal, civic, social, and recreational resources, including the use of schools and other public buildings; to establish adequate and well supervised playgrounds; to extend the organized observance of civic holidays and festivals; to increase the public library service, and to foster public musical and dramatic expression, the Milwaukee Association for Public Play and Social Education was formed last fall.

First the school board adopted rules granting to adult citizens the use of their public school buildings as meeting places for non-partisan, non-sectarian organizations having as their purpose the development of intelligent public spirit by the open presentation and free discussion of public questions; or for such other social activities as would not interfere with the prime function of the buildings. Provision was also made to meet the request of such organizations for directors and equipment for boys' and girls' clubs, gymnasium classes, branch public libraries, lectures, and entertainments. These regulations were modeled upon those in use in Rochester and approved by a majority of the committee on school extension of the National Municipal League. Seventy-five leading men and women of Milwaukee, representing all political, religious, and social viewpoints, consented to give their services as speakers before neighborhood civic clubs. A list of the names and topics was printed in a leaflet, explaining the use of the school buildings and pointing out that the real government of the city—its citizenship—at last had a chance to make itself felt directly and quickly.

Ten motion picture shows in as many school buildings, open to all, were contributed by the Milwaukee *Journal*. The success of this series showed that the people gladly avail themselves of such opportunities—numbers were turned away on account of lack of room at each show—and that a large assembly hall on the ground floor is needed in every school building.

Branch public libraries in the public schools are a part of the announced policy of the new librarian, who brings to his work an especial appreciation of this need, because of his previous service as principal of the West Side High School.

Festivals are expected to play an important part in the recreation program. A fine beginning was made on Labor Day when the first Milwaukee play festival was held in Lake Park. A "sane" Hallowe'en came next, to replace the nuisance which the celebration of this evening usually entails. At Lapham Park the children gathered in the afternoon. From there, dressed in witches' capes and hats and carrying transparencies and torches, they marched behind a brass band to a point where all gathered around a bonfire, whose flames were marvelously colored by "witch powder."

A department of public recreation, to carry out through municipal authority the activities and policies now unofficially urged by the Milwaukee Association for Public Play and Social Education, has been proposed. This accords with the recommendations of the Playground Association of America. It is suggested that the department be under a board on which should serve the mayor and a representative of the school, park, police, and library boards. A director of public recreation, with district or neighborhood directors, should organize and supervise recreational activities. Public sentiment seems favorable to the creation of such a department, as evidenced by enthusiastic mass meetings, and the city administration and the various existing boards have also given their approval. The way is expected to be smoothed by the insertion of home rule provisions in the city charter—which seem likely to be secured.

A series of large public dances, with a small admission fee, have been conducted by the Association for Public Play and Social Education. These have attracted attention through newspaper accounts throughout the country. Their purpose was not only to provide dances in good surroundings and under good auspices, but to afford a few big occasions which should focus the thought of the city upon the need for a thorough dealing with the problem of public recreation. The dances were held in the splendid new Milwaukee Auditorium, of which the city is half owner. About 2,000 people attended the first, which used but one of the halls in the building. The price of admission was twenty cents and the profit amounted to over $300. The grand march was led by an octogenarian dancing master of early Milwaukee with the wife of the city treasurer as partner. Every nationality and degree of economic condition among the people was represented. The floor committee was led by the head resident of the University Settlement, who had as assistants six young men from the settlement and six from the University Club. The hour of closing was 11.30. At subsequent dances the admission was lowered to fifteen cents and the crowds were so numerous that three large halls in the auditorium had to be used. During intermissions there were a few brief talks by prominent officials, and folk dancing in costume by groups of various nationalities added picturesqueness to the scene. Non-alcoholic drinks were served at popular prices. While these dances were pronounced a great success, it is thought by some that they should serve as the stimulus for smaller neighborhood dances. While the big dances make for civic spirit in the city as a whole, they are open to the objection that young people are taken away from home neighborhoods, where in smaller dances, attended by parents, a more wholesome, restraining influence prevails.

UTILITY LAWS IN PENNSYLVANIA

It will be interesting to watch the development and possible passage of a public utilities commission bill at the present session of the Pennsylvania Legislature.

A State Railroad Commission was established during the session of 1907, which had powers of recommendation only. Its attempts to remedy the lack of proper service of the traction system in Pittsburgh is an example of the ineffectiveness of such a body without power to enforce its decrees. Two years ago Mayor W. A. Magee of Pittsburgh attempted to secure amendments to this law which would make the commission more effective, but these were never passed. Mayor Magee still desires such legislation and among the many bills he has had prepared are some to give sufficient power to some body to compel reasonable, safe, and adequate traction service in Pittsburgh. It is stated that he intends to have one or more of these bills introduced in the Legislature. Governor Tener, in his inaugural address, declared himself to be in favor of legislation, which should provide for a commission to cover public utilities generally, and which should have power to enforce its orders.

The Pittsburgh Civic Commission, through its committees on rapid transit and legislation, has likewise been much interested in favoring this movement, not only on account of the local situation, but because it is believed that general regulation of all public utilities will be helpful to the user and to the investor. Certain representatives of the people in the communities surrounding Philadelphia are also actively interested in this question, primarily aroused because of a dispute with a large water company regarding rates charged which have recently been increased. They are, however, broad minded and see the advantage of considering the problem from the better point of view of regulating public service and rates in all lines of activity.

A conference was called in Philadelphia January 23, in which drafts of a public utilities bill, as suggested by eastern and by western representatives, were considered. Another conference took place in Harrisburg January 25, at which the mayor of Pittsburgh and the state senators and representatives of Allegheny county were present. This meeting resulted in the appointment of a committee to confer with the governor and atorney-general and aid in the drafting of a just bill, which will meet the crying needs of the people and at the same time guarantee security to investment and freedom from foolish attempts upon such corporations are doing their best.

This committee consists of George M. Alter, member of House from Allegheny county, chairman; Elmer C. Bown, assistant city solicitor, Pittsburgh; William Righter Fisher, attorney, Philadelphia; George Wharton Pepper, attorney, Philadelphia, and V. Gilpin Robinson, member of House from Chester City.

The personnel of the committee insures a comprehensive study of the problem. It is understood that the membership is in touch with Attorney-General John C. Bell, and that thus, when finally prepared and presented to the Legislature, it will appear as an administration measure with all the force and backing which this means.

A SURVEY FOR LAWRENCE

Lawrence, Mass., is in for a "survey." This New England city was planned as a "model town" in the fifties. It has broad streets and centrally located parks. But these aspects have been less in the limelight recently than the fact that the mayor elected last year is now serving a three-year sentence in the county jail, and the chief of the Fire Department, selected by him and confirmed by the aldermen, is serving a term in state prison. The survey, which is to be paid for by the trustees of the White Fund, was undertaken solely in order to get a comprehensive knowledge of social conditions in the community. The work will go forward under several heads, such as industries, education, charities, amusements, parks, etc. It will be of value in enabling the individuals and organizations interested in helping Lawrence to do so without groping in the dark.

SUBWAY FRANCHISE IN PARIS

In the *Engineering News* for January 19, Robert H. Whitten, librarian statistician for the New York Public Service Commission, First District, makes an analysis of the Paris subway system with special reference to franchise terms and conditions. Paris adopted the system of municipal construction with private operation. With one exception the city has held to the plan of owning the entire system and leasing it to one operating company. It exacts universal free transfers. The franchise term for each of the three sub-systems is thirty-five years from the time of its completion. At the expiration of the time the property reverts to the city, but the municipality may purchase seven years after the entire system is in operation. The company pays to the city approximately one-third of its revenue from passenger traffic on terms very favorable to the city as compared to those obtaining in New York.

The most interesting provisions imposed on the operators are those in favor of the employes of the road, which is a matter to which this country has paid little attention. The company is required to create a special fund for the relief and insurance of employes in case of sickness or accident. Free medical and dispensary service is given; employes are insured against accident; the wages of an employe in case of duly authenticated sickness are continued for a year, and in case of temporary incapacity due to an accident, until complete recovery without prejudice to any indemnity that may be due to him. The company contributes seven-eighths of the cost of insuring its employes in the National Pension Fund, payments to which must equal eight per cent of the total payroll.

HEALTH

HOSPITAL COMMITMENT OF THE INSANE

JULIA C. LATHROP
HULL HOUSE, CHICAGO

In the last three months I have seen something of the commitment service for the insane in three European cities, Copenhagen, Munich, and Florence. The manner in which an individual believed to be insane is first taken care of by the authorities and sent to the proper hospital is much alike in these three very unlike towns. It is of interest to us because it shows practicable expedients for treating the insane from the beginning as sick people who are to be put in charge of doctors and nurses, without unnecessary police intervention and without detention in police stations or jails. The system is nowhere perfect, nor even as good as we might have with a little effort, but it is far better than the system we have in most American towns.

Copenhagen has a communal hospital which has been noted for many years for its excellent wards for the insane. For almost fifty years its insane patients, men and women, have been nursed by the women nurses, as patients sick with other ailments are nursed in the other wards of the hospital. This ward has two floors with forty-five beds each, one for men and one for women, and though it is too small for its work, it is yet large enough to receive, for the most part, the insane or presumably insane persons who are sent to hospitals in Copenhagen. Patients are brought by friends, often consenting to come to the hospital, or doubtless by police authority if it is impossible to persuade them. The physician in charge of this service decides upon the cases after suitable observation and his directions are carried out; he can send to an asylum or discharge. There is no detention in a jail or police station. An instance of the method was seen during the International Congress of Charities last August. One morning during the speeches an elderly woman quietly came forward, and standing between the speaker and the chairman began to demand a hearing. When no attention was given her she attacked the speaker, inflicting a slight dagger wound. She was at once overpowered and the audience dismissed. In the Parliamentary Building where the sessions were held was a Red Cross First Aid Station with a nurse, physician, and orderly. After some soothing talk the woman yielded to the nurse and agreed to go to the hospital, being taken there peaceably in a carriage. She was obviously insane, with some fancied grievance which she desired to relate to the congress. It may not be amiss to add, as illustrating the fear of the insane which still governs so much our dealings with them, that while the nurse was trying to persuade the patient to go to the hospital, a gentleman prominent in the congress was credibly reported to have advanced—evidently quite hysterical with alarm—and to have shaken the patient violently, thus certainly confirming any idea of ill-treatment which she had previously entertained, and of course adding to the difficulties of the nurse, who, however, by gentle firmness succeeded in her task.

In Munich, if a person becomes insane, in a boarding house, for example, every effort is made to persuade him to go voluntarily to the hospital known as the University-Clinic, which is under the direction of the distinguished Dr. Kraepelin. If the patient refuses, then a municipal doctor and the police are sent for. If the doctor states that the patient is dangerous to himself or to others, the police are responsible for his conveyance to the hospital, but the patient is conveyed directly there, not in a police conveyance, but in a private carriage or ambulance; and the police, after the German manner, are responsible for ascertaining if the patient or his friends can pay for his care. In this hospital patients are nursed and studied, the cases, after a stay usually of three weeks or less, being discharged or sent to other institutions by the medical head.

In Florence, if a person becomes suddenly insane and uncontrollable, any doctor's statement believing him insane is enough to secure his admission to the University Hospital on the edge of the city. If the patient's friends cannot take him there, the police may do so, but they use a private carriage—never a

police conveyance. They never conduct the patient to a police station, but always to this hospital clinic maintained by the University of Florence. All insane patients pass through this hospital, remaining not more than one month and usually much less, where they are studied and the cases disposed of by the medical officer in charge.

The significant features of these plans are that the insane are treated as patients from the start with as little police intervention as possible; and that in each one of these cities there is a special hospital for receiving insane patients. These hospitals are connected with the university schools of medicine, and have at their head distinguished physicians who are also teachers, and whose presence insures for patients the benefit of whatever wisdom exists, at the same time drawing students of medicine who may in time popularize a better attitude toward the insane and the newer ideas as to the preservation of healthy minds as well as healthy bodies. It is significant, further, that all these hospitals treat their patients like other sick persons, put them to bed, give them doctors and nurses, abundance of good food, and no mechanical restraint. In the Munich Hospital Dr. Kraepelin has gathered a small museum of appliances for restraint, and old prints illustrating many ingeniously disagreeable or painful methods of dealing with the insane. Dr. Zeller of Illinois has a similar collection, and in common with many other American superintendents has likewise abandoned mechanical restraint in his institution. I wish it could be said of all the hospitals in America, as it is said of the fifty-two public hospitals in Italy, that like the University Hospital of Florence, they have all "practically abandoned mechanical restraint."

Nowhere in Europe, I believe, is the actual nursing care of patients better than in those American hospitals which have put trained nurses in charge. Personally I have seen no hospital, save the one in Copenhagen, which seemed to a non-professional eye to approximate our best hospitals in this regard.

It is in that critical moment of commitment, of withdrawing from the patient—often reluctant or suspicious or violent—his most precious possession,—his own right of self-direction, that we need most of all to emphasize the doctor and the nurse, and to substitute instantly the hospital for the prison. Here our American methods can be improved, and by the use of the public health officers in both city and country we can eliminate entirely the need of even such employment of the police as still prevails in the cities I have mentioned. The new law of the state of New York, placing health officers in charge of commitment of the insane, is a splendid beginning.

CALIFORNIA COMMITMENTS

In its fourth biennial report, just published, the California State Board of Charities and Corrections recommends treatment of the insane very much in line with that observed in Europe by Miss Lathrop, and described in her article above. Following the board's recommendation in 1906, that its insane hospitals no longer be conducted as places for detention of the chronic insane, but as places for the treatment of insanity as a disease, "all of the state hospitals were provided with cottages equipped," the report states, "with the best apparatus known to medical science for the treatment of insanity." The last cottage was completed lately and the board now gives its attention to a new advance step, the matter of commitments. It has this to say:

We strongly recommend, however, that a law be enacted providing for the voluntary admission of insane patients into our treatment buildings, the necessity for such treatment to be decided by the medical staff of the hospital. This will do away with all expense of commitment and save the patient from the stigma of a judgment of insanity in a court of record. It cannot be denied that there is a feeling that a commitment for insanity is a kind of criminal conviction. The patients would be saved this, and for that reason many would come in the earlier stages of the disease, when the chance of cure is much better. These cases would be voluntary and could not be kept by force, but we have faith to believe that if such a law were enacted it would be but a few years when most cases would come in this way, and it might in time lead to the breaking down of the constitutional bars which now make a quasi-criminal procedure for the commitment of insane necessary.

A CITY'S BEST ASSETS

"The opening of the Panama Canal, the development of waterways and railroads, ore and coal mines, metal and fabric industries, means much in wealth production and material prosperity; but," says Morris Knowles, the sanitary engineer who supervised the erection of the great Pittsburgh filtration plant, in a recent article in the *Manufacturers Record* on the Development of Municipal Utilities in the

South, "it will be unfortunate if the people of the South do not profit by some of the mistakes of the North and do some of their planning before what is now realized to be an error in many communities." Mr. Knowles points out one of these mistakes to be the short-sighted rush in many northern cities to build up "one big live industry, without care for housing, decent living, health, comfort, and the pleasure of its working classes." The broad gauge, far-seeing, statesmanlike policy that will lead one industrial community to out-distance another, must take human as well as mechanical development into account. Mr. Knowles continues:

We hear a great deal about attracting industrial and manufacturing concerns to a community by all sorts of inducements, free water and free power for a time; free sites, low or no taxation, and for a while even cash bonuses. I wonder if, when doing this, the promoters think of the old adage: "You cannot get something for nothing." It is quite likely to be true that the concern that needs and must have such careful coddling is not worth the effort and has not enough capital or stability to build for the future. But there is a higher, better, and more certain standard determining the desirability of location. The careful, conservative business man or manufacturer will look further than the short-time effect of the above-named conditions; he will ask not only what are your natural facilities and what are the inducements you will offer for a period of time, as above, but more important still, what are your provisions for public utilities, what of the methods and efficiency and honesty of your governmental forces as they affect the life of your community, and are they actuated by honest, right living, efficient effort? Are you planning for commodious, sanitary, and safe housing facilities and a proper building code? Are you planning for the health of the community by a clear and pure water supply and sanitary disposal of sewage, household refuse, and waste? Are you planning for proper transit and traffic facilities that the people can get about to and from work and to the shopping districts comfortably and easily? Are you planning for good, well-administered schools, playgrounds, small open-air spaces, and larger parks, with plenty of opportunities for the children to grow up in a normal, open-air, healthful existence? We are fast coming to the time, if it is not already here, when the manufacturer, for his own advantage and his own pocketbook, because his help will thus stay with him, as well as because of his broad humanitarian viewpoint, will ask these last questions largely, rather than how much power, water, or land can I get free or how many years of freedom from taxation.

The article concludes with a discussion of the resources and liabilities of southern cities in conserving public health, and points the way toward improving the water supply and sewer system by intelligent conservation of forest, construction of river barriers and reservoirs, filtration, curtailing the extravagant waste of water by installing meters, and wise forethought and careful planning of both sewer and water systems far ahead and beyond present corporate limits, in order to provide for future development and to obviate complications when new territory is annexed.

SITE FOR CHICAGO SANITARIUM

With the vote of the Chicago City Council on January 30, authorizing the purchase of the site for the Municipal Tuberculosis Sanitarium, the long fight in which the directors sought to secure land within the city limits is terminated. The tract is 160 acres and the cost $158,000. Located in the northwestern part of the city, the site is double the area and better suited for the purpose than the tract submitted last fall, and abandoned because of neighborhood objections and clouded title. It is undoubtedly one of the best sites that could be found inside the city.

Bordered on the south and west by 540 acres of partly wooded cemetery property, precluding the possibility of smoke producing factories in this direction; and on the north and west by unimproved prairie, the land itself has shrubbery, selected nursery stock, and over 5,000 trees growing upon it. Drainage and sewerage possibilities are good. It is three and one-half miles from Lake Michigan, about nine miles from the downtown district, and it can be reached from any part of the city by a five cent fare.

Developments in the dispensary department of the sanitarium have also been rapid. A night clinic has been opened at the Gads Hill dispensary; a downtown day and night dispensary, calculated to reach the lodging house population and the people employed in the factories and business houses in the loop district, is about to be opened in the Iroquois Memorial Emergency Hospital, recently turned over to the Health Department, and preparations are under way for the opening of a clinic for colored people at the Provident Hospital, as well as a dispensary in the northwest section. The nursing staff has been doubled and the entire salaried service placed under the provisions of the municipal civil service. The Visiting Nurse Association, which has heretofore handled cases of tuberculosis, has transferred 500 of its ambulatory cases, and as soon as practicable will relinquish all tuberculous patients who can go to the dispensaries.

The 1911 tax appropriation budget contains a tax levy for the Municipal Sanatarium of one-half mill for 1912. This will yield $442,000 and bids fair to be passed by the City Council.

Stimulating the public through educational work, investigating and reporting on conditions tending to spread tuberculosis, and advising existing agencies for the care of the tuberculous, figure prominently in the immediate work before the Chicago Tuberculosis Institute.

HANDBOOK ON OPEN-AIR SCHOOLS

The buoyant air of optimism which swells deeper and stronger with every fresh advance of the tuberculosis campaigners rarely affords a more stimulating breadth than is to be found in Open-Air Crusaders. This book of 107 pages tells the story of the Elizabeth McCormick Open-Air School, which the United Charities of Chicago has maintained since October, 1909. THE SURVEY, in its issue for March 5, 1910, called attention to the school and to the beginning of its wider influence in opening the windows of Chicago school houses. The great progress which has followed and the co-operation which has rallied are detailed in this attractively illustrated report.

The United Charities found in studying two hundred families, in each of which there was one or more cases of tuberculosis, that the average income was about six dollars a week and the average number of rooms occupied was a little over three. With the feeling that "the poor cannot afford it and the community cannot afford it" the organization decided to supplement the direct warfare on the white plague by a flank movement. By increasing resistance and bodily vigor among children whose sub-normal physical condition renders them susceptible, it is hoped to limit the territory which the disease finds easy to conquer. What the school accomplished in building up these pallid little ones is stated in a table which shows that forty-nine children were in the aggregate 609 pounds below normal. These children gained 178 pounds; the greatest individual gain was fourteen pounds in seven weeks.

Of significance, however, for all Chicago's school children is the gain in ability to learn. The report says: "They were listless, inattentive, uninterested and uninteresting. There was not enough energy created in the body to light the mind." Yet, although the time given to instruction was decreased by the exercise, feeding, and rest periods, the children soon reached a normal standard of alertness and interest in their school work. It is put tersely in a "schoolgram", asking, "What shall it profit a child if he gain the whole curriculum and lose his health?"

The book is edited by Sherman C. Kingsley, superintendent of the United Charities. The stories of the children are told by Alice Bunker and Mabel B. Ellis. Chapters on the details of management and on statistics are contributed by the physician in charge, Dr. James A. Britton. Frank E. Wing, superintendent of the Chicago Municipal Tuberculosis Sanitarium, writes of the first open-air school in Chicago, and points the need for making such schooling available for the 4,700 tuberculous children in Chicago. The experience and good results of opening the windows in the average school room are discussed by William E. Watts, and Health Commissioner William A. Evans states convincingly the scientific aspects of the problem of school room ventilation. As a handbook for people who are contemplating open-air schools, its value can hardly be over-emphasized.

Through the generosity of the trustees of the Elizabeth McCormick Memorial Fund, the United Charities is enabled to place the book before the public free of charge to those interested in open-air schools, and copies may be obtained by addressing the United Charities, 51 LaSalle street, Chicago.

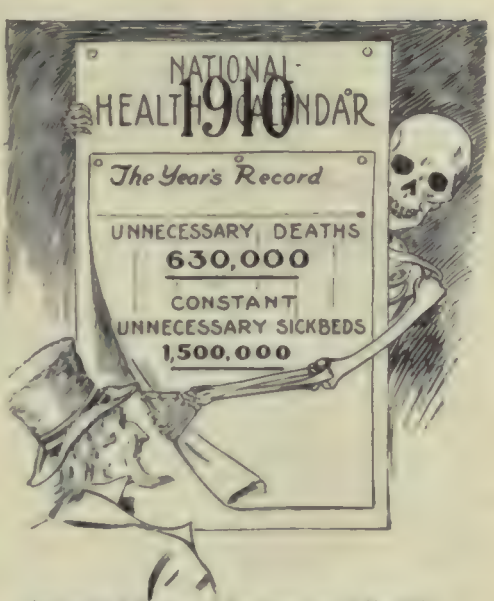
WRETCHEDNESS A CAUSE OF POLITICAL UNREST

Dr. Ronald Ross, whose explanations in regard to the propagation of malaria have given him high rank as a sanitary authority, contributes the following very interesting letter to the London *Times*, on the completion of a series of articles from a special correspondent on the subject of Unrest in India. It would be difficult to find a more succinct statement of the new sort of constructive statesmanship or a better illustration to give point of the statement.

"TO THE EDITOR OF THE TIMES:

"In your admirable series of articles on Indian Unrest little stress seems to have been laid (though I may have overlooked references) to what must be one of the principal causes of that unrest, the extreme wretchedness in which the vast masses of the Indian people live—I mean particularly what may be called the mechanical causes of that condition, bad housing and insanitary surroundings.

"Probably the only class of British officials in India who ever really penetrate into these mysteries of misery are the medical, and especially the sanitary, officers—a class to which I had the honor of belonging for many years. One has actually to see the interior of the houses, in which each family is often compelled to live in a single small cell, made of mud walls and with a mud floor; containing small yards littered with rubbish, often crowded with cattle; possessing wells permeated by rain soaking through this filthy surface; and frequently jumbled together in inchoate masses called towns and cities. The sanitary condition may be inferred from the fact that the total death rate in India is nearly double the British death rate. Taking merely a government report which happens to be lying on my table, I see that in the five years 1902-6



the mean annual death rate was nearly 34 per thousand, and in 1907 the death rate was more than 37 per thousand on an average for the total population in British India of 225,921,260 —rising to as many as 144.31 in the town of Dinga, and to as many as 106.67 in the Gujrat district of the Punjab. The industry, thriftiness, and patience of the Indian people are proverbial; and yet here surely there is enough to make them somewhat restless at times.

"It will of course be said at once that these conditions have existed in India from time immemorial and are no more likely to cause unrest now than previously; but in my opinion the unrest has always existed there in a subterranean form. Moreover, in the old days the populace could scarcely make any comparisons between their own condition and that of more fortunate people; now they can compare their own slums and terrrible 'native quarters' with the much better ordered cantonments, stations, and houses of the British officials and even of their own wealthier brethren. So far as I can see such misery is always the fundamental cause of all popular unrest; I have always understood that it produced the French Revolution, and I think that it causes the unrest which occurs in Ireland and even in England. Seditious meetings, political chatter, and 'aspirations' of babus and demagogs are only the surface manifestation of the deeper disturbance—a manifestation which occurs only when the strong hand is relaxed.

"It will be said at once that all this misery is merely the result of unavoidable economical causes; but this is much open to doubt. I fear it must be confessed that the slum is largely a condition found only in certain nations. It has been almost entirely banished from Germany, Sweden, and I believe several other nations; but it abounds not only in India, but in Britain, most of our colonies, and in the United States. If it can be banished from some countries why cannot it be banished from all? Surely there is here something else besides unconquerable natural causes.

"Much of what has been said in the *Times* regarding our future policy in India is absolutely true, but I think that much has been left unsaid. It is quite correct that in connection with our great work in India the British people must be true to its highest and oldest ideals; but times are changing and we must also adopt some new and still more fruitful ideals. I think that we are not sufficiently scientific in the way in which we deal with these immense questions of town management and sanitation—fundamental subjects of administration which are all too often relegated to the background of affairs. We are too fond of endless talk about the mere machinery of governments, the formation and powers of committees, and so-called representation of the people in them. Experience is beginning to show that all this really produces little effect on the mass of the people—the slum abounds almost as much in British towns as in Constantinople. Great stress is laid upon character in the rulers; but they require knowledge as well. To place a man of the greatest integrity at the head of a large municipality or district is not enough—he must also possess a full knowledge of how to deal with such problems as I mention. It is just there where I think we fail. Town management and sanitation are difficult arts, requiring much training and thought; and it is not disrespectful to say that most of our greatest officials are extremely ignorant of them.

"It is a commonplace with sanitary men in India and elsewhere that they can often obtain no serious or intelligent hearing of their pleas. I need quote only a single example, which I have often referred to in the *Times*. Malaria alone causes, according to official estimate, more than one million deaths per annum in India. Eleven years ago we found how the disease is produced, and I suggested a simple and inexpensive method for reducing it—a method which has been carried out successfully in many parts of the world. And yet it is only quite recently that any organized attempt has been commenced in India to act upon this suggestion. To me it seems that the construction of a really efficient sanitary service for India, and closer attention to the housing and town-managing problems and to allied questions, would confer a much greater benefit on the Indian people than mere political adjustments and readjustments. For this sanitarians have been crying for years, but they have always cried in the wilderness; and

Wanted: A National Department of Health.—

January Bulletin, Committee of One Hundred on National Health.

THE COMMITTEE ADVOCATES CONSERVATION OF HEALTH AS A NATIONAL RESOURCE.

the conclusion of your series of articles seems to be an appropriate moment for reiterating opinions so often stated by all of us and so often forgotten.

"I am, Sir, yours faithfully,

"RONALD ROSS.

"Liverpool School of Tropical Medicine.
"September 20."

HOW $25,000 SAVED $225,000

If it costs $25,000 to restore to life and health 161 men and women whose combined lives, even at the paltry value of $1,500 each, are worth over $225,000, what is the net gain to the community?

This is a problem answered in a report of three and one-half years' work of the Edward Sanatorium, written by Dr. Theodore B. Sachs and issued by the Chicago Tuberculosis Institute. Dr. Sachs shows by a series of carefully prepared tables that of the 176 patients admitted to the sanatorium in the incipient stage of tuberculosis, 161, or 91.5 per cent, who were discharged as either apparently cured, improved, or arrested, are still maintaining their condition and enjoy their full working capacity. "These cured patients," says Dr. Sachs, "at the end of periods ranging from six months to three and one-half years since their discharge, may be found in various homes, offices, and mercantile and manufacturing establishments of Chicago and other cities." Of the moderately advanced cases treated at the sanatorium during the same period, 35 per cent are at present in possession of full working capacity. The average period of treatment of the incipient cases was 15.6 weeks, and of the moderately advanced, 19.7 weeks. On this basis, at an average cost of about ten dollars per week per patient, it has cost the Chicago Tuberculosis Institute about $25,000 to save the lives of the 161 incipient cases, or an average of about $160 per life.

Another significant part of the work of the Edward Sanatorium is that it submits again incontrovertible figures showing that the treatment of tuberculosis is not a question of climate or altitude, but one of fresh air, rest, good food, and rigid medical supervision.

WITHOUT A BIRTH RATE

"Talk about registration of births in the United States! Why, for not more than one-half (55.3 per cent) of the total population of this country is there even fairly accurate registrations of deaths alone. No other civilized nation on the face of the earth so neglects its duty in this respect, or holds the vital records of its people of such low esteem." This is quoted from the recent report by the census committee on the registration of births. An interesting statement regarding the establishment by the Census Bureau of a provisional birth registration area in the United States, for the purpose of compiling statistics enabling the scientific study and prevention of infantile mortality, has been submitted to Census Director Durand by Dr. C. L. Wilbur, chief statistician for vital statistics. The statement notes that America is far behind most foreign nations in regard to vital statistics, and that there is not a single state, nor even a single city, in the entire United States which possesses a complete registration of births. Boston claims to have the best, but is only ninety-six per cent complete, while probably the most worthless registration of births among all the cities of the entire world, it is stated, may be claimed by Baltimore, Chicago, and New Orleans.

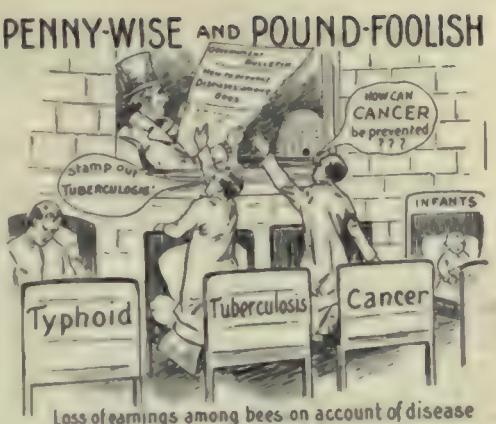
The accurate collection, tabulation, and analysis of records of births, deaths, stillbirths, marriage, divorces, and sickness may be said to constitute the bookkeeping of humanity. Acting on the principle that vital statistics are the foundation of scientific public health work, Dr. Wilbur began in 1908 the collection of statistics of births, with a view to establishing a provisional birth registration area. This work has steadily progressed until at the present time the tentative area includes the New England States, Pennsylvania, Michigan, and the District of Columbia, although the latter does not register all its births. In fact Pennsylvania is the only state in which a determined effort has been made to enforce thoroughly the registration of births, as the law provides, where the state has such a law. But the bureau wishes records kept in other states, better records in all states, and not only records of births, but of all other vital facts. At present there is a bill before Congress providing for better registration of births in the District of Columbia. Owing to the fact that, with the exception of the district and the territories, all laws governing vital statistics are state enactments, the bill before Congress is aimed to be something of a model and standard for similar bills in the states, in order that as much uniformity in methods as possible may be secured. Meanwhile, the bureau is waging an active campaign to arouse public interest in the registration of births, with the special object of reducing infantile mortality.

DEATH RATE FOR 1910

Although complete returns for 1910 have not been received, enough were in hand at the end of January to enable Dr. C. L. Wilbur, chief statistician for vital statistics of the Census Bureau, to make an approximate provisional estimate (the earliest statement of the kind, by the way, ever given out by the Census Bureau), of mortality in the registration area. This area comprises about one-half of the total population of the United States. "If the returns not yet received for 1910 for certain areas prove to be substantially the same as those for the corresponding months of the previous year," states Dr. Wilbur, "then the total number of deaths that will be reported from the registration area (the registration states and certain cities in non-registration states) for 1910 will be about 780,000, and for the registration states, 667,-

000." These give a death rate of 15.0 for the larger area and of 14.8 for the registration states. The death rate for the registration area in 1909, revised on the basis of recent population returns, was 14.4 per 1,000, and this was the lowest in the history of the United States. Thus, though the death rates for both areas in 1910 are slightly greater than for the preceding year, the Census Bureau considers the showing remarkably favorable. In view of the very low rates, actual and relative, reported from California, Indiana, Michigan, and especially Wisconsin (11.8), it may reasonably be questioned whether the actual death rate is not appreciably above 14.8, the registered death rate. A tendency to inflate population figures, slackness in reporting deaths, or both, if found in one or several state, would lower the registered rate for the whole area below the actual number of deaths in each thousand of the population.

FOR THE MENTALLY DISEASED



Massachusetts is investing $500,000 in the erection of a state Psychopathic Hospital which will be a center for receiving, classifying, and distributing patients with mental diseases. The institution expects to be able to receive 1,500 patients, the wards accommodating 100, and the remainder being sent elsewhere for treatment according to their individual needs. Boston gets the hospital, and it is to be completed in about a year.

RESULTS IN CLEVELAND

The report of the Anti-Tuberculosis League of Cleveland shows a remarkable extension of preventive work within the last year. New features of the year are appropriations by the municipality for a sanatorium and hospital and for general investigation and care of the sick, dispensary extension under a director, a day camp, open-air schools, visiting nurses, school inspection, and the starting of a school in a tent colony already established.

HEALTH DAY IN SCHOOLS

Booklets No. 22 and 23 of the Health Education League, 113 Devonshire street, Boston, are on Typhoid Fever, Its Infection and Prevention, by Mary Hinman Abel; and The Observance of Health Day in Schools, by Dr. Thomas F. Harrington, director of school hygiene in the Boston public schools. The

January Bulletin, Committee of One Hundred on National Health.

ANOTHER REASON FOR A FEDERAL DEPARTMENT OF HEALTH.

latter booklet, which the league is planning to spread widely among school superintendents, contains the arguments for setting aside a school day for teaching the elements of hygiene, together with outlines of lessons on health given in the Boston schools, where the first annual Health Day (October 7) was established two years ago.

AN EAST BOSTON SHOWING

The first annual report of the Warwick Dispensary of East Boston shows over 5,000 visits by patients through the year, with an average daily attendance of twenty-five in the month of September, the latter representing a gain of over 100 per cent over the first month of the year. Though still in its beginnings and hampered by lack of funds, the dispensary has justified its existence by its first year's work. More than half the patients are Jewish and Italian children brought by school nurses from the public schools of the district, and to these, as to the older patients, an effort is made to give education in the principles of health, besides medical treatment. East Boston is a district of longshoremen and teamsters working along the wharves, and has been until lately overlooked by charity.

INDUSTRY

WORK-POISONS

THE REPORT OF THE ILLINOIS COMMISSION ON OCCUPATIONAL DISEASES

What lead, arsenic, zinc, cyanide of potash, hydrofluoric acid mean, not as re-agents on a chemist's shelves, but as factors in the every-day life of many American work people, is brought out in the report of the Illinois Commission on Occupational Diseases, which was sent to Governor Deneen at the convening of the Legislature in January. In this report, primarily on the poisons, Illinois thus leads the American commonwealths in the accurate and comprehensive study of work processes from the standpoint of industrial hygiene; and even more significant than any of the striking facts which the commission brought to light in the scant year at its disposal, is its vigorous recommendation to the Legislature that the study of occupational diseases be continued.

This commission, which began its work last March, consisted of the following persons:

George W. Webster, M.D., president Illinois State Board of Health.
James A. Egan, M.D., secretary, Illinois State Board of Health.
David Ross, secretary, Bureau of Labor Statistics.
Edgar T. Davies, chief, Department of Factory Inspection.
Ludwig Hektoen, M.D., Memorial Institute for Infectious Diseases.
Walter S. Haines, M.D., Rush Medical College.
W. H. Allport, M.D., surgeon to St. Luke's Hospital.
James Simpson, vice-president, Marshall Field and Company.
Charles R. Henderson, University of Chicago, secretary.

Dr. Hektoen is one of the foremost pathologists of the country. Dr. Haines is a chemist and toxicologist of national reputation. Both are on the faculty of Rush Medical College. Dr. Allport had shown his interest in the social aspect of medicine by a series of articles in the *Illinois Medical Journal* dealing with workmen's compensation. Mr. Simpson was the representative of the employers, and Professor Henderson, to whose efforts was due the appointment of the commission, served as its secretary,—altogether a group of men from whom could be expected a careful and valuable piece of work.

The report, which covers some 200 pages, opens with an introduction by Dr. Henderson giving a history of the work of the commission, a summary of the problem of industrial hygiene and of the principals of effective legislation, a short review of the subject of trade risk and sickness insurance, and closes with the recommendation to the Legislature to continue the study. Then follow the reports on the special investigations.

The reason for selecting for the most part those trades in which there are industrial poisons rather than the dusty trades which are numerically so much more important, is probably to be found in the fact that the poisonous trades cause definite lesions which can be clearly traced to the poison itself, while the connection between the dusty trades and respiratory diseases is harder to establish. As the commission had only a little over nine months in which to make investigations, it wisely decided to select one restricted field of work for an intensive study, rather than to make a general survey of the whole subject.

The appropriation granted to the commission seems to have been expended entirely upon the investigation itself, for office room was donated by the university and the medical men in the commission gave the use of their laboratories. Consequently a large force of investigators could be put to work. The list includes eleven physicians and ten laymen, the former taking up the hygiene of the different trades and the physical condition of the work people, the latter investigating factories and examining records of hospitals, dispensaries, and sick benefit societies.

The poisons studied were lead, arsenic, brass, zinc, turpentine, carbon monoxide (gas), cyanide of potash, nitrate of silver, hydrofluoric acid, metol, platinum, the chromates, and chromic acid. In addition there was a study of caisson, or compressed air disease, one of boilermakers' deafness, and one of miners' nystagmus (oscillation of the eye).

The general impression gained from a perusal of these reports is that industrial poisoning is a common thing in this country, unless

conditions in Illinois are different from those in other states—a far more common thing than has been supposed. Lead poisoning, brass chills, "gassing," inflammation of mucous membranes from acid fumes, cyanide poisoning, turpentine poisoning, seem all to be of frequent occurrence among the workers engaged in handling these poisons—so frequent, in fact, that one wonders why such conditions have not been more conspicuous, why it has needed a painstaking search to unearth them.

LEAD POISONING

We have always supposed that in the matter of lead poisoning, for instance, conditions in America were far better than in the older countries and that the elaborate precautions enforced over there would be absurd and out of place here, but Dr. Alice Hamilton's report on the Lead Trades of Illinois shows that the contrary is true, and that the evils which have led to restrictive legislation in England and on the continent exist among us today.

Lead is stated to be the most important of the industrial poisons, because of its wide use. About twenty-eight trades were studied in the course of this investigation, in all of which lead is used and in all of which lead poisoning was found. The most dangerous trades appear to be lead smelting, the white lead trades and paint factories, the painting trade, and the making of storage batteries. The investigation found that workmen in these trades do not receive the protection which European laws provide for them, and that in addition the methods of work peculiar to American industry are more dangerous than those in use abroad. So that the American workman is not only exposed to more danger than is the English or German workman, but he is not protected by careful hygienic regulations as are the latter. A comparison of the results of European control and American "*laissez-faire*" is made in two trades. For the white lead industry Dr. Hamilton states that

> in one English white lead factory employing 182 men careful medical inspection failed to disclose one case of lead poisoning in the years 1909-1910. In an Illinois factory employing 142 men partial inspection revealed 25 men suffering from lead poisoning last year. In another English factory employing 90 men no case was discovered for five successive years. In an Illinois factory employing 94 men 28 per cent of all employes have had lead poisoning and 40 per cent of all employed in the dustier work.

The contrast between English storage battery works and those in Illinois is just as striking:

> At the Hart Accumulator Works, in London, 80 to 100 men are employed, and there has been no case of lead poisoning for over a year. On the other hand, one small plant in Chicago belonging to one of the railroads employs only 15 men, but had two known cases of lead poisoning in a period of nine months.

Perhaps the most important section of this lead report is the one dealing with the painter's trade, because it employs such a large number of men. Here, too, it appears that American methods are fraught with great danger to the workmen, and that the painter cannot protect himself against lead poisoning if he is obliged to do the dusty part of the work.

The report emphasizes the fact that the lead trades employ large numbers of unskilled foreigners who are ignorant of the dangers, or perhaps aware that the work is dangerous but quite at a loss how to protect themselves. Instances are cited of newly arrived foreigners being put to work without instructions and contracting severe lead poisoning in a few weeks' time. The investigators found "almost no effort in the lead works to instruct foreigners in the care of their persons and in the avoidance of danger." These foreigners tend to drop out of the work as soon as they feel ill or see a comrade taken ill, and "there is therefore in Illinois a large army of men who are continually moving in and out of the lead trades," a condition which "is productive of far more poisoning than would occur among a permanent force of men."

The tabulated list of 578 individual cases of lead poisoning has a column devoted to Compensation from Employers, which is interesting reading, because there is practically nothing there to read.

BRASS POISONING

Dr. Hayhurst's report of brass poisoning should be of great interest to foreign authorities on industrial hygiene, because the condition known as "brass founders' ague" is regarded by some of them as a myth, while others believe it exists, but have great trouble in tracking down instances. Dr. Hayhurst seems to have found no difficulty in this respect. His description of the brass trade is worth careful reading, but in this review a few details will have to suffice.

The workmen are poisoned by fumes, and

the most important part of Dr. Hayhurst's report is that which shows that the production of fumes is controllable and "brass founders' ague" a preventable evil:

Brass is an alloy of copper and zinc, and as the latter is the cheaper ingredient the poorer varieties of brass have the largest proportion of zinc. "Brass founders' ague" is probably caused by the sublimation products of zinc, and therefore the foundries making the cheaper grades are more dangerous to work in than those making better grades. In large foundries with good ventilation, either natural or artificial, brass chills are practically never seen. As for actual conditions in Chicago, Dr. Hayhurst finds that only 4 of the 89 foundries visited could be classed as well equipped and free from trade sickness; 63 were acknowledged as the centers of trade sickness; 7 more were suspected of being equally bad.

A physical examination of 187 men, representing 78 foundries, showed that 146 complained of some trade sickness, 45 of brass chills. As brass founders handle lead, arsenic, antimony, phosphorus, and the cyanides, chills are not the only form of illness to which they are subject. The recently employed men are more susceptible to brass chills than the old employes, who gain a sort of tolerance after a while; but these men often show the effects of chronic brass poisoning on the lungs, digestive tract, nervous system, and kidneys. The effect on longevity is shown by the fact that out of 1,761 foundry men only 17 were over fifty years of age, a very striking record.

CARBON MONOXIDE

Carbon monoxide poisoning in the steel works was studied by Dr. Matthew Karasek and Dr. George Apfelbach, who found ample material among the 20,000 men employed in the great steel plants in South Chicago and Joliet, where the gas is produced during the smelting of the iron ore with coke and lime. When a workman is sufficiently exposed to this gas he develops symptoms very like those of ether anaesthesia, and if he is not removed promptly to the fresh air the poisoning may result fatally. Of course, such accidents as falling from a height or against hot metal are not uncommon, because unconsciousness comes with great suddenness.

The investigators found that "gassing" was of frequent occurrence, but that it was supposed to cause no lasting injury to health. To settle this point they examined carefully 240 workers who were frequently exposed to the gas and found that very few of them were in good physical condition. The only way to prove that the exposure to gas was responsible for their ill health was to make a comparative study of men in similar work, with similar home conditions, of the same nationalities, but not exposed to gas. Such a comparison of 400 carefully selected cases showed that the men exposed to gas had a deficient muscular power, as indicated by the hand dynamometer—that is, that their strength was less than that of the men not exposed to gas. If this should prove to be actually due to gas inhalation "it means a large economic loss in the numerous industries where workers are exposed to CO."

Sluggish mentality was noted in most of these men, but the physicians were not willing to say positively that the gas is responsible for this condition, although they report four cases of insanity produced by severe "gassing."

COMPRESSED AIR

The article on compressed air disease by Dr. Peter Bassoe is very exhaustive, but the following extract will give the chief points of interest to the non-medical reader.

Work in compressed air is necessitated wherever excavations are made near water or in water-laden soil. Thus, in Illinois, the building of bridges, especially those for heavy railroad traffic, the diggings of tunnels, and the laying of deep foundations near a body of water must all be done in compressed air, which prevents caving in and keeps the water out. The workman must be more or less rapidly "compressed"—that is, subjected to increased atmospheric pressure—by forcible pumping in of air. This stage is disagreeable, but seldom attended with serious results except on the ears. The ear drum is often ruptured by the great pressure of air. After he has been "compressed" the workman is fairly comfortable until the time comes for decompression, for a return to the normal atmosphere. This is the hazardous stage, and unless it is very carefully managed it is attended with, or followed by, great suffering, and even death.

Dr. Bassoe gives some statistics showing the dangerous nature of this work before proper precautions were used:

Of the 3,500 men employed in the Hudson tunnels 1,419 suffered from caisson disease. Of the first 45 to 50 employed, 12 died, a mortality of 25 per cent, which, toward the end of the work, was reduced to 1 per cent by the introduction of a proper system of de-compression. In building the St. Louis bridge 600 men worked in compressed air, 119 had caisson disease and 14 died.

The report of conditions in Illinois is largely historical, as no important work in compressed air was being carried on at the time of writing, except the construction of the Mississippi iron bridge at East St. Louis.

Dr. Bassoe interviewed 161 men who had at some time worked in compressed air, and he gives the results in carefully constructed tables; 141 had had the so-called "bends," pains in the limbs; 6 had had the "blind staggers"—vertigo, and 2 the most dangerous form, dyspnoea, known as "the chokes"—87 had had some affection of the ear. As for permanent results, he found 65 with impaired hearing, 12 with symptoms of spinal cord disease, 11 with pain and stiffness in bones and point, and 5 with partial paralysis. Three fatal cases were reported as occurring during the construction of one bridge at East St. Louis and one from another, all having occurred during this year. Two more were reported from Rockford, none from Chicago.

Dr. Bassoe's paper contains most interesting matter on the history, pathology, and prevention of caisson disease.

PROPOSED LAW

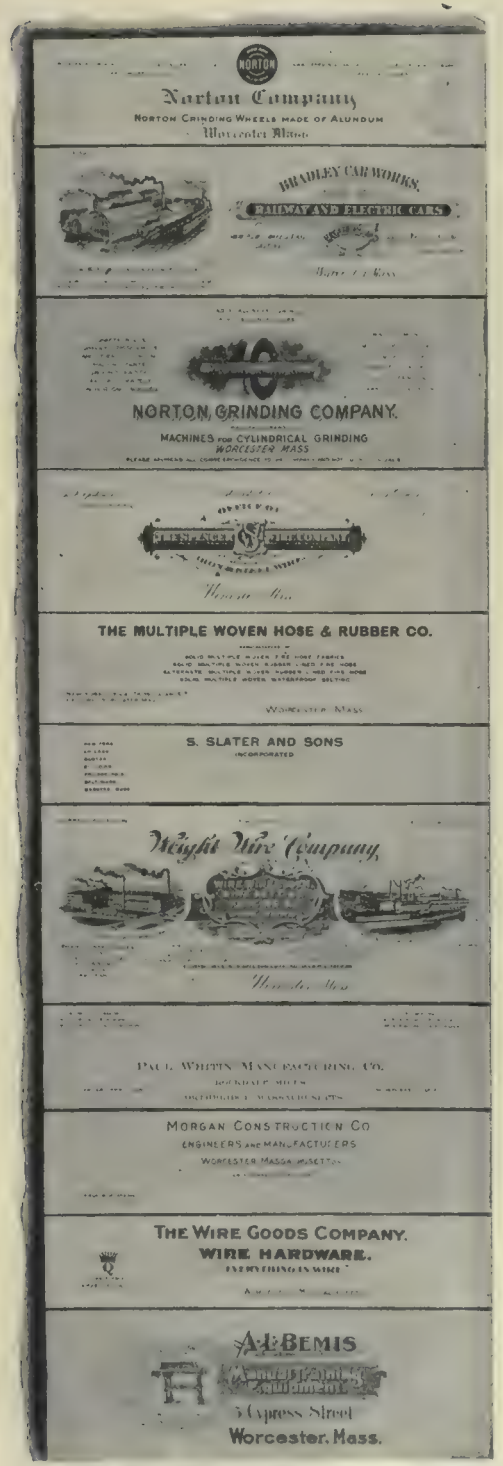
Short articles follow on miners' nystagmus and boilermakers' deafness, and the report concludes with suggestions as to cards of instructions for employers and employes in the lead trades and with two proposed bills, one for the control of the poisonous trades and the other for the protection of workers in caisson disease:

The bill would make the employer responsible for trade diseases in his employes—that is, for diseases peculiar to the work or process carried on. The trades specified as involving danger of disease are those in which poisons are handled or used—such as sugar of lead, white, yellow, or red lead, arsenate of lead, Paris green—also the manufacture of brass and the smelting of lead and zinc. In such trades the employer is required to provide and maintain working clothes and see that his employes wear them. Where dust or fumes are produced respirators must be furnished and used. Medical inspection once a month is required, and the report of the inspecting physician must be sent to the State Board of Health, which must transmit a copy to the Department of Factory Inspection.

The law also provides for adequately equipped lavatories, for lunch rooms, and for wholesome drinking water. There are other sections devoted to the removal of fumes and the prevention of dust, a section empowering the Department of Factory Inspection to carry out the provisions of the law, and one requiring the posting of simple instructions for employes as to the mode of avoiding diseases, these instructions to be in whatever language is necessary to make them intelligible to the employes.

A fine of fifty to one hundred dollars for the first offence, doubled for the second, is the penalty for violation of any provision in the act. And in addition, any injury to the health of any employe, caused by wilful violation or failure to comply, may be made the ground for action for direct damages, and in case of death, a right of action accrues to the legal heirs.

The Illinois commission has thus made a contribution to the practical literature of industrial diseases in America, comparable to the reports made on work-accidents and their prevention. It has shown what can be accomplished in nine months' work, and affords a basis for judging the immense increase in our knowledge of the human waste in industry and of ways to prevent it, which will follow if the Illinois Legislature decides to carry to completion this valuable inquiry, and if the Legislatures of other states decide to take up similar studies of the dangerous trades within their borders.



TWO YEARS OF THE "WORCESTER PLAN"

JOHN L. SEWALL
"Boston—1915"

A recent mass meeting of citizens of Worcester, which crowded the city's largest auditorium on a Sunday afternoon, is noteworthy as a waymark of progress in the effective battle of a great industrial center against

M. G. OVERLOCK, M.D.

Some of the Worcester firms co-operating in the tuberculosis agreement. Dr. Overlock states that 1,200 firms in New England have fallen into line.

the ravages of tuberculosis. Its immediate object was to honor Dr. Melvin G. Overlock, the state factory inspector for the eleventh district, from whom came the suggestion of what has since been known as the "Worcester Plan," and who was presented with a series of engrossed resolutions, signed by nearly 15,000 of his fellow citizens.

In 1902 Dr. Overlock began a vigorous campaign for better municipal provision for tuberculosis patients than the poor farm. The trustees of the city hospital, while making provision for all other maladies, including an isolation retreat for contagious diseases, professed themselves helpless when asked to care for sufferers from consumption. With the cooperation of Edward F. Fletcher, then mayor, Dr. Overlock started a campaign of agitation and education, which, aided by many other like-minded citizens, has gone steadily forward. In these years the sanatorium at Rutland, twelve miles distant—the first state sanatorium built in the United States—has been enlarged and developed, and places have been found there for many Worcester patients, pending the time when the city itself, or some of the health associations in it, shall provide a local institution.

It was a little more than two years ago that in the course of his work as state factory inspector Dr. Overlock found among the employes of the Royal Worcester Corset Company an incipient case of consumption. He warned the patient that she must at once leave her work and go to Rutland, but this, she told him, was a financial impossibility. Knowing well the spirit of the man who stood at the head of this establishment, the state physician presented the case to him, assuring him that with relief the girl could recover, but that without it her doom was certain. A few days later he received the following letter, dated November 14, 1908:

Dr. M. G. Overlock.

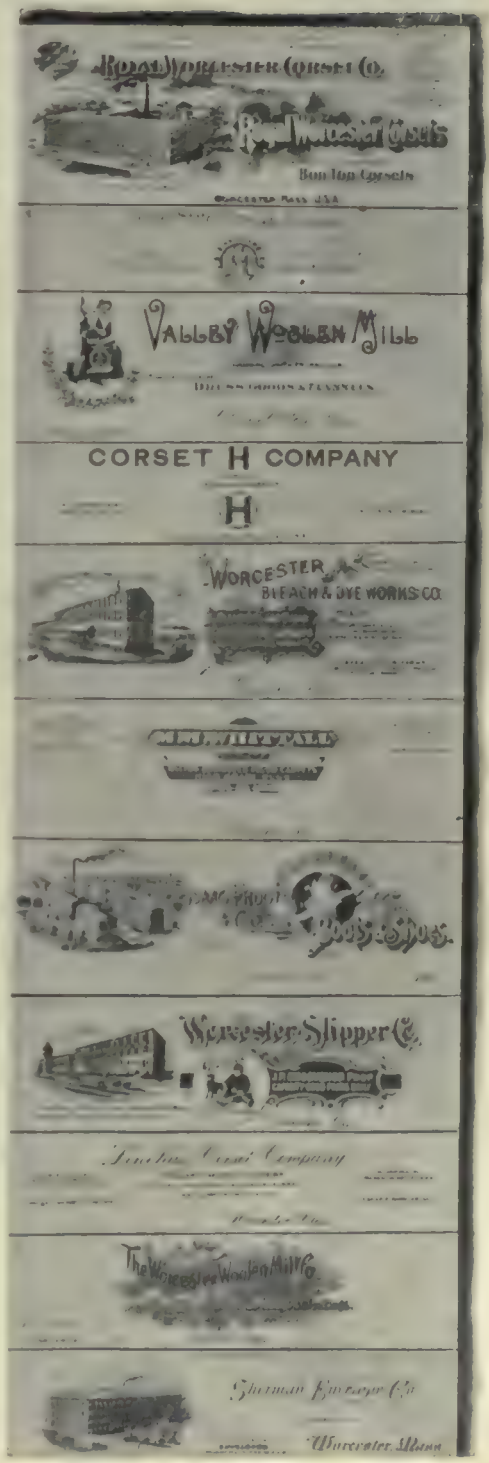
Dear Sir—Referring to my conversation with you a few days since, I desire to say that should any of the employes of the Royal Worcester Corset Company be so unfortunate as to contract tuberculosis our company will pay the expenses at Rutland Sanitarium for a period of three months, or longer, if necessary.

Very truly yours,

"David H. Fanning, President."

Such a letter, instead of being accepted as the satisfying conclusion of a single problem,

instantly opened the vision of an ever broadening movement of practical sympathy between employers and employes. That letter, which Dr. Overlock cherishes as one of his most valued treasures, is the first in a goodly collection, bearing the firm names of all the leading industrial concerns in Worcester and in neighboring towns, in which the first generous pledge has been taken up and duplicated, until not alone scores and hundreds, but thousands of wage-earners have been brought under its terms.



Naturally a work of this kind could not well limit itself to the boundaries of the city where it started. Boston early became interested in the plan; its Chamber of Commerce has given it a hearty endorsement and initial impetus among the factories and stores of that city; and Boston-1915has included this as one of the features in the program of its health conference. The initiation of like efforts in other cities, together with a constant stream of inquiries from nearly every state in the Union, and from foreign countries as far distant as Bulgaria and Japan, is a cheering prophecy of its future possibilities.

Prompted by the suggestion of a working man whose daughter had benefited by the agreement, resolutions were circulated in the shops of Worcester early in the winter for the testimonial meeting. Mayor Logan presided

In accepting the testimonial Dr. Overlock paid a tribute to all the manufacturers and merchants whose co-operation had made the "Worcester Plan" practicable:

> This movement is sending out into the community an army of trained sanatorians to preach the gospel of fresh air, cleanliness, sunshine, exercise, which is a potent factor in warding off not only tuberculosis, but all other diseases.
>
> No simpler, saner, surer plan for keeping the American workman supreme, physically and mechanically, has ever been devised. In the long run, in a commercial civilization such as the twentieth century boasts, the absolutely healthy nation will win.
>
> I claim nothing for this contribution to modern economics other than the desire to make it known. To the Worcester manufacturers and merchants belongs the credit for its launching. And especially to David H. Fanning, this vigorous old man, who, on August 4 celebrated his eightieth birthday, carrying on his shoulders at forescore years a burden that might stagger a man at half his age.

Veritably Mr. Fanning's letter started what proved to be in more senses than one a "great white" snowball.

It was David H. Fanning, the aged president of the Royal Worcester Corset Company, who started the ball rolling.

PLATE I.

SAFETY DEVICES FOR PREVENTING INJURIES TO THE EYE

Used in Plants of the American Steel and Wire Company

DAVID S. BEYER, Chief Safety Inspector

Water gauge tubes on boilers are liable to break, and the flying glass and steam might injure the eyes of anyone who happened to be near. The shield which is back of the glass in plate I can be revolved to the front, as shown in plate II for the protection of men when turning steam and water in a new glass, or when working in a position near enough to be injured; once through with their duties in this locality, the guard is revolved to the rear again, so that it does not interfere with a view of the height of the water.

PLATE II.

Plate III. The use of emery wheels is common in all shops and manufacturing plants, for grinding and finishing castings, tools, dies, etc. In doing such work it is a frequent occurrence for an operator to get particles which are thrown off the wheel into his eyes—and sometimes a wheel bursts or "explodes" so that large pieces are thrown outward with great force. Plate III illustrates a row of such grinding wheels, each of which has a steel hood and a plate glass shield. The hood is heavy enough to retain a bursting wheel, and the glass shield effectively protects the eyes of the operator from dust, even though he must view the work at close range. Each hood is connected at the rear to a forced draft pipe, which will be noted in the picture, and this combination of safeguards practically eliminates eye injuries of the kind in question. Shaded electric lights provide the necessary illumination without any annoying glare.

The canvas screen in plate IV is used for protecting men from flying particles of steel when castings are being chipped. It not only safeguards anyone who may be passing by, but also prevents the chips from rebounding and striking the chippers, as they either stick in the canvas or fall "dead."

Plate V shows a man who chips or cuts rough projections from castings, wearing goggles. It is difficult to get workmen to wear them constantly on account of the discomfort and a certain necessary interference with their vision.

PLATES VI, VII, VIII.

A prolific source of eye injury is the use of hammering tools which have burred or "mushroomed" edges, from which spawls of steel break and fly under the impact of a blow.

Plate VI shows a hammer with roughened edges from which some pieces have already been crushed off; plate VII a similar tool which has been properly dressed. All the American Steel and Mine company's shops are inspected weekly, and a constant endeavor is being made to keep these tools dressed up in good condition.

Plate VIII is a photograph of a man whose duties require him to work close to the blooming mill rolls; his eyes are protected from flying scale by a mask of wire gauze.

Plate IX

"Pulpit" or platform upon which the men who operate a blooming mill stand. The framework in front of them contains a heavy sheet of plate glass, which protects their eyes from the scale and cinder that fly from an ingot when it goes through the rolls.

Note. A further line of eye protection, especially designed for wire mills, was illustrated in an article by Mr. Byer in The Survey for May 7, 1910. The article referred to Safety Provisions in the United States Steel Corporation) dealt with the general range of accidents occurring in mill work and manufacture, and the systematic program of the Steel Corporation towards prevention. Mr. Beyers's study of eye hazards is an example of the specific way in which causes of injury are classified and treated as part of this program. The article was republished in full as an appendix to Miss Eastman's Work-Accidents and The Law, one of the volumes of the Pittsburgh Survey.]

LABOR LEGISLATION

JOHN B. ANDREWS

Secretary American Association for Labor Legislation

MINNESOTA COMMISSION REPORTS

The Minnesota Employes' Compensation Commission, the earliest appointed of the nine or ten state committees of the active period of the past two years, has submitted its report to the Legislature. No commission has been more active in attempting to reach a liberal interpretation in the economic and legal facts involved in the industrial accident problem.

The concise story of its activities fills a volume of about 300 pages. It is unfortunate that after two years of hard work the employer member of the commission, Mr. Gillette, and the other two members, Commissioner McEwen of the State Bureau of Labor and the chairman, Attorney H. V. Mercer, find themselves in disagreement over the three important topics: (1) contributions by employes, (2) constitutionality, and (3) cost. The majority report recommends a compulsory, non-contributory system of compensation covering all occupations, in substitution for all other legal rights and remedies.

INTERNATIONAL COMPETITION

The Italian Ministry of Agriculture, Industry, and Commerce has instituted an international prize competition for the invention of improved methods and appliances for preventing industrial accidents and for protecting the health of work people. This is in accordance with the progressive spirit of Italy in establishing the first clinic for industrial diseases.[1]

INTEREST IN FACTORY INSPECTION

Important bills on factory inspection are receiving close attention in several states. The Massachusetts Commission on Factory Inspection, which has prepared a valuable report, will make recommendations to the Legislature. In Missouri, where factory inspection has heretofore been limited to towns of 10,000 or over, the last census shows a remarkable increase in the number of factories established in the smaller towns. A new bill provides for inspection throughout the state, and a regular appropriation for the expenses of the department, heretofore supported by fees.

In California it is proposed to abolish the present Bureau of Labor and to establish separate bureaus, including free employment offices, in three of the largest cities of the state.

In Pennsylvania quarry-workers are not included in the present inspection system, but a new bill provides for their protection similar to that afforded mine workers. Another Pennsylvania proposal is to make the office of factory inspector elective. In Michigan attempts are being made to place inspectors under civil service regulation.

OHIO LAW IN OPERATION

Notices are being posted in Ohio factories requiring employes to report defects in machinery to the employer. According to one provision of the Norris employers' liability act passed last year, if the employer has failed to comply with the law respecting safeguards, the employe, even though he knew of the unsafe condition and continued at work, shall not be deemed to have assumed the risk of his employment, nor to have been guilty of contributory negligence, "unless by the terms of his employment it was expressly made the duty of such employe to report such neglect, or such defective or unsafe condition to the employer, and the evidence discloses that such employe failed so to report, and that the employer was not otherwise possessed of knowledge of such negligent, unsafe, or defective condition." Failure to report defects thus leaves the employe practically in the same position as to his rights to recover damages as existed before the enactment of the new law.

MINIMUM WAGE BOARDS

Among the bills "to protect women and minors as wage-earners" in Massachusetts, is one establishing a commission to investigate and report on the wages of women and children with reference to the advisability of establishing minimum wages boards.

In England, in accordance with the Board of Trade's regulations issued last July, a trade board is now established for the men's ready-made wholesale clothing industry. The board consists of thirty-one members, representing owners of factories, occupiers, employes, and five "appointed members." Trade boards have now been established by the English act, which came into effect January 1, 1910, for the four trades authorized—chain-making, certain processes in lace making, cardboard box making, and ready-made tailoring.

HOURS OF LABOR FOR MEN

The Wisconsin socialists have introduced two bills limiting hours of work. One provides for thirty-six continuous hours of rest out of every seven days. The other limits the hours of work in bakeries to sixty-one a week—the one hour being added to the time limit set by the New York act (which was declared unconstitutional in the famous Lochner case), in order that the law might again come before the courts.

[1] THE SURVEY for November 12, 1910.

CRIME AND ITS CURE

ISABEL C. BARROWS, Contributing Editor

THE NEW YORK STATE REFORMATORY FOR WOMEN

KATHARINE BEMENT DAVIS

SUPERINTENDENT NEW YORK STATE REFORMATORY FOR WOMEN

The question which was most frequently asked by the foreign delegates to the International Prison Congress on their trip of inspection to the reformatory institutions of this country was, "What are your results?" "You have splendidly equipped plants", they said, "apparently well officered and well managed. What success do you have in the work of reform?" They were disappointed when they found how little there was in the way of statistics to show what the reformatories had accomplished.

Each institution can show the number paroled and what proportion have broken parole, but in most cases that is about all. There is no legal machinery for following up the career of those discharged from parole, and whatever is known must be learned through the friendly relations of the institution with the individual. Simply through press of work, touch is often lost with many who would be glad to continue their friendly relations. This is the weak point of our reformatory system. Of course, when former inmates are re-arrested and re-sentenced for crime, the reformatory officials may or may not know it; the matter is largely accidental.

At Bedford we began to be asked about our results before we were a year old. Now there is nothing quite so difficult to measure in figures as change in character. We can say how many have kept their parole; how many we know have been re-arrested; of how many we know the whereabouts and believe them to be doing well; but the changes in character, the establishment of higher ideals, the doing of more efficient work as a result of the training received, these things can never be measured.

We said at Bedford we would attempt to give no statistics of results until we had handled a thousand cases. The first commitment to the institution was received May 11, 1901, the thousandth commitment November 26, 1909. In the year that is past, we have put together such information as we have concerning these one thousand cases. The entire amount of information is considerable and will be published later. Just now we will concern ourselves with some of the results.

HOW WE GET OUR INFORMATION

First, we have the record of conviction forwarded from the committing judge. Often this information is supplemented by a history of the case so far as known to the probation officer who investigated it; or the court and prison officials courteously put their information at the disposal of our marshal. As complete a history of the case as possible is obtained from the girl herself by the superintendent or assistant superintendent, immediately upon her arrival. An examination is made by the resident physician, and the medical history is recorded.

These histories are added to as time goes on. The girls are always "chaperoned" when they receive visits. The members of their family are interviewed by the superintendent or a deputy, and special visits are made by the parole officers when desirable. The outgoing and incoming correspondence is read by the assistant superintendent. From these and similar sources much of the family and social history of the girls is obtained. While on parole their is a regular system of letters, reports, and visits by our parole officers and others.

Of the thousand cases, 739 have been sent to us from New York city. Our parole officers are constantly going about New York and meeting our old girls. On the visits of the marshals to the various prisons in New York and Brooklyn they see the prison officials and make a point of inquiring whether any of the former inmates of Bedford have been re-arrested. Knowing we desire information, the officials have been most courteous in remembering to give it. We keep in touch with a number of the most efficient probation agencies in New York city, including the court and volunteer probation officers; they also give us information. In addition to our own two officers, our Jewish instructor does much visiting among the Jewish girls. The Church Mission of Help of the Protestant Episcopal Church is undertaking to supply volunteer visitors for the girls of that faith; a lady appointed by the Society of St. Vincent de Paul is looking after some of the Catholic girls. All these make reports to us. Our old girls

have always been encouraged to write us freely and to visit us when possible. Correspondence is kept up, not only with the superintendent, but with many of the teachers and matrons, who are asked to write on a slip of paper and put on a spindle on the parole officer's desk any trustworthy information they may receive about former inmates, on whose parole record cards all this information is entered. During the past year, the parole officers have taken special pains, so far as their duties permitted, to visit the old girls whose whereabouts we knew.

The statistics which follow are up to a date one year later than that on which we received the one thousandth commitment.

Of the first thousand commitments there were

Foreign born	20.1 per cent
Born in United States.....white	52.7 per cent
Born in United States....colored	18.2 per cent

The nativity of their parents was as follows:

Both parents born in United States:		
White	207	
Colored	153	
		360
Both parents foreign born	490	
Mixed parentage—one born in U. S., one foreign	94	
		584
Nativity of both parents unknown:		
White	26	
Colored	19	
		45
Nativity of one parent unknown:		
White	10	
Colored	1	
		11
		1,000

The thousand commitments were as follows:

Misdemeanors	22.1 per cent
Felonies	26.4 per cent
Other offences	51.5 per cent

"Other offences" means being a common prostitute, frequenting disorderly houses, and in danger of becoming morally depraved, habitual drunkards, soliciting on the public streets, etc. It should be said that out of the one thousand the number who have led sexually regular lives is almost negligible.

The average age of the one thousand was twenty-nine years, nine months. Eighty-nine could not read or write, 68 could read a foreign language but not English, and 12 could read a little but could not write; 276 had the barest elements of reading and writing. Forty-seven per cent were Protestants, 42 per cent Catholics, 11 per cent Jews. Of the thousand girls, 691 were single, 209 married. So far as is known, 180 of the married women had had children and 120 of the single women had had illegitimate children. Of the married women, 41 were widows, 8 were divorced and 125 were separated from their husbands; 5 were bigamists and the husbands of 22 were in prison.

As to occupation, the complete list is a long one. Four hundred and thirty registered as general house workers. (This means neither skilled nor continuous occupation in domestic service.) One hundred and twenty-one had no occupation at all at the time of arrest; 135 were factory operatives.

So far as we can ascertain, the number who had been in other institutions for delinquents previous to their commitment here was 314. Seventy-six had served more than one term previous to commitment to Bedford. Eighty-seven acknowledged repeated arrests, but had previously got off with fine or suspended sentence.

We are not prepared at this time to give complete statistics as to the physical condition of the thousand girls.

We were interested to compare our one thousand cases with a thousand cases of girls entering two collegiate institutions, Cornell University and Mt. Holyoke College. The comparison is as follows:

RESULTS OF 1000 MEASUREMENTS.

	Cornell University	*Mt. Holyoke College*	*State Reformatory—Bedford*
Age	20 yrs. 8.2 mo.	19	20 yrs. 9 mo.
Height	5 ft. 3.2 in.	5 ft. 2.7 in.	5 ft. 1.68 in.
Weight	123 lbs.	117 lbs.	121.8 lbs.

Among our thousand cases, it was necessary to treat for:

Alcoholism	112
(Of these only 44 were committed as habitual drunkards or for public intoxication. A very large proportion of the women who live irregular lives use alcohol and smoke cigarettes to some extent.)	
Venereal diseases	140
(In the acute stage. There can be no question but that a very much larger number had had the disease, but no external symptoms were discoverable; and the Wasserman reaction has not been used on account of lack of laboratory facilities.)	
Drug habit (treated)	33
Epilepsy	13
Tuberculosis	22

On the basis solely of observation, we have no hesitancy in pronouncing 157 of the total number feeble-minded. There is no question but that a proper mental test would show a much higher percentage of mentally sub-normal. It is generally believed that tattooing is common among criminals. We have found only eight in a thousand cases so marked.

DISPOSITION OF THESE CASES

In November, 1910, the disposition which had been made of these cases was as follows:

Paroled	668
Still in institution	111
Escaped	3
Died in institution	12
Transferred	47
Executed	16
Served entire term	80
Discharged by court	63
	1,000

It will be observed that 111 of the cases have not yet gone out from the institution. Eighty who served their entire time in the institution were kept for bad conduct or because it was so impossible to place them in any way satisfactorily that it seemed the social good would be best served by keeping them under our direct care as long as possible. Of the eighty so kept, thirty-nine belong to the unmistakably feeble-minded class. At the end of their three years we were able directly to arrange for the custodial care of five, and four were turned over to the county authorities to await their turn for admission to a custodial institution. The sixty-three discharged by court were without exception commitments from magistrates courts, and a large percentage of these were discharged under the so-called "Gaynor decision" in the years 1902, 1903, 1904. Since the amendment of the law in 1904 we have had almost no trouble with discharges under writ. For the most part, such writs were secured by the people from whom it was absolutely necessary to separate the young women, if there was to be any hope of their salvation. Among these sixty-three were three who were obviously feeble-minded.

Of the one thousand, thirty-three are known to be dead. Of these twelve died while in the institution; eight while on parole; twelve are known to have died after their discharge from parole. Of the eighty who served their entire time in the institution, one is known to be dead.

Of the forty-seven transferred to other institutions twenty-eight have been transferred to Matteawan State Asylum for the Insane.

RESULTS

It will be noted that 668 out of the thousand cases have been paroled. The status of these 668 in November, 1910, was as follows:

On parole	110
Discharged having done well	393
Violated parole, not found	52
Broke parole and returned	102
Transferred to Auburn Prison while on parole	1
Discharged by court while on parole	2
Died on parole	8
	668

Our statistics of parole show that while the average age of those committed to the institution has been twenty years and nine months, the average age of those paroled has been twenty years and eight months, and the average age of those who have violated their parole, twenty-one years and four months. The average length of stay in the institution of all of those paroled was two years. Inasmuch as in all cases we exercise supervision over the girl on parole until the expiration of the three years for which she was sentenced, the average period of supervision on parole has been one year.

As to the causes of violation of parole, the largest single cause has been immorality. The records show that twenty per cent of the violations were for intoxication, ten per cent for immorality at the place where the girl was working, eight per cent for dishonesty; in fifty-three per cent of these cases the girl left her place without permission, the immediate reason for such leaving being in almost every instance a man in the case. A comparison of those placed with their families and those placed in positions at the time of their parole, shows that the proportionate percentage who violate their paroles under the two conditions is twice as great when the girl is in her own home. This is to be expected, for, as a rule, if home conditions had been what they should be in the first place, the girl would not have come to the reformatory; yet where a family is respectable and there seems to be real need of the girl in the home, it sometimes seems wise to give her a chance there.

The following table shows the present status of the 393 girls who did well on parole and received their discharges:

Known to be doing well	127
Known to have criminal record	38
Known to have been immoral	58
Known to drink	9
Dead	12
Whereabouts unknown	154

Of the 127 who are doing well, 58 are married women; 44 have married with my consent while they were on parole or since that time without it. Of the 127, 24 girls are colored, 67 are white, of American parentage, and 36 are white, foreign born. The percentages conform almost exactly to the percentages of commitments in each class, although the statistics of parole show that of the total receiving it the percentage keeping it has been highest among colored girls and next among foreign born.

The occupation of those who are doing well is as follows:

Married (44 since leaving here)	58
Dressmakers	3
Keep house for members of family	3
Assist at home	6
Nurse	1
Office clerks	2
Salvation Army officer	1
Laundry	1
In sanatorium in poor health	1
Attendant Institution	1
Piano accompanist	1
Factory operatives	6
Saleswomen	5
Domestic service	38
	127

Among the girls who spent their entire time in the institution, we know of four who have had a criminal record; two who are leading immoral lives, and five whom we know to be

JESSIE D. HODDER.

Mrs. Hodder, after eighteen months service at the Lancaster State Industrial School, where she was in charge of feeble-minded girls, has just been appointed superintendent of the Massachusetts Reformatory Prison for Women.

doing well and with whom we are still in touch.

Among the fifty-two women who are listed as "known to have been immoral or known to drink since their discharge from parole," there are a good many who are earning their living and who are by no means leading continuously immoral lives. In some cases a woman has an illegitimate child which she is supporting.

As a result of our nearly ten years of experience, we wish to call attention to a very weak point in our law. We have legal charge of a girl either in the institution or out of it, for the maximum of three years. If a woman is sent to us who is an accidental criminal, who is physically well, fairly intelligent, and fairly efficient industrially, it may be necessary to keep her not over a year or even less, as has happened in a few instances. After she leaves us, according to the law, we may supervise her, if we wish, for the remainder of her term. In other words, we can keep her on parole for a period of two years or longer. On the other hand, a woman is sentenced to us who has for years led an immoral life, who is illiterate, vicious, inefficient industrially, depraved morally, and broken down physically. It may take us two years to begin to get hold of her. We have to choose between paroling her when we know she is not ready, or having no supervision over her after her discharge from the institution. This is the type of woman who needs the most careful supervision after leaving the institution. The large percentage of failures is due to just this fact. We are gradually building up a relationship with other organizations whereby we can secure friendly visitation for these women after we discharge them. The weak point here is that in many cases nothing but authority has any effect on the girl. Some day the law will be changed, authorizing a minimum period of parole of at least one year no matter what the length of stay at the institution.

A NEW SUPERINTENDENT

FRANCES G. CURTIS
Boston

An event of importance to all interested in prison problems in Massachusetts is the appointment by the Board of Prison Commissioners of Jessie D. Hodder to be superintendent of the Massachusetts Reformatory Prison for Women at Sherborn, in the place of Frances Morton, resigned from ill-health.

Mrs. Hodder leaves the social service department of the Massachusetts General Hospital, where for more than three years she had done wonderful work in the interest of young women in trouble of various kinds,—those about to become mothers, or suffering from the effects of vice and drink. Before entering this social service she was for eighteen months in charge of the cottage for feeble-minded girls at the Lancaster State Industrial School. Mrs. Hodder therefore goes to her new work at Sherborn with a mind well prepared, and with a heart keenly sensitive to the dangers, the weaknesses, and the temperaments of those whose welfare is in her hands. She combines to an unusual degree the power of analyzing and generalizing cases, with the sympathy that wells up in understanding each case. Large humanity, wide knowledge, and singleness of purpose mark Mrs. Hodder's work. Careful to keep herself abreast of what is being done elsewhere for these girls, she is not hampered by the methods of others, and does not fit her work into preconceived theories, but is open-minded and ready to receive new ideas.

The fact that this girl problem is only a part of the greater sex-problem, and that lack of education in sex hygiene is so often largely responsible, has made her feel deeply that every one should join in combating this ignorance. She herself has studied the question thoroughly, and has questioned the methods of all sorts of agencies, visiting societies, rescue homes, hospitals, schools for feeble-mind-

ed. before feeling qualified to use the resources of the community to the best advantage.

For the International Prison Congress, which was held in Washington last October, Mrs. Hodder was appointed one of the reviewers. She prepared a digest of the papers on bastardy which had been written for that meeting, and drew up, based on them, the resolutions with reference to illegitimate children which were adopted by the congress.

A short extract from a letter of hers on a common enough case shows the spirit, the freshness, the vividness of her management of a girl's case. Spiritual insight is the secret of her power.

"I do not agree with you that this girl cannot keep her baby; she can take care of it I am perfectly sure, and she will be a bigger, braver woman if she does, as you realize. I can imagine no more horrible fate than to feel that my baby—my own flesh and blood—was somewhere around in the world, I knew not where. Take this girl's life so far, add this experience, then add the experience of giving birth to her baby, plus the care she will have had of it so far: then subtract the baby, put it selfishly, brutally, out of her life, and what is there left? You see we stop being twenty and come to be forty, and we care a lot if our feelings are worth having. Life ceases to mean existence, and comes to mean soul and all that goes to make it richer, more worth while.

"How about the chance to develop the man morally? What bigger debt has he contracted in this world than his debt to his own child? Say it to him—make him feel that his baby, illegitimately born, is just as human a being, just as sensitive, just as ambitious, as a baby born in wedlock.

"I cannot feel that the community has any growth so long as its members are shirkers, and turn and run from any evidence of self-indulgence or wrongdoing."

REFORMATORIES FOR WOMEN

There are few state reformatories for women in this country. Massachusetts has one, Indiana one, and New York two. These have all proved benefits to the states which maintain them. There is ample opportunity for other states to imitate this method of caring for criminal women, and New Jersey, Connecticut, and perhaps some others may soon fall into line. In the meantime it is of extreme value to ascertain actual facts about what has been accomplished by the reformatory system.

We are fortunate in being able to give the results, so far as figures can do so, of the care of a thousand girls who have passed through the reformatory for women at Bedford, N. Y. Katharine B. Davis, who has been in charge of this excellent institution from the time of its organization, is making a comprehensive study of these figures, and her article in this department is suggestive of further work in this direction. Of this reformatory one of the leading prison experts of the International Prison Congress said: "Had I returned without seeing it I should have missed the best institution I saw in America."

The Massachusetts Reformatory Prison for Women is taking a new lease of life under the hands of Mrs. Hodder, the recently appointed superintendent. Though we have no very full statistics of what has been accomplished there in the past, we may look forward to more exact information in future.

It would be useful, in trying to cure criminality among girls and women, to find out how many there are in each state of the union who are at present subjected to the old soulless and dull routine of dealing with criminals. New Jersey has taken such a census. The total number of women in the state prison, county penitentiaries and jails, including those over sixteen in the Trenton state home for girls, is 336. There are 210 under thirty and of these 79 are in county institutions. No wonder the public-spirited men and women of New Jersey demand a reformatory for women.

No matter how humane the physical care they are now receiving, probably none of these younger women is in the least benefited morally by her term in a county institution. After their brief sentences they return to the community worse than they were before; no better fitted in any way for leading useful, decent lives, even were they minded so to do.

If no way can be devised for preventing girls and young women from falling into vicious and criminal lives, at least the state alone should have control of them after they have broken the laws of the state. No county should have the responsibility of caring for criminal women. If they have committed acts that place them behind bars, the state alone should be the turnkey; and a separate institution should be provided, where suitable discipline, including physical training, simple schooling, and education in domestic industries should be compulsory for every inmate. This seems so self-evident that one wonders why it should take years to impress the necessity of such treatment on the minds of legislators. It is such miserable economy to shut up, guard, clothe, and feed the 336 women criminals of New Jersey for a given time, and then turn them out into the world worse than when they were arrested. Of course the process must be repeated over and over unless some wiser course is adopted.

And what is true of New Jersey is true of every state in the union. Not one provides reformatory discipline for all the girls and women who are arrested, tried, and convicted.

THE MAGISTRATE AND THE OFFENDER

"I make it a practice never to do anything that will influence the sentence I may impose; hence I have never crossed the thresh-

old of a prison," was the reply that a New York judge once made to the question whether he knew the condition of a prison to which he was about to sentence a woman. Times have changed.

Not one, but a group of magistrates has recently made a visit of inspection to the Bedford Reformatory, along with some of the members of the committee on criminal courts of the Charity Organization Society. All the New York boroughs were represented by the visiting magistrates. This is what they found as the result of an entire day spent in inspection:

From arrival in the morning until the departure of the group at nightfall, the fact that this institution is not a prison, nor a place where punishment is meted out to offenders, but a place devoted entirely to making over and restoring to usefulness persons committed to it, continually impressed itself upon the visitors. On every hand educative work replaced the character-destroying idleness of the average workhouse and penitentiary.

Homelike cottages of attractive design, with generous-sized windows, replaced the usual congregate building of dark gray stone, dimly lighted by small, heavily barred windows. A single room for each inmate, plain, but neatly furnished, well lighted, and adequately ventilated, replaced the usual dark, poorly ventilated, cheerless cell or congregate dormitory.

Each individual is treated irrespective of her past offenses or defects and solely on the basis of her present need and future possibility, instead of on the usual sole basis of past record. Expert instructors, physicians, and housekeepers were found in the place of frequently stupid, if not brutal, keepers.

Kindly confidential relations were evident between officers and inmates in place of the oppressive, benumbing relations usually existing between keeper and prisoner; well directed efforts to build up character, in place of the degrading suppression of the average prison; careful classification based on age and temperament with a system of promotion in the place of herding and intermingling of the good with the vicious; physical examination and medical attendance; a gradual removal of restraints and extension of freedom by way of preparation for discharge from the institution, instead of uniform denial of opportunity to develop self-control by freedom; the parole of each discharged inmate to a remunerative position and the provision of suitable clothing, instead of the discharge of penniless, ill-clad persons upon a cheerless world; —these and many other things made an impression upon the magistrates and other visitors.

One important idea was brought out and referred to repeatedly during the day. This was that large cities should provide institutions to which cases convicted in the courts could be remanded for study and observation before sentence is passed.

NATIONAL COMMITTEE ON PRISON LABOR

E. STAGG WHITIN
Secretary

The National Committee on Prison Labor has been organized for effective work to ameliorate the conditions developing from the industries in our penal institutions.

The origin of the committee is not without interest. A complaint was lodged with the chairman of the Industrial Committee of the General Federation of Women's Clubs, Helen Varick Boswell, that the laws of many of the states regarding prison labor were being violated. The complaint being carried to the New York State Department of Labor, Commissioner Williams assigned E. Stagg Whitin, an expert of the department, to investigate the charges. As a result it was found that large quantities of prison-made goods, probably amounting to about $10,000,000 annually, were being shipped into the markets of New York city from other states; that the laws regulating their sale were under question as to constitutionality, and that the conditions under which they were manufactured in many states were open to question, from the standpoint of the laws of the state, the standpoint of justice to the convict, and the standpoint of outside free labor. The investigation showed also that while there existed a number of prison associations which dealt with the general reformation of prison conditions, trade unions which bitterly opposed the sale of prison manufactures in the open market, employers 'associations that advocated the suppression of certain industries in penal institutions, and groups of contractors who worked to secure prison contracts, still there was no concerted movement for the study of the conditions under which these industries are conducted, and no social program universally advocated and consistently pushed. To secure such a body Commissioner Williams recommended in his annual report last year the establishment of a national committee on prison labor, which should undertake to deal scientifically with the problem and to gather the conflicting forces and center them upon a social program.

Upon the executive committee of that body O. F. Lewis represents the prison associations; Joseph P. Byers, the secretary of the American Prison Association, the prison official; Henry Solomon, the president of the New York Prison Commission, the administrative standpoint; Mrs. Florence Kelley of the National Consumers' League, industrial workers; Helen Varick Boswell, the General Federation of Women's Clubs; Elizabeth B. Butler of the Bureau of Social Research, whose studies in women's trades are well known, the women's trades; Prof. Leslie Willis Sprague, the ethical standpoint; B. A. Larger, the general secretary of the United Garment Workers of America, labor. Alexander Johnson, the general secretary of the National Conference of Charities and Cor-

rection, is directing the study of the history of convict labor legislation. The officers of the committee are: Chairman, Rev. Thomas R. Slicer, who has been identified with many similar movements for the amelioration of the conditions of labor and the anti-policy crusades; treasurer, R. Montgomery Schell, for many years general trustee of the George Junior Republic, and secretary, E. Stagg Whitin, assistant in social legislation at Columbia University.

Much information has been collected from official reports, and from questionnaires which have been sent all over the country, taking in practically every phase of the subject. Agents of the committee have been at work in a number of centers learning those vital details which do not appear in official documents.

The committee has had the co-operation of prison contractors as well as of labor unions in gathering this material. In many of the states commissions have been appointed to consider the subject.

Any social program that may be adopted will be based upon the needs of the present, viewed in the light given by the large mass of testimony as to the experience of reformers in the past. Experiments in this direction began with the movement against capital punishment for trivial offenses, which prolonged imprisonment and created a promiscuous prison population, uncared for and unkept. Elizabeth Fry in her quiet Quaker way changed these "hells of vice", in which people of both sexes and all ages were huddled in rags and degradation, into communities of people abiding peacefully, clothed by their own work and developed by their own industry. Mrs. Fry did for the prisons of England what the poor law advocates of England had been trying to do with able-bodied beggars from the time of Elizabeth, by organizing workhouses in which they were supplied with materials and forced to work in return for shelter and food.

The work in penal institutions, introduced by Mrs. Fry, was the substitute for the inadequate financial support of the penal institutions by the state. Labor was not instituted to punish the criminal, but as a means of ameliorating his condition.

The treadmill, like the stocks, was relegated to oblivion by the humanitarian movement, and labor was introduced as a boon, to supply the worker with a few necessities for sustaining himself and those dependent upon him. This boon, which caused the little Quaker lady to be hailed as the greatest philanthropist of her age, developed into a more definite problem as the industrial revolution took place. Change from hand-work to machine-work necessitated supplying both workhouses and penal institutions with new devices, so that the goods might find a market. Against the introduction of these machines labor brought its full force, as part of the larger opposition to the new devices.

In the workhouses the labor movement was successful, not only in forbidding the use of machinery, but in suppressing competing industries. In the prisons the same was true, until the demand of the new industrial system for workmen pointed out to certain capitalists the pecuniary advantage of securing the work of convicts, in return for supplying machinery and marketing the product.

In England, France, and Germany the conflict was quieted by the limitation of the work of convicts for the most part to enterprises of the state: the construction of ditches and dykes, the building of institutions, and the manufacture of state goods. In the American states prison reformers were so eager in their advocacy of the congregate or solitary systems of housing the convicts, and the building of costly model institutions which might be an example for the world, that it became difficult to combat the growing evils of the penal industrial system without placing a very much larger responsibility upon the taxpayer than he would accept.

During this period, the system of contracting the work of prisoners to business enterprises developed and, despite the graft incident to it, paid the state so well that the citizens were seldom taxed for the maintenance of the prisons. The conditions in these industries were often the cause of investigations, and one device after another was employed to calm the wrath of the labor unions, to appease the demands of the prison reformers for more humane treatment of the prisoners, and at the same time, while building the great institutions, to trouble as little as possible the taxpayer.

Upon a wave of reform the American Prison Association was born. At its inception in 1879 it denounced the contract system as a solution of the industrial problem and recommended a change of system; but Dr. Wines, in his recent introduction to the fourth edition of his Punishment and Reformation, points out that in the thirty years since then little has been done to bring about the recommendations of that initial congress. New York state did away with the contractors in its prisons and supplied in 1894 a preferred market for its prison goods in its own institutions and departments. The limitations and inadequacies of the present New York system have been pointed out in the reports of the New York Commission on Prisons, and in many attacks in other states of the Union; while in no other state has so radical a step been taken, presumably because of the supposed failure of the New York system.

It is with this background that the National Committee on Prison Labor begins its work. The question is well asked, "What are the abuses which were complained of in 1870, and by the governors and legislative committees in every state for one hundred years?" What solution has been offered? Is there any reason inherent in the system itself which makes the New York state system so limited in its application and costly in its operation? In no state of the Union does the factory inspection department have power to inspect prison shops; in none does the ordinary protection

of the laboring man extend to the prisoner. The possibility of what a state itself might do in managing its own industries is given in the successful management, from a purely business standpoint, of certain contractors who have grown rich in the work. They have managed to build up a successful business, national in its scope, by the use of prisoners.

Naturally the good of the prisoner and the benefit of the state are not factors primarily considered by the men engaged in making fortunes through prison contracts. When the state combines with a business man in a contract it is not justified in asking him to be a philanthropist.

It is the duty of the public to demand that the condition of the prisoner in these industries shall conduce to his own development. The public should also demand that the state receive an adequate return for the capital invested and a return for the expenses entailed. The public has a right to demand that the stability of the market be protected from unfair competition and that the state itself profit, if profit there be over a fair wage for the prisoners, from the manufactures of the state. Modern methods must be adapted to prison industries, which should be conducted on a basis of decent efficiency and under conditions at least equal to those demanded from individual manufacturing concerns.

The problem before the National Committee on Prison Labor is to show how in each state of the Union this ideal can be carried out practically. It will study each state as a separate problem and try to develop the best system for that particular state.

PRISON LABOR

When Mr. Stolypin, the prime minister of Russia, was discussing the International Prison Congress with the writer, he said he hoped ample time would be given to a consideration of prison labor. From every quarter comes the same demand. There are those who look on it selfishly, but there are many who wish the subject carefully considered for the sake of the effect on the prisoner himself. A recent writer in the New York *Times* says:

"I believe that one of the first steps to be taken is that of remunerating the prisoner for the work done while he remains in prison. This is forced work, but there is no reason why the distribution of it should not be intelligently organized, and properly remunerated, so as to give a chance to the man to improve himself mentally as well as physically, at the same time that he looks after the needs of his family, who are often starving outside the prison walls.

"Solitary confinement and picking of oakum send out from the prison a man more brutalized, more embittered against society, than came into it. We aim at sending out of the prison a man who shall in every respect be superior to the man he was when he came in. I believe we can do this, and that, instead of dismissing from the prison gates, after a term of several years, a man whose heart burns with rage against the whole world, we shall dismiss from those same gates a man who has received an education which shall serve for him as a passport into a new life."

Frederick Howard Wines, the editor of the Illinois *Institution Quarterly*, who must everywhere be recognized as a friend of prisoners, does not think it such a simple matter to decide labor questions. Referring to the labor of prisoners, he says:

"It must not be forgotten that the 'earnings' of the prisoner, after meeting the cost of his incarceration for the crime committed by him, are often nil. In that event, it seems to be unpractical to demand, . . . that his earnings 'shall, if he is married, be given to his family; if unmarried, they shall be banked for him against the critical day of his return to society.' But it may be laid down as an ethical principle of general application, that no state has the right to enrich itself by the exploitation of convicts for pecuniary profit. If Minnesota expects in future to turn into her public treasury $300,000 a year, derived from the profits of prison labor, this expectation is not creditable to her. Its realization will be neither good morals, good politics, nor in accordance with the teachings of sociological and criminological science."

A TRIBUTE TO J. P. BYERS

The eighty-sixth annual report of the New York House of Refuge contains the following tribute of the managers to Joseph P. Byers, who has served as superintendent for five years and a half and who is now the secretary of the New Jersey State Charities Aid and Prison Association.

"The state of New York through Mr. Byers's resignation loses a public servant who combined executive and humane qualities, both of the highest order, and whose personal influence it may be said, has left a deep and lasting mark upon the lives of those who have been at different times committed to his care."

As the result of his work among these boys who are committed to the refuge between the ages of twelve and sixteen, and are held in custody only till twenty-one, no matter how vicious they may be, Mr. Byers says:

"If during this whole period he [the boy] shows the most pronounced criminal tendencies and gives other evidence of being a dangerous element in and outside of the institution, nevertheless at the age of twenty-one the law arbitrarily releases him from custody and supervision. With the development of our institutional parole system and the probation work of the children's courts, it will become increasingly evident that age limits must be obliterated and the sole standard must be the development of character that will render the individual a positive benefit to society, and that he shall not be released from custody and supervision so long as he continues to show himself unworthy of confidence and respect and incapable of self-control."

SOCIAL AGENCIES

INSTITUTE OF MUNICIPAL AND SOCIAL SERVICE IN MILWAUKEE

ANNA GARLIN SPENCER

Through the combined influence of a local committee and the extension division of the University of Wisconsin, this Institute of Municipal and Social Service was started October 17. Its object as defined in the preliminary program is "to aid in fitting men and women for more intelligent and effective social and municipal service."[1]

The city of Milwaukee is alive to the modern call to organize social forces for needed environmental change. The institute has sought to focus attention upon the problems of philanthropy and constructive social work for the poorer, weaker, and more ignorant classes of society, and to treat local and political problems from the educational point of view, leaving to other agencies those forms of social activity which involve elements of political friction. People of widely different codes and economic belief are striving in Milwaukee to make a better city.

In the midst of somewhat confusing discussion as to what method may be most effectively used to usher in the "new Jerusalem," it has seemed to the director of the Institute of Municipal and Social Service that the most important contribution such an educational agency could make was to try and outline, in a non-partisan manner, the conclusions of experts in different lines as to essential features of social and personal welfare.

To tell the tale of the "accomplished good," whether that has been brought about by private philanthropy or municipal pioneering; to compare methods that have worked effectively, is the special province of the teacher; and the institute, in part at least, has aimed to exercise that function. Because it was at best a small beginning of a school and a wholly experimental effort, the management of the institute has sought to reach as widely varied social interests in the community as one winter's work could accomplish.

An effort has therefore been made in the public meetings to have a varied program at the cost of thoroughness of treatment of any one theme, while the class work has aimed at starting a few students along more intensive lines of study.

The general statement issued to enlist the sympathy of the public reads:

"Pursuant of the established policy of the university, and in response to the solicitations of a number of citizens of Milwaukee, including those of varied political, social, and religious affiliations, the university extension division announces the following preliminary statement of an Institute of Municipal and Social Service for the season of 1910 and 1911. The purpose is to establish in Milwaukee a center of study, information, and training in social reform, social welfare, and municipal efficiency.

"Believing that the need is great for expert service with respect to the above purpose, particularly in the care of the unfortunate and the defective, in the prevention of crime and vice, and in the lessening of poverty, not only through the change of economic conditions, but also by raising the power of individuals as they now live and work, those who have been instrumental in establishing this institute, which has been made possible at this time by the generosity of one of Milwaukee's citizens, seek to learn and to apply more perfectly the laws of scientific philanthropy to the conduct of public and private affairs in the city."

The institute has carried forward two gen-

[1] The following statement as to its organization was issued by the university: "Organization for the University of Wisconsin, Louis E. Reber, director of the university extension division; Anna Garlin Spencer, local director of the Institute of Municipal and Social Service; William H. Lighty, secretary; Edward J. Ward, adviser for civic and social centers; at Milwaukee, Kenneth G. Smith, in charge of the first district, branch office, Milwaukee. For the city of Milwaukee, Rev. Frederick Edwards, chairman; H. A. Jacobs, secretary; Nathan Peeples, Jr., treasurer; Maud Tompkins, Julia Kurtz, Mrs. George A. Chamberlain, Rev. Walter F. Greenman, Rev. Samuel Hirshberg, Harvey Dee Brown, Katherine Van Wyck, Walter H. Cheever, Dr. Phillip F. Rogers."

eral courses: Part I, an evening course on Municipal Functions and Problems. Part II, an afternoon and evening course on Philanthropy and Social Uplift.

The first term, included in the second course four public sessions a week, Tuesday, Wednesday, Thursday, and Friday afternoon at 4 o'clock. The first two were devoted to a general survey of the topic assigned to the week, and Thursday and Friday afternoons to a presentation of Milwaukee conditions by local workers in different lines of social effort.

After the first three meetings of the institute, each week was given to a distinct field of inquiry, including criminology and the care of criminal classes, defective classes and their public and private care and training, care of the aged and infirm and hopelessly diseased, the normal children dependent upon society, the care of needy families in their homes, and the consideration of medical relief and aids to health and of improved housing. So far as possible the evening meetings gave a general presentation of the subject to which the afternoon sessions of that week were devoted.[1]

The programs of the Thursday and Friday afternoon conferences on local conditions included as speakers official representatives of most of the important philanthropic and educational agencies in the city: Catholic and Protestant, Jewish and Christian, public and private, general and non-sectarian. The special co-operation thus secured must react favorably upon the attempt to secure practical co-operation in the social work of Milwaukee.

In addition to these public meetings a special class for workers in and for institutions has been held every Monday evening, one for visiting and instructing nurses and those interested in medical aid on Wednesday evening, and two classes for friendly visitors, associated charities workers, settlement residents, and others on Thursday and Friday. These classes included in their work reading of required bibliography, preparation of papers on different topics, and general discussions.

The management of the institute, desiring to secure as wide an attendance as possible, placed the fee for students receiving all the privileges at the nominal sum of one dollar. Seventy-nine persons registered as special students on these terms. The general registration of those expressing special interest in the institute and desiring to attend all the public meetings, but not pledging themselves to any special reading or class work, numbered 258. The attendance of the afternoon meetings was very regular until the conflicting pressure of Christmas preparation. The institute has called forth many expressions of desire for a permanent center for philanthropic education in Milwaukee.

The second term began January 3 with a week of lectures and class conferences by Zilpha D. Smith of the Boston School for Social Workers, afternoon lectures and morning conferences, under the following heads: Work with Families and Neighborhoods, Charity Organization Development, How to Get Volunteers in Any Social Work, How to Train Friendly Visitors, Methods Common to Social Investigations.

The second week of afternoon lectures and conferences was devoted to settlements and constructive social work, with Mary MacDowell of the Chicago University Settlement and others.

The third week, under the leadership of Alexander Johnson, was given to the following topics: Work for and in Institutions., State Supervision of Public Charities and Correctional Institutions, Officers and Methods of Control in State Institutions, Business and Financial Management, Questions Connected with the Superintendent, the Domestic Department, Manufactured Products and Their Use.

During the fourth week attention was focused upon child saving and juvenile court work, with Hastings H. Hart of New York and speakers from Chicago to lead the discussions.

The evenings of January and all the work of the institute during February have been devoted to municipal problems; those elements of social protection, social control, and social

[1]The speakers for the evening meetings have included, Mayor Whitlock of Toledo, O.; Peter Witt, Cleveland, O.; Mayor Seidel of Milwaukee; D. W. Hoan, the city attorney of Milwaukee; Mrs. Van Wyck, general secretary Central Council of Philanthropies; Professor Ross on Criminology; Alexander Johnson on Defective Classes; Rev. W. F. Greenman and Harvey Dee Brown, of Milwaukee on Problems of Poverty; Graham Taylor of Chicago Commons, Chicago, on the City and its Normal Children; William H. Leiserson of the New York Commission on the Unemployed; Raymond Robins on Municipal Lodging Houses and Labor Bureaus; Dr. Ravenel of the University of Wisconsin, and Dr. Henry B. Favill of Chicago on Municipal Health Departments; Charles B. Ball, chief sanitary inspector of Chicago, and Rosa M. Perdue, state factory inspector, on the City and the Housing Problem.

uplift which depend for their efficiency upon legal and political mechanism.[1]

During March the management of the institute hopes to profit by special service from Francis H. McLean, and to hold a number of conferences of the social workers in Milwaukee and the representatives of the extension division of the University of Wisconsin, in order to determine what may seem desirable as a permanent outcome of the work of the institute.

Such an institute as is being held in Milwaukee cannot, of course, rival the great schools of civics and philanthropy already developed in the United States. It is possible, however, that similar institutes in different centers might become great educational forces to the general public and have such an influence upon the elect, who are destined to become experts and leaders in social reform, as to lead them toward those great schools and through them to useful vocational careers in the social field.

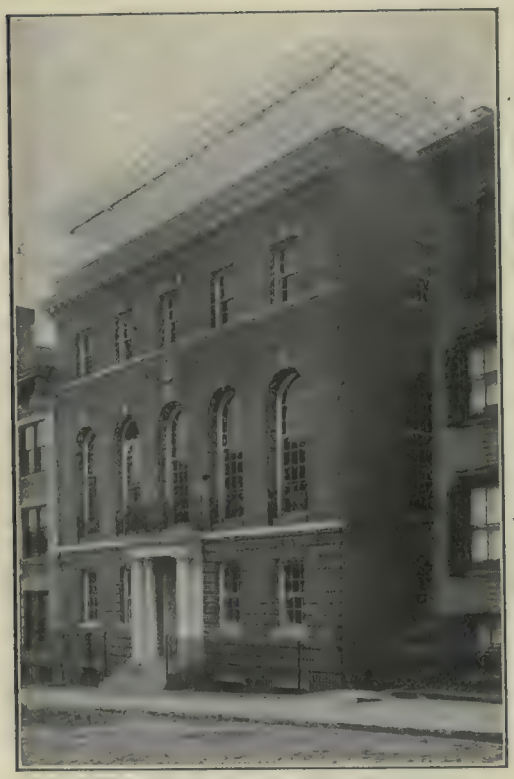
MERGING NEIGHBORHOOD WORK

LOUIS H. PINK
Headworker, United Neighborhood Guild

The United Neighborhood Guild has moved into its new building at 176 Nassau street, Brooklyn. The house boasts a large gymnasium, bowling alleys, pool room, club and class rooms, an attractive roof garden with pergola, and a large auditorium. The architect, J. Gamble Rogers, has done his work well. Inside and out the building is conceived in a spirit of simplicity. It is homelike and not institutional.

The opening of this building is the first proof of the success of an interesting experiment begun less than two years ago. Three distinct organizations, occupying a common neighborhood and controlling four separate buildings combined into one, gave up identity and sank all petty jealousies and rivalries in the belief that a strong work would result from the fusing of three struggling settlements.

During the first year of the experiment all the buildings were maintained and the work was conducted in each house much as before consolidation; the civic work and administration were centralized. The lesson taught by this year of trial is that neighborhood work is so personal that a headworker or head resident in each building is essential, so that all matters may receive proper attention and orderly progress may prevail. Centralization of administrative and civic work is desirable, but each center must have a responsible head.



Now that the new building has been completed, the two structures which housed the Asacog House and the Asacog Boys' Club have been given up. Maxwell House, formerly in large part a center for Irish-Americans, has been made headquarters for the Italian work of the guild, with W. E. Davenport in residence and in charge. Two floors of the former Italian Settlement House at 20 Front street have been retained. This neighborhood is most needy; its housing conditions are of the worst; the population is made up of recent arrivals from Sicily and Calabria. Here, tucked away under the old Brooklyn Bridge, exist factories and dilapidated frame dwellings converted into tenements.

Mr. Davenport has given ten years of his life to work in this vicinity, devoting his time and energy to personal service for his Italian neighbors. While there is a larger work for him at Maxwell House, the geographical center of the two Italian sections of "old" Brooklyn, yet he rightly feels that the guild must not entirely desert so needy a neighborhood. Therefore 29 Front street has been retained.

The new house at 176 Nassau street is the center for the general work of the guild. No strict line is drawn. Many Italians are members of the clubs which meet at the new building, and there are but few Italian clubs at Maxwell House which have no Irish-American members. Yet it is desirable to have, so far as possible, separate centers. The adult Italian immigrant needs education, instruction in the English language and in citizenship. Our native population requires recreation and culture, and is willing and able to put its shoulder to the wheel and carry on the civic and social activities. Older Italian immigrants do not feel at home in close contact with the younger American element, nor does young America always sympathize with or understand the immigrant. The reason for separating the work is not lack of democracy, but the wholesome process of natural selection.

Settlements have been criticised, often justly, for failing truly to represent the people of the neighborhood. The movement has never quite recovered from the mistake of those

[1] The evening meetings include the following topics and speakers: Public Utilities, by B. H. Meyer, railroad commissioner of Wisconsin; Employers Liability Act, Senator Sanborn, chairman of the legislative committee, Mr. Eckern, Merchants and Manufacturers' Association of Milwaukee and Mr. Lavin attorney for the labor unions; Courts' Delays or Trial by Jury by important local judges; City Promotion by Dr. Rastall and an expert from Duluth; Industrial Education by Messrs. McCarthy, Lindemann and Winslow; Vocational Choice and Vocational Bureau by Meyer Bloomfield of Boston and Mr. Brosch; Problems of Municipal Finances, by Messrs. Adams, Merriam, and Evarts; Uniform and Cost Accounting, by Messrs. Sands, Cleveland, and Hagenah; Civil Service, by Messrs. Moulton and Doty; City Planning, by Messrs. Hooker, Robinson, and Whitnall; The Problems of Entertainment and Leisure, by Mr. De Groot; Problems of Recreation and Play, by E. J. Ward; Preventable Nuisances, by Dr. Evans and Prof. K. G. Smith; and in March The Functions of Civic Organizations and Their Relations to Municipal Problems, by Messrs. Burns, Jones, and Thompson.

THE NEW NEIGHBORHOOD HOUSE

The merging of Brooklyn settlements will make of this a "neighborhood town-hall," as much a public building as the public school.

well-intentioned "reformers" who sought to uplift humanity by personal contact, and who unfortunately gave the idea that settlements were charitable institutions, not of the people, but supported by a superior class for the salvation of the poor and unfortunate. For this reason neighborhood centers have not had the force which they should have when advocating public measures before city boards or officials. Social workers as a class have little influence if they stand alone, but when they are recognized as the true and authorized representatives of the people among whom they work, they are all-powerful.

We have striven to make the new house truly democratic. A guild council, composed of delegates selected from the various clubs in proportion to their numbers, two from the board of directors, two from the Neighborhood Guild Association and two from the neighborhood-at-large, has charge of all club affairs, with entire power to fix dues and charges, and to collect and expend money. The council assigns rooms to clubs, manages all guild dances and functions, initiates civic activities, and preserves order. The council controls not alone in theory, but in fact.

It is the hope of those interested in the guild that the new building will become a "neighborhood town-hall," imbued with the spirit of democracy of the New England town meeting,—as much a public building as the public school. It is expected that civic organizations in the neighborhood will use the guild building for their meetings. The hall can be rented at a nominal charge by neighborhood organizations for any legitimate purpose. Political meetings alone are excluded. No doubt in time the ban against even these will be removed.

METHODIST SOCIAL SERVICE

WILLIAM BERNARD NORTON
Methodist Historical Society

Two prejudices have been met among church people in promoting social service. One is the idea that the work is designed only for specialists and not for the all around pastor and church member. Hence it seems to be a question of courses of study and of small groups of workers. The other prejudice is the feeling that social service is not spiritual and hence not of definite and immediate concern to the church.

These two prejudices the Methodist Federation for Social Service, which has recently held its third annual conference in Chicago, has sought to remove. The work of the federation is educational, but it is designed for the whole denomination and not for a selected few. It is spiritual in that it seeks to broaden the term, not by subtracting from it the ordinary meaning of the immediate apprehension of God in a heart experience, but by adding a further conception in which our occupations, pleasures, and various social relations are seen to have spiritual significance and interpretation.

The federation has made substantial progress since its organization in the issuing of literature, the perfection of its machinery, cooperation with similar bodies in other denominations in bringing to pass certain reforms, and in becoming, with the representatives of denominations, the channel for expression and for work of the Federal Council of the Churches of Christ in America. It was resolved at the conference that the time had come for the enlargement of the budget so as to include the pay of a general secretary, who would devote all his time to the prosecution of the work. This will mean a still greater advance the coming year.

The freedom with which debatable questions were discussed was indicative of the desire of the members of the federation to know the truth, however much it might contradict preconceived opinions. Among the radical changes advocated were the introduction of baseball and other amusements into the Sunday program, both for churches and social settlements, and the utilization of the reformed dance hall as a means of legitimate amusement and as a meeting place for families and well-disposed young people. President

Herbert Welch of Ohio Wesleyan University, who was re-elected president of the federation, in commenting on these revolutionary changes proposed by Edwin A. Peterson of Goodrich House, Cleveland, gave a first stroke of humor which means much if he intended to convey in all seriousness the idea contained in his remark. "I noticed," he said, "when Dr. Peterson was speaking, that the Bible on the desk did not move, but I imagine if a Methodist Discipline had been there it would have gradually crawled towards the edge until it fell off to the floor."

If it can clearly be proved that any change, however radical, does not in fact disturb the Bible, it will not be long before a corresponding change will be made in the church discipline; but one must have patience until the idea takes possession, not simply of a few, but of a considerable number of church leaders. There were those present at the conference who were disposed to allow, as a matter of experiment, the adoption of Sunday baseball and the reformed dance by the social settlement, but we are not ready to see the church, as such, take so long a step away from past convictions and traditions.

President Welch, Bishop Williams, and other speakers emphasized the primary importance of ministering to the soul needs as expressed in worship and in the prayer life, while urging with passionate earnestness the more often neglected duty of creating a soil and atmosphere in which this plant of the soul life can grow.

As a denomination the Methodist Episcopal Church stands:

For equal rights and complete justice for all men in all stations of life.

For the principle of conciliation and arbitration in industrial dissensions.

For the protection of the worker from dangerous machinery, occupational disease, injuries, and mortality.

For the abolition of child labor.

For such regulation of conditions of labor for women as shall safeguard the physical and moral health of the community.

For suppression of the sweating system.

For the gradual and reasonable reduction of the hours of labor to the lowest practical point, with work for all; and for that degree of leisure for all which is the condition of the highest human life.

For a release from employment one day in seven.

For the highest wage that each industry can afford, and for the most equitable division of the products of industry that can ultimately be devised.

For the recognition of the Golden Rule and the mind of Christ as the supreme law of society and the sure remedy of all social ills.

ORGANIZED CHARITY IN 1809

The Methodists of New York city over a hundred years ago started their first organized charity. The record of this early venture is preserved in a volume in the library of the Methodist Historical Society. On November 12, 1808, at a meeting held in the school at Worth and Hudson streets, the Assistance Society for Relieving and Advising Sick and Poor Persons in the City of New York was organized. The *Christian City* tells how the city was divided into districts. At first there were four, then five and six, till finally the number became seven. These were called walks.

In 1809 the distribution of food, clothing, and fuel began. Catharine Graham of 81 Church street, to whom one dollar was given, was the first to be aided. During the War of 1812 the society purchased soup tickets from the "Humane Society" at three dollars a hundred, and distributed eighty loads of wood. In December, 1812, 3,499 "suffering individuals" were helped and the total for the first four years was 28,000.

RESULTS OF INVESTIGATION

Dedicated to the work of caring for delinquent children, the Brooklyn Disciplinary Training School for Boys disgraced its calling. A member of its board of management made public its failings and proved his charges. The superintendent and every member of the board of managers save himself was removed or he resigned.

The larger task of restoring the school to its humanitarian purpose and the disheartening work of regaining public confidence remained as an aftermath. As the present superintendent says in his annual report, which has just been published, "I found the school disorganized. Physically, the children were underfed, unhealthy, and unclean. Morally, they had been neglected and allowed to exercise their perverted appetites. The men in immediate charge were men of low mental caliber, brutal and coarse."

In a very brief time much needed repairs have been made, the trade schools systematized, and the classes more accurately graded. The enrollment, which had been 229, fell as a result of the disclosures to 150, but more recently the committing judges, convinced by personal visits of the quality of work done at the school, have been sending more boys, till there are now 186.

The new board of management, besides applying itself to transforming a prison or penal institution, in which the boys had shaven heads, to a moral hospital, are trying to make a fundamental change of plan. It is convinced that the spirit of an institution conducted on the congregate plan is necessarily to a large extent that of a penal institution instead of a home, and that it is impossible in such a place entirely to check the prevalence of immorality and personal abuses. The idea of penal confinement is obviated in the cottage plan, since only twenty or twenty-five boys are placed under one roof. The only certain way to prevent these evils is to have a school

built on a cottage system, and for this the board of managers are asking $350,000.

The advantages of this system, which has been adopted in Boston and Chicago and for the New York Juvenile Asylum, are that the cottage father and mother can learn the peculiarities of each boy and keep a closer supervision over him. It also allows the superintendent to group boys so that the degenerate and the merely unfortunate are not too closely associated.

So the board of managers is using the unfortunate experience of the school to strengthen the forces that are working for this beneficent change in the administration of training schools, which, with probation, represent the best thought that has been applied to the reformation of boys.

ASYLUM EXTRAVAGANCE

The report of Joseph P. Byers, general secretary of the State Charities Aid and Prison Reform Association of New Jersey, upon the conditions existing at the Essex County Hospital for the Insane shows very plainly that an improvement in the conduct and administration of that institution is imperatively needed. Mr. Byers's findings, published in the January issue of the *New Jersey Review of Charities and Correction*, give in a brief and convincing way glaring evidences of mismanagement. His statement that "partisan politics seems to have played a large part in the administration of the Essex County Hospital at Overbrook" may be merely his belief; but his criticism of the policy of having two responsible heads, a medical superintendent and a warden, for the institution is amply borne out by the results. The consequent friction has made the cost of maintaining the hospital enormous. The cost for each patient has been from fifty to one hundred dollars more yearly than is paid in the states of New York, Ohio, Indiana, and Pennsylvania. Comparison was made with institutions both smaller and larger, including some of the so-called congregate and cottage types. The expense per patient in almost every one of the other twelve institutions listed were, for salaries and wages, fuel and light, clothing and dry goods, drugs and medicines, and food supplies, very much less, in many cases scarcely more than half.

Mr. Byers finds that at Overbrook the insane should be employed daily in some useful occupation as they are at many of the more progressive institutions. He recommends also that a woman physician be employed, and that imbecile children should not be sent to this hospital.

CENTRAL HOWARD ASSOCIATION

The Central Howard Association, organized to aid prisoners before and after release and to advocate improved laws for the prevention of crime, has completed ten years of useful work in the central western states. Over a thousand applicants apply to it yearly for aid, and judges parole more than six score of men to its charge annually.

During the decade it has labored the association has helped secure a reformatory in Iowa, the Boys' Farm School at St. Cloud, Ill., and legislation for the inauguration of a reformatory system in Kentucky. It has aided also in getting better buildings, such as the new prison in Minnesota, and in establishing in Minnesota, Michigan, and Kentucky the principle of payment of prisoners.

POWERS TO FIX MINIMUM WAGE

Following are the provisions with respect to fixing minimum wages in the Minnesota bill to create industrial boards in trades employing women and minors. [See page 813.]

Industrial boards shall, subject to the provisions of this section, fix minimum rates of wages for time-work of women and minimum rates of wages for time-work of minors for their trades (in this act referred to as minimum time-rates) and may also fix general minimum rates of wages for piece-work of women, and minimum rates of wages for piece-work of minors for their trades (in this act referred to as general minimum piece-rates); and those rates of wages (whether time- or piece-rates) may be so fixed as to apply universally to such workers in the trade, or to such workers in any special process in the work of the trade, or to any special class of such workers in the trade, or to such workers in any special area. An industrial board shall not fix rates of wages arbitrarily, but shall always fix them at such a level as will safeguard, to a reasonable degree, the health, morals, and general welfare of the workers affected, and, therefore, the health, morals, and welfare of the public. Specifically, such rates of wages shall, so far as practicable, be fixed at a level which will enable the workers affected to procure a reasonable minimum of food, clothing, and shelter, to maintain themselves in normal health and working efficiency, and to obtain those general conditions of living which are practically necessary for right moral life. Provided that, in the case of workers who are fed or housed by their employers, the rates of wages fixed by an industrial board shall make due allowance for such feeding or housing.

If an industrial board report to the State Board of Arbitration that it is impracticable in a particular case to fix minimum rates of wages (whether time-rates or piece-rates) in accordance with this section, the State Board of Arbitration may, so far as respects that case, relieve the board of its duty.

An industrial board shall, in the manner pre-

scribed by the State Board of Arbitration, give four months' notice of all minimum rates fixed by it, and consider objections that are lodged within two months of such notice; and it may revise such rates, so far as it deems fair and proper.

At the expiration of the four months, the State Board of Arbitration shall issue an order to all employers and workers affected, requiring them to comply with the minimum rates of wages finally fixed by the industrial board. Said rates of wages shall remain in force for at least one year, and thereafter until they have been reconsidered and revised by an industrial board, and the new rates have been ordered by the State Board of Arbitration. The provisions regarding four months' notice shall be observed with regard to the new and revised rates in the same way as in the case of original rates.

Whoever is aggrieved by an order of the State Board of Arbitration making a minimum time-rate or minimum piece-rate obligatory and effective under this act, may within sixty days after the date thereof appeal therefrom to the District Court of his district. But when such appeal is made, the appellant must give written notice to the State Board of Arbitration fifteen days before the entry of such appeal; and the order of said state board shall remain in force until the appeal has been determined.

An industrial board shall have the power to grant a permit exempting from the provisions of this act the employment of a worker affected by an infirmity or physical injury which renders him incapable of earning that rate, if in the opinion of the industrial board the case cannot be suitably met by employing the worker on piece-work; the above exemption to apply only to those working in a shop or factory; provided that the number exempted shall in no case exceed one-fifth of the whole number of the class of workers in any establishment.

When any minimum rate of wages fixed by an industrial board has been made obligatory by order of the State Board of Arbitration under this act, an employer shall, in cases to which the minimum rate is applicable, pay wages to the person at not less than the minimum rate clear of all deduction, and if he fails to do so shall be liable to a fine of not less than twenty-five nor more than one hundred dollars, or three months' imprisonment, or both, for each separate offense.

On any trial of an employer under this section, the burden of proof shall be upon the defendant to show by the production of proper wage sheets or other records of wages, or otherwise, that he has not paid, or agreed to pay, wages at less than the minimum rate.

Any agreement for the payment of wages contrary to the provisions of this act shall be void.

Where any minimum rate of wages has been fixed by an industrial board (but has not yet become fully obligatory under an order of the State Board of Arbitration made in pursuance of this act) the minimum rate shall, unless the State Board of Arbitration direct to the contrary, have a limited application as follows:

(a) In all cases to which the minimum rate is applicable, an employer shall, in the absence of a written agreement to the contrary, pay to the person employed wages at not less than the minimum rate; and in the absence of such agreement, the person employed may recover wages at such rate from the employer;

(b) Any employer may give written notice to the industrial board by which the minimum rate has been fixed that he is willing that that rate should be obligatory on him, and in that case, he shall be under the same obligation to pay wages to the person employed at not less than the minimum rate, and shall be liable to the same fine for not doing so as he would be if an order of the State Board of Arbitration were in force making the rate obligatory.

An industrial board shall keep a register of any notices given under this section.

Any person who makes an agreement, express or implied, with a worker, in pursuance of which the worker performs any work for which a minimum has been fixed under this act, shall be deemed for the purposes of this act, to be the employer of the worker, and the net remuneration received by the worker, after allowing for necessary expenditures in connection with the work, shall be deemed to be wages within the meaning of this act, and the industrial board shall investigate and determine the proper amount of deduction for said necessary expenditures.

Any worker to whom this act applies, or any person authorized by such worker, may complain to the industrial board that the wages paid to the worker by any employer in any case to which any minimum rate fixed by the industrial board is applicable are at a less rate than the minimum rate, and the industrial board shall consider that matter, and if warranted by their findings, proceed under this act on behalf of the worker.

Before proceeding under this act on behalf of the worker, an industrial board may, and on the first complaint shall, take reasonable steps to bring the case to the notice of the employer, with a view to the settlement of the case without recourse to proceedings.

COMMUNICATIONS

IMMIGRATION CONTROL

CONSTRUCTION vs DISTRIBUTION

To the Editor:

It is to be regretted that the Immigration Commission did not vote on the propositions that are their findings at the beginning of their work instead of its close. In that case they could hardly have helped asking what facts will prove these conclusions and then set about to find the needed evidence. As it is, there is little connection between the facts they bring out and the conclusions they draw. To make a selection among immigrants demands that differences among them should be pointed out upon which the selection could be based. It should also be shown that the tests to be applied would bring about the kind of selection it is proposed to introduce. Neither of these conditions is met. It is not shown that any large class of immigrants are undesirable, or differ in any fundamental respect from other classes now coming or from those that have previously come. Nor is it shown that an educational test would give a more desirable class of immigrants than those it would exclude.

The real animus of the findings lies in another quarter. There is a general belief that the number of immigrants is too great, and as a consequence the rate of wages is being lowered. In addition to this there is a feeling among laborers that the tariff has been beneficial mainly to employers, and that the prospective rise of wages it was to bring has been prevented by the increase of immigration. A measure to restrict immigration would thus help the cause of a high tariff by making it seem that finally something was to be done for the laborers. It would also be advocated by those who see no way out of the present economic difficulties except by some scheme for the redistribution of wealth and income. It is only fair to ask of those who believe in either of these measures that they state their case openly and defend it by legitimate means.

Problems of a tariff or of the distribution of wealth should be discussed from strictly economic premises. Any appeal to social prejudice or to social sentiment puts the discussion in a position where the original premises are soon lost sight of. Had the Immigration Commission brought in findings based on their facts, or sought facts in harmony with their political views, this shifting of the discussion from economic to social premises would not have taken place. At is is, each writer can go his own road and use what material he will for his own ends. Many diverging views have already been expressed, with the likelihood that the injection of prejudice and sentiment in the place of well verified facts will break up the unity which in recent years has characterized the advance of social science.

The only solution of existing evils lies in the elimination of race distinctions and in the redistribution of the white race to its new and enlarged environment. For these ends the free movement of population is essential. The return of immigrants to their native land is as much a part of the general forward movement as is the original immigration to America. The immigrant brings labor when he comes to us; he takes back ideas when he returns. He thus helps to transform America through its material progress and Europe through emancipation from its load of antiquated customs, habits, and ideals.

Only one way is open to secure a high standard of life, and that is for the whole white race to become unified and to be so redistributed that each part will help others in their uplift. There is no ideal America that does not involve an ideal Europe. To hem ourselves in or to shut others out is to lose the ideal ourselves and bring on race conflicts instead of international unity. Nor are there American ideals in any distinct local sense. All ideals are social, good for every land, race, and age. The only reason for giving them a specific name is to tell where they originated. Greek ideals have no peculiar fitness for Greece, but can thrive anywhere if conditions favor them. They represent a stage in the forward movement of thought which happened to express itself in Greece. So is it with American ideals. We want the honor of being the nation where the new civilization first works out its legitimate consequences. But these new ideals are not to be confined to American soil nor guarded against exportation. Our race has exactly the same blood as other white races; our ideals are theirs or will soon be. No policy of restriction can check the spread of ideas or prevent the blending of all races into one.

So much for general principles. There are difficulties in their application and I do not wonder that reformers grow impatient and wish for quicker means of attaining their ends. I agree with Dr. Devine in his eager desire to help the laborers whose incomes are below the standard of social well being. But will restriction of immigration afford a relief? This I doubt, and for it I shall give my reasons.

The policy of restriction as a matter of practical politics arises in connection with the tariff. No one would say that we could raise wages by restricting immigration unless a tariff raised the price of American goods above the European level. Two measures have, there-

fore, been proposed. One is a tariff board to fix rates so that reasonable profits can be paid, and the other a restriction of immigration so that the laborers would share in the benefits of the tariff. Those who advocate these measures do not recognize the fundamental change they make in the spirit of tariff legislation, and in the motives causing the success of earlier tariffs. Past tariffs have had as their end the enlargement of national industry and not the distribution of income. The successful industries have become powerful and have influenced Congress in their favor. Each new tariff has thus favored the successful and burdened those who are not. There has resulted a pushing of industry into fields where the return is greatest and a diminution of it where profits were low. The net result of this has been beneficial, and in the resulting prosperity all classes have gained, but in unequal degrees. This dynamic effect would be lost if all industries were guaranteed a reasonable profit. Industries for which the nation is not fitted would grow as rapidly as those suitable to American conditions. A check on prosperity would result, and a fall of wages even if severe restrictions be put on immigration.

There is little likelihood that the American public will permit a further rise in the cost of living, even if it be to the advantage of unskilled laborers; and if national prosperity is checked there would be no other way of bettering their condition. There is the additional difficulty that the importation of foreign goods exerts a more depressing influence on wages than does the movement of labor to this country. While it is quite clear that the tariff has made American standards higher, the difference is now at its maximum and will probably grow less instead of greater. The mobility of labor, capital, and goods is steadily increasing. They will bind Europe and America more closely together and impose on all parts of the white race the same social and economic standards.

It would therefore seem that future progress in wages depends more on what happens in Europe than on American events. The greatest element in the uplift of workmen is the free movement of labor to and from Europe. The flow of laborers to America enables us to transform our industries and cities through the growth of fixed capital, and the return of immigrants to Europe creates social changes that uplift the masses and Americanize European thought.

The present situation is thus not without hope. The change is slow, but it is certain. To desert the constructive program in which social workers have had so many successes for a distributive program seems to be a rash step. Dr. Devine has been a skillful leader whom we have all been glad to follow. He should, however, expound more fully the new doctrine or return to constructive social work. In any case, we should not mix social construction with social distribution. The two programs are distinct; between them there is no compromise. I, for one, have no confidence in distributive measures. They check the dynamic movement of society and in the end harm more than they aid the classes they are designed to help. The safe, slow road of construction reaches the only goals worth striving for.

THE SPIRIT OF INTERNATIONALISM

TO THE EDITOR:

Miss Addams writes of the birth of a "cosmic patriotism, which may yet move masses of men out of their narrow national considerations and cautions into new reaches of human effort and affection." If this spirit of internationalism, or rather over-nationalism, is finally about to assert itself, surely it will not regard a problem such as immigration as a purely local issue. It will consider not solely the difficulties to which our constant influx of aliens unquestionably gives rise, but also the relief it has afforded to thousands of debt-burdened and poverty-stricken communities across the sea.

We naturally turn to the pages of THE SURVEY for an expression of this *Weltanschauung;* for if there is any body of men and women actuated by a vision of mutual understanding and good will among all people, any group whose daily usefulness depends upon an unwavering faith in an ever-widening sphere of freedom for all, it is the social workers of America. They assuredly must realize that all barriers erected between men are reactionary and vicious, and that the United States can offer no greater service to humanity than in providing daily contact and common fellowship to men of innumerable nationalities, languages, and creeds.

"America is a home rehearsal of a drama that will have the whole world for its stage," wrote Henry Demorest Lloyd. Or, as your own editor put it before the 1905 Conference of Charities and Correction: "Is it not true as a matter of fact that we have come to understand the better that we are a part of the great brotherhood of man, because of the fact that so large a number of people have come to make their homes among us, and is it not almost worth while to bear the increased economic burdens in order that we may have the wider experience and the larger knowledge which comes from the fact that we ourselves, under our own cloak and under our own banners, have become to a very great extent the world, and have within our own borders all the elements that can be found throughout the world."

Only the forebodings of a frightful menace to our national institutions could carry Dr. Devine and many of his associates so far afield from their natural sympathies as to endorse the recommendations of the Immigration Commission. But certainly the brief report issued thus far by the commission furnishes no data to justify these apprehensions. The charge of marked criminal tendencies on the part of immigrants is admitted false, pauperism is shown to be relatively at a minimum, alcoholism rare, the desire for education universal, best of all agricultural training and instincts frequent.

In short, the immigrant is given quite as clean a bill of health as his most zealous partisan could require. We are, however, assured that "if one thing is better established by the commission's reports than another, it is that the great mass of immigrants who reach the United States at the present time are not idlers and ne'er-do-wells but, however unskilled and unadaptable, are productive factors in society."

And it appears that such "productive factors" are no longer desirable. Despite our vast undeveloped resources, our capacity to support over ten times our present population, we are solemnly assured that the "saturation point of unskilled labor" is almost at hand. The same fear has been expressed in every decade of our national existence. We are indeed living under an economic system which apparently necessitates a certain amount of unemployment, but the same phenomenon is as apparent in countries untouched by immigration as in our own. What really occurs when there is a positive glut of labor was clearly demonstrated in the panic year ending June 30, 1908, when over 714,000 persons departed from the United States.

It must be admitted that immigrant after immigrant has successfully crowded out his predecessor, but we all know that the earlier comer was as a class crowded up and not down. There must be something radically wrong if this power of absorption is now about to break down, and if in a community as young as ours an honest peasant with a sturdy physique and an aptitude for labor can for many years to come be other than a source of national gain. Are we again in the grip of the wages fund theory, that any increase in the number of workers is assumed to mean a decrease in wages, rather than an increase in the national dividend out of which wages are paid? Or are our workers so grossly underpaid that they can be considered solely as producers, not as consumers? If so, we are fiddling while Rome is burning, and the Immigration Restriction League had better by far devote itself to socialistic propaganda, rather than waste its energies and finances on so paltry an issue as immigration. Surely no one with any grasp of economic theory can examine the present difficulties of the unskilled workingman in America and lay the burden of his trouble upon the size of our population.

I dare not infringe further upon your courtesy, provoking both of discussion and criticism as are the methods of restriction proposed. In closing, however, I cannot resist saying that we all agree with Dr. Devine that we have a "national heritage," and "a sacred duty to transmit it unimpaired to our posterity." But to many of us there is no nobler nor more vital feature of this American heritage than the policy of hospitality towards the oppressed and abused of all climes and races. We know that the Russian Jew, and the Pole, and the southern Italian come from as bitter a persecution, religious, political, economic, as drove forth in turn Puritan, Irishman, and German; and we would hold ourselves faithless to the creed of human brotherhood if we spared word or deed in preserving the priceless tradition of the open door.

ARTHUR L. MAYER.

THE MAN WHO IS AN IMMIGRANT

TO THE EDITOR:

For a dozen years now we have been discussing the immigrants. We have had meetings, conventions, dinners—is there anything of public concern that does not in our days run to conventions and dinners and sometimes stick there?—commissions that have studied the immigrant at home and abroad, trying to help us to decide what to do with him; and we have arrived at certain conclusions concerning his kind. If he steals, if he comes here with a bad name, if he is foisted upon us to fill some one else's pockets, if he is a pauper or likely to become one, if sick in a way to threaten the rest of us—we don't want him. And that is all. Only as regards the Asiatic we have made a flat verdict of exclusion. The other keeps coming. And the question whether the southern European is good for us or not, is unanswered; also, it seems likely to remain so. Why is this?

Is it not, perhaps, because it cannot be answered fairly on the lines that have run in our minds? I say fairly because, whatever our likes or dislikes, as a people I am sure we want to answer the question fairly—fairly to him, fairly to us and to the spirit of our country: "The man, not the money." And may not the reason be this, that we have stared so long and so hard at the economic end of our problem that we have lost the real key to it? Have we not dwelt too much upon the money and forgotten the man?

This is what I mean: Suppose we look more to man's ideals, traditions, than at the money he brings. You cannot after all measure a man's fitness for citizenship by his pocket, or even by his capacity as a workman; and while we may want his labor we want his manhood more, if we are wise. What then does he come for? To better his condition? Good! That is his right; fair proof to start with that he has the making of an American in him. To do it, will he stay with us? Is he prepared to cast in his lot with us, for good or ill, or does he come just to earn so many dollars and go back to his own? The demand is made that he shall be able to read or write in his own language, if not in ours. That is good so far as it goes, though it does not in my judgment go very far. It does not guarantee quality. If the man is a criminal, he may be a much more dangerous one for being taught.

But suppose we find out what company he kept where he came from. Who were his heroes, or had he any? Does he know the great men of his own country? Say he is an Italian, what does he know of Garibaldi? Is the splendid story of United Italy in any measure his? If he is a Hungarian, do his eyes shine at the name of Kossuth? If a Polander, at the mention of Kosciusko? We shall not

need to ask the Jew for his heroes, though it might do some of the rest of us good to have these refugees who knock rehearse the deeds of the Maccabees, of Joshua, and of Moses, greatest of national leaders in any day.

The point I want to make is that, approaching him from that angle, we get at the real man, and thereby at his value as a prospective American citizen; whereas today, being concerned, if the truth be told, chiefly about the cheap labor he brings to our market, we have got our money's worth *plus* the problem he has become in our cities. Viewed as a man, the dreaded immigrant from the Balkan mountains, for instance, whom we bury shudderingly in our coal mines, becomes all at once the sturdy battler for the faith and freedom of his fathers who for centuries has bearded the Turk at his own door and held him back. To be sure, he is not apt to know much English, but would one fear damage to the republic from the injection of such a strain as his?

Note that when dealing with the whole matter in this way no violence is done to the established custom, where that is good. The thief, the leper, the anarchist, the man who is boosted over the ocean to fill some steamship company's pocket—these are still left one side, and I should not be surprised if it were found easier so to keep out the brigands who have swarmed in from Sicily since the government over there shut down on kidnapping for ransom. We have them all here now, in spite of our laws made to keep them out, and they are carrying on business successfully at the new stand. On the other hand, my plan would hold the door wide open for the man who comes here for conscience sake, the victim of unjust political persecution. When we get ready to slam our gate against these, we shall not need to discuss the matter any more. There will be nothing worth coming after.

Does all this sound visionary? Well, I am setting it down rather to make us think then because I expect my way to be adopted at once. But is it so visionary? Why was it we shut the Chinamen out? To be sure, there are the standards of life and the millions over yonder. Yet, was it not in fact because his ideals are not ours, because on that plane we could not meet or understand one another, and because, had it been otherwise, the Chinaman refused to be of us, insisted on remaining an exile in a strange land and sending even his bones home to be buried? And why should it be more unpractical, when you come right down to it, to find out whether a man had a patriotic soul to graft our citizinship on, than to ascertain whether he was a burglar or blackmailer in the old country? To be sure, we haven't made a very good fist of that last, but we can do better—shall have to in any event, unless we are indeed willing to harbor the traditional "scum of Europe."

Of course, there will then be the grafting process. That is our end of it. We shall have to make citizens of these men, having ascertained their fitness for it. That end we have let lie too long and it is time we took it up As for that, we know our duty and if we do not choose to do it, we need not complain of the evils that flow from our neglect.

No doubt some other system than the one that expedites three or four thousand immigrants a day through our gate on Ellis Island would have to be devised. The gate would have to be set up on the other side. These are details of management that can be arranged. For myself I have never been able to understand why our whole immigration business cannot be conducted exactly as a merchant hires help for his store or factory. He does not engage a score or ten score men and try them out by degrees. He asks each applicant if he can do the thing he wants done and makes that the test. In such a scheme a great national labor bureau, as comprehensive in its reach and operation as the Weather Bureau, that would feel the pulse of the labor market every day, would be like the frame of an umbrella, it would carry it all. By its aid they would know constantly in the ports of embarkation what kind of labor was in demand and where, and could sift out that kind and send it over, bound for the spot where it is needed—farmers, mechanics, miners, etc., and no others. Thus we should certainly avoid the clogging of our city slums that is good neither for us nor for the immigrant. He does not want to stay there but, coming without direction, he naturally goes where his friends are who can help him. We know the rest.

That, I have been told more than once, organized labor would never permit. Well, if anyone can tell me of anything more irrational than organized labor permitting the cheap labor of the world to come in, in free competition, while taxing themselves for its product under the tariff professedly made to protect American labor, I should be glad to hear of it. We shall have to use sense all around. My contention is that, having used it in the selection of the immigrant who asks to become an American, we shall be all the better qualified to decide the question whether we have any right to shut the gate against him entirely.

JACOB A. RIIS.

New York.

PERSONALS

Judge Mack on Commerce Bench.—The Senate's confirmation of the president's nomination of Judge Julian W. Mack to be a circuit judge of the United States, sitting in the new Court of Commerce, puts the official seal of national approval on a career of high usefulness.

Judge Mack was born in San Francisco in 1866. His parents removed a few months later to Cincinnati where he was brought up.

JULIAN W. MACK

He was graduated from Harvard Law School in 1887 at the head of a class which included Charles S. Hamlin, afterwards assistant secretary of the treasury; Joseph H. Beale, Jr., now professor of law in Harvard University; Joseph Lee of Boston, president of the Playground Association of America; John J. McKelvey, an eminent New York lawyer; Colin C. H. Fyffe and George W. Brown, prominent members of the Chicago bar, and John H. Wigmore, now professor of law in Northwestern University. At Harvard he won a traveling fellowship, the first awarded in many years to a law student, and spent the next three years abroad pursuing advanced legal studies.

In 1890 he returned to Cincinnati where the law school was being re-organized under Gustavus H. Wald, who had interested Judge, now President, Taft to become one of the lecturers. The young attorney's advice and influence were utilized in introducing modern methods of instruction. In 1891 he joined the Chicago law firm of Julius Rosenthal, now continued by the firm of Rosenthal and Hamill. Julius Rosenthal, a thorough scholar of the old type, and Julian Mack were frequently held to be the strongest influence in Chicago at that time for sound legal learning. In 1893 he was appointed professor of law in Northwestern University Law School, and in 1902 he joined the new law school of the University of Chicago. In both his special attention was given to commercial law.

In 1903, after serving a few months as a civil service commissioner, he was elected to the circuit court of Cook county and was re-elected in 1909. While serving there he was assigned to the Juvenile Court where his philanthropic spirit and legal talent enabled him to set a high standard of administration which has influenced the conduct of children's courts in this and other countries.

He has long been identified with other philanthropic movements. The Jewish and other charitable organizations in Chicago which he has served make a list too long to be enumerated here. He was at one time president of the National Conference of Jewish Charities and he has been a frequent speaker at the National Conference of Charities and Correction. He is president of the Chicago League for the Protection of Immigrants and a zealous worker in the Chicago branch of the Friends of Russian Freedom. He is a member of Charities Publication Committee. Judge Mack may be classed intellectually and emotionally as a radical. His natural instinct is to sympathize with the ideal in principle and with the oppressed in person. This instinct is checked by his thorough legal training and shrewd good sense, and by his clean, rational clarity of view; all of which combine to make him realize the value of things as they are, the stern necessity of law, and order, and progress, and the inevitable conditioning of the ideal by the now and here. The combination is a peculiarly valuable one for the duties of the bench, and it is precisely the one needed at the present time of national affairs.

A Friend of the Boys.—Chief Scout Ernest Thompson Seton of the Boy Scouts of America has announced that James E. West has begun his duties as executive secretary of the organization, a position of much responsibility in a movement growing so amazingly fast. There are now 1,400 local councils in the United States. England has 400,000 youngsters pledged to "scoutcraft," "doing a good turn every day to some one and getting fun out of it," as the announcement reads.

Mr. West has unique qualifications. "Graduate" of an orphanage and for many years tied to crutches, he found ways to go through a high school, and by years of night work, to win a degree at law from the National University of the District of Columbia. He has been a member of the Board of Pension Appeals and an assistant attorney in the office of the secretary of the interior. For two

JAMES E. WEST.

years he has been in charge of the *Delineator* child-rescue campaign, and to him is chiefly due the credit for the White House Conference on Children called by President Roosevelt. He gave up his law work to become secretary of the Washington Playground Association, and started that hibernating organization on an active and useful career. Further and moreover,—there is no end to what the man has done and done well, and always with a smile—he has been superintendent of the Sunday school of the Mount Pleasant Congregational Church, Washington, for five years, and has run up the enrollment from 300 to 1,000, with boys and young men predominating. He was secretary of the citizens' Committee which secured a juvenile court law for the District of Columbia. He has brought up by hand a half dozen boys for whom no one seemed to feel responsibility and now is specializing on a son of his own. The offices of the Boy Scouts of America are in the Fifth Avenue Building, New York.

Tuberculosis Worker Promoted.—George J. Nelbach succeeds John A. Kingsbury as assistant secretary of the New York State Charities Aid Association in charge of tuberculosis work. Mr. Kingsbury, it will be remembered, became general agent of the New York Association for Improving the Condition of the Poor on January 1. Mr. Nelbach has been in charge of local tuberculosis campaigns for the State Charities Aid Association for three years. He is a graduate of Cornell University.

For Workers, Send to Buffalo.—In announcing that his assistant, Paul E. Illman, had been made general secretary of the Syracuse, N. Y., Associated Charities, Frederic Almy said: "It is only two years since the Buffalo Charity Organization Society gave Porter Lee to Philadelphia, but we would rather have men we cannot keep than men we cannot lose."

GEORGE J. NELBACH.

PAUL E. ILLMAN.

Mr. Almy is the only one of the group of young men in the Buffalo Charity Organization Society who has not been "lost"—and that, it is well known, solely by his own choice. The society has furnished secretaries to the charity organization societies of Philadelphia, Minneapolis, Pasadena, Des Moines, and Springfield, and to the Philadelphia Society for the Prevention of Cruelty to Children. It is rumored that Boston is seeking a recruit from it. All of which is a record to be proud of, even in the oldest society of its kind in this country, and an eloquent testimonial to the sort of work and training to be had under one Frederic Almy.

Mr. Illman is a graduate of Harvard. While in college he was assistant superintendent of the Parker Memorial, which is conducted in connection with Hale House. At Buffalo he was assistant secretary of the Charity Organization Society and manager of the Fresh Air Mission. He has a promising field in Syracuse, for the city is much alive to its social needs and has the close and friendly co-operation of the university, the churches, and a large number of the citizens.

Business Man for Secretary.—The Des Moines Associated Charities has for its new general superintendent and secretary Horace S. Hollingsworth, for eighteen years assistant cashier of the Valley National Bank. Mr. Hollingsworth has been interested in charity work since his graduation from the University of Iowa in 1892. Under his direction the Associated Charities has plans for a closer-knit organization of charity in Des Moines, now a city of 110,000 population, and for a new scheme of charitable contributions which in the past have been solicited haphazard by various organizations and institutions.

H. S. HOLLINGSWORTH.

Financial Secretary, Philadelphia.—Berkeley G. Tobey, who on the first of the year began new duties as financial secretary of the Philadelphia Society for Organizing Charity, is the latest recruit to the group of young men who in a half dozen fields are pushing forward the social work of Philadelphia. Mr. Tobey was for two years financial secretary of Brooklyn Hospital, following an earlier experience with the New York Charity Organization Society.

Social Worker for Girard College.—There is much significance in the announcement that Frank D. Witherbee has been made field agent for Girard College, Philadelphia, for this old institution has not before sought the services of a trained social worker. It has a large endowment under which it is possible for it to do work of far-reaching importance in educating industrially the 1,500 boys who are enrolled. Under Cheesman A. Herrick, the new president appointed last spring, it is going ahead with new energy and purpose.

Mr. Witherbee's immediate work will be to supervise the selection of boys who enter the institution in order to secure those who can profit most from it. A man who combines abounding sympathy heartily expressed with the best sort of social training, he is admirably suited to the place. For over four years he has been assistant secretary of the Philadelphia Society for Organizing Charity, following a brief term as its financial secretary. Before that he was in charge of the Joint Application Bureau in New York, and still earlier of the boys' work at Denison House, Boston.

Reporting Venereal Diseases.—Departmental Control of Venereal Diseases will be the subject of the meeting of the American Society of Sanitary and Moral Prophylaxis the evening of February 23, at the New York Academy of Medicine. Papers and discussion will be by Prof. Frederick H. Gerrish of Portland, Me., Dr. Lucien Home of Buffalo, William A. Purrington, and others.

An Indispensable Reference on

IMMIGRATION

The discussion of the recommendations of the Federal Immigration Commission adds the greatest timeliness and importance to Prof. Emily Green Balch's book

OUR SLAVIC FELLOW CITIZENS

Here we have a study of a great group of immigrants in their peasant homes and in America. They are of the races now coming to us in greatest numbers, and they are largely laborers. They are studied smypathetically but critically by one who knows them well. They not only form parts of the "foreign quarters" of great cities and industrial towns, but are scattered over the continent as farmers, shopkeepers, workers in the trades.

A more valuable volume for American readers during the present immigration discussion could scarcely be penned.

At its publication the London *Spectator* hailed "Our Slavic Citizens" as "a remarkable example of the thoroughness with which economic investigation is carried on in the United States. . . We can warmly recommend this book to every one who is interested either in the future of the Slavs, with which the future of Europe promises to be more and more bound up, or in the conditions and prospects of European immigrants in the New World."

8vo, 550 pages; 49 full-page illustrations of Slavic types and scenes in Europe and America. Price, postpaid, $2.50.

SOCIAL FORCES

BY THE EDITOR

THE PEOPLE'S COURTS

More than local interest invests the attempt now being made at Albany to seize control for political purposes of all the inferior courts of criminal jurisdiction in the city of New York. If it should be successful one more reason would be given to the insurgent West, to self-respecting New England, and to the democracy of the South, for rejecting with contempt such claims to leadership as might come from this Empire State, if not indeed to association on equal terms in any place where decency is taken into account, where public interests are put above private interests. For this is not an academic issue as to whether judges should be appointed by a mayor or elected by the people. It is a reckless and desperate onslaught on a magistracy which is already good and is every week becoming better. The attack would have no significance and no chance of success except for the fact that through this very increasing efficiency in the public interest these courts are interfering, as it was intended that they should, with obnoxious personal and private interests.

The discussions of the past fortnight, and especially the joint hearing on February 15, have made all this as clear as daylight. The spokesman for the Sullivan "ripper" bill described himself as a lawyer who has more practice in the police courts than all the other members of the New York county lawyers' association combined. His claim is challenged, but there is enough basis for it to explain one ground of his interest. He finds the magistrates before whom he practices unreasonable and irritable. We are not surprised. He is especially annoyed because former District Attorney Jerome was able to put the fear of God into the hearts of judges. The rest of the community has found this rather a matter for congratulation. But we suspect that the nasty magisterial temper which troubles our legal friend is not so much a legacy from the former district attorney as it is the natural reaction of the human and judicial mind against the tactics which he employs in their presence. The speech which he made at Albany, so abusive and unparliamentary that his party associates have vied with the public press in denouncing it, was evidently nothing more nor less than a sample of his best court room manner. No doubt he is honestly astonished at the impression which it created. Probably he is quite sincere in protesting that he did not mean to be insulting and abusive. What interests us is that this ambitious East Side police court lawyer, who has been thrown by the accidents of politics into the position of chairman of the judiciary committee in the Assembly, clearly reveals that he has his personal grievances against the magistrates before whom he has been accustomed to practice. Probably, like others similarly placed, he may have his own quite legitimate ambition to take the place of one of them. As he has shown that he can be elected to the Legislature, notwithstanding his grave disqualifications, very likely he could so shape matters as to secure a

local judicial nomination and election. At least the chances are that he could have done this before February 15. With the unenviable reputation which he achieved on that date it might be more difficult. Failing in that, however, he might at least help to elect a more compliant magistrate than the "irritable dyspeptics" before whom he is now compelled to take his chances.

Here then we have three "good reasons" for passing the "ripper" bill which legislates out of office on a given date all of the fifty-five justices and magistrates who are now conducting these courts, and gives to each local district the right to elect its own magistrate at the time of a general election, incidentally and quite unnecessarily increasing the number of judges to be elected.

FIRST. It would get rid of the judges whom police court lawyers of a certain type and local politicians find objectionable, unreasonable, arbitrary, and "dyspeptic"!

SECOND. It would give these same local lawyers or others like them a better chance than they now have to step into their places.

THIRD. It would at best put the courts completely at the disposal and under the influence of the district leader and the political machine.

From the spoilsman's point of view these are all very good reasons. From the point of view of the public interest; from the point of view of the unfortunate people, innocent or guilty, who crowd these courts as defendants, and the scarcely less fortunate people who come into them as complainants; from the point of view of an orderly, impartial, and fearless administration of justice, they are no reasons at all. Vituperative scorn was poured out upon the secretary of the City Club, who was one of the opponents of the bill, because he claimed to be voicing the protest of the decent people of New York. Yet later discussion has shown that his claim was abundantly justified. Not all decent citizens are in the City Club, but those who are not seem quite as ready as those who are to speak their minds in opposition to this iniquitous project. We have yet to hear from one disinterested decent citizen who is ready to defend the bill on its merits. To speak for decency against so barefaced an attack on the independence and efficiency of magistrates is merely an obvious public duty, an assertion not of offensive superiority but of common sense.

We have not dwelt on the particular objections to the bill, that in its present form it would put an end to such specialized work as that of the two night courts and the domestic relations court, which have already won their way to immense popular favor. The fundamental objection to the bill lies against its fundamental purpose That it would undo the extraordinary progress of the last year should insure its defeat; but even if, as its sponsors profess to desire, all these improvements could be retained under the new scheme, as they clearly could not, it would still deserve all the public indignation which it has aroused, for the reason that its sole effect under existing conditions would be to put the people's courts into the vest pockets of district leaders. We have no quarrel with district leaders as such; but we have with the project to add the courts to their available assets.

THE COMMON WELFARE

HOIST BY THEIR OWN BILLINGSGATE

For many years advocates of city progress in New York have been galled by the tight rein held over the city by an up-state majority of a Legislature trained to make laws for the metropolis by their experience of the difficult problems of township finances and the administrative subtleties of district school boards. This year, through Tammany Hall, the city in a general way controls the Legislature, and it is interesting to see what happens.

The first hearing on a city bill—the Sullivan bill, incidentally drawn in such a way as to do away with the chief improvements in the minor courts which followed the enactment of the Page law—was made the occasion for venting on a delegation of social workers a heaped up measure of billingsgate. Thus does history repeat itself, for Tammany's first control of the state Legislature has led to just such a scene as was familiar when it had complete control of the city years ago under Boss Tweed and Mayor Van Wyck. And thus does fable reverse itself, for the delegation did not

> Come home from the ride with the lady inside
> And the smile on the face of the Tiger.

but rejoicing in the probable defeat of the measure by the very zeal of its friends. It is now currently understood that the bill will not be made an organization measure and, in an interview in the *Evening Post*, a Tammany member of the Legislature declares outright that this incident makes him ashamed of his connection with the organization.

Here were men and women from New York city whose own senators and representatives sneered at their motives, calling them "highbrows" and "high collar dudes", accusing them of working for their "pay envelope", and branding them as "professional reformers", and their opposition to the bill as "insincere, false, and dishonest" and calculated to result in "hysteria." The chief advocate of the bill was able to see merely a selfish demand for continuing the salaries of women probation officers in the plea of a woman who spoke against the bill from years of devoted work for a salvage of fallen girls. The personal appearance of some of the speakers was made the subject of remarks, greeted by laughter by members of the committee.

The delegation represented the City Club, the Charity Organization Society, the New York Probation Association, the Woman's Municipal League, the Board of City Magistrates, the Court of Special Sessions, and the State Supreme Court.

It is interesting to note that Assemblyman Aaron J. Levy, the man chiefly responsible for the affair, is a police court lawyer, and that the method he employed was the police court method of browbeating and blunt invective which the Sullivan bill would once more make possible in police courts. The *Evening Post* has since shown him to have taken her whole savings from an immigrant woman in deep trouble, and then to have secured payment from the city as her attorney on the claim that she was penniless. He has long been a candidate for magistrate, but has failed of appointment. His chances for the position, it has been pointed out, would probably be improved if the office were elective. The papers point out further that he is a political, and his brother a financial, associate of the Sullivans.

The "ripper" bill, as readers of THE SURVEY will remember, proposes to do away with the appointment by the mayor of city magistrates and justices of the Court of Special Sessions and to substitute their election by districts. This was the practice prior to 1873 and was held responsible for making police courts a term of reproach rather than an instrument for securing justice. The proposed change would do away with the centralized organization which under the Page law makes each justice and magistrate responsible to his chief and he in turn to the mayor. It would make them de-

pendent upon district leaders for nomination and election, thereby turning over fifty-five new positions to the leaders. It would abolish the night courts and the Court of Domestic Relations, as they are courts for the whole city and the law provides that a judge elected in a district can sit only in that district. The detail of what all this would mean need not be repeated here.

The New York *Times* finds the real motive of the bill to be not patronage, but the well-known relations of political leaders to vice. However respectable some men near the top, the machine at bottom is supported by the profits of vice either directly, through ownership of resorts by some of its leaders, or indirectly through "protection." Every step forward by the minor courts under the Page law, it might be shown, curtailed this power. The night courts did away with the professional bondsmen, limited to a degree the power of men who live on the earnings of prostitutes, and made more difficult the recruiting of white slaves. The Court of Domestic Relations greatly hampered the activities of police court lawyers. The organization under a chief magistrate holds the whole body more strictly to account. Should the courts go on developing to the highest point possible under the Page law, simple justice will become a fairly easy and undelayed matter, with little call for the services of Mr. Levy and his associates. Summing up, the *Times* says: "Sullivan's bill to make the magistrates elective is so obviously calculated to increase the revenue for 'protection' that even decent Tammany men are ashamed of it." Further, it is to be noted that Tammany leaders would not be the only beneficiaries, for the bill would throw patronage and power to republican leaders in republican districts, and it is held by many to be in fact not a measure urged by any political organization as such, but a move of and by certain district leaders regardless of party.

"CLOSE EARLY" SLOGAN FOR NEXT CHRISTMAS

Aside from the elaborate and encouraging address of the Rev. John A. Ryan of St. Paul Seminary on Minimum Wage Boards, to which the closing session was chiefly devoted, the twelfth annual meeting of the National Consumers' League, held in Pittsburgh, gave more time to shortening working hours than to any other theme. Reports on the Christmas shopping season were uniformly cheering. Since, however, hundreds of merchants, in scores of places, cut prices on the days immediately preceding Christmas, thus rewarding the late comers, the cry for the next holiday season will have to be, "Deal with merchants who close early," not merely, "Shop early!" Early closing is, after all, the chief aim of the shop early campaign.

Plans are already under way for the Saturday half holiday campaign for next summer. While New York, Philadelphia, Boston, and many other great cities already have this beneficent usage, in hundreds of smaller ones the stores are kept open extra late on summer Saturdays.

The following resolution, unanimously adopted, sums up the attitude of the meeting in relation to the short working day:

> Whereas, the Consumers' League of the City of New York passed a resolution endorsing the movement of the expressmen to obtain a reduction of their working day from thirteen hours to ten hours, the National Consumers' League assembled in council places itself on record as approving an eight hours day and endorses attempts to reach this standard.

Resolutions approving honest labeling of beer and whiskey have already been made public through the daily press. The National Consumers' League reasserted this position, because untruthful labeling of any food, drug, or beverage, leads inevitably to similar frauds all along the line.

Another resolution, based on the case of the boy of twelve sentenced to five years' confinement for stealing five dollars from a special delivery letter,[1] protested "against the employment of minors under twenty-one years in the delivery of mail, whether such employment be directly by the post office officials or indirectly under contract with local deliv-

[1] THE SURVEY for February 11.

ery companies," and affirmed that "mail matter of all classes should be delivered by adult responsible employes of the federal government. Copies of the resolution have been sent to President Taft, Postmaster General Hitchcock, and the appropriate committees of Congress.

TOWN MEETING OF CITY SIZE

Some of the people of Seattle were particularly well equipped this year to discuss the measures before the Legislature, which is about closing its annual term of sixty days, as a result of the Pre-Legislature Institute held at the suggestion of the Social Service Club. The Municipal League, a virile young organization, stood sponsor for the institute; the Y. M. C. A. gave the use of its auditorium; prominent citizens acted as presiding officers during the four days' sessions, and the Rev. Sidney Strong, an active participant in all social and civic matters in Seattle, was president.

The institute discussed proposed legislation regarding child labor, an eight-hour day for women, state supervision of charities, juvenile court, workmen's compensation, local option, the short ballot, direct legislation, and closed with an address on law enforcement by Judge J. T. Ronald of the Superior Court. The general plan was to present both sides, and it worked well in even so mooted a question as local option, on which speeches were made by representatives of the Anti-Saloon League and the Liquor Dealers' League.

The attendance at the institution averaged over two hundred. It was understood that no resolutions were to be passed by the institute. The newspapers gave good reports of the proceedings, and the meetings came nearer to being "town-meetings" than any previously known. A list of the senators and representatives and how to reach them was printed on the programs. The expense of carrying on the institute was less than twenty-five dollars.

If good government depends upon intelligent sympathy in the affairs of government, then such an institute, which could be held in any city, town, or village, standing for frank and non-partisan discussion of public issues, would, the members hold, be a contribution to the civic good.

SOCIAL CAUSES OF BLINDNESS

Helen Keller put the social causes of blindness in the clearest sort of way at the recent meeting of the Massachusetts Association for Promoting the Interests of the Blind, which discussed the prevention of blindness and the conservation of eyesight. She said:

> The trouble with most of us is that we do not understand the essential relation between poverty and disease. This case of blindness, the physician says, resulted from *ophthalmia*. It was really caused by a dark, overcrowded room, by the indecent herding together of human beings in insanitary tenements. We are told that another case of blindness resulted from the bursting of a wheel. The true cause was an employer's failure to safeguard his machine. Investigations show that there are many ingenious safeguards for machinery which are not adopted because their adoption would diminish the manufacturer's profits. We Americans have been slow, dishonorably slow, in taking measures for the protection of our workmen.
>
> Our worst foes are ignorance, poverty, and the unconscious cruelty of our commercial society. These are the causes of blindness; these are the enemies which destroy the sight of children and workmen and undermine the health of mankind. So long as these enemies remain unvanquished, so long will there be blind and crippled men and women. To study the diseases and accidents which cause loss of sight, and to learn how the surgeon can prevent or alleviate them, is not enough. We should strive to put an end to the conditions which produce the diseases and accidents.

Dr. F. Park Lewis of Buffalo reviewed the more common causes of blindness, the familiar cases of *ophthalmia neonatorum* and inherited blindness. He showed, too, how the danger of sightlessness is creeping into the poorly lighted school room and how badly printed school books and, "more than all, too long and persistent demands upon the adolescent eye for neat work" are making defective eyes. Badly lighted workshops are also sources of frequent blinding accidents, as well as causes of poor work. Dr. Lewis quoted the editor of the *Illuminating Engineer* to the effect that the loss of three minutes' time on the part of a workman because of im-

perfect lighting in a factory would cost more than adequate lighting for that man for the entire day; while an uncertain light not only produces lowered efficiency —injures the eyes of the man—but may result in an accident, the cost of which may be many thousands of dollars. Good illuminating is a paying investment to every employer of labor, he said.

INNOVATIONS IN THE PITTSBURGH BUDGET

For the first time a step—it might more properly be termed half a step—has been ventured in Pittsburgh to take the taxpayers into the confidence of the city administration regarding the distribution of the annual appropriations of over $13,500,000. On February 2 representatives of the Budget Conference and citizens generally were invited to meet the finance committee of Councils. The net result of the civic recommendations was a request for an increase of $8,000,

Mayor Magee had his directors make public their estimates for the ensuing year in December, following requests from the Budget Conference and citizens' petitions. Heretofore the Pittsburgh custom has been to hurl a mass of figures at Councils in February, at the last minute permissible by law, and follow the onslaught with pressure on behalf of the "poor firemen and policemen" whose salaries were held up. A deliberate and detailed study of the budget was thus impossible, and sessions of the finance committee have been known at which appropriations approximated a million dollars a minute.

During the past fifteen months a fight has been waged in behalf of the theory that taxpayers have a right to know how their money is to be spent. Inaugurated by a Chamber of Commerce committee, the effort to secure proper publicity has been carried on by the Budget Conference organized under the auspices of the Allied Boards of Trade. An opening wedge has been driven and future hopes focus on a budget exhibit. In view of the inertia which has had to be dispelled, the actual accomplishment of this year's agitation is far from a negligible factor; future hopes focus on a budget exhibit.

It would seem that one of the next steps to be taken by the conference is to improve the city's methods of keeping records and the form of budget estimates, so that, having the proposed appropriations, it may be in position to sanction or disapprove with an all-round knowledge of the values to be considered. Because of these limitations, the budget conference was forced to confine its recommendations to the Department of Charities and Correction. It suggested the employment of an expert alienist and five more attendants in the insane department, so that modern methods might supersede the present strap and straight-jacket treatment.

AN EXPERIMENT WORTH REPEATING

The dance held in Public School No. 40, on the evening of January 20, which was attended by some 300 young people and a score or so of parents and teachers, was the first thing of its kind in New York. A short program of music and speechmaking preceded the dance, which lasted until 11 o'clock. Several members of the local school board were present and they, as well as many mothers and teachers, took part in the dancing. While conducted ostensibly by a committee of the "junior alumni" for the benefit of their members and their girl friends, the dance was actually promoted and supported by the local Home and School Association with the active co-operation of Principal Joseph K. Van Denburg and his teachers. According to the regulations of the Board of Education assembly rooms may be used only until 10 o'clock, but in this instance an additional hour was granted.

Dancing has been a part of other social occasions held in New York schoolhouses by teachers, high school classes, and recreation center staffs, but the affair at "Forty" is said to have been the first out and out grammar school dance ever held in New York. Its marked success and the amount of inexpensive, whole-

some recreation that is possible under such circumstances lead to the hope that neighborhood dances may become a custom in New York school buildings.

RECALL OF THE SEATTLE MAYOR

The recall had its first thorough test in a city of considerable size when the voters of Seattle put out of office Mayor Hiram G. Gill, who had served less than the first year of the term for which he was elected last spring, and put in his place George W. Dilling. The most noteworthy previous use of the recall in a large city was by Los Angeles, where former Mayor Harper gave way to Mayor Alexander, but Mayor Harper resigned as soon as the machinery of the recall had been set in motion. In Seattle Mayor Gill fought to the last ditch and did not acknowledge defeat until the vote counted him out.

Mayor Dilling was elected on February 7 by a vote of 31,900 to 25,680 for former Mayor Gill and 4,580 for the socialist candidate. It was acknowledged on all sides that the votes by women—their first in Seattle—was a large factor in the overthrow of Gill.

Details of the situation report that the election of Gill last spring was accomplished by large business interests desirous to veto proposed heavy regrading undertakings and city improvements sought by newly annexed suburbs, and by the "personal liberty" element. Seattle under his administration is said to have been a "wide open" town in the broadest sense of that term. There was much talk of a vice syndicate alleged to be making huge profits through the acquiescence of a police force manipulated by Chief Wappenstein, a Gill appointee. Last summer, while Mayor Gill was on a trip to Alaska, an "insurgent" councilman became president of the council by chance. He ordered the flagrant law violators to close up, discharged Chief Wappenstein, and thus gave Gill, on his hurried return home, a chance to show his hand. Gill at once reinstated Wappenstein. The council then ordered an investigation of the situation, especially of police graft. The recently organized Public Welfare League obtained an injunction order forbidding Gill to violate the state law and the city ordinances by establishing a "red-light" district.

Meanwhile recall petitions were filed. Through "a taxpayer", attorneys for Gill secured an injunction from a federal judge forbidding the council to pay the expenses of the recall election. On an appeal by the Public Welfare League this injunction was dissolved and the case of the "taxpayer" was dismissed. The recall campaign was then on in full force.

The candidate of the Public Welfare League was George W. Dilling, a well known real estate man, former member of the state Legislature, and a "progressive" republican who had supported Senator-elect Poindexter. The fight against Gill rallied most of the civic and religious organizations of Seattle. For example, one of the culminating meetings on the Sunday afternoon before election was held under the auspices of the Ministerial Association. The presiding officer was a representative of the Y. M. C. A. Speeches were made by prominent ministers and civic leaders.

The vote of women was very large, for one of the factors in securing the women suffrage state law was the indignation over the "wide open" policy of Mayor Gill in Seattle. The registration last spring, before women suffrage came in, was 42,000. At the recall election it was 71,000, and it is estimated that out of 23,000 women registered, no less than 20,000 voted, despite the fact that in many instances the polling places had been put where it was thought women would not be likely to go.

PLAN EUROPEAN TOUR FOR SOCIAL WORKERS

When Professor Bailey of Yale began to bring his students to the Bowery for sociological observation, the New York press ridiculed such "slumming expeditions." Of late, however, our most progressive magazines and schools have demonstrated the value of carefully surveying conditions and agencies, if we are to participate intelligently in social movements. Gradually the scope of investigation has been extended to other

countries, and we have had parties of European experts studying our systems of prison administration and American commissions studying foreign methods of municipal control. In other fields vacation travel has been organized into a sort of international university extension movement to the extent that every summer groups of students direct their course toward the historic and artistic centers of the Old World. Now comes in turn the announcement of a European tour for social workers.

H. W. Dunning and Company of Boston have arranged a summer pilgrimage to the most notable centers of philanthropic, industrial, and civic advance in England and on the continent. The itinerary includes visits to children's homes, London settlements, and English garden cities; the study of Belgian co-operative concerns, the Bielefeld refuges, and the social museums of Berlin; investigation of Bavarian labor bureaus, Swiss industrial colonies, and Parisian crêches. Informal conferences with the directors of progressive agencies abroad are included in the plan. The party will be conducted by Howard B. Woolston, professor of sociology in the College of the City of New York, formerly headworker of Goodrich House, Cleveland.

EDITORIAL GRIST

WASHINGTON'S DAY FOR CITIZENSHIP

GRAHAM TAYLOR

There can be no moral and national tragedy greater than to lower the aspirations and lessen the love of liberty by which most of our immigrants are moved to make the struggle and sacrifice of their lives to reach the land of Washington and Lincoln. In sorry contrast with their proud hope and high endeavor are the shameful and painful disclosures of the wholesale barter of the American birthright of native-born citizens in Adams county, O.; in the Danville congressional district in Illinois, and in the Legislature of Lincoln's state. This collapse of citizenship at once overshadows and intensifies the otherwise portentous problem of distributing and assimilating the foreign elements of our population.

The observance of Washington's birthday as a civic holiday in Chicago this year afforded a refreshing and encouraging outlook, in turning toward which our whole country may find relief and hope. The Union League Club, which in Chicago as elsewhere owes its origin to a patriotic purpose, has reinforced its hitherto valuable service to this end by gaining the co-operation of practically all the foreign elements of the population. For over thirty years the club has given its members and friends the privilege of hearing on that day the foremost statesmen, including nearly all the presidents of the United States. For several years it has furnished the high school pupils and teachers a similar opportunity. This year a great mass meeting for people of foreign birth and parentage was arranged by the club, with the enthusiastic and united co-operation of the presidents of all the great national societies, and representative citizens and editors of foreign-speaking peoples. The 4,000 seats of the First Regiment Armory were filled by holders of admission tickets restricted to those within the specific province of the meeting.

This great opportunity to initiate a series of similar patriotic occasions was improved to the utmost by Theodore Roosevelt and Jane Addams. At the heart of every immigrant colony, in school buildings, recreation centers, church halls, settlement houses and other headquarters, illustrated lectures on American history and citizenship will be systematically and consecutively given by representatives of the various nationalities in their respective languages. Their societies will sing the patriotic songs of the old countries and the new.

Such co-operation on equal terms will not only develop the patriotism of those who have adopted this country as their own, but will add significance to the citizenship of those who cannot tell why they were born here and who therefore sometimes lose the sense of what it means to be an American. It will also reimpress the vital importance of the part which the public schools and libraries,

playground associations and immigrant protective leagues, the churches and the settl ments "schools for citizenship" should take in the work of interpreting immigrants and natives to one another, and in welding them into a composite citizenship. Pageants and play festivals, folk songs and dances, flags and fellowship, national music and international speech should make Washington's Birthday a type, to the keynote of which all other days of the year should be set.

No finer reciprocity illumines the American spirit than that which anticipated by a few weeks this community of interests prompted by Washington's Birthday. Over on the West Side of Chicago is the home plant of the greatest mail order supply house in the world. At the head of its business and its many thousands of employes is Julius Rosenwald, the wealthiest Jewish merchant in Chicago. Down on the South Side, in the "Black Belt," are the great majority of the neediest and most neglected families among the city's 50,000 Negroes. Between these two great human interests rises the sixteen-story central building of the Young Men's Christian Association. This is the setting for a truly great act. The time chosen for its announcement was the Christian Christmas holiday season. Speaking to 500 representative Negro citizens, the foremost representative of Chicago's Jewish people offered to give to the Christian Association of Chicago, and to that of any other American city, $25,000 for a Young Men's Christian Association building for the use of Negro men and boys, wherever others will add $75,000 to complete the erection and equipment of an adequate structure.

Mr. Rosenwald based his gift on the propriety of a member of the world's most persecuted race doing something for America's most persecuted people; and upon the confidence he had "that the Jew has a good chance in this country and, if he behaves himself properly, will some day come into his own," and "that the colored man has only to do the same." This he was sure of, notwithstanding the fact that "there are clubs in Chicago, representing what you might call the best type of citizenship, one of them a club of university men, that do not admit Jews to membership." His magnanimity of spirit is still further exemplified by intrusting not only this great gift, but $100,000 more, to the permanent funds of the Chicago Young Men's Christian Association, to whose active membership he himself, as a Jew, is not eligible. In his judgment "both in the interest of the colored race and in the interest of the country, . . . it is the duty of the white people irrespective of their religious beliefs, to evidence their interest in the welfare of these their neighbors by assisting to supply this need."

In thus acting upon this judgment, he felt that he is no less loyally a Jew in working toward "peace on earth and good will to men" as the highest ideal, and in working through the Young Men's Christian Association, because there is no organization better suited for this work." Such reciprocity of feeling soon became that of fact. The Negroes who promised $50,000 raised $66,000, and then other white friends added $75,000, thus doubling the total amount upon the raising of which Mr. Rosenwald conditioned his gift. The spirit prompting and expressed by this magnanimous act is worthy not only of Washington's loyalty to his country, but of the truest love of fellowmen inculcated either by the Old Testament or the New.

ROUTINE AND IDEALS

JOHN HAYNES HOLMES
Church of the Messiah, New York

No pages in Miss Addams's Twenty Years at Hull House[1] are more interesting than those in which she explains why she has never identified herself with the socialists, or any other organization of men who are committed to one specific ideal of human welfare or method of social reform. There is something almost pathetic in her statement that she would "have been most grateful to accept the tenets of socialism" and "longed for the comfort of a definite social creed, which should afford at one and the same time an explanation of the social chaos, and

[1] Twenty Years at Hull House. By Jane Addams. The Macmillan Company. New York. 1910. Pp. 462. By mail of THE SURVEY, $2.50.

the logical step toward its better ordering"; and there is something almost sublime also in her persistent refusal to join a fellowship which "depends upon identity of creed," and in her steadfast "desire to bear independent witness to social righteousness."

Miss Addams is plainly conscious of her kinship with the socialists, and more than once she expresses her unqualified admiration for "that gallant company" who are making such a "devoted effort to understand and relieve" those oppressive conditions of industrial life which constitute the tragedy of American civilization. But underlying all this, there is evident a "temperamental" distrust of the out-and-out idealist—of the man who is impatient to win the goal.

This feeling first found expression in an essay written for an oratorical contest in her school-days, in which she said:

> Those who believe that justice is but a poetical longing within us, the enthusiasts who think it will come in the form of a millennium . . . . are not those who have comprehended the vast truths of life. The actual justice must come by trained intelligence, by broadened sympathies toward the individual man or woman who crosses our path; one item added to another is the only method by which to build up a conception lofty enough to be of use in the world.

Miss Addams confesses that this is "callow writing," but affirms that she is "still ready to subscribe to it." "The schoolgirl receipt has been tested in many later experiences," she declares; and it has only led to the conclusion of her mature years, that "justice will have to be established in industrial affairs with the same care and patience which have been necessary for centuries in order to establish it in man's civic relationships."

But if Miss Addams feels thus distrustful of the eager idealist, it is equally true, on the other hand, that the idealist is distrustful of the realist—if I may be pardoned the word in this connection—who, like Miss Addams, plods patiently along the weary way of service, careful only of the next step, interested only in the day's work, exasperatingly content with "one item added to another." Nothing is more conspicuous in the editorials of the socialist journals and the speeches on the socialist platforms than the fine scorn for the "step by step" method of advancement. The socialist knows the ideal which he wants to achieve—he is convinced of the method which must be followed in order to achieve that ideal—and he is impatient of anything, however admirable in itself, which delays the immediate application of this method and thus the immediate fulfillment of this ideal. He wants the whole loaf, or he wants nothing. Any such half-loaf achievements as are credited to churches and settlement-houses and charity societies do not interest him. Nay, they more often arouse his bitterest antagonism. There is something magnificent in his scorn of compromises and expedients—something sublime in his devotion to a great ideal. But in this matter-of-fact world, where the day's work must be done, this has the serious disadvantage of making him, for all his courage and idealism, a poor soldier in the campaign for social justice. He sings the war-song, but he fails to carry the musket. "The convinced socialist," says one of the settlement-workers in New York, in a recent letter to me, "shirks the present job too persistently to be trusted with the tremendous responsibility of reformation. I would feel more sympathetic with the desires of the socialists, if I saw that they were using what means they have at hand for betterment as well as crying for more means." Just here is the explanation of the alienation which oftentimes exists today between the social worker, like Miss Addams, and the socialist. The one is the patient servant of routine—the other the impatient champion of the ideal. And yet, nothing could be more unfair, I believe, than to leave our characterization of these two classes of social reformers right here. For who can read Twenty Years at Hull House, and fail to see that Miss Addams is nothing if not an idealist? She may believe that the only method to follow in the great work for social change is that of "one item added to another." Her knowledge of history may teach her that "humanity moves onward" only by the slow process of constant struggle and endeavor. But all her life she has been dreaming dreams of a

better world, seeing visions of an uplifted humanity, and meditating how she could best fulfill these dreams and visions which have possessed her soul. The chapter on Boarding-school Ideals, where she describes the "ardent girls" who lived in so rapturous a realm of youthful idealism, is one without which the rest of the Hull House story would be unintelligible. Miss Addams may be concerned with the next item, but she never forgets the "lofty conception," to the realization of which that item is a definite contribution. She may be absorbed in the next step, but her gaze now and again lifts to the golden city in the far distance toward which she knows this step is directed. As a matter of fact, Miss Addams is one of the truest of idealists, and therefore does a recent writer do well when he speaks of the Twenty Years at Hull House as a "pursuit of the Holy Grail."

But if Miss Addams is thus an idealist, so do I believe that the typical socialist is, in spite of himself perhaps, a realist—a man, that is, who by no means despises the "item by item" method of advancement. So long as the socialist is a political propagandist, or a social agitator, or a preacher of righteousness, he is an uncompromising idealist—and he would be unworthy of his calling were he anything else! Like the minister of religion, he has no business to concern himself with problems of ways and means. But make the socialist a public executive—burden him with the task of municipal or state administration—and he gives himself at once to the consideration of "the one item added to another." And this, not because the socialist by election to public office and the resulting assumption of political responsibility is become a coward, or turn-coat, or traitor, as his comrades are all too often persuaded to believe. Not at all! He is the same brave, devoted man that he has always been. Only in the one case he is the preacher whose task it is to fix his gaze upon the distant city; and in the other case he is the worker whose task it is to take the next step on the road to this city. Each office, that is, has its specific function. And one only has to read such books as Robert Hunter's Socialists at Work, or Morris Hillquit's Socialism in Theory and Practice, or study the socialist city administration in Milwaukee, in order to see how successfully the socialist can achieve the routine work of adding "one item to another," without sacrificing one jot or tittle of his ideals.

In other words, there is no real quarrel here between Miss Addams and the social workers on the one side, and the socialists and their propagandist confrères upon the other. Such differences as exist are only those which are inevitable upon different points of view and different functions. The social worker, however bright his dreams, is engaged in the routine of daily work, and therefore is interested in items; but let him drop his work for a moment and preach, and lo! the ideals which inspire that work flame like beacons in the night. The socialist, however wise his understanding of practical methods, is engaged in preaching a crusade, and therefore is interested in ideals; but let him once be intrusted with specific work, political or otherwise, and lo! the "items" and the "next step" at once monopolize his attention. In other words, the social worker is as true an idealist as the socialist; and the socialist is as true a realist as the social worker. Only the social worker, because he must work, is in danger of forgetting the ideals, and thus compromising; and the socialist, because he must preach, is in danger of forgetting the next step, and thus becoming impractical and doctrinaire. Both should remember what Dean Briggs of Harvard has pointed out—that the road of progress is the road of "routine and ideals" together. The task of life, he says, is "not to shun drudgery but to do the work, and in doing it to know its higher end. . . . The practical life is the life of steady, persistent, intelligent, courageous work; doing well what lies before it. . . . But it is, or should be, even more than this. It makes, or should make, every task the expression of the vision that abides and commands."

COMMUNICATIONS

THE HOUSEHOLDS OF A MILLTOWN

To the Editor:

Another volume of the Pittsburgh Survey[1] has just been published, and a splendid volume it is. The author has not for a moment forgotten the true function of her work, which is not to criticise and find fault, but rather to hold up the weaknesses of our present factory life that there may come some remedy and some improvement. Any person can find faults in a tremendous enterprise which has grown up in an amazingly short space of time; nor is it hard to point out the sad lot of the unskilled working people. The author of this work, however, has tried, and successfully, too, to be more than critic. She has come as a sympathetic friend, to point out, in the kindliest spirit that there must be a change in the present arrangement, if working people are to receive "life, work, and happiness."

Some of the most glaring weaknesses of the state of affairs in Homestead are brought out by statistical records. A man can exist on $1.65 per day, but the inevitable consequences are bound to be detrimental to this country. There can be no home life, no sanctity to the home at all, unless the men receive a living wage. Instead of emphasizing the sad scenes at greater length, the writer has very sympathetically chosen to let us see the brave men and the courageous women who are trying so very hard to meet this unequal struggle in the best way they know how.

The great strike of 1892 and the political situation in Homestead have been handled in a most painstaking way. She has not allowed her feelings to get the better of her judgment, but in every possible way lets us know the good points in this city's growth. "In contrast to their general political indifference, the voters have insisted on efficiency in the one branch of borough government which specifically affects their children" (pp. 118-9). Yet the weaknesses of the system and the lack of a square deal to the young immigrant children are clearly set forth.

This volume serves a double purpose. In the first place, it aims to give a friendly diagnosis of the ills of Homestead; and if the constituted officials will read the work, they will not rest, provided they are conscientious,—until radical improvements are made to better the living conditions in Homestead. Changes, indeed, have taken place in the past three years, since the report was begun, but much remains to be done.

But in a larger sense this book tells just what can befall any city where the entire life comes from mills; and these mills are run by a system, in which the owners live at a distance and whose only concern is the obtaining of the annual dividends. No one can read this book and remain unmoved. The observations of the writer are so wide in their application that they will offer much serious food for reflection to the teacher, the minister, the sociologist, and the director in large concerns. This book has a real message to every thoughtful American, and we wish it a very wide circulation.

Rudolph I. Coffee.

THE COURT OF SPECIAL SESSIONS

To the Editor of The Survey:

Much has been heard of the recent law in relation to the inferior criminal courts, but as yet no attention has been given to the matter of the cost of these reorganized institutions. Further legislation is now pending, but it contemplates no betterment in this respect; on the contrary, it seeks to effect, among other things, still greater lavishness in city disbursements.

Since 1897 the per capita charge for these courts has more than doubled. From less than twelve cents for that year in the then city of Brooklyn, it has risen to more than twenty-four cents for each one of our four and a half million of population. Including the salaries of the police officers assigned to them, their maintenance involves an expenditure of $1,053,200 for the year 1911.

Of this sum $277,650 has been allotted to the Court of Special Sessions. It is a matter of importance to the community to see the relation which exists between this cost and the workings of that court.

Its main function is to try persons accused of misdemeanors. These are petty crimes of which ordinary assaults, petit larcenies, sanitary law violations, and violations of the highway law constitute nearly seventy per cent of all cases there heard. Each one of these defendants is brought, in the first instance, before the magistrate, who has power to discharge, but none to convict and sentence. The examination then made is, as a rule, as searching as a trial. It is in fact a trial in everything but in name and in effect. After such examinations nearly as many misdemeanant cases are discharged as are held, the number of defendants discharged by the magistrates in 1909 being 19,766 and those held 24,097.

The defendants who appear at Special Sessions, with a few exceptions, have therefore already been parties to a judicial inquiry as formal as a trial. They are there called upon to undergo, with their witnesses and lawyers, a second ordeal under conditions not nearly as favorable to thoroughness as in the City Magistrates' Court. There the calendar is always crowded and a patient hearing much more difficult to obtain.

There are twenty-four magistrates' courts in session every day in the year and but two parts of the Court of Special Sessions in action at any one time in the five boroughs. Each one of these twenty-four city magistrates, at the conclusion of his examination, held directly after the event, has as compre-

hensive a view of the case as the justices at sessions, weeks or months later. He is, too, in a far better position to deal effectively with the delinquent. These twenty-four steady currents all flow into one reservoir and when the two valves are periodically opened we see the inevitable rush of the high pressure. Here we find always an interminable calendar, haste to get through with it somehow, impatience, and lack of all dignity. It is no exaggeration to say that the sessions are "special" only in this, that nowhere else can such hurly-burly adjudication be seen.

The Page law authorized city magistrates to sit as trial judges, and not as examining magistrates, in cases of cruelty to animals, motor vehicle violations, and violations of the sanitary code. But why these misdemeanors only? Why were the owners of automobiles especially selected to enjoy the blessings of a speedy trial and other violators condemned to the old delay and its attendant expense? Were the societies for the prevention of cruelty to animals so weary of having their agents lose day after day in that court, that they saw economy in the increase of magisterial powers? Is the interest of the Department of Health, in the loss of time of its sanitary inspectors, of greater importance than that of other complainants in their loss? The magistrate can dispose of all misdemeanants as satisfactorily as do the justices at the second court. He can do it, and in the city of Brooklyn for many years did do it, with a celerity which the second court can never hope to attain. His exercise of such power, under the eye of the chief magistrate and the district attorney, is less liable to abuse than the present system. Surely his power now to discharge is as mighty as the power to convict and sentence. If he is fit and competent to do the one, he is fit and competent to do the other.

Instead of so rational a procedure we have the spectacle of counsel on both sides examining and cross-examining witnesses, making arguments and motions, only to end, if the prisoner be not freed, in the direction to do it all over again before another tribunal—a tribunal which in Brooklyn sits only three times weekly, and in the boroughs of Queens and Richmond but once a week. Until the day comes when the court returns, if he can find no bondsman, the accused spends his time in jail. In 1909 there were 6,570 such. If he does find a surety he must wait weeks, frequently months, until his case is called, set for trial, and finally tried.

If the hardships, the expense, the loss of time, and the vexations involved in this scheme of double trial, to the tens of thousands of complainants, defendants, witnesses, and sureties are considered, its injustice and absurdity must be perceived. It must be apparent that it would not be tolerated at all were it not for the fact that certain personal interests would suffer were it changed.

It should not be necessary to adduce further argument, since a distinguished member of that court has publicly admitted the existence of the conditions portrayed. In an address on the subject of Children's Courts before the department of law of the Brooklyn Institute, Robert J. Wilkin, justice of the Court of Special Sessions, stated that rather than cause the arrest of a man who had urged his twelve-year-old son on to beat and kick a girl, while he, the father, stood by, the speaker had convicted the boy and sentenced him to pay a fine, knowing that he would thus reach the real wrongdoer. This proceeding of convicting the child to punish the parent, he said, seemed better to him than to apply to a magistrate and thereafter wait two or three months for Special Sessions to inflict a punishment.

Surely an evil system can work only evil when, through the instrumentality of such an undoubted friend of childhood, the sin of the father must thus be visited upon the child.

With such a notable example of the efficient administration of justice, cheap and quick, which is furnished by the recently constituted Municipal Court of Chicago, which the Page Commission might have studied, it gave us back the ancient system—with patches. This antiquated, justice-retarding device of Special Sessions was restored and refurbished.

If it were abolished, if the Children's Court were established as a separate institution, and if original jurisdiction in the few special proceedings which now must be brought there were vested in the Court of Domestic Relations to which it properly belongs, these vexations would end at once; justice would be administered expeditiously; our inferior courts would rise in repute; our probation laws could be administered with thoroughness on a large scale—and there would be saved of the people's substance annually considerably more than two hundred thousand dollars. This is too large a sum of money to waste. It would build annually a beautiful court house, which could accommodate a municipal court and a magistrates' court, a building in an open space which would be a city ornament. It might be applied in various other ways to do work of beneficent public service if it were not being employed in doing a public harm.

Such a proposal would, of course, meet with bitter opposition. It would be fought hand, tooth, and nail, by those who have lucrative positions to conserve. We should hear much about the charter of our liberties and the sacred right of trial by jury. Trial by three justices, however, is not a trial by "twelve good men and true"; neither is one justice, trying and sentencing for felonies under the name of juvenile delinquency, in the strictest accord with our traditional law, whatever other conclusive argument may be advanced in its behalf. But the trial by indictment would lie as close at hand in the magistrates' court as it does at Special Sessions, and its exercise, in all probability, would be as infrequent there as it is here.

Reformers are altogether too much given to the advocacy of measures which involve new functionaries, new salaries, new expense. Here is an opportunity to redress a real grievance, improve in a vital way our governmental machinery, and with the same stroke cut off a huge outlay. The costliness of this institu-

tion is the main reason for its being. It furnishes places, honors, and pay, but nothing else which other existing agencies could not supply much more effectively and in a small fraction of the time.

If the civic bodies of New York will cause the introduction of a bill with such purposes in view and unitedly demand its enactment they may bring to an end conditions discreditable and humiliating in the extreme. It is with such a measure that the Sullivan Senate bill must be met. The intent to divest the mayor of the power of appointment and thrust it into the hands of party bosses should not only be thwarted, but in the reaction we ought to rid ourselves for all time of the unnecessary and indefensible Court of Special Sessions.

AN EXHIBIT OF HUMAN VALUES

TO THE EDITOR:

Interesting and instructive as the Budget Exhibition was—and manifestly it is an approved means of acquainting the people of New York of the manner in which public business is conducted—it prompts the suggestion that now would be the time for the different charitable organizations of the city to prepare to hold next year an exhibition of the way in which private business is conducted, and the public results.

For example, this year's exhibit placed conspicuously before the public the short measures and crooked scales whereby the housewife is defrauded of a pennyworth of beans or a nickel's or a dime's worth of meat. This is well and a good beginning. Next year let us show how merchant and manufacturer defraud society of the worth and value of a human being. We will not mention a human soul. Let us show, as we can show by records too sad and too many, that the merchants and manufacturers thrive not only at the customer's expense, but also at their employes' expense, and always at society's expense. The undervaluation of incoming humanity is a crime; it is a common means to commercial success.

Let us exhibit a photograph of a young woman, whose value the comptroller's exhibit showed is $1,500 as a contributing factor to the prosperity of the city. That is her cash value to the city as one of its inhabitants. She is the product of social effort and of vast expense of this age and of ages past. She belongs to society.

What is her value to her employer? We need not repeat that he does not pay her wages on which she may exist respectably. He pays the market price. But we should show by facts and figures how long she can work before her vitality is exhausted, her condition then, and how she is considered in the machinery of merchandizing.

Tired, half-fed girls, nervously wrecked by miserable, disgraceful wages, yet worth to the city $1,500 according to its finance department, are physically, mentally, and morally destroyed without effective protest. The bargains which are not bargains blind the eyes of the public to its own injury.

Nor can the philanthropic or charitably-minded find in the welfare work of great concerns any adequate compensation to the individual, nor to society for the havoc wrought by the present code of morality and practice of business men—for business men who pride themselves on their honor with one another realize that their success is reaped at the expense of society. They say society is to blame. So it is; and an exhibition of wage scales, hours worked, duration of years' employment, savings of employes, health and character of employes, and final condition of ex-employes, with a careful statement of trade deceptions practiced, would go far toward putting society right.

A minimum wage law and better hygienic conditions for employes are factors of much greater importance than the false-bottomed measures or the crooked scales. Photographs of filthy and horrible conditions did much to make the work of the tenement house commission possible. People did not know. Effective pictures of exploited girlhood and boyhood and manhood, of mocking pay envelopes, of impossible morality and defrauded society are also as available.

A constant stream of fresh, hopeful boys and girls are fed into this thing we call merchandising; that which comes out enfeebles, impoverishes, and poisons the city on which the merchant and the manufacturer feed.

The chief channel through which betterment may come lies in the activities of educational and charitable institutions and labor organizations.

Nor do we doubt that the merchants themselves would be the first to welcome an enforced curtailment of their advertising expenses, and the addition of sums so saved to the salaries of their employes, plus an enforced increase in wages throughout all classes in the state, such as a minimum wage law would bring.

Were it not for the incoming crude labor, our manufacturers and merchants before now would have recognized in practice with their employes the principle that "good business means a profit to both", and exploitation would be as fatal to business success as deception in weights and measures. But since unrestricted immigration has led to unrestricted exploitation, always at society's expense, an ill only to be cured by social action through education and legislation, and while the public mind is keenly alive to municipal waste of money and to measures of public economy, it follows that now is the psychological time for organized and directive relief bodies to begin their budget exhibit, truthfully and carefully depicting the waste in human lives and the vast sums vainly spent by them to ameliorate the results of unrestricted greed.

Let it be done. It is a condition upon which concerted action of all relief agencies through

pictorial and graphic representation can do the greatest social service. It is as pertinent to know at what cost a man succeeds in business as in politics.

The charitable organizations know the cost. Let them make public the facts and find in public sentiment an efficient ally to their work of redemption and constructive reform.

R. C. SANGER.

Franklin, N. H.

THE LIFE OF THE POOR

TO THE EDITOR:

I was glad to read a little book review in your paper, Just Folks. I may not be able to see the book, but if it will spread the idea that the poor are not a "class", but look at life with much the same interest as the rest of us, it will help to broaden the ideas of many people. The poor are not all sorrowful, they have their good times. Even the Wiggses" went to the theater. A recent letter from Miss Ovington, in the *Evening Post*, leads one to think that the poor all put on long faces when they see her coming. Things are better. Read about the "Five Points" in 1858 and then go through the East Side; or look at a "fresh-air party", and you will seek in vain for the old-time filth, rags, or squalor. Think of those times: no water but yard hydrants, no sanitary plumbing, no parks or playgrounds, not even a fire-escape! Cholera or smallpox epidemics (visitations of God) were expected as regularly as years of drouth.

New York is not perfect; nor are our ideals to be lowered, but to be continually raised. But there is no use in denying the wonderful betterment. It is not to pick up gold in the streets that a million immigrants throng to our shores every year. It is for work, at wages that seem fabulous to the dwellers in Posen, Lodz, or Kiev, or even to those in Naples and Torre del Greco. You have given in your Buffalo Survey a limit of $400 for a living wage for a Polish family and speak of living on less as an impossibility. You do not realize that to these people one-half of that sum represents the possibility of existence, and more than that, in their Polish homes. While here they have the free school, the free bath, the parks, and above all, what means the most to them, the free air, liberty, opportunity, all that to their countless compatriots at home spells "America"!

JOSEPH D. HOLMES.

New York.

International Hygiene Exhibit.—An international hygiene exhibit is to be held in Dresden from May to October. It will cover departments on history, physiology, athletics, and hygienic apparatus. The object will be to present to physicians, teachers, engineers, public officials, and all interested in such topics, a survey of all that has been accomplished in the field of hygiene, and to impart instruction to the general public in the principles of the science.

The secretary is Dr. Steinbach, Zwickauer Strasse 35, Dresden, Germany.

THE TREND OF THINGS

FRANCIS A. FOY.
1857-1910.

The *New Jersey Review of Charities and Correction* has appeared again after the lapse of a year, with the promise of more regularity in future. It has a fine portrait of the late Father Foy, whose death was a genuine loss to the cause of reform in New Jersey. The next State Conference of Charities and Correction in New Jersey will be held in Princeton, April 2, 3, 4. On Monday, the third, the subject will be the Delinquent Woman, with addresses by Mrs. Joseph Allen, president of the board of managers of the New York State Training School for Girls at Hudson, N. Y., and Katharine B. Davis, superintendent of the Woman's Reformatory at Bedford.

* * *

Many a good story lies tucked away in the records of the charity offices. The last report of the Joint Application Bureau in New York has a grist of them. There was the travel-worn young man who asked for assistance—in selling a large manuscript of poetry which he had written and brought all the way to New York from his home in Florida. A woman presented a letter of introduction delicately hinting that "anything you can do for this old lady will prolong her life and suffering and will be greatly appreciated by H—— F——." A drunkard who was cured in an institution to which the bureau sent him was most grateful because "it is the first time in years I have been able to eat a hearty breakfast. Before this it consisted of whiskey and

the shakes." The bureau wrote for transportation home for a man who had been robbed of his watch and all his money while "seeing Coney Island." The money was forthcoming, with a tart letter from his daughter who hoped "this will learn you a lesson." A newly-wedded couple asked that the groom's father be called upon for return fare for the honeymoon. The reply by telegram was prompt and highly expressive in its ten words: "I will not send you money. Try your wife. Sorry."

There were others of a most curious nature, like the old man whose sole occupation was building fires for Jews on Saturday; the woman who wanted transportation for herself and her two daughters to Alaska; and the man who wanted help in saving part of the money spent on his own funeral. He had been taken from Bellevue to City Hospital without notice to his family. They had identified a body in the morgue as his and held a $200 funeral. The day after he returned to find them in mourning, and, he said, "it was the greatest disappointment of his life to have all of that money wasted."

These, of course, are the exceptional cases, for the Joint Application Bureau ministers year in and year out, seven days in the week, from nine in the morning until midnight, to more than 38,000 people in twelve months, "from the half-nourished infant in his mother's arms to the homeless man of eighty asking for work; from the widow of sixteen with twin babies to the entire family turned out on the street for non-payment of rent; from the young girl deserted by her lover to the man who wants to be sent back to the wife he left while he was under the influence of drink; from the man just out of the hospital to the woman seeking a fighting chance against tuberculosis—these are all met and in some way dealt with."

* * *

The National Prisoners' Aid Association, which was organized during the last annual meeting of the American Prison Association, has begun the publication of a monthly *Review* as a means of keeping its members, who are the members of the thirty constituent societies, closely in touch with the details of work, legislation, and personal movements among its members. The first issue, dated January, shows the skilled hand of O. F. Lewis, secretary of the New York Prison Association, who is the editor. The *Review*, the latest addition to the technical journals for the various special groups in the social field, is planned especially for prison officials. Membership in the association is to include the *Review*, which will be sent to others for one dollar a year. It is published at 135 East 15th street.

* * *

As an echo of a Russian massacre of fourteen years ago, the *American Hebrew* tells the story of a Jewish Enoch Arden. With one daughter, he escaped and finally found his way to Hamilton, Ont. Unknown to him, his wife, a second daughter, and an infant son also escaped, finally reaching Toledo where, in the course of time, under the impression that she was a widow, the wife married again. The husband sought in every way to find traces of her and never married. His daughter finally located her in Toledo. The infant had developed into an unruly boy and had been placed in the Miami Children's Home. The father, now a prosperous man, did not seek to disturb the relations of the wife with her second husband, by whom she had borne children, but took this boy to his own home in Canada.

* * *

A useful handbook for those interested in industrial education is Bulletin No. 12 of the National Society for the Promotion of Industrial Education, New York. This is a compilation of legislation on this subject in the United States. Parts I, III and IV analyze state legislation on Industrial Education in the Public Schools, on Manual Training, on Industrial and Trade Education Systems, and Part II analyzes the trend of such legislation, gives comparative tables of the work of the six state commissions on Industrial Education created since 1908, and gives the Ohio law relating to compulsory part time school work. The pamphlet may be obtained free from the headquarters of the league 20 West Forty-fourth street, New York city.

* * *

In a volume of verse entitled The Iron Muse, to which THE SURVEY has already given critical attention, a number of the poems deal with social conditions. The Cotton Mill makes a plea for the children whose lives are stunted by their work, and The Slum bears testimony to the art, aspiration, and even salvation which shall come for the race and for the nation out of the lives oppressed by poverty. One entitled The Sweatshop Children tells again the old story that the ills of those who are most miserably treated extend to all of us. We are enjoined to give the unfit a chance to grow, since their irresponsibility is caused in part by our negligence. In these and other poems there is not only an appeal to the responsibilities of society, but also to the courage of the individual in the ranks of the unfortunate or down-and-out. A note of aspiration and idealism among workers is struck in several poems, especially The Clock in The Air, whose chimes high on Manhattan's tallest tower "teach the toilers how to dream."

* * *

Recent issues of the *Technical World Magazine* take up vigorously the struggle for the protection of the worker from overwork and accident. In the November number P. Harvey Middleton writes of Seven-Day Slaves of Steel, estimates the number employed at Sunday work in all trades—over 300,000 for New York alone—and describes the agitation in New York state and among the United States postal employes for one day of rest in seven. The December number contains Charles Frederick Carter's comparison of

the figures for boiler explosions in this country with those of England and Germany, showing our record to be four times that of England and many times that of Germany. Government inspection with heavy fines for failure to comply with the inspector's recommendations is the remedy, but the interests to which economy is more important than the saving of 398 lives—one year's record in America—last year defeated the persistent efforts of the boilermen's union to get federal inspection of locomotive boilers as an entering wedge toward inspection of all boilers.

* * *

The newly appointed Industrial Committee of the General Conference of Congregational Churches of Connecticut, of which the Rev. Ernest L. Wismer is secretary, at the annual meeting of the conference held at Putnam a few weeks ago, recommended that the church recognize the improvement of social conditions as a part of its legitimate work, and while reserving Sunday morning for purely religious exercises devote Sunday evenings to problems of human society, and one week night meeting to the organization of social service work among parishioners. The committee held further that it should be a part of the church's legitimate function to mediate in industrial disputes, and to give active support to legislative measures aimed at improving social conditions.

* * *

The band of pioneers who, with true '49 spirit, are blazing the way for model housing conditions in Los Angeles, have issued their fourth annual report. The pictured conditions tempt one to read the interesting explanatory text.

Special attention has been given to the problem of "house courts." They are one-room shacks built of dry goods boxes, gunny sacks and tin cans, unsanitary and unhygienic, giving only a slight protection against the weather. The type might be expected occasionally in a climate like that of California, but to find 250 of them, containing from three to sixty dwellings each, and scattered over all parts of the city, surprised even the Housing Commission. In making records of these houses, educational work has been carried on with landlords and tenants, and the material obtained will in turn educate the people of Los Angeles to appreciate the dangers of housing without supervision.

To replace this condition, the commission pictures its ideal of individual houses, built of non-combustible material, with a maximum density of twenty cottages to the acre.

* * *

A welcome newcomer in the circle of periodicals devoted to various phases of social progress is *Life and Labor*, the first issue of which appeared at the beginning of this year. It is a monthly magazine published by the National Women's Trade Union League, intended to serve as a news medium for all who are directly interested in this growing organization, and—of wider influence—to interpret the efforts and hopes of organized working women to all whose sympathy and support should be enlisted in the movement to enable the toilers to secure a larger share of life.

WHEN WORK WAS PLEASURE.

Frontispiece contributed by Charlotte O. Schetter, to *Life and Labor*, the new woman's Trade Union League Magazine.

The main feature of the first issue is an article descriptive of the garment workers' strike recently settled in Chicago. The causes of this strike, its remarkable spirit of mutual loyalty around which 50,000 strikers have rallied, the methods of its conduct—including the picketing, successful commissary stations, and the co-operation extended by the religious and civic organizations, and the history of the negotiations toward agreement are all outlined. Photographs portray typical scenes during the strike.

A neighborly interest in the new magazine is shown by the editor of the *Public*, Louis F Post, who contributes an article on Labor and the Law in which he traces the development of the use of the injunction, maintaining that privilege and power have used it to thwart the advancing masses.

Two stories appear, one by James Oppenheim entitled A Very Naughty Boy, and the other by Samuel McChord Crothers on Christmas and the Spirit of Democracy, which is reprinted from one of his books and brings Scrooge up-to-date with modern philanthropy.

A picture, When Work Was Pleasure, was specially drawn by Charlotte O. Schetter to

serve as a frontispiece. It is reproduced herewith. The February issue contains among other things an account of the end of the garment strike, an article on the educational value of the Woman's Trade Union by one of the lecturers for the league, Frances Squire Potter; and an interesting account of the work and personality of Frances A. Kellor, chief investigator of the Bureau of Industries and Immigration.

The office of the publication is at 79 Dearborn street, Chicago and the subscription price is one dollar a year.

* * *

That city officials should be looked upon as trustees of the property and interests of the public is often mentioned as an ideal by which to measure and judge the actions of our municipal overlords. The Bureau of Municipal Research has published an opinion by William J. Curtis, which says that in New York the city officials are not only in fact actual trustees, but that any taxpayer may bring suit for recovery in case the trust is violated.

For nearly fifty years the New York charter has had a section declaring that the Board of Aldermen and all officers and employes are trustees of the property, funds, and effects of the city, and that any resident taxpayer is a *cestui que* trust with all the rights for any co-trustee or *cestui que* trust. Oddly enough there are very few decisions which attempt to interpret this law. The more important of these, of which the most recent is Hearst *vs.* McClellan, tend to hold that city officials can only be restrained from a pending "waste" and "injury" when wrongful or dishonest action can be proved. There are minority opinions to the contrary, and some on similar statutes in New York which lead Mr. Curtis to believe that if a clear case is carefully presented and carried to the Court of Appeals, it will be decided that city officials can be held accountable even if fraud cannot be proved. The act, apparently intended to prevent waste, should be interpreted in the way that gives the public the fullest protection. Mr. Curtis feels that the courts have been too reluctant to adopt this view because of the power of the people to control the selection of proper officials. In some cases also the motives of the person appealing for equitable relief have not been beyond question.

It is probable that the courts would never apply this doctrine to the Board of Aldermen, for their whole policy is to allow full legislative discretion, but if other city officials could in fact be held to the position of trustees for the public, with personal financial liability for breach even in the absence of proved fraud, a great advance would be made. The brief half intimates that the Bureau of Municipal Research is contemplating a test case to establish this doctrine.

* * *

Through a gift from some prominent laymen, the National Municipal League has sent copies of Dean Hodges's leaflet, The Value of a Vote, to the clergy of the Episcopal Church in America.

JOTTINGS

Boston Children's Aid Society.—Carrington Howard, agent of the Boston Children's Aid Society, has been appointed secretary of the Boston Children's Friend Society to succeed Seymour H. Stone, who recently became secretary of the Boston Society for the Relief and Control of Tuberculosis. Mr. Howard was graduated from Yale in 1906. After graduation he became secretary of the Christian Association at Lehigh University, and from 1908 to the summer of 1909 he was field secretary of the Buffalo Charity Organization Society. From the Charity Organization Society he went to the Fresh Air Mission in Buffalo. In the fall of 1909 he became agent of the Boston Children's Aid Society.

Chicago Jewish Aid Society.—The recent appointment of Miriam Kalisky as superintendent of the Jewish Aid Society of Chicago recognizes her efficient work since she became connected with it in 1900. Edward Rubovits was superintendent, and following him, George Zepin. When Mr. Zepin resigned in August, 1908, on account of ill health, Miss Kalisky became acting superintendent. During the past year the relief office was moved to the west side so that the people for whose benefit the organiation exists—most of whom live in that section of the city—have been aided more promptly and in many instances more fairly than ever before.

During the last fiscal year the relief department spent $78,000, as compared with $62,000 in the preceding year. A new dispensary has been built by Mrs. Emanuel Mandel in memory of her husband. The old dispensary building now serves as an administrative building, housing not only the relief office but also the office of the bureau of personal service.

Co-operation with many organizations, such as the Michael Reese Hospital, the Woman's Loan Association and the Labor Bureau, has been most effective. Especially interesting has been the work of the ladies of the Jocannah Lodge, who visit the various schools in the congested district and report all children poorly fed and poorly clad. The society investigates the home conditions and reports back its conclusions and suggestions, which in almost every instance are accepted and acted upon favorably by the ladies of the lodge.

Three Meetings for the Blind.—Besides the Annual Convention of the American Association of Workers for the Blind, no less than two international conferences to consider the welfare of the blind are announced for this year. The fifth International Congress for Ameliorating the Lot of the Blind was held at Cairo, Egypt, February 20-25, and the third Triennial International Conference on the Blind will be held at Exeter, England, July 3-7. The secretary of the fifth international is Dr. Eloni Pasha, Egyptian University, Cairo. The Conference of American Workers for the Blind will be held at the School for the Blind, Overbrook, Pa., June 20-23.

CALENDAR OF CONFERENCES

INTERNATIONAL (NEW).

Second International Congress on the Welfare of the Child, under the auspices of the National Congress of Mothers, April 25-May 2. Washington. Secretary, Mrs. Arthur A. Burney, 806 Loan and Trust Building, Washington, D. C.

International Hygiene Exhibit, May-October. Dresden, Germany. Secretary, Dr. Steinbach, Zwickauer Strasse 35, Dresden, Germany.

Third Triennial International Conference on the Blind, July 3-7. Exeter, England. Corresponding officer, Henry J. Wilson, 53 Victoria street, Westminster, London S. W., England.

INTERNATIONAL (PREVIOUSLY ANNOUNCED).

International Congress on Tuberculosis. September 24-30. Rome, Italy. Secretary-general, Professor Ascoli, Via Lucina, Rome, Italy.

International Association for Labor Legislation, September, 1912. Zurich, Switzerland. Secretary, Stephen Bauer, Basle, Switzerland.

International Prison Congress (Quinquennial). London, 1915. Secretary, F. Simon Van der Aa, Groningen, Holland.

NATIONAL (NEW).

Convention of the American Association of Workers for the Blind, June 20-23. Overbrook, Pa. Secretary, Charles F. F. Campbell, 5733 Forbes street, Pittsburgh, Pa.

NATIONAL (PREVIOUSLY ANNOUNCED).

National Child Labor Committee, March 9-12. Birmingham, Ala. Corresponding officer, Owen R. Lovejoy, 105 East Twenty-second street, New York city.

National Association for the Study and Education of Exceptional Children, March or April. New York city. Corresponding officer, Waldemar Groszmann, Plainfield, N. J.

American Society of Sanitary and Moral Prophylaxis, Second Thursday in April. New York, N. Y. Corresponding officer, James Pedersen, M.D., 29 West Forty-second street, New York city.

General Federation of Women's Clubs, Council Meeting, April. Memphis, Tenn. Convention of the Federation June 1912. San Francisco, Cal. Corresponding secretary, Mrs. Frank Shiek, Wheatland, Wyo.

Convention of the Young Women's Christian Association of America, April 19-27. Indianapolis, Ind. Secretary, Lois J. Viele, 125 East Twenty-seventh street, New York city.

American Federation of Arts, May. Washington, D. C. Secretary, Leila Mechlin, 1741 New York avenue, Washington, D. C.

National Peace Congress, May 3-5. Baltimore, Md. Secretary, Theodore Marburg, 12 Mt. Vernon Place West, Baltimore, Md.

National Conference on City Planning, May 15-17. Philadelphia, Pa. Secretary, Flavel Shurtleff, 19 Congress street, Boston, Mass.

National Conference of Charities and Correction, June 7-14. Boston, Mass. Secretary, Alexander Johnson, Ft. Wayne, Ind.

National Probation Officers' Association, June 5-14. Boston, Mass. Secretary, Roger N. Baldwin, 903 Security Building, St. Louis, Mo.

National Women's Trade Union League, June. Boston, Mass. Corresponding officer, Mrs. D. W. Knefler, 5273 McPherson avenue, St. Louis, Mo.

National Federation of Remedial Loan Associations, June. Boston, Mass. Secretary, J. T. Exnicios, 914 G street, N. W., Washington, D. C.

Conference on the Education of Dependent, Backward, Truant and Delinquent Children, June. Boston, Mass. Secretary, Elmer L. Coffeen, Westboro, Mass.

National Conference of Poor Law Officials, June 7. Boston, Mass. President, Dr. Robert W. Hill, State Board of Charities, 105 East Twenty-second street, New York city.

Conference of Neighborhood Workers, June. Boston, Mass. Corresponding officer, Albert Kennedy, South End House, 20 Union Park, Boston, Mass.

National Association for the Study and Prevention of Tuberculosis, June 21-22. Denver, Col. Executive secretary, Dr. Livingston Farrand, 105 East Twenty-second street, New York city.

American Academy of Medicine, June 24-26, Los Angeles, Cal. Secretary, Charles McIntire, M.D., 52 North Fourth street, Easton, Pa. Subject: Medical Sociology.

American Medical Association, June 27. Los Angeles, Cal. Secretary, George H. Simmons, M. D., 535 Dearborn avenue, Chicago, Ill.

National Education Association of the United States, July. San Francisco, Cal. Secretary, Irwin Shepard, Winona, Minn.

National Fraternal Congress, August 21. Mackinac Island, Mich. Secretary, C. A. Gower, Lansing, Mich.

American Society of Municipal Improvements, September 26-29. Grand Rapids, Mich. Secretary, A. Prescott Folwell, 239 West Thirty-ninth street, New York city.

American Hospital Association, September 19-22. New York city. Secretary, J. N. E. Brown, M.D., Toronto General Hospital, Can.

American Prison Association, September. Omaha, Neb. Secretary, Joseph P. Byers, 13 Central avenue, Newark, N. J.

American Board of Commissioners for Foreign Missions, October 10-13. Milwaukee, Wis. Secretary, Cornelius H. Patten, 13 Beacon street, Boston, Mass.

National Conference of Catholic Charities, September, 1912. Washington, D. C. Secretary, William J. Kerby, D.D., Catholic University, Washington, D. C.

STATE AND LOCAL (PREVIOUSLY ANNOUNCED).

Massachusetts Civic Conference, March, 1-2. Boston, Mass. Secretary, E. T. Hartman, 3 Joy street, Boston, Mass.

Connecticut Conference of Charities and Correction, April. New Haven, Conn. Secretary, Charles P. Kellopp, Waterbury, Conn.

New Jersey Conference of Charities and Correction, April 2-4. Princeton, N. J. Secretary, J. Byron Deacon, 1701 Chestnut street, Philadelphia, Pa.

Kansas Association for the Study and Prevention of Tuberculosis, May. Topeka, Kas. Secretary, J. L. Everhardy, Leavenworth, Kas.

Arizona Association for the Study and Prevention of Tuberculosis, May. Bisbee, Ariz. Secretary, John W. Flinn, Prescott, Ariz.

Canadian Conference of Charities and Correction, May 8-12. Hamilton, Ont. Secretary, F. M. Nicholson, Parliament Buildings, Toronto, Ont.

New York City Conference of Charities and Correction, May 9-11. New York city. Secretary, John B. Prest, 287 Fourth avenue, New York city.

New England Conference on Street Cleaning, June. Springfield, Mass. Corresponding officer, Carol Aronovici, 55 Eddy street, Providence, R. I.

Northern Baptist Convention, June 13. Philadelphia, Pa. President, Emory W. Hunt, Denison University, Granville, O.

New York State County Superintendents of the Poor, June 20-23. Thousand Island Park, N. Y. Secretary, C. E. Weiss, 36 Bay Twentieth street, Bath Beach, N. Y.

Sagamore Sociological Conference, June 27-29. Sagamore Beach, Mass. President, George W. Coleman, 348 Congress street, Boston, Mass.

Stony Brook Assembly, August. Stony Brook, L. I. Director, J. W. Jenks, Cornell University, Ithaca, N. Y.

Pennsylvania Association of Directors of the Poor and Charities, October 10-12. Indiana, Pa. Secretary, L. C. Colborn, Somerset, Pa.

Ohio Conference of Charities and Correction, November. Toledo, Ohio. Secretary H. H. Shirer, 805 Harrison Building, 21 South High street, Columbus, Ohio.

Maryland Conference of Charities and Correction, November, Baltimore, Md. General secretary, H. Wirt Steele, 15 East Pleasant Place, Baltimore, Md.

Minnesota Conference of Charities and Correction, November. Duluth, Minn. Secretary, Eugene T. Lies, Associated Charities, Court House, Minneapolis, Minn.

South Carolina Conference of Charities and Correction, November. Columbia, S. C. President, A. T. Jamison, Connie Maxwell Orphanage, Greenwood, S. C.

Kentucky Conference of Charities and Correction, November. Lexington or Covington. Corresponding secretary, Linda Neville, 610 Main street, Lexington, Ky.

Missouri Conference of Charities and Correction, November. Kansas City, Mo. Secretary, W. T. Cross, State Board of Charities and Correction, Columbia, Mo.

New York Conference of Charities and Correction, November 14-16. Watertown, N. Y. Secretary, John A. Kingsbury, 105 East Twenty-second street, New York city.

Pennsylvania Conference of Charities and Correction, November 14-16. Pittsburgh, Pa. Secretary, Fred S. Hall, 1533 Real Estate Trust Building, Philadelphia, Pa.

Conference of Probation Officers, November 14-16. Watertown, N. Y. Secretary, Arthur W. Towne, State Probation Commission, Albany, N. Y.

"The most important question in the world"

Is Mankind Advancing?

by

MRS. JOHN MARTIN

(Prestonia Mann Martin)

"Mrs. Martin has produced a very amusing book. The drollery—hardly ironical because far from bitterness—with which she exposes the false pretenses of spread-eagleism all over the world, while affording constant entertainment loses nothing of force, hardly of seriousness. She is as vigorous as Wendell Phillips, and more industrious and methodical."

—*The Hartford Courant.*

"The reader is right well, right freely entertained."—*Chicago Inter-Ocean.*

"Reading this book is an adventure—like taking your first flight in an aeroplane."

"A most original and fascinating study of genius."

309 pages. Cloth, $2.00 net.

SOCIAL FORCES

BY THE EDITOR

THE RELIGIOUS BASIS OF SOCIAL WORK

An Englishman who is a keen and sympathetic student of American thought recently remarked that it seemed to him not unlikely that a prophet was again about to arise in our midst. All the conditions appeared to him favorable for a new crystallization of ideas, like that which occurred when the essays and lectures of Emerson dropped into the intellectual life of America and Europe. From some American community, he thought, rather than from any European nation, probably from the West rather than from New York or New England, might be expected to come this new word for a new time; and probably not the churches nor any conventional religious institution would have the honor of furnishing his pulpit; but rather he will represent some intellectual movement, and his appeal will be not to the emotions but to the sober convictions of men. "I wonder," said this Englishman, who is a practical politician, a university teacher, and a writer of successful books, and who was speaking in the privacy of his London apartment, "I wonder whether your friend Professor Patten may have the message for which our generation is waiting."

We do not know. Even if we had a "client", we would be mindful of Lowell's good-natured warning not to endanger his life by "trying to stretch him into a giant." We have made no secret, however, of the high estimate which we have placed on Professor Patten's contribution to the practical program of social work, in the New Basis of Civilization and in his other writings. He has now substantially increased this contribution by a discussion of the social basis of religion, from which we reproduce elsewhere copious and typical extracts. This book breathes a devout spirit, and its point of view is that of the orthodox Christian religion. Yet it is not a theological treatise, nor a text book in ethics. Judged from either of these standpoints it has no doubt defects of omission if not of commission. But to look for theological doctrine, or for new light on individual ethics, would be to misunderstand the book's purpose. What Professor Patten has done is to blend economics and natural theology into a message of hope, based upon the clear contrast between existing conditions and those more tolerable conditions which are here and now possible. His argument is that religion begins not with any intellectual belief, but with an emotional opposition to removable evils. Social misery in which sins have their roots is to be overcome by the isolation of its causes. Social activity is to evoke human sympathies and generate religious enthusiasm. Regeneration and the saving of social outcasts is the answer of religion to the fact of degeneration, and to the demand that those who are not fitted to survive unaided in the social struggle must go to the wall in the interests of culture and civilization. In a chapter in his earlier book on Heredity and Social Progress Professor Patten has expressed this thought even more clearly, that progress depends not on strengthening the strong, but on protecting the weak. Nature will care for progress if man will look out for reform. The grave danger is that the strong will exploit the weak, not that the weak will make undue demands upon the sources of strength. The appar-

be weak only because they are undifferentiated, only because they have not an opportunity to develop their own peculiar strength. Into this conception of the relation between the strong and the weak in human society the religious conception fits like the other half of a hinge. They that are strong must bear the burdens of the weak, is, in modern economic language, to justify the flow of income from the strong to those who are weak because they are undeveloped or unprotected. This may take place through taxation, through foundations for social amelioration, or through the personal service of individuals. No strong man ever has weakened his character or limited his usefulness to society by such contributions. Social service, whether given as a citizen, as a philanthropist, or as a reformer, assuming a rational choice of appropriate means, is trebly blessed. It blesses him that gives and him that takes and the society of which both are a part. Social work and social progress are one in spirit and one in the choice of means to their common end.

The settlement worker whom Mrs. Simkhovitch quotes on another page in mild rebuke of Mr. Fosdick's distinction between religious work and "mere social work," came suddenly, under the need of answering her visitor, to the truth of the relation between them, saying, "We think all our work is religious."

Objectively considered some of what is done in the settlements might fail to establish a religious character, just as some features of an orphan asylum, a relief society, or an institutional church might fail. But these are the exceptions which, in the right use of a much abused phrase, prove the rule. For any normal settlement, asylum, society, or church will regard such irreligious elements as unessential, either as harmless features to be tolerated for the time being, or objectionable features to be eliminated as soon as they are recognized and understood. All that is permanent in social work, all that draws to it the fresh enthusiasm of youth and retains the steadfast loyalty of maturer years, is fundamentally religious.

Our English friend may be right that America is to furnish the next seer of the things of the mind. We hope that he is. He may be right that he is to come out of the West. Many good things are coming from that quarter. But we do not share his feeling that the prophet may not come directly from the very altars of religion. The prayers of the social awakening by Walter Rauschenbusch, of which Professor Taylor speaks in this number, show that at least one clergyman feels that the unity of thought and aim and feeling is already such "that the utterances of one man may in a measure be the voice of all." The fact is that the churches are everywhere, as Professor Taylor puts it, laying foundations for more permanent, organized, widely concerted, and effective social action. If social workers increasingly acknowledge the essentially religious basis of their activities, and if the churches increasingly feel the need for a social program, who can predict whether the leaders in the great forward movements of the twentieth century shall come from the one side or the other of the imaginary line between them? And who will hesitate to hear the persuasive voice proclaiming social justice and good will, whether it speak the language of Judaism, of Catholicism, of Evangelism, or of some strange doctrine which to our unaccustomed ears may at first sound discordant jargon?

March 4, 1911.

THE COMMON WELFARE

WAY OUT FOR THE FARMER

At the National Rural Life Conference, held last month at Columbus, O., farmers and publicists, educators and reformers asked and tried to answer the question of what is the matter with American rural society today. The discussion itself was valuable, but the really notable result of the conference was the proof it gave of the essential unity of all of the efforts which are being made to improve rural society. Sociologists and farmers from the middle and real West, from New York, and from the Carolinas met on a footing of equality and talked over their problems and the probable solutions. Uplifters and those-to-be-uplifted worked together at the same task.

The conference is an amalgamation of the National Corn Show and the remnants of ex-President Roosevelt's Country Life Commission. The corn show has been broadened in scope and its tone improved, and the Country Life Commission has become somewhat popularized. Farmers and their families by the thousand come to the corn show, and many stay to take part in the discussions and hear the formal addresses.

The first question considered was economic. Under the chairmanship of Prof. L. H. Bailey of Cornell the conference discussed commercial co-operation in the rural community. The fact that the farmer's fundamental economic problem is not to raise more crops, but to obtain his share of the value of what he has raised, was admitted; sixty-five cents out of every dollar disappears between producer and consumer. The middleman was found at fault, but just what to do with him was not made clear. Dean Bailey said that commercial co-operation might improve the situation in some localities, but that for the country as a whole another remedy was needed. Drawing an analogy from the Interstate Commerce Commission and its operations, he advocated the federal control of middlemen, with a special court to which appeal might be carried by either party, and state legislation backing up the federal law. Co-operative buying and co-operation in various details of farm work were also discussed. A very human note came in the statement that although several co-operative laundries, notably in Minnesota, had been successful, most attempts had failed, not from any economic reason, but because the farmer's wife would not allow her family's mended clothing to be seen flapping in the wind at the cross roads!

Dr. Warren H. Wilson, superintendent of Church and Country Life, Board of Home Missions of the Presbyterian Church, presided at the mass meeting at which the relation of the rural church to its community was discussed. Denominationalism and lack of union,—not only between churches but also between churches and all forces working for betterment,—insufficient salaries for ministers, bad economic methods in agriculture, and the inefficient country school were recognized as the four greatest enemies to the progress of the rural church. But the progress which the country church has made in the face of its difficulties is a story which would surprise many urban laymen. Church after church has been socialized, and it has gone to work to provide recreation and instruction for its people, to co-operate with the grange and other similar institutions, to better public health and living conditions, to improve schools by consolidation or otherwise,—in short, to become the community center, sympathetic with all the needs of the parish and active in their relief. In most cases even the most orthodox of the church members have been quick to see that this socializing process has not come at the expense of neglecting the real business of the church, but that on the contrary the spiritual life of the community has been quickened. A. E. Roberts, international secretary of the county work department of the Young Men's Chris-

tian Association, told what his organization is doing for rural boys and young men.

Discussion of the rural school came next. Recognition of the inefficiency of the present system was frank. Consolidation was advanced as a practical remedy, but it was admitted that many localities would have one-room schools for years and that many others—poorer or more isolated—would probably continue the present system indefinitely.

So the immediate problem became that of the one-room school, with a teacher poorly paid and generally badly trained or not at all, a short term, equipment poor or unintelligently selected, and a curriculum unrelated to the students' actual needs.

The introduction of elementary agriculture was strongly urged. The teaching of domestic science and of manual training did not receive quite such hearty support; the objection pressed by the pedagogues was the necessity of adequate instruction, and by the farmers themselves the assertion that the boy and girl now receive at home from fathers and mothers informal but thorough training, as valuable as any which could be given by the ill-prepared country teacher.

Willet M. Hays, assistant secretary of agriculture, touched upon the proposed federal agricultural high schools and discussed the organization of farmers. At the conference the feeling seemed to be that the time is ripe for a successful federation of farmers' national and near-national organizations and that the necessary machinery is not lacking.

A more intangible but no less important subject came next. One of the fundamental difficulties with present rural life—if not the fundamental difficulty—is social, in the narrow sense of the term. The telephone, rural free delivery, better roads, automobile, and improved economic conditions have removed the old time physical isolation, but social isolation remains. There is no machinery for social intercourse; school and church, except in a few favored communities, are no longer social centers. Community solidarity seems gone. How to return to the old social conditions, how to make farm life socially attractive, was the problem.

At this meeting and at others the injustice of which the farm mother has been the victim was faced. By state and national governments and by colleges the farmer himself has been helped, but whatever slight consideration has been given his wife has been entirely incidental. The improvement in farm machinery has been revolutionary, but the farm mother generally has facilities little in advance of those with which her mother worked. The effect of this upon the daughter's mind has been seen in her effort to get to the city as soon as possible and to stay there; the effect upon rural life in general is painfully evident. The solution seems to be to bring the unvarnished facts home to the husband, to show him the folly of putting all his surplus into more land which he is often ill prepared to work, and to induce him to install machinery and appliances which will lighten the house work.

As has been said, this conference was notable not for any additions which may perhaps have been made to the knowledge of the problem, but for the proof which it has widely given that farmers and those individuals and organizations which are trying to help them can work together at their common task.

FARM AND CITY AND FACTORY

The New York State Commission on Distribution of Population, which was appointed by Governor Hughes last October to complement the work of Mayor Gaynor's City Commission on Congestion of Population, has reported to Governor Dix. Its recommendations take the form of three bills now before the Legislature.

The first of the bills would create a commission to continue the study, as the present commission feels that "the work is so great in importance and so vast in scope as to require far more intensive study and investigation than have been possible." The second bill would authorize inquiry into the extent, conditions, and results of home work in tene-

ments, which under the present law is subject to very little regulation.[1] The third bill would require the State Department of Labor to prepare an annual industrial directory showing opportunities for manufacture in cities and villages of the state, similar to the one issued in New Jersey.

To further its object of distributing population, the commission recommends that better facilities for helping distribute labor be given the State Department of Labor, and endorses the bill providing for public employment offices throughout the state, introduced by the earlier Commission on Employers' Liability, Causes of Industrial Accidents, and Unemployment.

It finds that to a considerable degree faulty distribution of population must be met by city and village rather than by state action. To this end it would make systematic plans for city development to take the place of the present unregulated growth; it would force public and private institutions out of cities where they increase congestion, but would exempt homes for the care of the aged, hospitals, and clinics; it would teach school gardening and give greater publicity to the agricultural opportunities of the state, including an endorsement of the program of the State Department of Education to give better training in rural schools; it would study the possibility of creating small holdings in country real estate and co-operation among producers and consumers, which would eliminate middlemen's profits the commission believes, and increase the number of small holdings and of farmers and farm tenants, as it has abroad.

The commision points out that New York state has a large acreage of very productive farm land which may be bought cheaply. "Enterprising farmers and fruit growers in the West are now coming to this state in considerable numbers and buying these lands because they can actually buy them cheaper than they can lands of like character in the West, which are far removed from good markets." It finds an increasing demand for trained farm laborers, dairymen, and helpers of other sorts, and

[1] See THE SURVEY for February 4, 1911, page 772.

Lee in Colorado Springs Gazette.

A LONG PULL AND A STRONG PULL.

The Park Commission of Colorado Springs is urging the City Council to establish a series of public playgrounds, a movement which has the endorsement of the local Playground Association established about a year ago. There is only one playground in Colorado Springs, opened last summer by the street railway company at the end of its line. The executors of the Stratton estate have given the city a piece of land called Stratton Park, to be used for a playground. The Park Commission urges that this be made the nucleus of the system.

suggests vocational farm training through special schools as one way of meeting it.

The report says:

At this time, when census statistics show such a tendency to city building and congestion, especially in Greater New York, we believe it to be sound policy for this state to give the greatest publicity to facts showing how desirable its farming lands are, and how remunerative scientific agriculture now is; also that there are many cities and villages in it where manufacturing can be profitably carried on without causing such congestion; in fact, where employes may often own their own homes and easily and quickly reach their work. Then, too, we should encourage public and charitable institutions to learn the lesson to be learned at Industry, N. Y. [where an institution for boys has made gardening and agriculture profitable], and to make it effective in training for their lives, in the country as far as possible, the boys and girls, and young women and young men in state and charitable institutions.

We believe it to be be cheaper for the state to assist those willing to work to obtain employment, and to assist in properly training the young for their vocations in life; than it is to take the chances of what may result from long-continued periods of unemployment to large numbers, or from the efficiency of either mental or physical labor because it has not been properly trained for work. Proper train-

ing in homes, schools, and institutions; publicity as to the industrial conditions in all our cities and towns, and proper regulation of tenement house manufactures and other abuses, not to mention anything else, must result in a more normal distribution of population, and less abnormal congestion and the evils that result from such congestion.

FROM CITY TO COUNTRY

In moving their printing plant and some 800 employes from New York to Garden City, Long Island, Doubleday, Page and Company may prove to be pioneers of a new order of things in the printing trade, Pied Pipers who shall draw in their train the monthly and weekly magazines which have not only editorial offices but manufacturing plants in a few well defined neighborhoods in New York city.[1]

When the offices and plant were in East Sixteenth street, forty-five per cent of the employes lived in New York and Brooklyn, while now only twelve per cent go through the reverse process of commuting back and forth from city to country. Not all of the remaining thirty-three per cent have moved out, for of course many of the less well-paid employes left and have been replaced from the neighborhood. As a matter of fact, most of the employes have moved to Mineola, Hempstead, and other near-by towns, for Garden City itself is largely held at high prices by a local real estate company. But within easy view from the editorial windows can be seen the house which the foreman of the pressroom is building for himself, and a half dozen other houses, the property of married employes.

The move is held to have sound business judgment behind it. Built around three sides of a square, on the general plan of Hampton Court, there is not a dark corner in the whole structure. The editorial offices and clerical department are on the second floor, the presses and all the paraphernalia for binding and mailing on the first. The editors walk you proudly past the machinery through which raw paper, rolled directly into one end of the building from branch tracks of the Long Island Railroad, comes out at the other end and on the same level in the form of the *World's Work*, *Country Life*, the *Garden Magazine*, and the latest best seller—and furthermore, you have to walk fast to keep pace. It is like the famous process in the Chicago Stock Yards, which in fifteen minutes grinds a squealing pig into next Sunday's sausages. By the same token it is economical, for besides the gain in efficiency by quick and easy handling, by cutting out the incessant hoisting of half-made books and magazines from one floor to another and back again, there is the advantage of having every process in one plant. There has not been time yet to make adequate calculations of cost, but the assumption is that country life is cheaper in the long run.

The Long Island Railroad has

[1] (We confess with misgiving that THE SURVEY is printed in New York. The amiable proprietors of the plant which we patronize live in suburban Brooklyn; some of their men in rural New Jersey. The printery in Fulton street, half way between, is probably one of the inevitable compromises of the present maladjustments in metropolitan industry. —ED.)

COUNTRY LIFE PRESS PRACTICING WHAT IT PREACHES.

Doubleday, Page and Company have moved their entire plant and offices from New York to Garden City, taking many of their employes to suburban homes.

co-operated by providing a new station on the company's grounds, and the government by establishing a branch post office in the cellar. These things, with direct telephone wires to their New York switchboard and two automobile trucks so modern that they carry advertisements for aviators on the roof, complete the links which bind the company by all modern conveniences to the metropolis. The forty-acre estate provides two tennis courts and a baseball diamond, besides a truck garden which netted thirty dollars last summer on corn alone, and experimental rose gardens, including a cedar-bordered pool. Social life is further promoted by dances from time to time to which the employes come and bring their friends. The Japanese cook provides refreshments for these festive occasions as well as hot lunches daily at a low figure for the staff.

STUDIO CLUB OF NEW YORK

Satisfying a social need quite as insistent as that met by a settlement is the Studio Club of New York, a social center for some two hundred of the thousands of students of art, music, and drama, who continually flock from all parts of the country to this national art center.

This club is more than an artists' club; it is a unique social movement which was started scarcely four years ago by a small group of active and sincere women. Beginning in one small room it has grown until it now occupies a large, comfortable house at 63 West Fifty-sixth street, which affords a home for twenty-six students, and attractive rooms where the full membership may gather for social times, lectures, educational and devotional classes.

Young art students—painters, sculptors, musicians—come to New York, full of life, hope, and ambition, anxious to fit themselves to do their part in the creation of all those things which make life beautiful and worth the living. There are ten thousand of them, keenly desirous of knowledge and eager for work. They are housed all over the city, many living in small, dark hall-bedrooms.

Robinson in New York Tribune.

BACK TO THE GOOD OLD TIMES.

The Sullivan bill to have city magistrates in New York elected by districts, instead of appointed by the mayor, would forge again the old link between district leaders and magistrates whose nominations they control. "He's all right, your honor," is the suggestive line which the *Tribune* printed under this cartoon.

With a natural, youthful longing for self-expression and a need for recreation, they come to the big strange city, have their first dazzling encounter with "the Great White Way," and perhaps meet unforeseen dangers, frequently unexpected hardships. Two sisters who came from Wisconsin to study music had some talent, but funds too slender to stand the drain caused by the illness of one of them. Too proud to ask for help, they moved to a crowded, insanitary tenement where they were found, both ill by that time, by their instructor who had missed them from her classes. Although assistance and proper medical attendance were given them, both died soon afterward.

The Studio Club is for just such girls. It aims to supply the home and social influences necessary to the art students' proper development and to give them contact with other lines of effort—a deeper understanding of life, which is necessary to artistic accomplishment. Charles Zueblin, Stephen S. Wise, Maude Miner and other social workers have lectured at the club, and well-known artists have given their services freely. The idea of the club has met with a quick response from the students themselves, the art leagues, the dramatic and musical schools.

The constant demand for such a home is very much greater than this club, the only one of its kind in the city, can supply. It is endeavoring to get its work before the public. Within three years it hopes to have a well-equipped, modern clubhouse, where at least a hundred girls may live and a membership of a thousand may come together. It is hoped to start an art employment bureau and a professional interchange league. The club is partially supported by contributions and is managed by a co-operative committee of earnest women. Its head worker and resident superintendent is A. Evelyn Newman, whose fine work and true spirit are large factors in its success.

LOS ANGELES PLANNING AGAINST GROWING PAINS

In the "Get Together Dinner" recently held, Los Angeles gave notice of a concerted movement for social control of the problems which are pressing upon it from a tremendous growth of 200 per cent in ten years (102,000 to 210,000 people), a startling increase of immigrant colonies with a well-developed slum nucleus, as witnessed by Mrs. von Wagner's article on another page, and the prospect of even greater growth with the opening of the Panama Canal in 1915.

The dinner was in fact the first annual banquet of the Los Angeles Conference of Social Workers. It was held chiefly to give the members an opportunity to

DEDICATED BY THE MEN WHO BUILT IT.

The closing service at the dedication of the new First Baptist Church at Montclair, N. J., was largely given over to the workmen who had been employed on it. This follows the example of the People's Church at Kalamazoo, Mich., which many years ago held a "fellowship banquet" at which "every man who had driven a nail or laid a brick, everyone from organ-builder to hod-carrier and their wives and sweethearts," broke bread with the church officers and the minister, the Rev. Caroline Bartlett Crane.

become better acquainted and thus to promote co-operation among the social agencies of the city. Many of the social workers were unacquainted with one another, or as someone said were merely "names" to one another. But all felt a kinship in the bond of social interest. Introductions were unnecessary, and the whole evening was characterized by a spirit of the greatest friendliness and vivacity.

The Conference of Social Workers is the outgrowth of the Los Angeles Charity Conference Committee formed two years ago. All the important charitable organizations of the city belonged to it. Regular monthly meetings were held with papers and discussion, and an effort was made to prevent overlapping of charitable work and to secure some unity of plan for the city. Many members felt, however, that the name was restricting the influence of the organization to relief-giving agencies, and it was decided to take a name of wider significance and to revise the constitution so as to make the larger purpose more apparent.

The conference is becoming an important body and its purpose, "to co-ordinate the activities for all agencies working for social betterment in Los Angeles and vicinity", is more nearly fulfilled. It has standing committees on endorsement, co-operation and survey, child-helping agencies, recreation, public health, crime, mendicancy, schools, and city planning. The chairman of each committee is a person prominently identified with the particular work in charge of the committee. Thus the conference is becoming a real clearing house of social information. It stands in a special relation to the Associated Charities, whose secretary is *ex-officio* its secretary. The Associated Charities bears the expenses for stationery, etc., making membership dues unnecessary. The Associated Charities has, however, no preponderating influence in the organization and seeks none.

Los Angeles has a City Planning Commission to work out unity of physical features. The Conference of Social Workers hopes to carry the city planning idea into the region of social effort, to connect disjointed social lanes and streets, close up unnecessary thoroughfares—in short, work out a harmonious and efficient plan for bettering conditions of life in Los Angeles.

Blessington in Houston Post.

CUTTING HIS BONDS.

In Houston, Texas, the courts have recently declared the assignment of unearned wages to be contrary to public policy. Many loan agents have been enjoined from enforcing their claims against the borrowers. In this way the fear of discharge, the loan agent's greatest weapon, is removed.

THE MEN WHO BUILT A CHURCH

As a fitting close of the series of special dedicatory services at the First Baptist Church of Montclair, N. J., a gathering was held last month "in recognition of the men who built the church and the companions in the ranks of labor." The church's expanding work demands a larger material equipment, and if honest labor is put into such an enterprise surely those who build have their part in the good work. In this church the end of the task did not bring from building committee, pastor, and congregation the sigh of relief that difficulties and squabblings were finally over, which all too often marks the completion of a new church.

The pastor, the Rev. Harry Emerson

Fosdick, has been actively interested in all civic movements of the town and has kept closely in touch with the progress of the workingman's cause. Some time ago he prepared for the local press an article on the history of the trades unions of the town. Thus it was with a real sense of gratitude that a public opportunity for an expression of his interest was planned. Representatives of several unions co-operated in the arrangements for the service and a large number of workingmen were in the audience.

The service was addressed by the minister and Joseph R. Buchanan, who, it will be remembered, played an important part in the early days of labor unions in Colorado. He is now a member of Typographical Union No. 6 of New York, and the author of The Story of a Labor Agitator. Speaking on The Church and the Labor Movement, he made a plea for a renewed spirit of sympathy between labor union and church, as both are pledged to the same great cause—the redemption of man. After reviewing the early antipathy, he remarked with satisfaction the cordial feeling and true appreciation with which the one is growing to regard the other. The church's part in the future will be to help conserve the spirit of brotherhood in the midst of a hard commercialism that has affected the unions as it has affected the rest of modern life; through its spiritual message to the individual, the church can bring special aid, he said.

Mr. Fosdick brought a message of personal gratitude from the officers of the church in recognition of work well done.

EDITORIAL GRIST

AFTER THE CHILD WELFARE EXHIBIT

MARY WILLCOX GLENN

Walk along the narrow sculpture gallery to the north of the great stairway of the Metropolitan Museum of Art in New York and one will come to a lesser connecting gallery, in the

RODIN'S STATUE, LE PENSEUR.

center of which stands a fine cast of Rodin's great *Penseur*. For those who may wish to contemplate the master conception a bench has been placed in front of the statue, and one should linger on it so as to get a sharp impression of the significance not only of the statue itself, but of its surroundings. In front, to right and left, are reproductions of works of another French sculptor, Dubois's St. John the Baptist as a child, and his youthful Florentine singer; behind, on each of the narrow wall spaces to right and left of the large opening, which leads into a further gallery, is a bas relief of St. Gaudens, exquisite, pure reproductions of child life, the one a brother and sister side by side adventuring into the unknown world of acquisition; the other a charming small boy, who just typifies splendid, healthy babyhood. Through the opening at the back are to be seen two friezes of enamelled brick taken from the palace of Artaxerxes II at Susa. One shows a procession of advancing archers, "the famous Immortals, the body-guard of the Persian king" to quote the catalogue.

Perhaps the grouping was fortuitous, but one wonders if it were not another instance of the fine intuition of the museum management to relate so intimately these particular treasures.

Does one not feel it! Happy, hopeful childhood; inspired, inspiring youth laden with its sense of being a messenger to a hurried, hurrying people; talented youth with its generous contribution to the sum of joyous recreation; and lying back of them all, the centuries on centuries old duty of serving the government. The same old insistence on the need of men. Two men and a woman stopped one afternoon before *Le Penseur*. Many people had come and gone, interested, bored, curious, absent-minded, some speaking in foreign tongues, but all but these three had passed quickly on. What did the great tense, crouched figure mean, they said, and they stood puzzled. At last one answered, "He ain't thinking, he's just uneasy in his mind"—and they moved on satisfied.

"Uneasy in his mind" yes, that's the meaning of this grouping. The burden of decision lies on him. Here is the spirit of youth, there ahead lie the tasks of manhood. Here is promise, there fulfillment or negation. Now the city, the state, the nation need real men, in that near future they will need them yet more. Therefore, he sits still in order that he may know how to conserve the welfare of the child.

Turner in Newburgh, N. Y., Register.

ONE FORM OF PREVENTION.

A New York state law requires children to be tried separately from grown persons and when practicable in a separate room. In Newburgh children's cases have nevertheless been heard in the public police court after the cases of adults. Judge Cantine, who recently assumed office in Newburgh, has announced his intention of keeping children away from the atmosphere and association of a police court by hearing their cases in his private offices.

ENFORCEMENT OF LABOR LAWS

JOHN B. ANDREWS
Secretary American Association for Labor Legislation

A most important step in the advance toward more efficient factory inspection and better enforcement of labor laws has just been taken by Massachusetts. The Old Bay state has been thought by some to be in danger of losing her leadership in labor legislation, but present indications are to the contrary. Massachusetts takes no pride in doing things by halves, and her Commission on Factory Inspection, organized last June, has brought forth a concise, clearly written, concrete report of 112 pages that will be interesting and valuable reading in every industrial state in America.

The commission was instructed by the Legislature

to investigate the general subject of the inspection of factories, workshops, mercantile establishments, and other buildings, to study the present system of such inspection as it is administered by the district police, the State Board of Health, and the local authorities, to determine if there is any duplication of work or absence of proper inspection, to consider the need of extending the scope of the inspection, and to recommend such changes in the law as shall seem necessary to co-ordinate the work and to secure greater efficiency and greater economy in the said inspection.

It was further hinted that the commission might draft a bill to carry its recommendations into effect.

Albert S. Apsey, state senator from Cambridge, was appointed chairman, with John Golden, president of the United Textile Workers of the World, secretary. W. S. Southworth represented the manufacturing interests, H. C. Emerson the medical profession, and Florence Marshall, the women. They held public hearings in eight different cities where they personally inspected in-

dustrial establishments, and visited New York, Ohio, Illinois, and Wisconsin to observe various systems of inspection.

Finding that the entire subject of inspection involves roughly one-seventh of all the statutes of Massachusetts, they wisely concentrated upon inspection of factories, workshops and mercantile establishments as at present conducted by the district police and the Board of Health. With the exception of boiler inspection, they found the former "ineffective," and the latter "good as far as it goes."

Criticism is aimed principally at the inadequacy of present inspection, duplication of work, and incompetency of s me inspectors. The inspectors are too few in number, several testifying that they could not make even one complete inspection of their districts within a year, and one admitting that he had not been able to cover the field in three years. A disproportionate amount of time is occupied with clerical work, and one Fall River operative insisted that the active inspection force should not be recruited from "veterans of a war that was fought forty-six years ago."

Physical examination of adult workmen as well as children was urged by one health inspector who at many autopsies had found "lungs filled with metal dust." Another physician hoped the commission would help demonstrate that manufacturers cannot afford to have valuable workmen sick with preventable diseases.

The recommendations of the commission, as presented in the draft of a bill after long and careful consideration, do not stop with timid, ineffective suggestions for patch-work. They embody nothing less than the organization of an entirely separate and independent state board of industrial inspection. The plan, when put into effect, will relieve the district police and the Board of Health of purely industrial inspection, and place this work where it belongs under the supervision of a group of public-spirited citizens who can both prod and protect the man in direct charge of the important work of factory inspection. This man is to be designated as chief commissioner, with a salary of $6,000 to $8,000 and with the privilege of nominating to the board his two deputies. One of these is to have charge of the execution of laws relating to health in industrial establishments, the other the execution of all other industrial inspection laws except those concerning employment offices, conciliation and arbitration, and workmen's compensation. The inspectors also are to be appointed by the board upon nomination of the chief commissioner, under civil service rules. A registrar is provided to furnish information concerning the operation of laws and the results of inspection.

This plan, in brief, commends itself because it takes factory inspection out of politics, confines duties of inspection to purely industrial establishments and, most important of all, makes provision for the co-operation of experts with an advisory board in the establishment of standards of safety and health for different occupations.

The commission urges immediate concentration upon this plan of organization, but under the head of Supplementary Suggestions outlines further recommendations including: (1) registration of all industrial establishments; (2) reporting by insurance companies through licensed inspectors, as now carried out with unique success in Massachusetts boiler inspection; (3) standardization of occupations with reference to safety, light, ventilation and sanitation, thus, through the board, adding to the labor code details not covered by statutory provisions; (4 the inclusion of bakeshops among industrial establishments; (5) the health inspection of minors in all industrial establishments and the possible inclusion of adults; (6) the provision of blanks for the reporting of industrial accidents; (7) the issuance of formal certificates of compliance to industrial establishments in which no violation of the law is found; and (8) the extension of authority of inspectors with reference to approval of plans of all buildings to be used for industrial purposes.

Many of these recommendations are in complete harmony with the outline of organization for industrial inspection as

advanced by the Association for Labor Legislation, and it is hoped that every state will, like Massachusetts, recognize the importance of making careful provision for intelligent and effective administration of labor laws.

Massachusetts for more than a generation has held an advanced position in labor legislation. The report of her Commission on Factory Inspection, as much as anything in the past ten years, indicates her intention to maintain that leadership.

THE MECHANICAL ENGINEER AND ACCIDENTS

The American Society of Mechanical Engineers has given considerable attention from time to time to the conservation of natural resources, but with the exception of a monograph on the safeguarding of life in theaters, which formed the presidential address of John R. Freeman at the annual meeting of 1905, no specific attention has been given to the human side of the problem. John Calder, manager of the Remington Typewriter works at Ilion, N. Y., opened up a new range of interest, therefore, in his paper last month on The Mechanical Engineer and the Prevention of Accidents. To his mind,

> the preservation, as a national asset, of the lives and limbs of our citizens and industrial workers is more urgent and vital than any steps taken to insure adequate means of subsistence and industry for future generations.

Mr. Calder's paper was given up, for the most part, to a careful presentation of methods of safeguarding machinery which he has studied and experimented upon for some years.

"Progress in this direction", he holds, "cannot be attained entirely by accident legislation, pressure from state officials, warnings and recommendations from casualty insurance corporations, admonitions from sociologists, valuable though those are." He would put the responsibility squarely up to the mechanical engineer in the same way that we should put the responsibility for health up to the physician. It was this clear-cut challenge to his profession which gave distinction to his paper. He said:

> The principles of safeguarding and safe-working in industry should be as much a part of the economic education of the young engineer as those of efficiency and conservation in other directions. Many engineers enter on responsible control of operations and industries with little or no realization of the employ-

ment risks involved. Such a consciousness comes in time, but it is often through the painful and harrowing experience of avoidable accidents and fatalities which were not prevented.

The scientific study as a matter of course and the solution by the mechanical engineer of individual problems of safeguarding, supervision, and instruction of employes as they arise in their daily routine will do more than all other existing agencies to bring about satisfactory results. The progress of the art of preventing industrial accident, wherever that is practicable, depends very largely upon the amount of intelligent interest manifested in the subject by members of the profession whether engaged in plant maintenance, the manufacture of tools and other apparatus, invention of safeguards, or in works administration. In such matters as this the attitude and action of the executive are all important and give the keynote to the whole plant.

The author wishes to make it clear, however, that all industrial accidents are not considered preventable, either by employer or employe, and that, of those that may be avoided, some do not fall strictly within the engineer's province and a large proportion is directly within the control of the injured themselves. Nevertheless, a considerable number of casualities remain which are the most serious in their consequences to operatives and employers alike, and which can and ought to be prevented by mechanical and executive precautions and the exercise of the same faculties which the engineer efficiently applies to his other problems.

As an example of the practical grounds for his belief, Mr. Calder cited a plant which had had a yearly average of 200 accidents. By means of exceptional preventive measures, both mechanical and administrative, without reducing the earning opportunities of any employe, the number of accidents for the last annual period was brought down to sixty-four:

> In no instance had any accident occurred in a year's time from negligence of the employer and in only one case was the injury contributed to by the negligence of a foreman or responsible overseer. In twenty-five of the cases the accident was caused solely by the negligence of the person injured and in the remaining thirty-eight cases the occurrence was purely fortuitous, accidental, and nonpreventable in the most literal sense, no blame being attached to anyone. The latter evidently represents the unavoidable trade risk of this particular plant. Yet the actual risk before safeguarding and instruction of employes was seriously undertaken, was nearly six times as great, and the resultant risk, including all cases of carelessness on the part of operatives, was less than one-third the original rate. This experience has been repeated in many cases.

If in one known establishment two-thirds[1] of the average yearly record of accidents was actually eliminated by such engineering and disciplinary processes as Mr. Calder outlined,—and if in all plants one-third would, as he holds, yield to them—no more emphatic argument could be found for compensation legislation which would make every accident a charge on the industry, and which would therefore, as Miss Eastman puts it, bring it to pass that "the prevention of accidents should be a motive with employers at all times—present at the times of construction, present at times of engaging and organizing and changing the force, present through every day of operation."

Mr. Calder, indeed, bore perhaps unconscious testimony to the need for compensation legislation, not solely as a matter of industrial justice, but as an accelerator of the work of prevention when he said in his address:

> Fire, steam generators and other vessels under pressure, electricity, railroads, and elevators, as contributing factors to accident, are omitted from present consideration because they are, of all industrial dangers, those upon which mechanical and other engineers have already lavished attention. It is significant that it is chiefly in cases where property, as well as persons, is liable to injury that preventive measures against accident have as yet been generally and efficiently elaborated.

In other words, in a competitive society, the will of the employer is the best fulcrum through which social control can be exercised over industrial casualties; and "the motive for prevention can never be compelling until to each injury and death is affixed a uniform and unescapable penalty." If managers and stockholders had demanded safety work of the engineers in the past, and stood ready to pay its cost, they would have got it. They would have demanded it *en-masse* had injuries "come higher."

The more this economic motive, which is the basis of the present compensa-

[1] There remained in this one example twelve and one-half per cent which he charges to carelessness among the men injured, and to eliminate which educational work could well be demanded from trade unions, public schools, and employers. Mr. Calder would have also "strict discipline in the shops, the adoption of salutary punitive measures, and the firm elimination of the dangerous employe." He designated nineteen per cent as the "unavoidable trade risk" in the plant studied.

tory legislative program, can be supplemented by an enlightened humanitarianism on the part of progressive employers, the more effective it will be; if it may be supplemented also by an enlightened professionalism on the part of mechanical engineers its effectiveness will again be notably increased. For it is in the investment and operating decisions of the former and in scientific study and mechanical solutions by the latter, that the actual shaping and execution of methods of prevention are to come. (To these should be added as indispensable the responsible co-operation of safety committees made up of the workmen themselves). And it is because the "successful operation of thorough preventive measures" has gone on "unnoticed at some relatively few individual works," and because there have been inventions in workable protective machinery and methods by such exceptional engineers as Mr. Calder, that the future is full of hope. Their demonstrations are at once the arguments before which the hardest headed traditionalism caves in, and our best assurance of raising the whole level of American industrial practice to a standard of human as well as material conservation.

In putting their part in the advance squarely up to the mechanical engineers—in showing where their profession lifts to the ranks of law and medicine by touching on the humanities—Mr. Calder has done a public service. His address should be circulated before every engineering society in the country, and made matter of unfinished business before the faculty meeting of every engineering college.

PATRIOTISM AND LEGAL ETHICS

The Bar Association of San Francisco, says the *Green Bag*, has shown itself to be one of the most progressive organizations in the country, both in its program of procedural reform and in improvements in judicial administration and professional ethics. The ethical code adopted unanimously by the association last October lays down the principle that in view of the superiority of the judicial over the other branches of our government, "American patriotism is the keystone of American legal ethics." Besides setting a high standard of intelligence, responsibility, and personal integrity, the code announces four prime obligations upon members of the bar—to improve the administration of criminal cases, to restore the jury system to a position of respect in the community, to lessen the law's delays, and "to do their utmost to keep the science of the law abreast of the times." To the latter end they are to exert themselves to bring about the abolition of any rules or practices not suited to present conditions or not consonant with justice and equity.

To these might well be added the necessity for such a close approach by bench and bar to the facts and tendencies in the present economic life, as Professor Goodnow urges in his trenchant article in this issue. The lawyer and the physician, no less than the engineer and the churchman, need new alignment with the social forces of the times; new obligations are imposed on the law schools to enrich their curicula in economics and the social sciences.

THE PULPIT IN PUBLIC AFFAIRS

RUDOLPH I. COFFEE
Rabbi Congregation Tree of Life, Pittsburgh

No clergyman can read the fourth volume of the Pittsburgh Survey, The Steel Workers[1] by Fitch, without feeling the impotence of the church and synagogue at the present time. It is a sad commentary that large and influential religious bodies in this vicinity should have done so little to right the sad condition of affairs that for these many years has been oppressing the workingmen of this district. Conditions are revealed in this book which explain why the Church has lost its influence, and why thousands of people are not affiliated with a church or synagogue.

For years men have been working twelve hours a day and seven days every week. What are churches and syna-

[1] The Steel Workers. By John A. Fitch. Charities Publication Committee. New York. 1910. Pp. 380. Price $1.50; by mail of THE SURVEY $1.73.

gogues for, if not to champion the weak and the oppressed? Why should there be millions of dollars of untaxed property, with stately churches erected thereon, unless to cry aloud "Spare not, lift up thy voice like a trumpet, and show my people their transgression" (Isaiah LVIII, i)?

We preach about the brotherhood of man, and all the while see the smoke of the factories where the reverse has been practiced. Had the ministers combined, had every pulpit used its best endeavor to aid the workingman and see that every laborer had fair play in his work, they surely could have raised an influence that would have been felt on behalf of right. This opportunity has been neglected, and what improvements have come, have come without their aid.

The ministers have combated Sunday work, but they have directed their energies more frequently against drug stores, confectionery and fruit stores, and amusements, than they have against the United States Steel Corporation with its thousands of employes working the "long turn." (Fitch, p. 224). And then we lament the weakness of the pulpit today!

Another example is furnished by the recent graft exposure in the public school system of Pittsburgh. Here we have the record of a shameful abuse of power, not against men and women, but against innocent school children. The report is so depressing that we wonder if there can be any greater depth of depravity than making money at the expense of little children whose lives are thereby endangered. Here was a legitimate field for the pulpit to join as one man and forever make impossible another such condition. The opportunity is passing, and the pulpits are busy with their personal affairs while this all absorbing school problem is to be solved by a private body of public-spirited citizens.

I am not criticising Pittsburgh clergymen. We have some of the most earnest men in the country in this city. They are doing precisely what the ministers of other cities are doing, and that is the point of weakness. The Church should stand for the new and changing order of things, for purity in politics, and for a square deal to the workingman. Because ministers do not busy themselves with fundamentals, their power has greatly diminished. Just one year ago, during the street car strike in Philadelphia, a priest, a rabbi and a Protestant minister, representatives of the three large denominations, called on the mayor and asked him to use his influence to have the merits of the strike arbitrated. They were practically told to mind their own business—if the newspapers reported correctly. To this has the pulpit come, that when it seeks to better the world it is told not to meddle. Is our function merely to marry and to bury people, to be a social appendage? Or are we not rather to strike at the very vitals of the ills in our modern day civilization and point out the way of improving the world? This cannot come as long as individual ministers cry out, but only when there will be a united clergy. We have been debating about our differences long enough; let us now search for a platform on which we can all stand. Lecky in his History of European Morals (chapter iv) says that the first consequence of Christianity was a new sense of the sanctity of human life. We do not see that sanctity today, and that is the weakness of the pulpit. Every denomination should join on the common platform of respect for human beings. Such a rallying point will re-assert the power of the pulpit, and speed the day when injustice and oppression will no longer rule so powerfully.

Ministers can best exert influence when all denominations are working for a common purpose, and that purpose should be to emphasize the brotherhood of man, "to loose the bands of wickedness, to undo the heavy burdens, and let the oppressed go free, and that you break every yoke" (Isaiah, LVIII, 6). Then, and then only, will the reproach against the pulpit of being too little interested in the workingman pass away. No longer shall there be just cause for talk about forty million unchurched people; and instead of the enormous increase in religious sects these past years there will be a steady decrease, because the one vital problem will be to spread the gospel of righteousness on earth.

March 4, 1911.

THE SOCIAL BASIS OF RELIGION[1]

SIMON N. PATTEN

AUTHOR OF THE NEW BASIS OF CIVILIZATION, ETC.

[FROM PROFESSOR PATTEN'S BOOK NOW IN PRESS ENTITLED THE SOCIAL BASIS OF RELIGION, WE HAVE BEEN PERMITTED TO SELECT A NUMBER OF TYPICAL AND STRIKING PASSAGES WHICH WILL BE EQUALLY OF SERVICE TO THOSE WHO WISH TO CATCH ITS GENERAL DRIFT IN THE EASIEST AND QUICKEST WAY, AND TO THE LARGER NUMBER WHO IN THIS MANNER MAY HAVE THEIR ATTENTION CALLED FOR THE FIRST TIME TO THE BOOK ITSELF, WHICH IS AN ORIGINAL AND STIMULATING DISCUSSION, IN BRIEF COMPASS, OF THE MOST FUNDAMENTAL AND IMPORTANT OF ALL SOCIAL PROBLEMS.—EDITOR.]

Religion begins not with a belief in God but with an emotional opposition to removable evils. It is a psychic reaction, not an intellectual conviction, and its one essential element is its program for saving social outcasts. Our social instincts are thus evoked in its favor, and its opposite lies in the selfish tendencies that would force to the wall those not fitted for the struggle demanded for survival. Out of this background all religions have risen; they will continue to evoke human sympathies and generate religious enthusiasm so long as the present rigid conditions of survival remain. Social activity readily assumes a religious form when men recognize that they sink through degeneration and may rise again through regeneration. Degeneration, regeneration, and the will are thus religion's first problems, from which all others are derived.

The first step in a social reform is a clear contrast between existing conditions and those now possible. It must also be recognized that present evils are due not to general, but to particular causes. If there is no contrast between the "is" and the "might be," the imagination has no chance to work; if evils are due to general and not to local conditions, there is no way of altering them. When clear contrasts are made and the local nature of evils becomes manifest, a social program can be formulated that, setting aside local evils, makes the "might be" into a reality. Take, for example, the social program now forming that would eliminate poverty. To make it effective, people must first see how different the world would be if poverty were removed. But to make this picture an effective motive, poverty must be shown to be due to definite causes. The older view did not permit the isolation of the causes of poverty, because they were viewed as resulting from defects in human nature or in natural conditions. The doctrine of total depravity made poverty a general condition from which there was only occasional relief. The law of diminishing returns, coupled as it was with the "niggardliness of nature" doctrine of the classical economists, had a like effect. The abolition of poverty can become a social program only when both these viewpoints are displaced and the particular causes of poverty are separated from the general conditions of prosperity. We can conceive of progress without poverty only as we ascribe poverty to some specific cause.

The primal cause of degeneration is failing resources or some misuse of them. Sin is misery, misery is poverty, and the antidote of poverty is income. Such is the message of hope delivered by economics and natural theology when their principles are blended in one discipline.

While many good things are natural, most bad things are economic. The good is also the outcome of general laws; the bad is the result of local conditions that may be altered. Evils thus have

[1]The Social Basis of Religion. By Simon N. Patten. New York: The Macmillan Company. To be published March 8, 1911. Pp. about 250. Price $1.25; by mail of THE SURVEY $1.35.

specific causes that may be isolated and removed. They never arise from the general laws of nature nor from the native impulses of men. Neither nature nor man needs to have his laws altered. Nature is beneficent and man is good; they become malignant forces only under local conditions that prevent the full expression of natural law and keep men from following their better impulses. To remove the temptation to sin means to do away with starvation, poverty, disease, overwork, and bad conditions which depress workers and turn virtue into vice. There is no general law either of nature or of man that forces misery and vice on man.

Heredity is a reality, but it not so definite nor so mechanical as is generally supposed. Nutrition is responsible for much that passes for heredity. Only after its effects have been definitely ascertained can the real mechanism of heredity be understood. Why, for example, does each organism reach maturity and finally sink into old age? Is there a determent in the germ cell that when active checks growth? Does the mechanism of life run progressively to a certain point and then refuse to act? Or is maturity merely a state of maximum nutrition and old age a running down because nutrition fails? To state the problem in another way: Does a given organ cease to grow because the possibilities of its inherited mechanism have become exhausted, or does growth end because nutrition fails when the energy of the organism is turned in other directions? The latter is, I believe, the sounder view.

Morbidness is primarily an overflow of energy; senility a loss of vital power. The one leads to disease, the other to decay. They are both found in abnormal persons, because an overflow of energy in one direction leads to its diminution in others. The marks of the two, however, are so distinct that they can readily be separated and studied. Of the two, morbidness is more closely allied to defective heredity, and hence the stigmata of the two are practically the same. Defective heredity is the more deep-seated; the morbidness of over-nutrition shows itself in a stunted development of the higher faculties. Its cause is an arresting of the normal diversion of surplus energy from the lower to the higher organs. Morbidness ends in disease when the local surplus becomes unmanageable; it creates mental abnormalities through indirect effects on the higher powers. Disease, hysteria, and insanity are its most pronounced manifestations; but it has so many minor symptoms that its abnormal effects cannot be related to their cause without the most careful study.

We must think of the physical antecedent of the will as clearly as we do of other native powers and faculties. This antecedent is surplus energy. Without vigor all acts are routine not involving volition. The will is mind made active by surplus energy; the intellect is the mind acting under a deficit; passion is the mind controlled by its inherited mechanisms. The intellect gets its force through the acquired characters that are objective in their origin. Passion is a matter of heredity. It is the surplus of energy above the demands of heredity and environment that makes volition possible. Volition should therefore be associated with strenuous, and not with moral, acts. The best measure of this force is to be had in sports, athletic contests, and sudden emergencies that call forth all the powers of a man. It is the will of the athlete, not his physical powers, that gives him the victory. If we looked to him for example of volition, instead of looking to the moral recluse, we should have no difficulty in separating acts of volition from those of the intellect.

Freedom is not the power to do what one pleases, but the power to throw off depression and abnormalities. It demands not the absence of control over individual acts, but the power of a thorough regeneration.

Our methods of propagating religious ideas are sadly deficient. Until other

means are found of helping people to intensify their spiritual convictions, religion will continue in the state of decline so evident in recent years. Any cause fights a losing battle that does not win converts. Our vital experience dies with us unless revived by others. It ceases to have value as evidence unless it be made a matter of heritage. We must therefore analyze religious feelings to get the key to their revival in others. Seeming losses will be transmuted into gains if in the end sound methods of propagating religious feeling are found and used.

The first essential is to realize that volition takes its rise, not in reason, but in surplus energy. The will does not act on experience or proof, but from a primary impulse aroused by free energy. Its usefulness is not in what it does, but in the absorption of energy that keeps the lower organs normal by forcing them to work under a deficit. The start of volition is thus in energy; its end is in a sentiment. Any repeated act gains emotional power, and thus an impulse is generated that acts like other impulses in a steady, persistent manner toward given ends. At any moment the force of the will lies in the sentiments that its repeated acts have formed. So long, then, as surplus energy flows normally through the will, there is a growth of acquired sentiments and an increase in their dominance over natural impulses. Once check the flow of surplus energy, and character degenerates. Control then becomes emotional or intellectual. In the latter case, senile traits steadily increase until old age comes on, with its rigidity of thought and action.

Volition is thus a definite process, beginning in surplus of energy and ending in sentiments. Reason has no direct influence on the will. Its influence is corrective, not formative. Volition makes sentiments and through them beliefs. Reason chooses between beliefs, but it originates nothing. It merely decides between thoughts and opinions already formed. Reason is an expression of deficit and gets its force by weeding out what some more original power creates. Between the many different directions in which indeterminate activity goes out, it forces choices which make volition seem to be its product instead of its superior. In the virgin soil of a plastic mind beliefs grow lavishly. They are not the result of evidence nor of experience, but of rapid organic growth. To act is to believe. In this state of mind the young go along until they stumble on some limitation arising from lack of energy. Then beliefs begin to clash. The weaker go to the wall, for they are least capable of resisting the pressure of deficit. When we pride ourselves in getting the greatest return for the least effort, we are plainly under the pressure of want and far from that primal state where energy dominates. The utilitarian cramps our concepts so much that we lose sight of our earlier, more energetic state. We even go so far as to esteem personal relics of it as marks of degeneration. These latter states are more effective, but they are neither higher nor primal. We must look in some other quarter than reason to find their source. It is also plain that if surplus energy and its plastic manifestations are the source from which new thought arises, children are more normal than their elders. Their simple faith is nearer the source of inspiration and of new thought than is the logic of later years. With them to think is to act. Simple suggestion is transformed into action by the force of the surplus within them. To act is to create a sentiment in favor of the action. This tends towards its repetition and increase in power.

Most men are subject to irregularities in their supply of energy. Sickness, disaster, bad food, and many other conditions produce this result. In consequence, most men at intervals pass from one extreme to the other. Downward curves bring doubt, fear, and depression; upward curves create men anew and give the higher powers an unwonted supply of energy. It is during the dominance of the upward movement that suggestion is potent and new beliefs are readily formed. The many plans of re-

cent origin for the suppression of pain and the inculcation of invigorating belief have their bases in this thought, even if the mode of expressing it is so immaterial that the physical background of the mind is ignored. To keep the thought of pain out of the mind when depression tends to make it vivid, and to utilize the early epochs of recovery for presenting suggestive ideas, are two rules that work wonders in rebuilding the higher life among those temporarily depressed.

The apparent miracles of new types of belief are readily explained if the relation of suggestion to surplus energy is once understood.

Man's constitution shows that he is a long-lived being. For his development there must have been a period when the natural span of life was more fully realized than in the recent past. Disease in its present forms is a result of historic conditions. Especially is this true of the great epidemics that have so much shortened life. Filth comes mainly through overcrowding; contagious diseases could not have antedated it. When the world was sparsely populated and the natural surplus large, a mature old age must have been the general expectation. Infant mortality was doubtless large; but this would not have much influence on social organization if this dangerous period was followed by a long period of vigorous manhood. Old age would also, as with animals, quickly lead to death. The young and vigorous would thus set the pace and shape social and religious usage. Then youth and vigor were long and old age short; now, youth is but a passing moment and old age an enduring, hopeless epoch. With us the senile hand is on every institution and influences every social event. It is not to be wondered that religion has reflected this change and has become a thing of age and grief.

No nation can have a normal growth with poverty-stricken neighbors trying to displace it. War, therefore, became the glory of nations, and pillage was more honorable than industry. To these evils were added the great plagues arising from the increasing contact with semi-tropical regions. Famine, war, and disease became scourges, making life so insecure as to seem worthless. With the terrors of death ever imminent, it was inevitable that religion should reflect the change. A future life and its rewards became the compensation for the trials and suffering bound up with present existence.

Prosperity, liberty, and co-operation furnish a principle more potent than the dread of want. When we accept it, we shall rebuild on safer foundations, and make religion a higher expression of manhood than it could become while state religions and ascetic morality suppressed the vigor, joy, and freedom of normal life.

The religion of service could have no better exposition than in the teachings of Christ. What we need is not to formulate a clear statement of it, but to find conditions and institutions to make it effective. Christianity in this sense is not an historic institution. It is an ideal that has fought a losing battle with state religions, encrusted in historic institutions, and made vigorous by the failures of men in ages of disease and want. The sayings of Christ seem utopian even to those influenced by them. To the mass of men they are meaningless, because they are not impressed by such striking pictures as those enforcing a religion of sacrifice. To be a hero, to struggle for victory, to die for one's country, have vivid meaning. They give an impetus to activity which the truer but less picturesque ideas of service do not arouse.

It is difficult to associate Christ with a purely social religion because His teachings have been overshadowed by the striking events of His death. For this reason we do not see the fundamental opposition between what He taught and what His death has been made to teach. If Christ's doctrines had

been handed down to us by a Plato instead of a Paul, or by one who knew only of His life and not of His death, Christ to us would be a social leader, preaching salvation only in terms of love, co-operation, and service. Salvation through sacrifice, especially through a blood atonement, would be a repugnant doctrine from the dread of which He wished to free the world. There is nothing more paradoxical in history than the rise of the dogma that a gulf is placed between God and man, which can be bridged, not by love, but only by the death of one who strove to fill the gap in the other way. This glaring antinomy in religious thought must be removed before social religion can be put on a sound basis. If Christ's doctrine be that of salvation through love, the path is open to reconstruct religion in ways that meet modern needs.

If Christians, adhering to an unsocial concept of religion, fail to show that redemption for the masses is attainable, they must not find fault if the ideal of an unsocial superman displaces that of service. The social plan of redemption will be tested in this century as the hope of personal salvation was tested by the facts and conditions of the first century. A new missionary movement is demanded in our age. To succeed, this must have the vigor and clearness of thought that Paul gave to the first extensions of Christ's influence. The impress of past centuries has put modern religion in as helpless a condition to meet present emergencies as the Jewish religion was in the first century. The work that Christ began could not be fully developed in the early centuries because of adverse economic conditions. It can, however, be successfully completed now because favorable environing conditions have replaced race antagonisms with a spirit of social co-operation. This has opened the road to social regeneration as contrasted with social elimination. To meet this new situation is the religious need of the day. Success or failure are alternatives that will make Christianity dominant or will displace it as an encumbrance to progress.

To-day, we have no fear of war, famine, disease, or failing resources. The advance in knowledge has guarded men against these evils; but it is none the less true that civilization must be extended to other regions and races, or it will go down as it did at Rome. Prosperity checks the birth rate and promotes race suicide to such a degree that if new races cannot be raised to take the place of those dying out, there will be a decline in civilization to the level existing before the rise of Christianity. All of the earlier missionary efforts will be in vain unless methods are devised to arouse new classes, races, and nations with the same success with which our ancestors were awakened in earlier epochs by the prevailing forms of religious propagation. If laborers remain outside the church, if immigrants are not assimilated into our national life, or if we fail to do for Africa, India, and China what the early Christian missions did for our German ancestors, a slow but certain death awaits the church, no matter what may be its success in other fields.

Capitalism will die out much more readily through the loss of discipline that follows the cessation of saving than through any revolution its opponents may provoke. Nor are the socialists on any other basis than the classes they would displace. Class antagonism and the fear of oppression are as prominent elements in the discipline they evoke as is the fear of want among the capitalists, the fear of war among patriots or the fear of the future among religious people.

The measure of knowledge and efficiency is twofold. Nationally, it is wealth; individually, it is health. As nations grow wealthy and men become healthy, we may be sure knowledge and efficiency are on the increase, and that a movement has been started in the di-

rection of universal peace. National peace makes men wealthy; mental peace makes them healthy.

By the old standard, men thought God was with them when they and their families prospered. This crude measure was good enough for primitive epochs, but today progress demands not individual wealth, but a large social surplus utilized for the good of society. As an individual measure, health is much better than wealth. Social health cannot exist without social wealth, but it may well exist without large fortunes. Moreover, when we have social wealth, the higher test of progress is health. This, measured statistically, means longevity. No test is so good as a low death rate and a long working period.

The "new birth" is not to be worked for. It will come of itself if men are made normal.

The social mission of the church, however, is not to make men religious, but to make men normal. The religious awakening comes from within and can be wrought only by indirect means. The normal man is a religious man because his emotions are social, and because they clash with the economic and biologic régime imposed by heredity and external conditions. To make men normal is to start a train that leads to religious awakening. These indirect means will make more converts than the emphasis of fear. When such methods are employed, conversion will be a permanent change in mental attitude, and not a temporary upheaval. Missionary movements succeed only as they carry to new races and classes the underlying means for their betterment. Religion is contagious when these are secured. We can plow the land, but the fruit comes in its own way.

The best evidence that religious movements are succeeding is that they make men live longer. A steady increase in the length of life has followed the spread of Christianity. When the average life of man has been increased to sixty years, the advantages of normal living will be overwhelming and the strength of forward social movements correspondingly increased. Health is thus the test of normality, and the church can safely be sponsor for social movements that improve it. On this basis must the social program of the church be built. Many evils are beyond our present power to remedy. We cannot therefore make their removal part of a working program for the twentieth century. But the crimes against health are plainly within our control. We cannot make every one wealthy, but there is no need of poverty. Neither do we need to crush the life of children in factories, nor to lower the vitality of women by long working hours. A standard of living capable of maintaining health and welfare is not a mere ideal, but a perfectly workable plan. These and other economic reforms lie at the basis of all home missionary efforts, just as the health, security, and happiness of other races is the essence of successful work abroad. Christianity needs not preachers, but workers. Its supremacy can come only as civilization and culture are socialized and the economic world so transformed that the minimum of tomorrow's welfare will include more of health and comfort than the maximum of today's standards.

Social concepts grow; they are not made nor can they be coercively impressed. They are based on the agreements of past experience, verified by the current events in which all participate. The broader, deeper, and more harmonious the social life of mankind is, the clearer do the social ideals stand forth and the more widespread is their influence. Social concepts appeal; they do not command. They arouse energy and direct activity; they do not repress, restrict, nor define. Were all men normal, healthy, and active, their force would be irresistible; for then men would be aroused by the same motives and struggle for the same ends. It is the opposition, the conflict, the degeneration, the differences in race, type, class, and language that keep men so much isolated that common

ideals and aspirations do not arise. Every barrier broken down between races, classes or languages leads to a blending of the thought and ideals of the united group.

One God will come with one economic system, one type of government, one science, and one literature. The unifying forces are active in all these fields. They are delayed by argument and controversy. Our interest should lie not in getting this inevitable unity, but in making it express in its various fields the highest thoughts that life, vitality, and genius can attain.

The most social of all ideals is that which man holds of women. He sees woman not as she is, but as he pictures her. This vision is due to the many ways in which the beauty of woman is presented. If one view of woman were declared orthodox and all others opposed or excluded, the ideal of woman would be lowered and its power to restrain men correspondingly reduced. There is no opposition to the various views of women given by art. They blend into a composite picture and create a powerful social force to restrain the brutality and passion of men. So is it with the concept of God. Gods are in opposition only in national contests. They are made diverse by every struggle or argument into which men enter. Lift the obstacles that struggle and argument impose, and the unifying tendency becomes supreme. God now reflects all the moods and aspirations of men and from them an ever nobler concept emanates. The higher the level of thought, the more are His unity and glory reflected in it.

The test of morality is not happiness and culture, but increased vigor and longevity. The test of vice, on the other hand, is decreased vitality and early death. "The wages of sin is death" is an old observation and as true today as ever. In favor of morality increased efficiency, vigor, and longevity are always working. Against vice elimination is active. The moral is therefore that which gives vigor, while vice is that against which elimination is at work.

Constructive morality is both attractive and coercive. Every public measure to remove disease, degeneration, vice, and crime must be general in its application and hence coercive; yet the coercion is not exercised against individual acts, but against bad social conditions. So also is it attractive; yet the appeal is not to personal happiness, but to public welfare. Social morality thus has in itself all the elements for its upbuilding. It does not need antecedent tradition, superior authority nor external sanction.

Socialism is a combination of an economic program of reform and of an ideal reconstruction of society that is to follow. With its present emphasis on class struggle it is antagonistic to religion; but when class struggle has disappeared and the material obstacles to social progress are surmounted, social anticipation will be more prominent. Religious and social aspirations will then harmonize. Socialism will go the road of previous reforms. As the economic program for which it stands is worked out or displaced by a better one, the social background will blend with other movements of a similar nature and lead to a religious upbuilding.

City planning, health, and prosperity give a new direction to social ideals which in the end will be transformed into a religious movement to reconstruct what is within man as well as what is about him. The new City of God will not only be well planned, healthy, and prosperous, but will also be the center of spiritual aspiration.

THE CHURCH PREPARING FOR SOCIAL ACTION

GRAHAM TAYLOR

There are increasing indications in many directions of very significant preparations for social action by the churches. They are all the more impressive from the fact that they are appearing not only in concerted movements, but far more widely and fundamentally in what seems to be a spontaneous and independent movement in religious feeling, thought, and scholarship. The increased social activities both in local churches and in their great denominational fellowships, such as THE SURVEY has recently reported,[1] are no less significant than we interpreted them to be. But the social literature and scientific inquiry into actual conditions, such as we now report, are indicative of progress in laying foundations for far more permanent, organized, widely concerted, and effective social action.

FOUNDATIONS LAID BY SCHOLARS

Representing the Anglican Church, two of its distinguished scholars connected with the University of Cambridge have recently published volumes which place equally weighty social emphasis upon the obligation and opportunity of Christianity, from distinctly different points of view. It is noteworthy that one of these volumes, bearing the title Christianity and Social Questions,[2] is included in a "new series of handbooks interpreting Biblical criticism, for the use of ministers, theological students, and general readers." In it Dr. Cunningham, long recognized as one of the authoritative scholars and authors on English economic and industrial history, attempts "to set forth from a Christian standpoint the relative importance of all the forces which make for human welfare or militate against it." Within the short space of 224 pages he has succeeded wonderfully well in defining the Christian aspects of physical conditions, racial differences, civil authority, functions of government, economic and industrial forces. But he contends throughout that the social influence of Christianity in all these spheres of action is to be exerted directly by individual Christians, and only indirectly by the Church. From this individualistic point of view, however, he emphasizes, with great wealth of scholarship and strong Christian feeling, the supreme obligation of the individual Christian to exert this social influence to the full extent, and also the practical and permanent effectiveness of Christian ideals and character, thus personally applied in individual or organized civic effort, to promote social progress. This brief but most comprehensive handbook is as remarkable for the way in which it socializes the Christian life as for the power with which it spiritualizes economic relations and political theory and action.

The Hulsean Lectures[3] for 1909-1910, by W. Edward Chadwick, are devoted to the discussion of "social relationships in the light of Christianity."

Starting with the inconsistency between standards of life enjoined by the Old Testament, the New Testament, and the Book of Common Prayer, and the actual failure under present conditions to fulfill the family, commercial, civic, international, and pastoral relationships of life, he insists upon the responsibility of the Church for knowing actual conditions, for understanding Christian principles applicable to them, and for directly applying spiritual forces to the fulfillment of all human relations. This he does by a scholarly interpretation both of scriptural and Church teaching and of existing social conditions. While he treats the latter

far less specifically than Dr. Cunningham, his treatment of Christian ideals and standards far more adequately emphasizes the collective responsibility and opportunity of the Church.

Prof. Shailer Matthews in his Gospel and the Modern Man[1] lays almost as much of a social emphasis upon his theological thinking as he does when interpreting The Social Gospel.[2] He considers the spiritual life to be so dependent upon the social order, from which it finds itself inseparable, as to warrant him in saying, "Change it, and the soul changes; change the soul and the environment changes." He regards the Church as "the social organ of the spiritual life, aggressive on both its destructive and constructive sides . . . the one great institution of the times which is deliberately endeavoring to socialize the fundamental principles of the spiritual life as set forth in the life and teachings of Jesus." He thinks that "the recognition of social solidarity is compelling the modern man to bring the Gospel into transforming relations with social forces." "The Church", he insists, "must undertake to evangelize the great formative forces which are making tomorrow . . ."

Out of his experience at the Church of the Ascension in New York, Dr. Percy Stickney Grant has been contributing to the periodical press some trenchant discussions of the religious aspect of economic conditions which he has now gathered into a volume.[3] Its incisive criticisms, vigorous style, and fearlessly frank spirit are enhanced in value by, if they are not due to, the work with wage-earners in which Dr. Grant has been enlisted with Rev. Alexander Irvine for the last three years. While his account of the free-speech experiment which they tried with their "third service" on Sunday evening at the church and in the parish house is reserved for the concluding chapter, allusion is made to it in the preface as the point of view from which the other contents of the book may best be interpreted. The volume is valuable in showing how extremes can and do meet under the sanction of religion, even though the effort to bring them together in this, as in other instances, is as yet a temporary experiment rather than a mutually recognized and permanently successful feature of church work. To socialize the spiritual life it must spiritualize the formative forces of society by "individuals trained to social sympathy."

THE INDIVIDUAL AND THE CHURCH

Not since Prof. H. S. Nash published his brilliant study of Christianity's part in developing the modern socialized individual,[4] has the rise of the individual into his democratic independence been so powerfully described in its relation to the Church as by the Rev. Frank Ilsley Paradise,[5] rector of Grace Episcopal Church, Medford, Mass.

The fact of democracy is unreservedly accepted in all its bearings. "The new individual", which it has developed, is seen not only as a personal factor to be reckoned with, but as organized with vast numbers of his kind and rapidly assuming commanding influence in industry, politics, and the affairs of nations. While both the individual and the Church seem to have lost themselves and each other in the transition, this fact is interpreted as a divine demand for a new order of things in which both state and Church shall readjust their procedure to the industrial democracy which is coming to be. This readjustment is fearlessly accepted, not only as an imperative necessity, but as a supreme opportunity. With learning, new and old, and with a remarkably sustained elevation of spirit and style, the author pleads the indispensable need and glorious possibility of a democratized Church in solving the problem of social and religious unity and in promoting human progress. Based upon clear in-

sight into actual conditions and the moral crisis involved in economic issues, his appeal for "the higher loyalty" is carried home to conscience and heart with the stern intelligence of hard facts and with the deepest passion and highest ideal of religion.

Prof. Thomas C. Hall of Union Theological Seminary in his Social Solutions in the Light of Christian Ethics[1], goes farther afield in testing both social theories and Christian ethics by comparing them with each other. His keen analyses and trenchant discussions illuminate both the social outlook of Jesus and the apostles in their "Kingdom dream", and the classical political economy, socialism, single tax, and modern political machinery.

DENOMINATIONAL SOCIAL AGENCIES

The authorized denominational and social agencies are also adding notable contributions to the social literature of the Church. The latest of these are issued by the Methodist Federation for Social Service, which reports the addresses before its First National Conference under the title of The Socialized Church[2], and has in preparation another such volume reporting its second conference recently held in Chicago. Its editorial secretary, Harry F. Ward, has published a valuable symposium as an introduction to the study and practice of social service, entitled Social Ministry.[3] Among the contributors of its chapters are Prof. Charles J. Little of Garrett Biblical Institute, who writes on The Social Activities of John Wesley; Prof. George E. Vincent of the University of Chicago, on The Industrial Revolution; Edward T. Devine, on Constructive Philanthropy; Homer Folks, on The Needy Child; Mary E. McDowell, on The Helpless in Industry; George T. Nesmith, on The Social Service in the Rural Church; Frank Mason North, on The City and the Kingdom, and the editor, who furnishes an able review of the labor movement in relation to the Church.

FOR CHURCH STUDY GROUPS

Textbooks for the study of social problems by church groups are beginning to appear. The Young Men's Christian Association led the way by introducing Prof. Jeremiah W. Jenks's suggestive but fragmentary studies of the social teachings of Jesus.[4]

The Young People's Missionary Movement followed with its Forward Mission Study Courses, which include Dr. Josiah Strong's Challenge to the City[4] and Howard B. Grose's Aliens or Americans,[4] soon to be followed by another course on religion in human relationship applied especially to the work of the churches for their own localities.

Prof. Charles R. Henderson furnishes a textbook on Social Duties from the Christian Point of View[5] for the series of Constructive Bible Studies. In an untechnical but scholarly form the text covers the whole round of social duties both in rural and urban conditions and includes helpful references to easily accessible books, together with suggestions to teachers and topics for discussion by the class.

The Gospel of The Kingdom studies by Dr. Josiah Strong, issued monthly by the American Institute of Social Service, Bible House, New York, are well adapted to the weekly use of church groups.

The most concerted effort to put such teachings into practical effect is now being launched by a great combination of men's organizations, denominational and inter-denominational, under the Men and Religion Movement.[6] A country-wide campaign, in ninety-two cities, is to be strongly pushed to enlist men in virile religious life and work, with the social emphasis placed upon both.

SOCIAL SPIRIT AND HOPE

Perhaps of still greater significance is the emphasis, only beginning to be laid on hymns of a more social spirit. Most hymns, and therefore all collections of them, express the individual experience of need and aspiration very much more than that of the group or of the larger community interests. The hymns with "I," "me", and "my" as their keynotes vastly preponderate over the comparatively few that strike the great common notes, "we", "us", and "our." Those that do so have been growing in favor and use these later years, and worthily express the great fellowship of the Church, to which, however, they are almost all restricted. It is noteworthy that some of the first and best of our modern hymns which give expression to the broader human fellowship were written by our American poets Bryant, Holmes, Samuel Longfellow, and notably Whittier.

Hymns of the Living Church,[1] edited by Charles Taylor Ives and R. Huntington Woodman, avowedly includes "newer material to express the forward movement of the day in service, missions, unity, and work." Ancient and modern, individual and social hymns blend with fine spirit and proportion in a service book of great worth. The Hymns of the Kingdom of God,[2] edited by Henry S. Coffin and Ambrose W. Vernon, thus justifies its social title and principle of selection: "Each generation emphasizes a particular aspect of the everlasting Gospel. Our own lays the stress upon the Kingdom of God and its establishment on earth. This book meets the demand for hymns that give adequate expression to this growing social consciousness, together with hymns of a distinctly devotional character." More nearly than in any other collection, the hymns it gathers under the heading the Home, the City, the Nation, and the World express the modern view of the relation between religion and the whole world of human life. From the nature hymns at the beginning to those for times, services, and seasons at the end, and throughout all the varied expression given to the distinctively Christian experience, the unity of life lived with God and each other is the master motive. In both of these collections, however, there is a significant failure to find or include hymns expressing some of the most vital experiences which predominate in modern life. There is only one hymn on the city in this world, very few on family and neighborhood life, and no real workaday hymns which voice either the joys and sorrows, the sacrifices and fellowship of labor, or the responsibilities and human service of commerce and wealth.

PRAYERS OF THE SOCIAL AWAKENING

It was reserved for Walter Rauschenbusch to initiate a reverential effort to give conscious social expression to the new religious emotions and social purpose which are transforming our whole conception of the meaning of Christianity. Freemantle had long anticipated this need in his two forerunning volumes bearing the suggestive titles, The World as the Subject of Redemption and Christian Ordinances and Social Problems. But Professor Rauschenbusch's Prayers of the Social Awakening under the title For God and the People[3] is the first attempt practically to meet the need "to blaze new paths to God for the feet of the modern man"; to provide "a religious expression of the new social feeling"; "to set Christendom praying on our new social problems." He realizes how difficult it is, though not impossible, to give individual expression to such common prayer. But such is "the unity of thought and aim and feeling that the utterances of one man may in a measure be the voice of all. Whenever a great movement stirs the deeper passions of men a common soul is born."

This "common soul" finds a truly catholic expression in these prayers of the *Zeit-Geist*, as uttered by one who

[3] For God and the People. Prayers of the Social Awakening. By Walter Rauschenbusch. The Pilgrim Press. New York. 1910. Pp. 126. Price $1; by mail of THE SURVEY $1.10.

singularly shares in his personality what is common to his Father God and fellowman. His "praise for the world" combines something of St. Francis's canticle with the new conscience for conserving the national resource of the earth for future generations. His group prayers are as impressive for the breadth of their range as for sounding the depths of personal experiences possible to the individual involved in the callings for which these prayers are offered. They go up to the heights and down to the depths with those whose burdens and blessings they bear: "employers", "men in business", "working men", "the idle", "all mothers", "women who toil", "children who work", "children of the streets", "judges", "lawyers and legislators", "public officers", "doctors and nurses", "writers and newspaper men", "ministers and teachers", "artists and musicians", "kings and magnates." Love of the living breathes through all the "prayers of wrath" against war, drink, mammon, and impurity. The progress of humanity prompts prayers for those who come after us, prophets and pioneers, those without knowledge, on the harm we have done, and for a share in the work of redemption. Through petitions for the Kingdom of God, the Church, and the city, ascent is found to a final, all-comprehensive prayer "for the co-operative commonwealth."

In this finely conceived and fittingly published devotional volume the author goes far toward fulfilling his own hope, that "if the moral demands of our higher social thought could find adequate expression in prayer, it would have a profound influence upon the social movement."

CHURCH INVESTIGATION

Accompanying this movement of social life and literature within the churches are very significant inquiries into existing social conditions. The Young Men's and Young Women's Christian Associations are leading the way in making and publishing such careful investigations of conditions affecting immigrants, our city populations, women in industry, men and boys employed on railways, mines, shops, lumber and construction camps, and in the army and navy. These inquiries are prompting city associations to undertake such investigations as the Chicago Y. M. C. A. is preparing to make of conditions surrounding young men and boys of foreign parentage in Chicago. In New York and elsewhere very definite plans and efforts are being made to interest young men in social work. Suggestions are offered to attract the interest and the co-operation of college graduates starting their city life, and of other young men in the churches and in varied social and religious activities. Questions are furnished to guide those who, individually or in groups, may thus be prompted to acquire and use an accurate knowledge of local conditions. They cover such as are involved in the relief of the poor; the prevention and treatment of delinquents; public education; provision and use of parks, playgrounds, and wholesome amusements; tuberculosis; false weights and measures; labor unions; immigration; inebriety; and housing. The brotherhoods in the several denominations are not only devoting themselves to definite lines of social work, but are uniting to improve moral and political conditions in certain localities. Such a co-operation in Chicago includes Roman Catholic, Protestant, and Jewish men's organizations. Federations of churches in cities and states are also promoting interdenominational co-operation for social progress. The sociological canvasses made by the New York City Federation of Churches several years ago set the type and standard for patient and thorough inquiry. In Wisconsin an interesting series of maps and charts was presented at the first conference of such a federation by C. J. Galpin of Madison, showing by stereopticon slides significant phases of religious and social conditions in the state. Every church and Sunday school was thus located, the racial distribution of the foreign-born population designated, the prohibition and license territory indicated, the location of every Christian association, temperance union, college and academy, university extension center, and associated charities marked.

Universities are also co-operating in investigating religious and social conditions through their departments of soci-

ology. An investigation of country churches in Missouri has recently been completed by A. C. Zumbrunnen for the University of Missouri. Illustrated by graphic diagrams the report tabulates and thoroughly discusses the increase and decrease of churches, Sunday schools, young people's societies, financial resources and properties. The salary and education of pastors, the length of pastorates and the number of churches served by them are used to illuminate the country church problem. Opinions regarding the effect of the telephone and rural free delivery on the churches are classified. The attitude of churches and ministers toward federation measures the breadth or narrowness of their view. The investigator concludes that "the majority of the laity of the country church do not regard it as a social factor or of much importance in that respect." Nevertheless he regards it as one of the problems of the rural churches to make themselves felt as among the most powerful social agencies within the bounds of the state. And he regards the solution of that problem as vitally involved in the fulfillment of their religious mission. The rallying of country ministers and farmers at agricultural colleges to be inspired and guided in their interpretation and improvement of rural conditions, is one of the most significant signs of hope.[1]

TYPE OF SOCIALIZED MINISTRY

This review may well be summed up by a reference to Dr. Washington Gladden, as perhaps the one man more than all others in the ministry of the American churches who throughout his fifty years of pastoral and public work has been identified with every phase of the social movement referred to. In his Recollections[2] are vividly depicted the reactions of a country lad on city environments, of a college man upon public issues, of a man of peace and a peacemaker on war times, of a scholar on social and industrial agitation, of a religious thinker on the struggle between conservatism and loyalty to truth and liberty. As a preacher, author, citizen, and man of public affairs he has thought and taught his way through almost every phase of our social, industrial, civic, and philanthropic life, especially as related to Christianity, the Church, and its ministry. Out of his own experience and example, therefore, he is justified in entering this protest:

> The plea of the religious teachers that they are incompetent to deal with social questions is a fearful self-accusation. They have no right to be incompetent. If there are any subjects on which they are bound to have clear ideas and sound convictions, they are these subjects, which concern the relations of men in industrial society. Shall the teacher of religion confess that in the arena where character is mainly won or lost, where the life of the church is at stake, where the destiny of the nation is trembling in the balance, he is unfit for any efficient service? It is as if a physician should declare that he would only prescribe for nettle-rash and chicken-pox and like disorders, but that he declined to deal with typhoid, or diphtheria, or tuberculosis, or any of the deadly diseases. The services of such a physician would not be in great demand.

When his fellow citizens at Columbus, O., gathered to celebrate the fiftieth anniversary of his ordination, they made it a civic event. The mayor said, "I regard him as Columbus's first citizen." The president of the Chamber of Commerce declared him to be "one of the greatest constructive forces the city ever had." Governor Harmon pronounced him "the city's worthiest citizen." Not any the less, but all the more, for all that, Washington Gladden is justly regarded by those who know him best and have worked with him most as the highest type of the ministry in his day and generation, as tested by the spiritual results of his pulpit and pastoral work to be seen in the characters of his people and the influence of his church; by the way in which his interpretations of life and religion to each other stand the test of time; and by the strength and beauty of his devout life and spirit as they are reflected in the simple yet profound hymn of his own soul, in which he gathers all others to himself in praying:

O Master, let me walk with thee,
In lowly paths of service free,
In hope that sends a shining ray
Far down the future's broadening way.

CONGREGATIONALIST SECRETARY FOR LABOR AND SOCIAL SERVICE

The attention which THE SURVEY called to the preparation of the churches for social action may already be turned to a most significant act which the great fellowship of Congregational churches has recently taken. THE SURVEY pointed out the culmination of the years of preparation made by the industrial committee of these churches, when in their National Council, by a unanimous rising vote, action was taken to establish a secretaryship for labor and social service, directed and supported by the Congregational Brotherhood of America.

This action has now been consummated at Chicago with impressive ceremonial and significant utterance at the inauguration of the Rev. Henry A. Atkinson to that office. The occasion was notable for plain speech and constructive thought on the question how churchmen can best contribute to social progress and industrial betterment. Jane Addams pleaded for the churches to concern themselves with the interests of the community as a whole. She declared her belief that there is enough divine discontent in the youth of today to draw them to the social service of the churches, if heroic sacrifice for humanity is demanded of them. The responsibility of employers to the workers and to the community was defined by Towner K. Webster, a Chicago manufacturer, with a conscientious and public-spirited frankness all too rare in public discussion. While the necessity of making the business pay dividends to its stockholders was his major premise, his conclusion was that the public should not be required to pay the living expenses of the employes. Where the living wage is not paid as a part of the cost of the product, the public pays the balance needed to support the families of underpaid employes. To take advantage of the ignorance or stupidity of immigrant employes to reap profits off a minimum wage was denounced as unworthy of any honest employer. Owen R. Lovejoy sounded the battle cry of the church against child labor. The leisure problem was urged as an opportunity for the churches to get the city, through its park and school boards, to do its duty in furnishing facilities for recreation, free from the demoralizing influences of exploiters who make profit out of the people's pleasure. Raymond Robins further stirred the assembly by asserting that "the church does not realize the power and influence it could wield for good in working for decency in politics and honesty at the polls." The wage-earner's efficiency and responsibility were realistically described by President Ozora S. Davis of the Chicago Theological Seminary, out of his years of experience as a railway employe and telegraph operator. Dr. Gunsaulus's sermon was an eloquent emphasis upon brotherhood as the motive power of Christianity. In giving "the charge" to the brotherhood and the new secretary, as chairman of the National Council committee on industry, Prof. Graham Taylor characterized the occasion as "a re-entrance" of the Pilgrim churches upon that field of social action which they had entered by their forefathers' compact in the cabin of the Mayflower. As soon as they landed on Plymouth Rock they began building the first of the American commonwealths. Among Indians, Negroes, mountain whites, and the settlers on the advancing frontiers, they have done their religious work through schools, shops, and training for home and farm. Through every mission of their American Board and every school and college they have planted abroad they have laid foundations for liberty and democracy. Their social religious literature has flowed in a steady stream all the way from the pen of Cotton Mather and Thomas Hooker to that of Washington Gladden. The men of the churches through their brotherhood and its secretary, but not without the constant and effective co-operation of the women, were charged to inquire into the conditions of life and labor in their own local communities; to interpret to one another, and to mediate between native and foreigner, employer and em-

ployé, rural folk and city dwellers, men and boys; to help formulate a constructive, progressive policy for each community; and to bring into social co-operation the community of interests which exists in every locality.

Greetings from labor were personally presented by Edwin R. Wright, president of the Illinois Federation of Labor, and by John Mitchell in a characteristic letter, in which he said the occasion "indicates in a tangible way the ever increasing interest of religious organizations in the solution of our social and industrial problems." "The labor movement," he said, "will wish you success in your wide field for good work, and labor men rejoice with you in the selection of your executive officer." The Rev. Charles Stelzle, in sending the greetings of the Presbyterian Department of Labor, noted the progress which had been marked during his eight years of service. The caution with which he was permitted to begin work in the first secretaryship of its kind was shown to be in marked contrast to the unanimity and publicity with which this second church secretaryship for labor was established.

Mr. Atkinson comes to his national work and its headquarters at Chicago from successful pastorates in Atlanta, Ga., and Springfield, O., in both of which states he won the confidence and co-operation of working men and business men to a marked degree. The Atlanta Federation of Trades impressively expressed the regret of its members at the loss of Mr. Atkinson's fellowship, by which, however, they were confident the great cause of our whole people would gain.

MR. ATKINSON'S INAUGURAL

The discovery of Mr. Atkinson's point of view and his outlook upon the new work devolving upon him and the churches was awaited with great interest. Detached excerpts from his inaugural follow:

> The strain will be lifted. There is a new spirit abroad in the world, the spirit of brotherhood. A deep spirit of religion is finding expression in the movements and organizations for better social conditions. The world is gradually coming to see the value in Christ's teachings. He is the ideal of every reformer; the claimed leader of every party. His spirit is coming to its own. . . . The ugly mood has not come to its own. All classes of people are fairly reasonable. Men are reading. They are observant, the world was never so industrious and long headed as at present. Societies, clubs, and unions are working away at fundamentals. The church is getting down to bed rock. The times are ripe for real constructive work in the building of the Kingdom of God. . . . The needs of the individual soul are made more vital as the relation of men to each other is more clearly understood. . .
>
> The Church, in a humbler frame of mind, is hearing the Master's words, and instead of trying to explain away the incompatibility existing between the Sermon on the Mount and the industrial system, is recognizing that Jesus meant what he said. If Christianity is worth anything it must hasten the disappearance of poverty and lessen the grinding conditions of drudgery and routine which are deadening the spiritual and mental fiber of man. If the Church has any power it ought to be able to drive out the pagan ideal from business and establish the Christian ideal in control. . . The fight to gain leisure for physical, mental, and moral health, when won, will add to the beauty and fulness of life. The identification of the Church with the needs of man as man, together with a fuller realization within the Church of the possibilities of democracy, will give the Church first place among those agencies ordained by the Almighty for man's salvation.
>
> There ought to be no good grounds for considering the Church amateurish when it approaches social questions. The minister ought to be the best versed man on social and economic questions of any man in his community. He must be, if the church he serves is to come to its own. . . The Church ought to be informed on every great movement, and a movement cannot be understood until we know the principles that lie back of it. The information ought to be from primary sources. The minister has the best possible chance for knowing conditions, if he will only take the trouble to investigate. The minister who does not know what is going on in his city, who is unacquainted with the needs and the efforts being put forth to meet them, and who is not able to bring himself into sympathy with the point of view of other folk, no matter what their condition, temporal or spiritual, may be, is not as fully equipped for his high and holy task as he should be.
>
> The attitude of the Church on all social questions is that of a referee. Its sole interest is in seeing that righteousness prevails. It holds no brief for any party or parties. Its voice is raised against the crying evils of our times because they work an injustice to man, because they are shutting the door of opportunity. The laboring man does not want the patronage of the Church. He wants an even chance in this, his Father's world. and it is the duty of the Church to help him get it. Wholesome factory conditions, safety in the

pursuit of the daily task, adequate wages and a reasonable workday,—these are not merely subjects of an academic discussion. These questions and their righteous settlement mean life to millions of our brothers and sisters.

As long as immense fortunes are being made at the expense of little children and destitute women; as long as it is possible for a man to give the best years of his life to a machine and then be thrown out to die, or for the community to support, when his vitality has all been coined into profits for private individuals; just so long the child labor problem, the problem of woman's work, old age pensions, and a national indemnity law for accidents in industry, will be proper subjcets of study, prayer, and work by the Church.

I am satisfied that the Church can be led into the widest, most helpful lines of service if the proper method of presentation and approach is employed. Tuberculosis can be stamped out so thoroughly that in ten years the Great White Plague, like the Black Plague, will be only a sad memory. Any pastor, if he will take the time and trouble, can secure the co-operation of his people in this crusade against death.

I am satisfied that the churches can be enlisted in the movement to make the air, the sunshine, the parks, which belong to all of the people, more common. Every city can have public playgrounds; and if they are led, the churches will be strong factors in the establishment and maintenance of such playgrounds. Shorter hours of labor, Saturday half holidays, and a dozen other questions could gain the indorsement of the churches immediately. This is just the beginning. These changes will call for others. More air and sunshine mean the tearing down of good profit-paying, but tuberculosis-breeding, tenements, and building in their place decent homes for the people.

One reform will call for another; one blessing will make the next more imperative, but on the whole more easily gained.

Everything needed cannot be done all at once. Moral reforms are consummated slowly. The ultimate good is far off. It will take years of patient toil and much hearty service to bring business under the law of love, and make actual the Golden Rule in every heart and life, but it will be done. The present offers a magnificent summons to the Church to do its part, and by making its contribution the Church will enter into a larger and wider work in proportion to its new tasks and will gain for itself a new and larger life.

LINCOLN'S BIRTHDAY CONFERENCE

MARY KINGSBURY SIMKHOVITCH

Greenwich House, New York

Twelve years ago at the Procathedral on Stanton street the first Quiet Day for New York social workers was conducted by the Rev. Dr. Nash of the Episcopal Theological Cathedral of Cambridge. Mrs. Lowell was there that day to bless the group with her gracious and inspiring presence. Dr. Blaustein was present too, and many others of the relatively small group which was at that time deeply interested in the social problems of New York's industrial neighborhoods. Several years later a similar day was held at the Church of the Ascension.

It was felt by some at that time that a wider character could profitably be given such a day. On Lincoln's Birthday, 1908, the first conference was held at the Union Theological Seminary. Discussion followed the addresses and opportunity was given for interchange of thought. Later conferences, while interesting and valuable, have somewhat lost the plastic note of the earlier days.

On February 13, the beautiful chapel of the new Union Theological Seminary was crowded to hear the interesting addresses. The seminary hospitably invited all persons to remain at luncheon when there was a freer opportunity for conference. Social workers were not so largely in attendance as at former conferences and, as the day was originally intended for them, it is interesting to surmise the reason for their flagging interest. I would venture a guess. The growing formality tends to alienate, if not positively to petrify, those who would like very much to compare notes as to the spiritual values being wrung out of daily contact with the living social problems of the day.

The opening address of Prof. George W. Knox on what constitutes the religious attitude deserves a more extended notice than this brief review allows. Religion, Dr. Knox said, is in one aspect

worship, adoration, the recognition of what is higher than ourselves. It is incompatible with the state of mind which is superficial, occupied, and content with the merely transient. For this religious emotion, which we dominate "solemn," is associated with thoughts of the deeper aspects of the universe, or if we prefer, with life.

Religion is the product of a somewhat advanced stage in man's development. Doubtless its elements are found in all stages, and are to be traced even in the animal world. So with all the so-called higher activities of man: art, science, ethics. Our modern science traces them to a pre-human origin, but all of them come to what we may call self-consciousness only when groups of men have attained a certain stage of stability, when the immediate struggle for existence has been so far modified that there is opportunity for something beyond the importunate questions, what shall we eat and drink and wherewithal shall we be clothed; when not only the individual but the group reflects and considers not only the immediate and proximate, but the mediate and the remote.

This faculty of man, this power of considering the remoter causes, this response to something besides the apparent and the immediate, is productive of much which we may call "foolishness." This is true of religion, but not more of religion than of knowledge; and as science consists in the progressive elimination of mistaken judgment, so is it with religious truth. For our insistence is that religion is not something apart, to be put in a quite distinct category; but that it is man himself functioning in response to his environment, and sharing at once in the weakness and in the strength of his total activity. Religion has no especial claim to infallibility, but shares with knowledge and with art in man's foolishness and also in his wisdom and his truth.

So considered, we find that religion, like the other expressions of man's permanent instincts, is universal, characteristic of humanity in all time and in all stages of development. And hence, if we hold in any degree the modern theories of development, we must believe that it has performed some vitally necessary function. This is true for the individual and for society. It has been religion which has held together our Hebrew friends through long centuries of physical dispersion and cruel prosecution. It was religion which made Arabia an important element in the history of the world, when the Prophet succeeded in substituting the bond of faith for the tie of blood relationship; and it is religion which has welded the diverse elements of the Japanese nation into an effective unity. In the present, as in the past, it is religion which is the most powerful agent in binding man to man.

The most influential ideal now moving men is the vision of the Kingdom of God on earth. The most telling illustration of our own age is socialism, which exhibits in a marked degree the characteristics of religion.

Religion is an expression of the deep trust that there are values which do not perish with the using; that though the individual perish they remain. So in primitive society men religiously believe that the family, the tribe, the nation are more than the individual. Religion binds into one the past with the present and forecasts the future. Its exhortation is: "Seeing we are surrounded with so great a crowd of witnesses let us lay aside every weight and the sin that doth so easily beset us, and let us run with patience the race that is set before us." "It endures as seeing that which is invisible." It feels that there is an inherent irrationality in the notion that all which makes life worth living, the highest and deepest which man knows, disappears without lasting import, so that finally vice like virtue, and lies like truth, are all made alike in an oblivion of nothingness.

Finally, the religious attitude has significance as man reflects upon his own individual ineffectiveness and insignificance. It is only as a part of a greater whole that one's personal efforts after the good, the beautiful, and the true are worth while. We can accomplish so little and our efforts are so unavailing that it is only as we are conscious that we are members of a greater whole, in the group and in the world, that we gain confidence to do our little whole and to quit ourselves like men. Ultimately it is a belief that it is God, however we define that word, who works within us to will and to do of his good pleasure.

Prof. William Adams Brown spoke of religion as the homestead of the soul, contributing stability, inspiration, beauty, and companionship to the life of the individual. He asked if our souls could afford to miss the reinforcement which religion brings as we face the social situation.

Prof. Thomas Hall, in speaking of the contribution of religion to society, asserted that through it our ideals had been created and preserved—created by the prophets and preserved by organization and tradition. Creation and conservation of ideals are necessarily often in conflict. Naturally the prophet is opposed to organization, and organization distrusts the prophet, who, in fact, must justify himself to be accepted.

In the discussion that followed the morning conference Bolton Hall referred to the need of an independent ministry unhampered by reliance upon funds which may be withdrawn in case the minister

confesses his true convictions. The Rev. Elliott White, in commenting upon Dr. Hall's paper, added that the prophetic and conserving elements are present not only in society, but in each person as well, and that it is especially necessary for the prophetic element to get itself freely expressed.

Jane Addams opened the afternoon session. Is it not significant that there was a larger attendance for this address than for any other? This was not alone a personal tribute to Miss Addams's growing fame as writer and leader, but rather an indication of the thirst in people to hear what are the actual convictions of those most deeply involved in the human conflict. It was the unconscious expression of the ever-deepening conviction that out of life itself, if from any source, must religion spring; that religion, born of human association, is tested by experience alone; that its validity is established in direct proportion to the necessity for its existence and to its utility in daily living.

Miss Addams dwelt upon the fact that the new point of view is being worked out with pain, sorrow, and difficulty. She indicated the passing of the old political economy, and the passing as well of the superstition that possession of knowledge alone can by and of itself induce spiritual unity. She emphasized the need of a norm for fellowship as there is a needs for norms in material development. It is impossible to disregard the fervor of thirty million socialists whose spirit of devotion is not unlike that of the Salvation Army. Wherever there is a common work to do, a common conviction is developing in regard to life as a whole.

The Rev. Henry Fosdick followed with an address on the social workers' need for religion. He dwelt on the necessity for a conviction that the "fight is coming out somewhere." To many present Mr. Fosdick's expression, "all mere social work," seemed to indicate that a distinction exists in his mind between religious and social work. In this connection it may be recalled that years ago a visitor at the College Settlemen inquired if any religious work were carried on there. The young resident who had received the visitor flushed, but unhesitatingly replied, "We think all our work is religious!"

The Rev. Henry Sloane Coffin gave the last address of the day. He said that "every man whose heart is set on righteouness and who wants to see it here is our brother." Dr. Coffin expressed the belief that through common work common convictions would arise, that "Abiding worthfulness" is "our criterion of truth."

Mowbray Clark, Sculptor

WHY TEACHING THE TENANT IS NEEDED.

THE HOUSING AWAKENING[1]

VII

TEACHING THE TENANT

JOHANNA VON WAGNER

EXPERT, LOS ANGELES HOUSING COMMISSION

Teaching the tenant: When that means dealing with people of thirty nationalities, different customs, superstitions and languages, one might well hesitate before embarking on that sea. Once in it, one is carried away by the deep, dark undercurrent, and is well repaid for his efforts to teach the hard-working, greatly underpaid class of society, our tenement dwellers, how to keep afloat.

[1] A series of articles describing housing conditions in typical American cities large and small, East and West, and the efforts being made to improve those conditions. Published with the cooperation of the National Housing Association. I. Introduction, by Lawrence Veiller, THE SURVEY, November 19, 1910, price 10 cents; II Socialists and Seams—Milwaukee, by Carl D. Thompson, December 3, 1910, price 25 cents; III The Awakening of a State—Indiana, by Albion Fellows Bacon, December 17, 1910, price 10 cents; IV. Housing Reform in Cold Storage—Boston, by Edward T. Hartman, January 21, 1911, price 10 cents; V The Huddled Poles of Buffalo by Frederic Almy, February 4, 1911, price 25 cents; VI. New Tenements and Old Shacks—St. Louis, by Roger N. Baldwin, February 18, 1911, price 10 cents.

Everybody is struggling to reach the light, sometime, somewhere; and those who would remain down deep in the dark, indifferent to better ideals, should be coaxed and pushed and helped until the inertia is overcome. Unless we feel that all of the thirty nationalities of our large cities have to be dealt with as members of one big family, irrespective of color or creed, we fail of our mission and might better choose some other work.

Is it worth while? If it is not worth while for the other fellow, it is worth while for one's self to have helped along in the work of God, "the cause of man," —evolution, economic and spiritual. To make the most of present-day conditions and surroundings, and to awaken desire for better standards of living, is our work. So we start out with good will towards all men, a speaking knowledge

IN LOCKHARDT COURT.

Mrs. Von Wagner interviewing an old woman.

of several languages, the experience in sickness of four years' hospital training, to meet and conquer the two great foes, ignorance and superstition, or tradition and self-love.

At the beginning of my work, twelve years ago, I was rudely made to realize that while I had some things to give, it was a difficult matter for some to receive. My first day as woman inspector was perhaps one of my hardest, because I had to adjust my theories to existing customs. By request of the doctor, I went to the home of an Irish family, an old ram-shackle cottage on a high hill, dirty and vermin infested; a child dying, a new baby expected any minute. The doctor thought that, while the child was probably doomed, the house should be made a little cleaner for the arrival of the newcomer.

Words fail to describe the chaos and pathos of the situation—the child in the kitchen in a cradle, lying on old garments, the pinched little face covered with flies; the emaciated body covered with soiled rags. On the floor, on chairs, everywhere, soiled clothes and pieces of old cloth; dirty dishes on the table, in the sink and on a broken-down stove; flies, flies everywhere! The dirt of ages on walls, ceilings, furniture; the mother sitting by the cradle drunk; the father arranging pipes and glasses for the anticipated wake, drunk also; sympathetic neighbors all around, partaking of the beer, helping to swell the lamentations; the air unbearably oppressive, and with it all, the sultry heat of a summer day.

For a minute I stood overcome. When I stated that I had been sent by the doctor to lend a hand and look after the sick child, a storm of opposition broke loose. "It is Divine Providence that the child shall die; I stand for no interference. One dead, and one born every year, so it has ben for seven years, and this one must go too. O, my baby!" More yelling and more drinking.

No moral persuasion would help here. A minute more and the drunken men would have put me out on the street. "All right," I said, "we will do what we can and leave the rest with God." I said it positively, put my handbag down and asked the sanest woman in the crowd to help me clean up; put on my apron and commanded all out, to give a chance to the baby. There was confusion and threatening, but I stood my ground. I managed to put the mother to bed, to sleep off the effects of liquor. The father was easily persuaded to lie down. Then work commenced. We repaired the fire box, heated some water and, after bathing the baby and reviving it with a little hot water and a few drops of brandy, the woman and I went to work, cleaned the kitchen and washed the child's linen. When that was done I left the woman in charge of the child, and went out to get some necessary articles to work with and telephone to the doctor, besides looking after several other sick babies, as we had at that time no district nurses.

It was several hours before I could return. Climbing back upon the hill in the evening, lo and behold most of my work had been undone; the mourners had returned, the pipes were being smoked, more beer and whiskey consumed, and the baby was almost lifeless. Righteous indignation does not express my feelings! Out, they had to go, and they went, through the front and back door, and

then I gave my attention to the little one, the mother interfering continually. "I tell ye it won't swallow another spoonful, it is going; I tell ye it won't draw another breath." And more like it. I just had to ignore her and do what had to be done.

Fortunately the doctor came in about ten o'clock, and with his help the woman was made to lie down once more in the next room, calling to her husband, "I tell ye she is going to kill that baby, that's what she is doing, and you sit there and watch her." After a while there was silence, and the "watchman," shamefacedly, was only too glad to follow his wife's example and retire.

Thank God I was alone with the baby. The doctor had given little hope, but it was a relief to have had his advice and help in smoothing the difficulties. Alone with the dying child in the dimly lighted kitchen, a sultry night, innumerable bugs and insects creeping from behind broken wall paper, and cracks, and crevices, roaches and bed bugs—shall I ever forget the horror of it! Sitting with the baby on my lap before the kitchen fire to keep the hot compresses on its little body, feeding, drop by drop, the barley water and stimulant, protecting it against flies and vermin with a piece of mosquito netting, from which continually I had to scoop off the bugs falling upon us from the ceiling.

To intensify the horrors of the night, mice and rats began running across the floor, and there was nothing to do but keep my feet on another chair as all my attention had to be devoted to the baby, which by this time showed the symptoms of approaching death. Its whole little body became rigid, the eyes seemed broken, a yellowish fluid exuded from the lids, and there was no pulse at the wrist.

I could not give up the child. I wrapped it up in a blanket, took it out in the garden, walking and praying that it might live. And it lived and began to breathe and get warm; and there out of doors I sat with the baby in my arms until five in the morning, watching the sun rise on a new day. Then the mother appeared on the scene, a pitiful sight, sullen, untidy, dirty. Placing the child in the carriage, I talked to her one solid hour. What didn't I say! The woman cried and saw her duties in a different light, promising by all that was holy to take care of the little life and save it from an early grave. After her promise to care for the child according to instructions, I walked home—there were no cars at that time in that part of the city—for I needed a bath, clean clothes and some breakfast before beginning another day's work.

The following day conditions of home and mother were made more favorable for the arrival of the unborn, and for the first time in her married life there were two living children in the family! The spell was broken and five born since have lived. While the woman never became a very clean housekeeper, she developed into an excellent mother and nurse; the children were kept clean, and the father in his leisure hours did most of the housecleaning. The new baby was named for me, and the children felt they had a claim on me, especially the two elder ones. Drink was practically eliminated from the household; the man may have had a glass of beer with his supper some days, but other than that I never saw signs of it.

During my first week of work, seeing

IN MURILLO COURT.
The babies are always a bond of sympathy.

a child in convulsions in an Italian family, I said to the mother, "Quick, get some hot water to put the child into a bath." She replied, "What do you know about children? I guess I know what to do—a mother of twelve children." "Well, then, send one of the twelve for a doctor. Where are they?" (not seeing one). "I buried eleven." "Well," I said, "you will bury the twelfth if you sit still and wait for the child to recover without help." Without as much as "by your leave" I made a fire, a good mustard bath which brought the sufferer comfort, and perhaps saved the woman her last child. I then went out and sent for a doctor to give medical aid. The mother, who was then quite violently opposed to my advice, later became a very dear friend; the boy is living yet; two more children have been born and lived, because the woman was willing to be taught the care and feeding of infants, besides cleanliness of body and home.

A child had just died in a tenement consisting of two light and two dark rooms. The windows were all on one side and it was absolutely impossible to establish a current of air. The father was given to much drink; the mother took in washing. A beautiful baby, the pet of the family I had known so well, was dead (pneumonia). "How did it happen?" "O, Mrs. Von Wagner, it was not my fault. I have been up day and night, never took off my clothes, never opened a window since the baby was sick."

The people had sent for me to care for the child, but could not find me as I was out of the city at the time, and the baby had to die from ignorant care and fear of fresh air. I could not then tell the poor mother the reason why, but later I did, to protect the health of the others. The father, who earned good wages when sober but spent most of it in saloons, was standing by the little coffin, broken-hearted. I went up and talked to him, told him how sad it was that a chance had not been given the beautiful baby; nobody could know how much was lost to the family and to the world; what a great gift from heaven it was to care for a little soul, and that one day we should have to answer for it. The man put his hand on the little cold forehead and then and there made a vow to give up drink —and he kept it. The family moved into a light, airy flat, and the children got a chance for better health and education.

Another experience that stays in my memory was of an Italian tenement in a basement, the kitchen containing a long table, benches close to the wall, chairs hanging upon the walls to make room for the affairs of day; in one corner a small bed in which was a child sick of diphtheria. In an adjoining room, on a high bed, the mother was sick of cholera morbus, and this, the family bedroom, had to serve as the storeroom as well, as the cheap tenements have no closet room for food or clothes.

On ropes overhanging the bed, sausages, peppers, dried fruit, and other eatables; underneath the bed, flour, and macaroni; tomato balls—a preserve of tomato made into a tight hard ball—rolled under the bed in their natural state, and from them pieces were broken off every day for soup or macaroni, plus cobwebs, dirt, and vermin. The toilets were in the yards, necessitating the use of vessels in bedrooms. The doctor whom I called in to see the patients, on being shown the unhygienic condition of food stuffs in the bedrooms, became nauseated and had to leave the room. The family was persuaded to let the child go to the Contagious Disease Hospital; the kitchen was fumigated; all eatables were removed from the bedroom, and the woman was cared for until recovery. With the aid of the father and willingness to be instructed, more sanitary ways of living resulted, the family being persuaded to leave the unhealthful basement and move above ground.

Almost always the Italians rent a tenement large enough to sublet several bedrooms, each having as many beds as the space allows, two or three double beds with a few cot beds between, according to the size of the room. To economize space, the doors are taken off the hinges and put in the cellar and a thin curtain is put in their place. When asked how many men are kept, the number given equals the number of beds. Ex-

perience has taught us that the number of boarders accommodated is far in excess, as many as two or three men sharing one double bed. Very often this number has to be doubled, as there are different occupants of these beds from the day and night shifts of workers.

Night inspections of such premises prove these facts and aid effectually in eliminating overcrowding. While the subletting of rooms swells the income and bank account, the family life deteriorates morally and physically and untold harm is done to the growing children. In talking to the children about having to help with the burdens of the household duties, they often confide their troubles and complain to me. Little girls have said, "The men are nasty and lift up our skirts." Many children have contracted venereal troubles by having to use toilets in common with ten or twelve boarders.

Being present at the funeral of an Italian woman who had died of consumption, leaving nine children and ten boarders, the oldest daughter, crying, said, "She had to kill herself for the men. My father made her keep them long after it was necessary." The bank account was more precious than the mother's life, and the children were the sufferers.

A baby very sick, no doctor, no nurse —I tried to persuade the family to call in a doctor to save the little one, to feed it properly, to take it out of the hot kitchen. The father said, "Never mind, baby die, it's all right, my wife she makee another." But the doctor and the nurse do get there in spite of objections. Sometimes their advice and ministrations are accepted; other times refused, and another life is lost.

The Italians are very independent, so far as their ways of living are concerned and in obeying city ordinances. Most of them are thrifty; their main object seems to be to save all they earn, while on the other hand they are anxious to get all the material help possible, whether needed or not. Mutual helpfulness is not much practiced among them. Often in a tenement, when some woman was sick and a little girl was standing by a sink trying to do a washing, or leaning far out of the window to hang up clothes, I would go from floor to floor asking for help. The neighbors would reply, "Who will help me when I'm sick?" "Have too much work myself", etc. Some lessons in moral obligations have to be taught right here.

Too frequently the Italian landlord cannot be coaxed to comply with tenement house laws, but must be threatened; and even that is useless when he has become a political boss and dares defy the laws.

My experience in another home was instructive. It was a very dirty tenement house, sadly neglected, occupied by colored families having three rooms each. On entering, I saw sacks and sacks of rags and women and children sorting them. Becoming acquainted with the circumstances of the family first, I begged permission to inspect the rooms. It was granted, except that I was asked not to go into one of the bedrooms as the husband was sick in bed. As the wife had seemed anxious to hide the fact, I was just as anxious to be allowed to know the nature of the sickness. After persuading her to let me see if I could give any aid, I entered and found a case of smallpox, with the people sorting rags and taking them away. The man was promptly removed; the premises were fumigated; all rags, bedding, and clothes were burned; the loss was made good, and the whole house, both halls and rooms, was kalsomined. The people had to discontinue their business of sorting rags in the tenements; they were told of the danger of infection and acquainted with the law.

One woman, pleased to get into a new house, took the dark room flat because of the difference in price. When told of the danger to the family's health, she admitted that she would have to move because the gas bill was equal to the difference in rent. Besides, all were suffering more or less with eye trouble, especially the mother, who every time she went on the street had to become accustomed to daylight. Having to get eyeglasses for herself and children she lost considerably in health and money, in her effort to save rent. If the woman had known the value of sunshine and light

A WOMAN'S INFLUENCE IS NEEDED HERE.

she would never have moved into a dark tenement.

Oh, these basement rooms! One I remember well. It was damp, but cheap; the family occupied the kitchen, two women boarders the small bedroom. On one side the diminutive windows opened on a yard, on the other side the doors opened into a dark damp cellar, part of it partitioned off for men boarders. One cold winter day I found the head of the family, a consumptive, lying on a small bed in the kitchen, rocking a cradle by his side. The wife was away in the mills, working to support all. A small fire burned in the stove; the windows were tightly closed; moisture condensed on walls and woodwork; green mould was everywhere—on the walls in the kitchen, bedroom, cellar; even the mattress the sick man was lying on was soaking wet except the upper layer—a terrible dead, chilly air. But a fire, and at the same time an open window, would have seemed to the man like wasting precious fuel, as it is not the custom among these people to open a window at night or during the winter.

And so there was the seventh funeral from this small basement, which looked innocent enough from the outside, even clean; but the grade of the yard was toward the house—no drain, all water soaking under the cellar. After a death the family usually moved out; another one was ready to move in, every one of them losing some member with lung trouble. The tenants earned very little. They thought to save all they could by subletting the only bedroom and even part of the cellar. Man and wife together hardly earned eight dollars a week—sometimes less. All living there were sick, more or less, with bronchitis, rheumatism, and tuberculosis.

The seventh funeral ended the chapter. At my request, the Board of Health vacated this "death trap" for all time. The family, with the aid of the charities, was helped to move into healthier surroundings, and cared for. If the tenants had known that dampness undermines health and in the long or short run spells death, they would have paid a little more rent and lived above ground.

My first day among Slavic tenants made me go out on the street and weep. It tempted me to pray for an earthquake to take us all down! What could I do single-handed, teaching the art of living to those who only struggled to exist? The largest family occupied the kitchen, with two beds and a cradle, benches around the walls, children everywhere—on the bed, on the floor, in the cradle; the stove full of kettles (all coffee kettles), and one large soup pot with the individual pound or half-pound of meat for each family or boarder.

But this is wash day. Wash day happens often during the week, and the woman who sublets the rooms, and incidentally looks after the babies, is rocking a cradle back of her with her foot while washing away at the tub. She must wash for the boarders, cook their food and mend their clothes. The heat and oppressive atmosphere from so much cooking and washing in those close quarters on a summer day, the moisture of the steam and the stale bedroom air on a winter day when all windows are closed, are beyond description. Small wonder that the babes die and the women become consumptives! No wonder that the women say, "Too much trouble to have children, too many boarders;" and the midwives are kept busy, many of the women dying as a result of their mal-practice.

Out of the kindness of their hearts, the baby gets a glass of beer with the rest of the family, or a little wine or whiskey because it is so pale and weak, "to make it strong"; or, as one of the women said when I stopped her from pouring a whole glass of beer down the baby's throat, "It is only for good luck." The others had all died and she did want to save this one.

Behind the scenes, as it were, through gaining their confidence and being able to speak their language, one hears the tale of woe of the women, veritable beasts of burden, and learns of the brutality of the men, who use the knut (whip) if their wives are sick in bed and not able to cook for the boarders. In one instance, I stopped a man from beating his wife two hours after childbirth because she was unable to get up and prepare dinner. There were seven men to cook for.

Often when the woman is a wreck from overwork in carrying heavy loads of wood on her back from the docks up the hilly streets to her home to save the price of fuel, in addition to doing all the rest of her work, if you insist that her husband, who by this time has a bank account, shall pay for proper care and food for her, he says, "No, sir, she is no more good to me, she'll go in the box." Only the arm of the law helps here—seldom moral persuasion. Frequently the successor of the wornout wife is already installed and mistress of the man.

If in the instances cited I have confined myself to the faults in human nature and a wrong social condition, it is not because I have not been able to see the good and beautiful—these are everywhere, among all nationalities, side by side with the bad.

A bright Jewish girl watching my work, going with me from the cellar to the top of the house to see what I was doing, asked, "Lady, is the Board of Health your husband?" She had come from New York and had seen only men inspectors. "I am so glad it is a woman this time," the mother said, and asked a good many questions regarding the health of her children.

The titles given me in my work have been various; to the boys I was the "city"; to the girls the "health-lady"; to many Slavic women, the "Mrs. Board of Health"; and to one dear Irish friend, the "Lady of the Sanctuary" (meaning sanitary).

The request to come on a Sunday when the boys and girls are home, or in the evenings when the husband is home, to take a meal underground (basement), or under the roof (attic), or somewhere else, is gladly complied with, as personal touch helps much toward promoting confidence and establishing friendly relations. In return, my evenings at home were attended mostly by my friends from the tenements. Much to my surprise, the people who thought it was quite necessary to have in their best room, cheap imitation lace curtains, glaring colored

carpets, and painful chromos (which are so easily obtained from the ever-present "installment plan" man in tenement houses), admired my inexpensive furnishings, from the cheese-cloth window curtain to the social cup of coffee. Prices and recipes were asked, patterns taken, and many pleasant hours spent in mutual benefit.

"What do we have to teach?" you ask. Is there anything that is not to be taught? The people must know the laws of health; the mothers must be taught how to get that health in the home. They must know the principles of sanitation as applied practically in the home: cleanliness of air, of food, of body, of rooms, of kitchen utensils; right removal of all dirt and dust, especially the care of garbage; the dangers of defective plumbing; symptoms of declining health; defective eye sight, hearing, the beginning of tuberculosis, etc. With each family the situation differs. The more knowledge, plus common sense, the worker has, the better for the people. We give and we take, because we can also learn much from those we meet.

THE RELATION OF ECONOMICS TO THE LAW

FRANK J. GOODNOW
COLUMBIA UNIVERSITY

Blackstone in his Commentaries on the Laws of England, which was first published in 1765, defines law as "a rule of civil conduct prescribed by the supreme power in a state, commanding what is right and prohibiting what is wrong." In explaining the last part of this definition he says:

> Those rights then which God and nature have established, and are therefore called natural rights, such as are life and liberty, need not the aid of human laws to be more effectually invested in every man than they are; neither do they receive any additional strength when declared by the municipal laws to be inviolable. On the contrary no human legislature has power to abridge or destroy them. . . . For that legislature in all these cases acts only, as was before observed, in subordination to the great lawgiver, transcribing and publishing his precepts. So that, upon the whole, the declaratory part of the municipal law has no force or operation at all, with regard to actions that are naturally and intrinsically right or wrong.

Blackstone evidently conceived of law as the formation of certain abstract and universally applicable principles of justice, which man by searching could find out. His definition of law has been criticised by later authorities, not so much because it attempted to impart to law the characteristic of permanence, as because it confounded law and ethics, ethics being regarded as embracing the rules of individual conduct which man regardless of legal sanctions was expected to follow.

Blackstone wrote more than fifty years before the theory of evolution had been perceived or formulated, and under the influence of what, in place of a better term, we may designate as the theological attitude toward life. The essential characteristic of this attitude was that it was based on the assumption of a divine revelation of the truth, which broadly speaking was considered to be applicable to all conditions and to all times. The close connection between religion and early law had made it seem natural for the lawyers of the eighteenth century to conceive of law as having some of the sanctity of a divine command, and as being the expression, imperfect it is true, of eternal principles whose apprehension by the human mind was possible through a process of reasoning largely *a priori* in character.

Brooks Adams, writing more than a century later, says in Centralization and the Law:

> Legal right, broadly, is what the dominant force in society, deflected more or less by opposition, requires or authorizes.

Mr. Adams evidently conceives of law

as not in its nature having any close connection with what we have been accustomed to assume to be abstract justice, but as being the determination, reached as the result of compromise between social clases whose interests are conflicting, of the relations which those classes shall have to one another, so far as concerns the recognition which shall be accorded to them by the supreme social power, *i. e.*, the state.

Which of these views is true is really a much more important question than at first blush appears. For if we are ethically inclined, as we must assume ourselves to be, else the whole basis of social organization disappears, we are bound to endeavor to approximate in our law a realization of the principles of that abstract justice which we assume to exist, and we must resist with all our force attempts to depart from our ideal which are based on motives of temporary political or social expediency. If, on the other hand, we do not assume that there are eternal principles of justice, but accept frankly that the law does not really attempt to realize any such principles, but is on the contrary rather the result of the compromise of conflicting class interests, and is primarily governed by considerations of political or social expediency more or less perfectly apprehended, no ethical scruples need stand in the way of realizing what seems to be in the light of existing conditions politically or socially expedient.

That Mr. Adams was more nearly right in his views than Blackstone would appear not susceptible of successful refutation. The making of law has in the past been in the hands of the property owning and employing classes, since democratic government, which is theoretically at any rate the exercise of legislative power by the propertyless and employed classes, is, comparatively speaking, of only very recent origin. Without accusing the property owning and employing classes of conscious selfishness, we may say that judges belonging by birth and association to those classes and legislatures chosen by them are apt, without being conscious of the fact, to consider that the preservation of the social system under which they live is absolutely necessary to the existence of all social order, and therefore are also apt to consider that the law must be framed so as to favor the preservation of that system. This attitude on the part of judges and legislatures is not inconsistent with their honest belief that, in framing the law so as to be in the interest of the classes they represent, they are really endeavoring to apply those eternal principles of justice which so many judges and legislatures have in the past felt to be the basis of the law. Furthermore, it cannot be denied that often what was deemed to be just was, at the time it was made law, socially and politically expedient.

What has so far been stated in a rather abstract form may perhaps be made clearer by certain concrete examples. It is well known that early in the last century there were introduced into our law three rules governing the relations of employer and employed, which have had a most important effect upon the lot of the working classes. These rules were, first, that the employed could not recover damages from the employer for an injury which was due in any degree to his own negligence; second, that he could not recover for an injury due to the negligence of a co-servant, and third, that if knowing that there was danger in continuing at his work he still remained at work, he assumed the risk and therefore could not recover for an injury resulting from the dangerous conditions of which he had knowledge. These three rules, called the contributory negligence rule, the co-servant rule, and the assumption of the risk rule, received widespread application at a time when both the judges were by reason of birth or association more in sympathy with the class of employers than with that of the employed, and when, because of our developing industrial life, it was socially expedient to favor the employer in order to encourage the investment of capital in industrial enterprises. Their adoption was therefore only natural, if we assume that law is rather the result of the compromise of conflicting class interests, than the expression of eternal principles of justice. Furthermore, assuming that

there are such principles, it is difficult to comprehend how they were applied when these rules of law were formulated. For we can hardly refrain from inquiring why it is just to relieve the employer from all liability where he as well as the employe has been negligent, where he, rather than the employe, has chosen the servant whose negligence caused the injury, and where it is he, rather than the employe, who can control the dangerous conditions the risk of which the employe is deemed to have assumed.

If now we admit that Brooks Adams is, broadly speaking, right in his definition of the law, we may, freed from the reproach of immorality or of departure from eternal principles of justice, endeavor to ascertain, with the aid of the faculties with which we may be endowed, what, in the social and economic conditions in which we live, is demanded by considerations of social, political, and economic expediency.

Now lawyers and judges constitute the class which probably has the most potent influence on the making of the law, whether by the courts or by the legislatures. By American custom those on the bench are chosen from those at the bar. It is a matter, therefore, of the greatest importance that education for the bar shall include something more than the study of mere legal literature. The lawyer who as advocate is to influence the decisions of the bench and the actions of legislatures, and as judge or legislator is to make the law, should study systematically at some time in his career the economic history and conditions of the country in the shaping of whose law he is to aid. This knowledge he will not obtain in sufficient amount if he confines himself to judicial decision and legal treatise. For, unfortunate as it is, it is none the less true that our ordinary legal literature as a general thing treats economic history and conditions with contempt, if it treats them at all, and is still quite generally permeated with such notions of eternal principles of justice as are exemplified by the doctrines of natural rights and social contract. There is perhaps no subject whose distinctive literature has been less influenced by the evolutionary idea than the law. Eternal principles of universal application are, as a rule, still the basis of most legal treatises and the reliance of most lawyers and judges. Apart from that branch of the law which is known in the United States as constitutional law, little attempt is made to show the gradual development of specific legal principles. None at all is made to show the influence upon such principles of the social and economic conditions in existence at the time they were being formulated. The ordinary lawyer or judge who is called upon either to influence or make the law is not, as a result of the distinctly professional training which he has received, prepared for the work which he has undertaken, and the development of the law suffers as a consequence.

The disadvantage of such conditions is peculiarly marked in a country like the United States, where written constitutions impose limitations upon legislative activity, the extent and effect of which are to be determined by the courts. In the case of the United States constitution these limitations are practically unalterable, except as a result of a change in judicial interpretation. It is therefore extremely desirable that the courts both be acquainted with the economic and social conditions sought to be regulated by the legislative acts whose constitutionality is to be determined, and be willing to accord them their proper influence. It will be disastrous in the extreme if, on the supposition that there are principles of universal application, courts adopt a view which is derived from a consideration of what are considered to be such principles. For their decisions made in such a way may be absolutely unsuited to the conditions to which they have to be applied.

The comprehension and application of the principle that a rule of law should be framed in view of the conditions existent at the time of its formulation, and as a matter of fact is largely the result of compromise between conflicting class interests, are finally peculiarly desirable at a time like the present, when great

changes in economic conditions are taking place and are taking place with remarkable rapidity. Rules of law with regard, *e. g.*, to what is restraint of trade, which were developed in a period of intense competition between independent trade rivals, are inapplicable where those rivals are now living in harmony under the protection and management of one great corporation.

It is therefore peculiarly necessary in this country, and at this time, that lawyers and judges should have an extensive knowledge of economic conditions. The acquisition of such knowledge should be a part of their training for their profession. It may be added also that just as the lawyer must, to be successful, keep up his legal studies after admission to the bar, so the really great and successful lawyer and judge must keep up his economic studies, if he is to wield the proper influence he should have on the development of the law.

ANOTHER STATE IN LINE

JOSEPHINE GOLDMARK
NATIONAL CONSUMERS' LEAGUE

As a preliminary to the opening of state legislatures in more than thirty states, another victory for working women in the courts is auspicious. In December the Supreme Court of Michigan handed down a decision upholding the constitutionality of the recently enacted fifty-four hours law for women.

This decision carries us a step further on our march towards the goal of conserving the health of working girls and women—a march still wavering and far from its terminus—upon which England started the world more than a century ago.

The Michigan law, now held constitutional, was enacted in 1909, one of the harvest of laws reaped after the favorable (1908) decision of the United States Supreme Court in the Oregon ten-hours case.

The Michigan law is, in some important respects, more advanced than any legislation for working women yet held constitutional. It provides that women may not be employed more than an average of nine hours in any one day, and never more than ten hours in any day. It prohibits more than fifty-four hours' work in one week. It includes not only women working in factories and laundries, but also those employed in any store or mercantile establishment, or in any clothing, dressmaking, or millinery establishment.

The constitutionality of the law was attacked by the International Lock and Seal Company, a corporation which manufactures seals used by railroad companies and shippers of freight for locking the doors of freight cars.

The attack upon the law expressed itself in the two old war cries, familiar in every attempt to discredit such legislation in the courts: that the law was unconstitutional, first, because it interfered with the laborer's property, that is, her right to labor and contract with her employer; second, because it was "class" legislation.

It is worth our while to examine these two arguments somewhat in detail, since they are not at all local or theoretical, but apply directly to the practical business of protecting girls and women from overwork.

First, then, as to the claim that a law limiting women's hours of work is unconstitutional because it interferes with their freedom to contract and work at will.

So far as the federal constitution is concerned, the decision of the United States Supreme Court in the Oregon case, settled this matter for the first time and for all time. The court held, as is well known, that the states may, under their police powers, interfere with individual property rights in many ways in the interest of public health and welfare, even though the fourteenth amendment specifically guarantees to every

person possession of "life, liberty, and property." This well-known phrase was inserted into the constitution for the protection of slaves, newly freed, and by one of life's ironies had been so distorted as to deprive working people of protection from exploitation in the name of their so-called "right" to contract for any number of hours. In the Oregon decision the judges of our highest court rejected the fiction of the free contract, as regards the working woman, and declared that her physical nature and the evil effects of overwork upon her and her future children "justify legislation to protect her from the greed, as well as the passion, of men."

This was the first great judicial victory for working women, freeing them from the misinterpretation of the fourteenth amendment of the federal constitution.

They were freed from a like incubus in a state constitution by last year's decision in the Illinois ten-hours case. We must bear in mind that these laws limiting hours of work must be in harmony not only with the federal, but with state constitutions. An earlier Illinois law for women met shipwreck precisely on that section of the Illinois state constitution which is identical with the fourteenth amendment, guaranteeing individual liberty. Illinois had to wait fifteen years before her supreme court, following the Oregon precedent, reversed the earlier decision, and declared in 1909 that the ten-hours day, whether it invades property rights or not, is a legitimate, because a necessary, exercise of the police powers of the state.

Now Michigan shows us an easier method out of the dilemma, by avoiding it altogether. The bogie of the fourteenth amendment of the federal constitution was laid by the Oregon decision. The bogie of a state constitution need not arise at all! It did not arise in the Michigan case, because the constitution of Michigan contains a section specifically authorizing the Legislature to enact laws "relative to the hours and conditions under which women and children may be employed."

Here we have a perfectly feasible and reasonable way of avoiding a danger. Let every state constitution which does not contain it, copy section 29 of art. v of the revised constitution of Michigan, and the obstacle will automatically disappear upon which have split the only state laws limiting women's working hours which the courts have held unconstitutional, in Illinois, New York, and Colorado.

The second point of attack upon the Michigan law—that it is class legislation—involves a much larger and more fundamental issue; one, indeed, at the basis of our democracy, the right of the legislature, undeterred by the courts, to use its discretion in determining the scope of laws. In their review of legislation, it is the function of the courts to determine whether the legislature had any reasonable grounds for its action; not whether the laws as enacted are inherently and in themselves good or bad, but whether the legislature was justified in its conclusions as embodied in the laws.

Obviously, in enacting any laws limiting hours of labor, the legislature must use its discretion in choosing among various alternatives, such as the number of hours to be fixed, the persons to be protected, and other similar points. Opponents of these laws have usually raised the cry that they were unfairly discriminatory, because certain persons or classes of persons were included or left out.

In the Illinois case, for instance, it was claimed that the law was unfair "class" legislation, because it included women working in factories and laundries, not in other occupations. In the Michigan case the law was attacked as "class" legislation because a different class of workers is omitted.

In both these cases the court performed a great service by upholding and reasserting the freedom of the legislatures to use their discretion as to the scope of the laws. "If all laws were held unconstitutional because they did not embrace all persons," said the Illinois court (quoting another decision), "few would stand the test." And it concluded that the law was not class

legislation, although it did single out those workers who seemed to the legislature most in need of protection. The Michigan court again throws the responsibility for the scope of the law squarely upon the discretion of the legislature, quoting with approval from Cooley's Constitutional Limitations on this point, "the legislature must judge." The law cannot be called unconstitutional because "it does not apply to all callings."

This emphasis upon the freedom of the legislature all lovers of democracy must heartily welcome, even though legislatures, like all human agencies, are liable to err and prove false to their trust.

II.

The freedom of legislatures is essential in a democracy; it carries with it responsibilities.

In the law at bar the Michigan Legislature has been culpably at fault. One of its sections is thoroughly vicious. It totally exempts from the protection of the statute all women "engaged in preserving perishable goods in fruit and vegetable canning establishments."

No condemnation can be too severe for the total exemption of this industry. On this point we thoroughly endorse all that counsel for the International Lock and Seal Company says regarding the Legislature's action: "that they were not looking to the health of the women, but rather the preservation of fruits and vegetables. It is purely the spirit of commercialism, without any thought of the health of the women or the number of hours that they shall be employed; in other words, the provision means simply this, that in order to protect the commercial interests of that class of citizens who are engaged in preserving perishable goods and who invested their money in canning establishments, (the canneries) may work women any number of hours in order that their profits may be increased and their business not interfered with."

In many states, the canners have claimed what they succeeded in inducing the Michigan Legislature to believe and enact into law—that their business is so different from all others that they must have special privileges over other manufacturers and longer working hours. It is true indeed that the canners cannot stay the hand of nature, nor delay the sudden ripening of crops which at times fills the canneries with a glut of raw materials. But no impartial observer can learn of the management of the canners, their lack of efficiency in providing beforehand for their emergencies, without realizing that they have simply rested on their alleged necessity for overtime work, and devoted to the management of the workers none of the skill which has perfected the technical mechanical processes of the business.

The outrageous duration of working hours in the canneries is a matter of common knowledge. Renewed investigation last summer showed that in New York state, where the ten-hours law has never been enforcible in the canneries, women were worked fifteen hours a day on successive days of the week. This continues under a management so inefficient that the burden of proof still rests on the canners to show that they cannot carry on their business without so exploiting women's strength and health.

The Michigan law, by freeing the canners from all legislative restrictions as to working hours, simply invites a repetition of such conditions if they do not already exist.

Just because the canners have greater difficulties than other manufacturers in obtaining their raw material regularly, the workers need the protection of specific laws. On the other hand, "by the famous might that lurks in reaction and recoil", such laws protecting the workers have been found in all civilized countries the best stimuli to improvements in management and efficiency.

After all, the emergencies in the canning trade are not essentially different from those which may arise in all businesses. With the fickleness of modern fashions and the extraordinarily sudden changes, the market for most commodities is precarious. All the articles of men's as well as of women's clothing—garments, neckwear, footwear, orna-

ments, jewelry—the furniture of our houses, the service upon our tables, sports like bicycling a few years ago and motoring today, the very songs of the music halls, echoing in the streets and in the innumerable musical instruments whose manufacture develops from year to year—all these things are subject to changes in fashion more violent than a former generation could dream of.

Are we, then, driven to conclude that all these manufacturers must have special concessions and privileges of overtime, allowed by law, such as the canneries claim? No. In this country we have with single exceptions recorded in our legislation (and are now facing the problem of enforcing) our contention that, so far as working women and children are affected, the seasonal necessities must be provided for by good management within reasonable working hours: that, in a word, production must be limited to conserve the workers' health and welfare, which are the health and welfare of the nation.

In exempting the canneries, then, from all restrictions, the Michigan Legislature took a step backward. As the Supreme Court of Nebraska said in a fine decision nine years ago, upholding the women's ten-hours law in Nebraska:

"The moment the police power is destroyed or curbed by fixed or rigid rules, a danger will be introduced into our system which would be far greater than the results arising from an occasional mistake by legislative bodies in exercising such power."

THE PREMIUM ON ABNORMALITY

SCOTT NEARING
UNIVERSITY OF PENNSYLVANIA

Could we, in pursuance of De Quincy's advice, select our ancestors, a cursory examination of modern social facts would, I am sure, induce those of us who yearn for the comforts of life to join the ranks of the defectives, dependents, or delinquents, rather than to eat our lot with the family of an unskilled American workman.

Such a choice would be inevitable, because the child who is being cared for in a modern child-saving institution is not only assured of a constant supply of the necessaries of life, but is actually receiving more of these necessaries than the child in the family of an unskilled workingman. For the sake of clearness we shall ignore the problems of mal-nutrition, insanitation, overcrowding, sweated work, and street life, which, while universal in the homes of the poor, are wholly absent in the modern child-saving institution. This gives, at the outset, a handicap in favor of the home. Nevertheless, by contrasting the actual expenditures in each case, I purpose to show that the child in the institution is better supplied with the economic necessaries of life than is the child in the unskilled worker's home.

The most recent investigation of wages covered the 9,000 employes in the Bethlehem Steel Company's plant at South Bethlehem, Pa. Of these workers, thirty per cent were receiving $1.50 a day or less, while the wages of sixty per cent were less than $2 a day. As this showing in the Bethlehem Steel Works is very similar to conditions described in Pittsburgh by the Pittsburgh Survey, we may safely accept these wage figures as typical of wages in the steel industry at large. Hence, conclusions based on an analysis of the wages of unskilled labor in South Bethlehem may with justice be applied to the families of unskilled laborers in many other sections of eastern United States.

These wage figures are cited merely to establish the facts. The personal experience of every reader will furnish abundant proof of the statement that unskilled labor wages in the eastern part of the United States range from $1.25 to $2, centering about $1.50.

The next point that must be estab-

lished is the relation between $1.50 per day ($450 a year) and the income of the average child in such a family. Accepting the usual "man, wife, and three children under fourteen" family as standard, and employing the figures of the United States Department of Agriculture (man—1, Woman—.8, Children —.2 to .9), $450 per year for such a family provides $128.57 per year per adult man and $77.14 for the average child (.6 of a man).

The children of the 2,700 South Bethlehem steel workers who were earning $1.50 per day would therefore be required to live on not more than $77.14 per year, provided, first, that there was no stoppage of wage due to sickness, accident, or unemployment; and, second, that there were not more than three children in the family. Any unemployment or any addition to the family would still further decrease this meager sum. For these employes receiving $2 per day ($600 per year) the amount per child would be $102.84. The children of such families, in cases where their share was not squandered or unwisely expended by their parents, would therefore receive between $77.14 and $102.84 annually as their rightful share of family income.

How do these sums compare with the amounts expended by public and private philanthropy for the care of (1) dependent children, (2) defective children, and (3) delinquent children?

Between the $77.14 which the dollar-and-a-half man with a family of three may spend on each child and the amount expended on children who have become public charges, a startling discrepancy appears. The expenditure for dependent children (orphans and homeless) seldom falls below $104 per year; in the case of the New York Orphan Asylum, (Hastings on the Hudson) it rises to $228.12 per year, while the Seybert Institute, Meadowbrook, Pa., spends $329.66 per child, and the Haddock Memorial Institution, Philadelphia, spends $521.56 annually. The abundant provision made for dependent children is almost equalled by that made for delinquent children. In the House of Refuge, Glen Mills, Pa., the per capita yearly expenditure for the 855 boys was (1909) $174.84, while for the 381 girls the expenditure was $225.73. Turning from these expenditures for dependents and delinquents to the expenditure for defectives (feeble-minded and epileptic) a like situation appears. The average expenditure in such institutions is considerably over $100 per capita per year, amounting in Indiana to $148.91, and in Vineland, N. J. to $230. The normal child in the family of a dollar-and-a-half-a-day laborer is therefore at a distinct disadvantage as compared with a child who is being cared for in an institution for abnormal children.

The wage statistics of the South Bethlehem Steel Works show that one-third of all of the workmen are receiving wages so low as to be unable to provide for their children an income equal to that of the child in the most ordinary child-saving institutions, while another third are able to provide per child only $102 a year, or an amount about equal to the average for child saving institutions ($104). Is such discrimination justifiable? Certainly not. The institutional children are at best a social cost, and at worst a social menace, while the children in the families of the unskilled workers will be called upon to assume the responsibilities of citizenship and to do the work of the new generation. The institution is supporting social wastage while the home is charged with the care of future society.

The argument, it will be remembered, has been placed entirely on the side of the home by assuming, (1) that insanitation, mal-nutrition, and overcrowding were eliminated; (2) that employment was continuous, and (3) that the income was not squandered. These assumptions are on their face ridiculous. The most casual observer knows of the prevalence of insanitation and congestion; sickness, accident, and stoppage of work are constant source of unemployment, while the ignorant among the poor are continually squandering their incomes through unwise expenditure, or dissipation.

The inequality between the normal and the abnormal children is accentuated by the inefficient systems of expenditure

and consumption in private homes and the large scale, efficient devices with which all modern institutions are equipped. The methods of domestic economy in the households of the poor are nearly always extravagant and frequently wasteful. Popular superstition to the contrary notwithstanding, this wastefulness is due to ignorance and inefficiency rather than to dissipation. Be the cause what it may, the effect on the child is the same, depriving him of even the scant standard which his $77.14 should provide. Sharply contrasted with the wastefulness of the home is the catering in institution, which is carried forward under the most auspicious conditions. Freed from the payment of taxes, and secured by private bequest against changing depreciation of their equipment, these social life-saving stations may devote all their energy to providing the most efficient and economical organization that money or ingenuity can secure. While the normal family struggles forward, shackled by ignorance and cramped by lack of capital, the institution prepared for the care of abnormal children is equipped by the best procurable modern systems of maintenance.

The child of an inquiring turn of mind, after due consideration of its ancestors, would therefore discover that society is not only expending more per capita upon its dependent, defective, and delinquent children than it is upon its normal children, but that the amounts expended upon these social charges are in some cases in excess of the amounts which a dollar-and-a-half-per-day man has to spend upon his entire family. If in addition to inquisitiveness this embryo being were gifted with reason, it would be but a short cry to the discovery that, if he wished to be well fed, clothed, and housed, it were infinitely more desirable to come into the world with a misshapen brain, or a tendency to predatory activities, or even to start life as an orphan, than to begin a losing fight in the family of a common laborer.

Even a child might observe that society is taking more effective care of the abnormal than of the normal children of its unskilled laborers,—that it is placing a premium on abnormality.

CO-OPERATIVE PHILANTHROPY

ADMINISTRATION OF RELIEF DURING THE STRIKE OF THE CHICAGO GARMENT WORKERS

ZELIE P. EMERSON and KATHARINE COMAN

Ethelbert Stewart of the Federal Tariff Commission, speaking recently before the Chicago School of Civics and Philanthrophy, said "that the relief funds of the striking Garment Workers, for the short space of time in which the system was planned, were administered in the most efficient and economical way that he had ever seen." The commissary stores, the form of strike benefit developed and used during the strike, have been called a permanent addition to organized labor's equipment.

The strike had not long been on before the leaders realized the pressing need of the utmost economy of resources, which must be limited, while the demands were great and ever increasing. John Fitzpatrick, president of the Chicago Federation of Labor, and Mrs. Raymond Robins, president of the Women's Trade Union League, early realized the extravagance of cash benefits, and concluded that the only adequate way to cope with the situation was to establish commissary stations in the districts most affected by the strike. Of the economy of the system there is no question; a well organized body is able to purchase supplies in quantity—always at wholesale price and sometimes at cost—and can frequently draw in this crisis, as it did, upon the good feeling of merchants and dealers and thus receive large contributions of bread, coal, and other commodities.

Accordingly, stores were established at 1,272 North Lincoln street, where

ONE OF THE COMMISSARY STORES DURING THE CHICAGO GARMENT WORKERS' STRIKE.

By a careful system of investigation supplies were given only to those in real need. The distribution was safeguarded by tickets, one of which is shown on another page. Over 32,000 people were aided, and many immigrants received incidental lessons in the relative nutritive values of foods.

GROCERIES WERE BOUGHT AT WHOLESALE.

most of the Poles and Lithuanians live; at 1,853 Blue Island avenue, in the heart of the Ghetto; at 1,015 Johnson street, in the Italian district, and at 610 West Fourteenth street, the Bohemian center. Mr. Cain of the Cigar Makers' Union, to whom the Chicago Federation of Labor paid a salary, and Mr. O'Neil, whose services were given by the firemen, purchased the supplies, while the four clerks of each store saw to distribution of the food under the direction of a superintendent.

The tickets, of which 500 were issued for each store for each of the six days of the week, were given out by Agnes Nestor of the Women's Trade Union League and Emmet Flood, organizer for the American Federation of Labor, to the fifty and more shop chairmen. Each chairman was responsible for a certain number and he gave out the tickets to those whose need was known to him. Each ticket, properly numbered and assigned, entitled the holder to a month's supply of food and fresh bread every day. In the first weeks of the strike the tickets called for supplies on two days of the week, but it was found impossible to handle so many people and the order was changed to once a week. When the cards were presented at the store and the week's supply of provisions was given out, the recipients signed receipts. This system made fraud impossible and no further investigation was necessary. Thus nearly 32,000 people were at least kept from starving. Incidentally a great many foreigners learned the nutritive value of articles of food hitherto unknown, such as beans and oatmeal. Hereafter they will probably demand a higher class of ordinary groceries than before.

James Mullenbach, whose experience in the relief work at Cherry Mine made his advice most valuable, helped Mr. Fitzpatrick and Mrs. Robins in planning the family rations, both as to quantity and nutritive value. The weekly rations for the variously sized families, with potatoes, and for the Italians, macaroni, follow:

FAMILY OF TWO PERSONS.

Bread	7 loaves
Sugar	2 lbs.
Oatmeal	1 pkge. (small)
Coffee	1 lb.
Beans	2 lbs.
Ham	8 lbs.

FAMILY OF THREE PERSONS.

Bread	11 loaves
Sugar	3 lbs.
Oatmeal	1 pkge. (large)
Coffee	1 1-2 lbs.
Beans	3 lbs.
Ham	10 lbs.

FAMILY OF FOUR PERSONS.

Bread	14 loaves
Sugar	4 lbs.
Oatmeal	2 pkgs. (small)
Coffee	2 lbs.
Beans	4 lbs.
Ham	8 lbs.

FAMILY OF FIVE PERSONS.

Bread	18 loaves
Sugar	5 lbs.
Oatmeal	2 pkgs. (large)
Coffee	2 1-2 lbs.
Beans	5 lbs.
Ham	10 lbs.

FAMILY OF SIX PERSONS.

Bread	20 loaves
Sugar	6 lbs.
Oatmeal	3 pkgs. (small)
Coffee	3 lbs.
Beans	6 lbs.
Ham	12 lbs

Articles not listed in the regular supplies were furnished occasionally to afford variety, *e. g.* lard and sardines; but all luxuries were soon abandoned. Ham or corned beef was provided until Thanksgiving, when these were deemed too expensive and salt cod-fish and herring were substituted. By January 1 these, too, were given up and the diet was reduced to cereals, beans, coffee, and bread.

In all, twenty-two car loads of food and 200,000 loaves of bread were furnished. Here is the list of several amounts given out:

147,060 lbs. granulated sugar.
108,108 lbs. rice.
37,486 lbs. ground coffee compound.
16,726 lbs. roasted whole coffee.
103,973 lbs. navy beans.
52,850 lbs. rolled oats.
240 cases pancake flour.
57,331 lbs. lentils.
21,243 lbs. flour.
15,256 lbs. pearl barley.
569½ doz. tins syrup.
445 cases macaroni.
440 small packages macaroni.
12 cases tomato paste (250 tins in a case.)
416 2 lb. tins of tomatoes.
30½ cases ¼ lb. oiled sardines (100 tins each)
51 barrels imported Holland herring.
63 round shore herring.
180 cases mustard sardines (48 tins each)
40 cases condensed milk (small tins.)
238 cases condensed milk (large tins.)
185 cases boneless codfish (40 tins to a case)
55 cases Pacific peas.
16 cases North Star peas.
45½ cases mackerel, in tins.
140 cases lima beans.

When the stores were first started, people who had had experience in this sort of thing feared that there would be more or less crowding and cheating at the stores. Fortunately, owing to the self-respecting and law-abiding characteristics of the workers—for the most part foreign born—the rations were distributed quite as at any other shop. Each store had five hundred patrons a day, but they wasted no time picking and choosing. In two hours 148 people were served at one store.

With the stores taking care of the families, the next great problem was the best way to provide for single men and girls, of whom there were about 18,000, many of them absolutely alone in this country, without friends and unable to speak a word of English.

For ten weeks meal tickets for 3,000 people were issued weekly by the *Jewish Labor World* and the Jewish Working Men's Conference. They were issued in series good for seven fifteen-cent meals.

The Women's Trade Union League maintained a lunch room in a little Polish Bakery at 1,014 Noble street, where a cup of coffee and two cheese or ham sandwiches were given at cost to 200 single men and girls. Here the thoughtfulness of the strikers for one another was exhibited to a marked degree. When asked to take a second sandwich many would say, "I had breakfast this morning; give it to someone who needs it more than I." It was found that special provision must be made for certain little girls of strict training, Jews and Poles, who explained to Mrs. Robins with tears in their eyes that it was impossible for them to go into a restaurant where there were strange people because it would not be decent. A special fund was set aside for them, and each girl received two dollars a week to tide over the time of trouble.

The strike was well advanced when Christmas came, and many philanthropic people began to ask for names and addresses of strikers to whom they might send Christmas baskets. About 1,200 baskets were given out through churches, settlements, individuals, and the newspaper offices. On the Northwest Side, where the more radical element held its meetings and where the spirit of brotherhood was most intense, it was almost impossible to secure names for the distribution of baskets. When asked for addresses many would say, "Oh, my children are too little to know what Christmas means; give it to someone who has older children"; or, "My children have had many nice Christmases; give it to someone who needs it more than they do." At the suggestion of the chairman of one hall Christmas parties were given in several places of assembly. Christmas tree parties, with presents for the children and speeches and music for the older

people, were the order of the day. Everybody felt that at least the "spirit of Christmas" was not on strike.

The Citizens' Committee, appalled at the suffering of thousands of babies and children who could not eat the food furnished by the Commissary Department, started a milk fund. Mrs. Joseph F. Bowen made the first contribution of $1,000 and more than $8,000 was secured. An attempt was made to handle the milk supply at the stores, but as that would have necessitated more clerks and larger rooms, it was found advisable to have the milk delivered at the homes. It took some time to reach all the people in this way, because many did not know their streets and numbers and some, when they came to headquarters with credentials from their shop chairman, could not make themselves understood. However, at length everything was straightened out, and for two months 2,000 quarts of milk were delivered daily.

The Women's Trade Union League undertook to provide coal for needy families on the presentation of the grocery ticket or credential from the shop chairmen. This was delivered at the homes by one of the large retail dealers in quarter and half-ton lots, which the people understood must last at least two weeks. Many took special pride in making the supplies last longer by letting the fire go out at night and banking it with ashes when not in use for cooking. In cases of sickness, or when it was impossible to use soft coal in the stove, hard coal was sent, but not until the situation was investigated. Here again the difficulty with addresses arose, although great care was taken to get them correct, as the company refused to take responsibility for delivery except where the street, number, part of the house, cross street, and quarter of the city were given clearly. Delays in delivery, caused by mistakes in addresses, often occasioned suffering, and in any case it takes a long time to deliver 720 tons of coal in quarter-tons. The relief agencies are much indebted to the skill and patience of the retail company entrusted with this service.

The Strike Committee did not attempt to handle the gas bills, so where gas was turned off the people were told to buy candles. It is impossible to discover in how many houses gas was turned off, as the company did not record who were strikers among delinquents and who were not.

The special committee appointed to deal with rents and evictions decided to use the same methods as are used by the United Charities, and to pay only for moving and the first month's rent when the tenant was about to be evicted. In every instance a call was made upon the landlord, who was asked to wait for his money until the strike was over. In most cases the landlords, although themselves poor men, agreed to wait, the strikers promising to pay as soon as possible. There were only four actual evictions in the course of the four months the strike lasted, and two of these could have been prevented if the advice of the committee had been taken.

The people themselves helped solve the problem of housing single men and girls. Families living in four rooms, for instance, would move into two and give two to young strikers. Many hundreds were taken care of this way; and many landladies, although in need of money, moved by the plight of their lodgers, kept them, regardless of a debt which could not be paid for months. For those unprovided for in such ways, special arrangements were made through the shop chairmen.

The strike started on September 22 when the weather was still warm. Fortunately the cold held off until November. Then the children began to need warm clothes and there was no money to buy them. "Old clothes" supplies at various settlements were secured, but this resource was soon exhausted. Pitiful tales of the suffering by little newly-born babies were reported. Touched by these, Mrs. J. F. Morse issued an appeal for baby clothes and received and distributed 750 layettes, the need being investigated in every case. In addition, about seventy-five barrels of clothing and shoes were distributed from Northwestern Settlement, Henry Booth House, Hull House, and Mrs. Morse's home.

Only in the most pressing cases of destitution was money given, and then

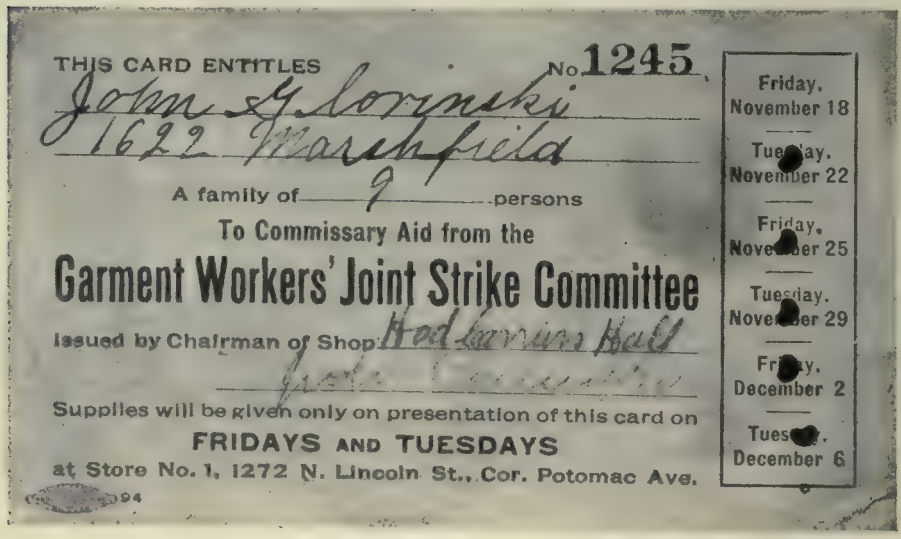
only after a thorough investigation. Since the strike beneficiaries were not on the lists of the United Charities or of the Hebrew Charities, about 3,000 calls had to be made to determine just how the relief should be afforded. One visitor with a record of 800 visits in two months, in widely separated parts of the city, reported only five cases where relief was not, to her mind, absolutely necessary.

The Lying-In-Hospital and the Maternity Ward of the Presbyterian Hospital took care of an unusual number of maternity cases. Here also the Visiting Nurse's Association did its share of the work. However, taking everything into consideration, there was comparatively little sickness. Physicians familiar with the district observed that the people were unusually vigorous, and many of the strikers, because of long days spent in the open air and freedom from nervous strain, went back to work physically improved.

GIVING OUT SUPPLIES.

The picture shows the interior of a commissary store in the Bohemian quarter. The man in shirt sleeves is the manager. The girl at the table is checking off strike orders.

The sick people were not overlooked in the general plan of relief. As soon as any sickness was reported to headquarters, doctors, who gave their services, and of whom two were specialists, were called in. If the case needed hospital care, arrangements were at once made for the sufferer to be taken there. If the patient was able to remain at home, the visiting nurses were called in.



Even with this elaborate system of relief assistance was given only to the most destitute strikers. Thousands never came to the stores or strike headquarters, living on the hard-earned savings of years, or else borrowing money of their more fortunate relatives or friends and loading themselves down with debt.

The total amount spent in relief was divided as follows:

Commissary supplies	$43,875.06
Meal tickets	36,000.00
Milk	8,519.39
Coal	4,255.80
Money relief	1,552.00
Rent	150.00
Restaurant, Women's Trade Union League	700.00
Total	$95,052.25

Of this sum all but $25,000 was contributed by working people. The most considerable contributors were the Chicago Federation of Labor, the Woman's Trade Union League, the Jewish Working Men's Conference, the United Garment Workers, and the United Mine Workers of America.

Every strike has its demoralizing side, but so far as the giving of relief is concerned the strike of the Chicago garment workers was remarkably free from pauperizing tendencies. Many strikers were engaged in raising funds, sometimes by house to house canvass in the poorest quarters of the city, and they knew at what cost the money was given. All the garment workers understood that their resources were limited and that a desperate struggle was before them. Thus the spirit of self-help was stimulated rather than weakened. The *esprit de corps* developed by the sense of common purpose and mutual responsibility was one of the most extraordinary features of this great industrial war. When the strike was called off the people said: "We are tired of being beggars. We will go to work and save money, so that when we strike again we shall have funds of our own to live upon."

THE COMPENSATION COMMISSIONS

A REVIEW OF LEGISLATION PROPOSED IN SEVEN STATES WITH RESPECT TO WORK ACCIDENTS

P. TECUMSEH SHERMAN

NEW YORK

UNDER VARIOUS NAMES, SEVEN COMMISSIONS ARE REPORTING THIS WINTER TO THE LEGISLATURES OF ILLINOIS, MASSACHUSETTS, MINNESOTA, NEW JERSEY, OHIO, WASHINGTON, AND WISCONSIN ON THE SUBJECT OF COMPENSATION FOR WORK ACCIDENTS. LAST YEAR THE NEW YORK STATE COMMISSION MADE ITS REPORT, AND THE YEAR BEFORE THE PITTSBURGH SURVEY FOLLOWED 500 FATAL CASES BACK FROM THE CORONER'S OFFICE TO THE HOMES OF THE KILLED WORKERS, AND SHOWED BY ITS FINDINGS THAT UNDER THE COMMON LAW, IN A TYPICAL AMERICAN INDUSTRIAL DISTRICT, THE BURDEN OF WORK ACCIDENTS STAYS FOR THE MOST PART WHERE IT FIRST FALLS, ON THE SHOULDERS OF THOSE LEAST ABLE TO BEAR IT.

THE MOVEMENT HAS GATHERED HEAD NATIONALLY. CONSTRUCTIVE STATESMANSHIP IS NEEDED IN CRYSTALLIZING THE AROUSED PUBLIC SENTIMENT INTO FAIRER LAW. AT SUCH A JUNCTURE MR. SHERMAN HAS PERFORMED A PUBLIC SERVICE IN HIS COMPARATIVE REVIEW OF THE OFFICIAL REPORTS WHICH HAVE COME FROM THE PRESSES IN JANUARY AND FEBRUARY.

TO HIS ANALYSIS HE BRINGS AN EXPERIENCED JUDGMENT, BOTH AS LAWYER AND AS A FORMER SUCCESSFUL COMMISSIONER OF LABOR OF ONE OF THE GREAT INDUSTRIAL STATES—NEW YORK.

In order to understand the review of the reports of the various state commissions on the subject of employers' liability which follows, it is necessary first to comprehend wherein lies the difference between their recommendations and the existing laws, and the obstacles in the way of accomplishing the purpose of those recommendations

Under our common law an employer is liable to an employe in full damages, as for a *wrong*, for any accidental injury due to the employer's negligence or fault —unless the employe's negligence or fault contributes to it (defence of "contributory negligence"). For accidents due to the ordinary risks of the employment (defence of "assumed risks") or—with some exceptions—to the negligence of a co-employe (defence of "fellow-servant"), the employer is not liable. Under the common law, therefore, as interpreted by the courts during the past fifty years, injured workmen seldom have had any right to relief from their employers; and in the hazardous industries particularly, it has been generally most unfair to them. Therefore in recent years that law has been variously amended in the different states by statutes (popularly entitled "employers' liability laws"), to make the employer liable not only to the injured workman personally, but also to his next-of-kin if he is killed, to limit the defences of "contributory negligence," "assumed risks" and "fellow-servant," and in other ways to extend the conditions under which the employer should be liable for full damages. These statutes, although uncertain in their results in particular cases, have on the average improved the workmen's position; but, on the other hand, they have generally entailed an entirely disproportionate cost and frequent gross injustice upon employers, and many other serious incidental evils.

In Europe and the colonies of Great Britain this method of curing the defects of the earlier law has, in general, been long abandoned; and in place of the liability for negligence or wrong there has been substituted, either wholly or partially, and either in all employments or in hazardous industries only, a novel liability whereby the question of fault or wrong is largely or wholly eliminated, and the employer is made liable gener-

ally to "compensate" his employes or their dependents for approximately a certain fixed proportion (generally fifty per cent) of their wage losses from injuries incurred in the employment. In addition to the mere liability for such compensation (the English system) Germany, Austria, and some other European countries require the employer to insure its payment in some prescribed manner. Under the European laws the liability for and the amount of compensation, etc., are variously determined by agreement, by voluntary arbitration, by compulsory arbitration, by special boards of experts, or by the ordinary courts. These foreign laws, in respect of the public welfare and of private justice between employer and employe, are infinitely superior to our obsolete system of liability.

We have now suddenly awakened to a realization of that fact; and it is the purpose of the recommendations of the reports of all the commissions which are reviewed below to substitute, or to make a move in the direction of substituting, the "compensation" principle of liability, which is the basis of those foreign laws, in place of the "negligence" principle of liability, which is the basis of our common law, and of the "employers' liability" statutes by which we have been seeking to correct its defects. But the problem of framing a system of liability law based upon the "compensation" principle is peculiarly difficult with us, owing to the necessity of its conforming in every respect to the provisions of our written constitutions, and is further complicated, as between the different states, by the fact that the constitutional provisions of those states differ among themselves. These differences, and differences of opinion as to the effect of certain common constitutional restrictions, as to what form of compensation law is the ideal, and as to the expediency of changing the law immediately to the ideal or of moving towards it by gradual steps, are the cause of the more material difference between the legislative proposals put forward by the several commissions.

These bills, however, are not the first efforts in the direction of the European system. New York has already enacted a "compulsory compensation law" in certain dangerous trades (Laws 1910, Chap. 674), and also an elective compensation law for voluntary adoption by employers in other lines, which would put them on practically the same footing as employers in the dangerous trades specified (Laws 1910, Chap. 352); but the latter has proved so impracticable as not to call for consideration; and Maryland and Montana have already experimented, or are experimenting, with "compulsory insurance" of mine-workers.

NEW YORK

The New York law deserves explanation for purposes of comparison. That law applies only to a few exceptionally hazardous occupations and industries, and only to those injuries therein due to the fault of the employer or of "fellow servants," or to "trade risks."

The "compensation" liability which it imposes is *additional* to the older liability for damages; and the option is given the injured employe, after the accident, to choose between them.

It provides for compensation as follows:

In case of death: If there are total dependents, a lump sum equal, to three years' wages, but not to exceed $3,000. If only partial dependents, a proportion of the foregoing. And if no dependents, medical and funeral expenses not to exceed $100.

In case of disablement: Weekly payments of fifty per cent of wages if the disablement is complete, or of fifty per cent of impairment of earnings if it is partial, but of not more than ten dollars, beginning at the end of the second week and continuing during disablement but not longer than eight years.

Disputes are to be settled by arbitration or by action at law. A judgment in an action is to be for a lump sum only, equal to the sum of the payments prospectively due.

ILLINOIS

The Report of the Illinois Employers' Liability Commission presents a bill which applies to all employments in the course of trade or business; to all employes not "casual"; and to all accidental injuries and deaths caused in the course of the employment, except those due to the serious and wilful miscon-

duct of the injured employe, and those not causing disablement for more than one week.

It is a mixed "negligence" and "elective compensation" law. It abolishes the defences of "assumption of risks" and "fellow servant" in the law of negligence; and then gives the employer the option to *elect* liability for compensation alone, upon condition that he manifest such election in a prescribed public manner. In default of such election the employer is made liable under both laws. If he elects the compensation liability, a contract is presumed between him and each of his employes (except such employe as by written notice expresses a contrary election on his part) to substitute that liability for all others, except where the injury is caused by the wilful failure of the employer to comply with "statutory safety regulations," in which case the employer is to be liable for full damages.

The compensation payable is as follows:

In case of death: To a widow, parents, and descendants if any, towards whose support the deceased has contributed within five years, three years' wages but not less than $1,500 nor more than $3,000. Otherwise, to other collateral dependents, a proportion of the foregoing. And if no such dependents, not more than $150 to the personal representative of deceased. The sum above provided for as compensation to dependents is payable for the first six months in installments, like wages, and thereafter in a lump sum or in installments, at the option of the person entitled thereto.

In case of disablement: Periodical payments from the date of and continuing during disablement, or until the sum of the payments equals the amount which would have been due in case of death,[1] as follows: If disablement is *complete* a weekly payment of fifty per cent of wages but not less than five dollars nor more than ten dollars, for eight years; and thereafter, if complete disability continues, eight per cent of the amount which would have been due in case of death, payable in monthly payments during life. The loss of both eyes, or of both hands, etc., is always to be deemed complete disablement. If disablement is only *partial*, a weekly payment of fifty per cent of the impairment of earnings, not to continue longer than six years; but other definite proportions of wages in weekly payments for fixed periods are prescribed for certain specified injuries; (*i. e.* the loss of a hand, of an eye, etc.). Where weekly payments have continued six months and the disablement is determined to be permanent, an option is given the injured employe to demand in settlement a lump sum equal to four years' compensation, less the amount of payment received.

Also, for the first ninety days, the employer is to furnish necessary medical care, appliances, etc.

[1]The effect of this provision upon the following provisions is uncertain.

Compensation may be determined by agreement. Disputes must be settled by arbitration.

This bill did not receive the approval of a majority of the commission, which therefore does not recommend it for enactment. The employers on the commission objected to that provision which would leave an employer liable for damages for an accident due to his wilful failure to comply with "statutory safety regulations." The labor representatives on the commision filed two sets of objections to the bill. Two of them endorsed the demands of the Chicago Federation of Labor, that an advanced "employers' liability law" should precede a "compensation law." Four of them, on the contrary, objected that the "compensation" liability should be made compulsory instead of elective, and that the compensation provided ("three years' wages" for death and "four years' wages" for complete disability) would be inadequate.

WISCONSIN

The Report of the Special Committee on Industrial Insurance of the Wisconsin Legislature recommends a bill which applies to all employments; to all employes except those whose employment is but casual or not in the usual course of the trade, business, profession, or occupation of the employer; and to all injuries and deaths proximately due to accidents incurred where the employe is performing service growing out of and incidental to his employment, unless caused by wilful misconduct (whether of the injured employe, of a fellow servant, of the employer, or of a stranger).

It is a mixed "negligence," "elective compensation," and "compulsory compensation" law. It abolishes the defences of "assumption of risks" and "fel-

[1]A careful study has failed to reveal any such provision in the bill. But what the bill does provide is a conundrum, and this may be the correct answer.

low servant" in the law of negligence (except as to railroads, as to which those defences have already been modified); then imposes instead the compensation liability alone upon the state, and each county, city, town, village, and school district therein; and then gives every private employer the option to *elect* liability for compensation alone, upon condition that he manifest such election by filing notice with the Industrial Accident Board, which notice binds him until withdrawn in the manner in the bill prescribed. And unless an employe, at the time of hiring, notifies the employer in writing of his election not to be subject to the compensation law, the liability thereunder is to be the exclusive remedy against the employer for accidental injuries and deaths. It is to be noticed that this leaves the employer liable for damages under the law of negligence, as amended, for accidents due to his "wilful misconduct."

The compensation prescribed is as follows:

In case of death: If there are total dependents, a sum (less the amount of any payments for disablement previously made) equal to four times the deceased's average annual earnings (to be taken at not less than $375 nor more than $750) payable in weekly installments, unless the Industrial Accident Board shall direct payment in gross. Wife, husband, and children, under certain conditions, are to be conclusively presumed to be total dependents. If there are only partial dependents, the foregoing compensation is to be proportionately reduced; and if there are no dependents, the expenses of burial, not to exceed $100.

In case of disability: Nothing for the first week. Thereafter weekly payments as follows: If the disablement is complete, of sixty-five per cent of average weekly earnings, or if it be so complete as to render the injured person so helpless as to require a nurse, of one hundred per cent of such earnings; if the disablement is only partial, the foregoing payments to be proportionately reduced; such payments to continue during disablement, but not longer than fifteen years, nor to exceed in the aggregate four years' average earnings. (Average yearly earnings are to be taken at not less than $375 nor more than $750; and average weekly earnings at one fifty-second thereof.) Payments may be withheld for twenty-nine days after disablement, and if the injured employe recovers in the interval no payment is to be due.

In addition, the employer must furnish necessary medical and surgical treatment, medicines, appliances, etc., for ninety days; and in case of his failure to do so he is to be liable to others for the cost thereof.

If, after permanent disablement, death results from an independent cause, the employer is nevertheless to be liable for compensation as for death, less the amount of compensation for disablement already paid.

A State Industrial Accident Board is established, to consist of three members. Every compromise (settlement?) of a claim for compensation is subject to review by this board within one year. And every dispute concerning compensation is to be determined by it, subject to review by the courts upon certain questions of law only.

Voluntary mutual insurance schemes are permitted, but not as a substitute for the legal liability.

NEW JERSEY

The Report of the New Jersey Commission on Employers' Liability recommends a bill which applies to all employments, to all employes except "casual", and to all injuries or deaths in the course of the employment, unless intentionally self-inflicted.

Like the Illinois bill, it is a mixed "negligence" and "elective compensation" law. It abolishes the defences of "assumption of risks" and "fellow servant" and restricts the rule of "contributory negligence" in the negligence law; and then provides that employer and employe may contract for the "elective compensation" liability alone, and that such a contract shall be presumed in every case, unless a contract to the contrary is made in writing.

The compensation payable under this bill is as follows:

In case of death: If there are total dependents, weekly payments of varying proportions (from twenty-five per cent to sixty per cent) of wages, depending upon the number and relationship of the dependents, but of not less than five dollars nor more than ten dollars, and not to continue longer than 300 weeks. If there are only partial dependents, such weekly payments are to be proportionately reduced. And if there are no dependents, not more than $200 for expenses of last illness and burial. Children over sixteen and non-resident alien dependents are not to be deemed dependents.

In case of disablement: Weekly payments, beginning at the end of the second week, of fifty per cent of wages if the dis-

ablement is complete, but of not less than five dollars nor more than ten dollars, and to continue during disablement but not longer than 300 weeks, if the disablement is temporary, or 400 weeks, if it is permanent. If the disablement is only partial, the foregoing rates are to be proportionately reduced;—but in certain cases (*i. e.* the loss of a hand, a foot, or an eye, etc.) fifty per cent of wages for definite numbers of weeks is specified.

In addition, the employer must furnish necessary medical and hospital services during the first two weeks, not to exceed $100 in cost.

Payments may be commuted for a lump sum, only where, upon application, the court decides it to be "in the interest of justice."

Compensation may be determined by agreement. Disputes are to be settled by the courts "in a summary manner."

The representatives of labor on the New Jersey commission objected to that provision in the bill which fixes the maximum compensation in case of death at ten dollars per week for 300 weeks or $3,000, and contended for a maximum of 400 weeks or $4,000.

MINNESOTA

The Report of the Minnesota Employes' Compensation Commission recommends a bill which applies to all employments in industries conducted for gain or profit, (nominally only to those which are dangerous, but every industrial employment in which an accident shall occur is naively declared to be dangerous); to those employes only who are commonly known as laborers and workmen, or technically as "servants"; and to all personal injuries arising out of and in the course of the employment, unless occasioned by drunkenness or purposely self-inflicted, (both with some qualifications).

It is a strict "compulsory compensation law"; and, where it applies, is exclusive of all other liabilities.

The compensation payable is as follows

In case of death: Funeral expenses, not to exceed, $100 and: If there are total dependents, periodical payments (not less frequently than monthly) of fifty per cent of wages, continuing during the condition of dependence, but not longer than five years nor to aggregate more than $3,000. If there are only partial dependents the foregoing payments are to be proportionately reduced. And if there are no dependents, medical and hospital expenses, not to exceed $100.

In case of disablement: Medical and hospital expenses, not to exceed $100, and: If the disablement is complete, periodical payments (as above) of fifty per cent of wages (but the annual amount of compensation never to exceed fifty per cent of $2,000), commencing at the end of the second week and continuing during disability but not longer than five years. If the disablement is only partial, the payments are to be fifty per cent of the decrease in wages (or if wages exceed $2,000, fifty per cent of the decrease below $2,000). But the percentage of wages is to be increased in certain specified cases of maiming.

Payments may be commuted for a lump sum or by the purchase of an annuity, but only with the approval of the Board of Arbitration.

A system of boards of arbitration is established, with one board composed of three officials in each county, and a code of procedure therefor is provided. Settlements and agreements as to compensation are subject to the approval of the proper board; and all disputes are to be determined in first instance by that board, with the right of appeal to the courts.

Detailed provisions governing the insurance of the liability for compensation are laid down. Voluntary mutual insurance schemes are permitted upon conditions, but not as a substitute for the legal liability.

One of the three members of the Minnesota commission objected to the bill on the following grounds: (1) That some adaptation of the German system of compulsory insurance is preferable. (2) That industrial chaos is to be feared if the bill should be enacted and the law subsequently declared unconstitutional. (3) That the question of cost has not yet been adequately considered.

MASSACHUSETTS

The Report of the Massachusetts Commission on Compensation for Industrial Accidents presents no bill. The commission expresses itself as greatly impressed by the pronounced opposition of both employers and employes to the tentative draft of a compensation bill which it published some weeks before its report, and recommends that further investigation and study should be undertaken before a measure is submitted for enactment.

The tentative draft bill referred to applies to every employment in which the employer has more than five persons continuously in his employ for at least three days; to all employes except those who by reason of advanced age, etc., are more liable to accidents or to more serious consequences from accidents, and who have, with the approval of the Accident Board, agreed with their employers not to claim the benefits of the act; and to all injuries arising out of and in the course of the employment, except those due to the injured employe's deliberate intention, his deliberate breach of statutory regulations, or his intoxication.

It is a "compulsory compensation" law; and the liability imposed is exclusive of all others, except where the circumstances are such that the employer would be liable at "common law," in which event an option is given the injured employe either to sue for damages at common law or to claim compensation.

The compensation payable is as follow:

In case of death: If there are total dependents, weekly payments of fifty per cent of wages, but of not less than four dollars nor more than ten dollars, for 300 weeks. Wife, husband, and children are to be deemed total dependents. If there are only partial dependents, such weekly payments are to be proportionately reduced. And if there are no dependents, expenses of last illness and burial, not to exceed $200.

In case of disablement: Weekly payments, beginning at the end of the second week, of fifty per cent of wages, but of not less than four dollars nor more than ten dollars, if the disablement is complete; or of fifty per cent of impairment of earnings if it is only partial; to continue during disablement, but not longer than 300 weeks from the date of accident *i. e.* for 298 weeks.

In unusual cases a weekly payment, after it has continued for six months, may be commuted for a lump sum, subject to the approval of the Accident Board.

All insurance policies, which cover the liability of employers under this proposed law, must make the insurance company liable directly to the injured employe.

A State Accident Board of three members is established. Settlements and agreements as to compensation are subject to the approval of that board. All disputes are to be determined in first instance by a board of arbitration, two members of which are to be selected by the employer and the injured employe respectively, and the third is to be a member of the State Accident Board. From the decision of that board an appeal is allowed to the courts on all questions except the *amount* of compensation.

Voluntary mutual insurance schemes, in lieu of the legal liability for compensation, are permitted upon conditions, provided that they be approved by the Accident Board and be not obligatory upon employes.

WASHINGTON

The bill recommended by the Washington Commission on Industrial Accidents and Employes' Compensation is what is known as a "compulsory insurance law," and is essentially different in method from the preceding.

It applies only to employment in "extra-hazardous works" (which are enumerated and defined to include practically all machino-facture, mining, quarrying, lumbering, transportation, engineering and electrical work, besides many specific occupations, and to which are to be added, by administrative determination, such other occupations as may prove in fact to be extra-hazardous) or where the employer elects to come under the law; to all classes of employes; and to all injuries received unless due to the deliberate intention of the injured.

Every employer to whom the proposed act applies is to pay annually to the state a fixed percentage of his annual payroll (varying from .015 in some industries to .1 in others), no part of which he may deduct from wages, for an Accident Fund; and four cents a working day for each employe, two cents of which he may deduct from wages, for a First Aid Fund; and upon paying such premiums he is to be relieved from all further liability, except for intentional wrong or for violation of safety regulations—for which latter he is liable to the state substantially in damages for the accidents caused thereby. Default in paying the required premiums subjects an employer to double liability—both for "damages" and for "compensation."

Out of the First Aid Fund injured

workmen are to be paid compensation of five dollars per week for not to exceed three weeks; and employers are to be reimbursed for the expenses of necessary medical and surgical care, which they are obligated to provide immediately after accidents.

Out of the Accident Fund compensation is payable as follows:

In case of death: Funeral expenses not to exceed seventy-five dollars, and to dependents, if any, monthly payments varying from ten to thirty-five dollars, depending upon the number and degree of relationship and dependence of the dependents, with appropriate limitations as to duration, but under some circumstances to continue for life.

In case of disablement: Monthly payments, beginning from the end of the third week, of varying sums, depending upon the degree of disablement and the number of dependents, but of not more than thirty-five dollars in any case and of not less than twenty dollars in case of complete disablement, such payments to continue during disablement or for life;—except that for permanent partial disablement the payment is to be a lump sum, "equal to the extent of the injury" but not more than $1,500. Certain specified injuries (loss of limbs, loss of sight, paralysis, etc.) are always to be deemed to constitute permanent complete disablement, and certain others, permanent partial disablement. Payments may be commuted for a lump sum, upon the request of the beneficiary.

A State Industrial Insurance Department is created to administer the funds. The Accident Fund is intended to be exactly self-supporting, and provision is made for segregating special funds to meet liabilities as they are incurred, and for the repayment of surplus premiums and for assessing further premiums to make good deficiencies. If the fund is insufficient to meet a liability the employer must pay it, but a right is given him to reimbursement from the state. If any establishment, on account of poor or careless management, is unduly dangerous in comparison with other like establishments, the department may raise its premium rates. From the decision of the department in any matter affecting premiums, compensation, etc., an appeal lies to the courts.

It is the idea of the bill that the proposed department shall exercise wide discretion, and that the Legislature shall frequently amend the rates of premiums prescribed in and other minor provisions of the proposed act, as experience may dictate to be proper to carry out its purpose.

OHIO

The Report[1] of the Ohio Commission on Employers' Liability recommends a bill which applies to all employments under the state or any of its counties, towns, school districts, etc., in any establishment wherein five or more persons are regularly employed or for any employer who complies with the provision of the proposed act; to all employes in such employments; and to all accidental injuries and deaths, not self-inflicted, from accidents arising in the course of the employment.

It is a "compulsory insurance" law, with provisions for voluntary election by those employers upon whom it is not made compulsory. It requires every employer to whom it applies to pay into the State Insurance Fund annual premiums based upon his payrolls according to rates of risks to be fixed annually by the state actuary. The employer may deduct one-quarter of those premiums from wages. Upon making such payments the employer is relieved from all other liability. If an employer, who is obligated under the bill to make such payments, fails to do so, he is made liable for damages both to the state *and* to the injured employe, under the law of negligence amended by the abolition of the defenses of "contributory negligence," "assumption of risks", and "fellow servant."

The compensation, payable out of the Insurance Fund, is as follows:

In all cases: Necessary medical and hospital services and medicines not to exceed $150 in cost.

In case of death within one year after the injury: Funeral expenses, and: If there are dependents residing in the United States, monthly payments of sixty per cent of wages, for 300 weeks from the date of the injury, but not to amount to more than $3,400, or less than $1,500. Husband, wife, children, father, mother, sisters, and brothers only are to be classed as dependents. Dependents residing outside the United States are to be entitled to one-half the above compensation.

In case of disablement: Nothing for the first week. Thereafter monthly payments beginning at the end of the first week as fol-

[1]This report was received too late for careful and accurate analysis.

lows: If it is complete but only temporary, of sixty per cent of wages, continuing during total disablement, but not longer than 300 weeks, nor to amount to more than $3,400 or less than $1,500. If it is complete and permanent, such payments to continue for life. If it is only partial, payments of sixty per cent of impairment of earnings, but not more than twelve dollars nor less than five dollars per week, to continue during disablement, but not longer than 300 weeks.

Periodical payments may be commuted for lump sum payments by the State Board of Compensation Awards.

A State Insurance Fund is established and a state actuary and a State Board of Compensation Awards are created;—the latter board to consist of five members, with power to appoint an examining physician to represent it in each county. That board is charged with the disbursement of the Insurance Fund and the determination of all claims for compensation. From its determination on certain questions an appeal lies to the courts.

In addition to the provisions hereinbefore summarized, all the measures reviewed provide for prompt notice to the employer of an accident and of a claim for compensation, and for medical examinations of injured employes, at reasonable intervals, by the employers' (in Washington and Ohio the state's) physicians. They also all provide for the modification of the rate or the discontinuance of compensation, when the conditions upon which compensation depends vary or cease to exist; etc.

From the foregoing review it will be perceived that there are many substantial differences between the schemes proposed. But all that will be possible in brief space is to explain the causes of the principal differences and to offer a few comments upon them.

ELECTIVE AND COMPULSORY FEATURES

The first point of difference to be noted is that in Illinois, Wisconsin, and New Jersey it is an "elective compensation law" that is proposed; that in New York there is, and in Massachusetts and Minnesota there is proposed, a "compulsory compensation law," and in Washington and Ohio a "compulsory insurance law." The compulsory and elective compensation laws reach practically the same end, by different means, while the compulsory insurance law is practically a compensation law which goes beyond that end and accomplishes a further purpose. The only reason for an elective compensation law is doubt as to the constitutionality of a compulsory law. Because there is little doubt of the constitutionality of so far increasing the employer's liability under the law of negligence as to render his position intolerable, and of then permitting him to escape it by assuming the compensation liability instead, the elective form gets around the constitutional difficulty and results in a compensation liability, which although theoretically elective is practically compulsory, except as to small employers in comparatively safe employments. The compulsory compensation bills, on the other hand, go directly to their purpose, in the faith that the constitutional objections to the compulsory compensation liability are not sound. The arguments against its constitutionality are that under our constitutional restrictions the state has the power only to make the employer legally liable for injuries due to his faults—his own personal faults or those of his agents or agencies,—which power is exhausted when the defences of "contributory negligence," "assumption of risks," and "fellow servant" are abolished; and that, if it is desired to extend the liability further, it can only be done by the voluntary act or election of the employer. The New York compulsory compensation law seeks to avoid this difficulty by making the employer liable only for accidents due wholly or in part to his fault, to the fault of fellow servants, or to "trade risks."

But the broad compulsory compensation bills—those of Minnesota, Massachusetts, Ohio, and Washington—go further, and make the employer presumptively liable for all injuries, with exceptions—the burden of proving an exception resting upon the employer. Such laws would frequently result in making the employer liable for compensation for injuries due solely to some fault of the injured workman himself, or to "acts of God" or of strangers; and it is contended that such a liability is forbidden by the "Bill of Rights" in our constitutions. In answer, it is argued in favor of the con-

stitutionality of such a liability, that foreign experience demonstrates that a broad compensation law effects a far higher average degree of justice in practice, as between employer and employe, than any form of the law of negligence, and therefore does not in fact offend against constitutional provisions designed to insure justice; and our own experience indicates that it is necessary for the welfare of the state to compel the proprietors of industries to pay some compensation, in all but exceptional cases, in order to prevent the continued reduction of large masses of victims of industrial accidents to a condition of destitution, and to relieve the public from the heavy burden of wasteful litigation caused by the "employers' liability laws."

"But the Ohio and Washington bills go further than compensation for accidents regardless of fault. They also compel employers to insure the payment of such compensation. The practical advantage of "compulsory insurance" over the simple liability for compensation is that it protects injured workmen against the possible insolvency of their employers. The objections to it are that its constitutionality is yet more doubtful than that of simple compulsory compensation, and that it does not avoid all danger of insolvency, for the insurance fund itself may become insolvent.

The German scheme of compulsory insurance (generally esteemed the best), which is a complicated system of checks and balances, has successfully avoided all danger on that score. But the Netherlands and Norwegian schemes of "state insurance," after which those of Washington and Ohio are patterned, have manifested serious weaknesses and defects. It must be said, however, that the Washington bill contains provisions designed to correct those defects, and on the whole appears to be a carefully studied measure. So great are the advantages of compulsory insurance that an experiment in it on a small scale, as in Washington, would be desirable: but compulsory state insurance is too liable to complete miscarriage, through the slightest political misdirection or actuarial mistake, to make it other than an extra hazardous experiment, if it should be tried on a large scale in any of the great industrial states.

OCCUPATIONAL SCOPE

The next point that calls for attention is the scope of the proposed laws. For reasons too lengthy and technical to be set forth here, the arguments for the constitutionality and justice of and the public necessity for a compulsory compensation law apply with particular force to the more hazardous industries. A large proportion of the European compensation laws apply only to such industries. And in England, where the existing compensation law (the act of 1906) applies to nearly all employments, it was preceded by an earlier law (the act of 1897), which applied only to hazardous industries; and there is a good deal in English experience to support the opinion that whether we eventually follow England's example to the extreme of the act of 1906 or not, it would be more expedient to follow a similar course of gradual approach, and begin with a compensation law applying only to hazardous industries. Consequently there is a strong body of opinion in favor of what may be called the hazardous industry limitation for the first compensation laws. The objection to that limitation is that it is difficult to define the hazardous industries so as to include within the application of the law all occupations which are in fact equally hazardous, and to exclude all which in fact are comparatively safe; yet unless the classification be reasonably correct there is danger that it will offend against that other constitutional provision which forbids unreasonable discrimination in the law between persons and classes. The New York law follows the hazardous industry rule, for it applies only to a small list of exceptionally dangerous employments. The Washington bill does likewise, only it applies to a much broader list of dangerous employments and also to other employments which may be found to be equally hazardous. The Minnesota bill nominally follows the same rule and applies only to dangerous industries; but it attempts to "straddle" the difficulty of classification by classing all industries as hazardous, and thus in effect extends

its scope far beyond the truly hazardous industries. The Illinois, Wisconsin, New Jersey, Ohio, and Massachusetts bills, on the other hand, do not recognize the hazardous industry rule, and have a far wider scope.

Even if the application of a compensation law is not to be limited to the more dangerous industries, it does not follow that it should be without limitations. Because the compensation liability is generally right, it does not follow that it is right always and under all conditions. There are many employments or conditions of employment in which the common law rule is still the more just and expedient. To illustrate: few, if any, of the European compensation laws apply to high salaried employes; there are strong reasons for excepting purely casual labor; the application of the liability to those workmen who are aged, infirm, or of unknown health or habits undoubtedly causes discrimination against them in employment and tends to increase the number of the unemployed; and where the position of the employe approaches that of an independent contractor the justice and public policy of the compensation liability is questionable.

The broad-scope bills under consideration all recognize the necessity for some limitations upon the scope of the liability, but adopt different limitations. Thus the Illinois and Wisconsin bills are limited to apply only to employment in the employer's trade or business—a reasonable limitation, but not so definite in practice as it appears upon first impression or as is desirable. The Minnesota bill has practically the same limitation, but is further limited in application to workmen and laborers (a class meant to be distinguished from clerks, salaried employes, etc.). The New Jersey bill has the widest scope, and excepts only "casual" labor, and the Wisconsin bill also excepts "casual" labor; (but "casual labor" is also a phrase of doubtful meaning, which is liable to be construed so as to exclude from the benefits of the law some of the most dangerous kinds of labor, such as dock labor, which most unquestionably should be included). The Massachusetts bill seeks to let out small employers by excluding those who employ not more than five persons, and provides a way by which the aged and infirm may be excepted from the application of the law. The latter exception is good; but there are serious objections to the former, for it would except from the application of the law some of the most dangerous employments, and would make the application of the liability and the right to compensation depend upon a fact, which is often most uncertain and difficult to prove. The similar exception in the Ohio bill is better, because it is more definite and has a practical relation to the "fellow-servant" risk.

LEGAL MACHINERY PROPOSED

In another direction the bills differ in their scope. At the one extreme the New Jersey bill, for example, is confined closely to its subject, *i. e.*, the change in the substantive law governing the liability of employer to employe. The Minnesota bill, at the other extreme, besides reaching into the field of insurance law, establishes a novel system of official boards and a code of procedure for the control and determination of settlements and disputes concerning compensation. There is no disagreement but that when a compensation law is established its operation may be improved by regulating insurance of the liability, by controlling private settlements, and by establishing boards of experts to aid or—in first instance—to replace the courts in the determination of disputes. But it is objected to the Minnesota project (and to the somewhat less ambitious projects of the Wisconsin and Massachusetts bills) that the attempt to cover all these subjects at once, especially where it entails an expensive system of novel boards of officials, more than doubles the doubts and dangers of the experiment in compensation; and that it would be more expedient, as a first step, simply to enact the compensation liability—as in the New Jersey bill—and later to make such corrections and improvements in procedure and in collateral branches of the law as experience may dictate to be appropriate.

Involved in this topic is the right to trial by jury. There is no doubt but that

much of the uncertainty and miscarriage of justice under the present law arises from trial by jury. It is therefore desirable to avoid that method of determination of the liability and of the amount of liability as much as possible. But in some of the states the right to trial by jury is preserved by their constitutions and cannot be absolutely abolished; while in other states that constitutional restriction is less clear or does not exist; and consequently we find that the measures under review differ widely in this particular. The New York law, for example, makes no attempt to avoid jury trials, except to permit voluntary arbitrations. Under the Wisconsin, Illinois, and New Jersey bills, the compensation liability is to be assumed by contract, by which contract the right to trial by jury is to be deemed waived. Under the Minnesota, Ohio, and Washington bills, a preliminary trial, before a board of arbitration under the first, and a determination by a state department under the two latter, must precede any resort to the courts. And under the Massachusetts bill a method of arbitration is provided as an alternative to resort to the courts. How far these methods would succeed in their ultimate purpose of avoiding long drawn out and uncertain litigation, and how far the substituted methods of determining compensation would be satisfactory, is problematical.

EXTENT OF THE EMPLOYER'S LIABILITY

The next point of difference to be noted is the extent to which the liability of the employer—who is made liable or has elected the liability for compensation—for full damages for negligence is retained. The compensation liability is based upon the theory that physical accidents are generally unavoidable, and due not so much to fault or wrong as to necessary risk, the consequences of which employers and injured workmen should share between them. To carry out that theory the compensation laws require the employer to pay his injured workmen some equitable proportion of their wage-losses from accidents, except where the injury can be shown to be due to the injured workman's wilful misconduct. If that theory and practice be just, then the employer, on his side, should be left liable for full damages only for accidents due to his wilful misconduct. But here we encounter the objection, that it is probably unconstitutional to deprive an employe of the right to recover full damages for an injury due to his employer's personal and positive wrong, whether wilful or otherwise.

The Minnesota, Ohio, and Washington bills are based upon the opinion that this objection is not sound, and relieve the employer from all liability for damages to employes under any conditions. The Massachusetts bill successfully avoids this objection by leaving the employer liable for damages under "circumstances where he would be liable at common law." The New Jersey bill avoids it by making the liability a matter of contract, by which contract the liability for compensation is substituted for all others. The Illinois and Wisconsin bills do the same, except that the Wisconsin bill leaves the employer liable for damages for "wilful misconduct," and the Illinois bill leaves him similarly liable where he wilfully fails to comply with "statutory safety regulations." This last exception is designed to promote safety, but it aroused the opposition of Illinois employers. The reason for their objection to it is that statutory safety regulations are often far from definite; —they may provide, for instance, that machinery shall be made "as safe as possible," or be guarded "where practicable," and it is the prevailing expert opinion that they are must effective in that form. It is always a matter of expert opinion whether such regulations have been complied with; and although an employer may have exercised his best judgment in complying therewith, yet, in case of accident, it is always possible to procure an alleged expert to testify to an adverse opinion. Such testimony is sufficient to carry a case to the jury; and a jury is always prone to decide to some extent against the employer. Consequently, the effect of such a provision would be to leave the employers still liable to actions for full damages in a large proportion of cases, and to perpetuate the evils of the

negligence law as against them. Therefore, while apparently reasonable, this proposed provision is really most unfair and harmful. The effect of a similar right reserved under the Washington bill, to hold the employer liable for the practical equivalent of full damages *to the state*, would probably be different; for there the question would be tried upon its merits, unbiased by sympathy, and according to a consistent line of expert opinion as to safety methods. The New York compulsory compensation law follows an entirely different course. It imposes an additional liability for compensation and leaves the employer liable for damages as before. To the injured employe is given an option between the two liabilities, after the accident. This tends to perpetuate the evils of the negligence law, which the compensation law is designed to cure. Nevertheless many working people (as is illustrated by the objection of the Chicago Federation of Labor to the Illinois bill) are inclined to insist upon it; and their insistence is excusable The only relief they have known from the injustices of the "common law" has been obtained from the "employers' liability laws," and they are reluctant to abandon that path of apparent improvement in favor of "compensation laws," with the results of which they are not familiar and of the purpose of which they are naturally suspicious.

VOLUNTARY RELIEF PLANS

Many of the most humane and considerate of American employers have been disposed to oppose the movement for compensation laws, because they have established or are establishing in their industries schemes for the insurance of their workmen against accidents, sickness, etc., which a rigid compensation law would seriously interfere with.

Experience in England indicates that often such schemes are far more beneficial to the workmen affected than the general compensation law, because they are better adapted to the particular industry to which they respectively apply. Therefore the English law permits such schemes, as a substitute for the liability for compensation under the law, provided that they yield benefits to the workmen equivalent to those of the law; or, if the workmen contribute, equivalent to those of the law in addition to the contributions of the workmen. It is most desirable that this permission should be incorporated in our proposed American laws; and that it should be most liberal in its terms, provided that its conditions be substantially complied with. Of the measures reviewed, only the Massachusetts bill contains any such permission. The Wisconsin and Minnesota bills permit voluntary mutual insurance schemes —which may require contributions from the workmen,—but only upon condition that they provide compensation *exactly* in accordance with the provisions of the bills.

COMPENSATION PROVISIONS

We turn now to the compensation schedules. It is in this respect that comparative uniformity is most desirable in the laws of the different states, in order that the cost of compensation may be uniform in all. But, in this respect there is extreme diversity,—although it is not apparent upon first impression, for the reason that the principal factors of cost in a compensation law are the problematical results in practice of apparently minor provisions. For example, if we should compare some two of the above mentioned bills, it would be a mistake to conclude that the one which allowed the higher maximum rates and the longer continuing periods of compensation would necessarily be the more expensive. And it would be an equal mistake to conclude that the bill which would cost employers the more would therefore be the more beneficial to the victims of accidents;—it might, on the contrary, build up a class of parasites upon compensation.

It will be noticed that in case of disablement, the New York law and the Minnesota, Massachusetts, and New Jersey bills provide for no compensation for the first two weeks. The Wisconsin bill gives none unless the disablement lasts longer than twenty-nine days, and even then none for the first week. It is a condition and not a theory which compels this apparent hardship. Human nature is so constituted that men will gen-

erally, upon slight excuse, take a vacation upon half pay, and foreign experience indicates that without this "waiting period" a large proportion of trifling injuries would be turned into apparent disablements and the cost of compensation consequently *approximately doubled*. The Illinois bill runs the dangers of this consequence when it allows compensation from the date of the injury. In Washington this difficulty is met by making the compensation and medical expenses, etc., for the first three weeks payable out of a First Aid Fund towards which the workmen contribute one-half. The purpose of requiring such contributions from them is that they may be made to feel the consequences of impositions upon the fund, and thereby be impelled to support all measures found to be necessary to prevent such impositions.

There is a similar danger with the provisions in these bills which require the employer, immediately after an injury, to furnish medical and surgical attendance, supplies, treatment etc., for long periods (*e. g.* ninety days). It is not the liability for such expenses in serious cases which employers have to fear, but rather that they will be held liable up to the maximum in nearly every case, however unnecessary. Foreign experience indicates that under such provisions there is serious danger that there will grow up a class of "ambulance chasing" doctors to replace our "ambulance chasing" lawyers. And this danger is not altogether avoided by providing that the employer himself shall provide the physician, medicines, etc., where he is also made liable to others for their cost if he does not provide them, unless jurisdiction to determine the necessity of such provision be lodged in some readily accessible person. The English law is based upon the assumption that no such provision is necessary, because the employer's self-interest to reduce his liability for compensation will impel him to provide all that is necessary to cure the injured workman; and English experience, on the whole, sustains this contention.

In the objection cited to the maximum limitations upon the amount of compensation in the New Jersey bill, there is to be noted an insistence on the part of the representatives of labor that compensation for death should be equal to compensation for permanent and complete disablement. This is a survivance of the idea of revenge, of blood-money, of reparation for a wrong, which was the basis of the older laws which we are seeking to displace. Compensation, on the contrary, aims to relieve material distress. In case of death the workman is gone, and it is only his dependents who are left and whose needs are to be provided for only so far and so long as they cannot provide for them themselves. But where the workman is completely disabled there is one more person to be completely provided for; and if he is permanently disabled that condition continues for his life, which may be long. Therefore there is every reason why the maximum compensation for complete and permanent disablement should be larger than that for death, and that it should be as large as industry can bear. Under the English law, compensation for such disablement continues for life (while that for death is limited to three years' wages). It is in that direction—after compensation is first established on a milder scale and insurance rates are adjusted and worked down to a normal basis—that the workingmen should seek to obtain an extension of the maximum of compensation.

There are two ideas which influence the measure of compensation. The first is that of private justice, which requires that compensation should be in some degree proportioned to the wage loss; and the second is that of social welfare, which requires that, except for his own certain and serious fault, no victim of accident should thereby be reduced to destitution and made dependent upon public charity. The simple compensation bills which have been reviewed are formulated principally in accordance with the first idea; the Washington bill, on the other hand, is based entirely upon the second. That bill provides for equal compensation for all injured workmen or their dependents, regardless of differences in wages. It provides a very low

rate of compensation, to continue, however, during disability or condition of dependence without time limitation. Its one purpose, towards which all its provisions are consistently directed, is to prevent absolute destitution. Beyond the provision for bare maintenance which it assures, it leaves upon the higher waged workmen the burden of insuring themselves. It is an interesting synthesis of state-socialism and individualism, which may produce most beneficial social results. The simple compensation idea, however, is more in accord with our constitutional principles.

Only the New Jersey and Ohio bills mention non-resident alien dependents. The first would give them no compensation; the second would give them half compensation; while all the other bills would give them equal treatment with citizens. The last course would subject employers to numerous false claims, induced by the much larger comparative value of money abroad, which it would be difficult and expensive to disprove. The first course would be clearly unjust to the real dependents of immigrant workmen. The middle course, therefore, appears to be the most just and expedient.

It will be noticed that all the measures discussed call for the payment of compensation weekly or otherwise periodically;—only the New York law provides a lump sum payment as compensation for death. It would appear that the authors of these measures have not fully comprehended the practical difficulties in the way of such a procedure, for they have not fully regulated the conditions and methods of such payments. The workmen anticipate that such payments will be made to them in cash at their residences at hours convenient to them. Employers anticipate that such payments will be made in the same manner as the payment of wages to their regular employes or else be forwarded by check. Neither of these methods will be mutually satisfactory and either will involve serious hardships, difficulties, and expense upon one side. And the difficulties are increased and dangers incurred in the case of payments to numerous dependents who reside at or have removed to a distance from the employer, and whose right to payments will depend upon the continuance of certain conditions. Although the inability of the working classes generally to manage lump sums of money profitably make periodical payments generally preferable, yet it is questionable whether it would not be fairer to employers and preventive of many probable disputes and abuses, to provide for lump-sum payments in case of death, and then, if found desirable, to provide for the management and distribution of such sums and their income by special court or administrative officers.

The foregoing comments touch merely upon a few of the salient points and principal points of difference in the measures discussed, and by no means cover the field or give an adequate idea of the complexities of the problem. Enough, however, has been presented to support the wisdom of the recommendation of the Massachusetts Commission: "that further investigation and study should be undertaken."

So much space has been required to discuss the main features of the bills presented that none is left for a consideration of the material contained in the reports of the commissions. It can only be stated for the benefit of the reader who may desire to study the subject further, that a digest of the foreign compensation laws, a good history of the compensation movement in America, and a thorough brief upon the constitutional law involved are to be found in the Minnesota Report; an equally thorough brief on the constitutional law is in the Washington Report; instructive explanatory notes upon the provisions of the proposed bill and some accident statistics are in the Wisconsin Report; a great deal of valuable statistical material is in the Illinois Report[1]; and a digest of the foreign compensation laws, accompanied with exhaustive studies of the English and German schemes and other valuable national material, in the Ohio Report.

[1]For the latest and most complete statistical information bearing upon the probable cost of "compensation," see *Bulletin of Bureau of Labor* (U. S.), No. 90, September, 1910.

INDUSTRIAL SURVEY OF THE MONTH

PERSONAL EQUATIONS IN INDUSTRIAL STRIFE

GRAHAM TAYLOR

While personal equations when over emphasized unnecessarily complicate our industrial problems, they are shown by recent events to be inevitably influential. To charge that real industrial differences are due to unjust and hard-hearted employers or to bad and hot-headed walking delegates of labor unions frequently aggravates a situation already dangerously difficult. Overhearing a little group of employers accounting in this way for an interruption of business that extended all over the city, another of larger mold remarked: "The trouble with these men is that they do not know their difficulties to be due to the clash of world-wide forces at variance over real issues." For the lack of just this historical background, and of knowledge sufficient to interpret the present by the past, many a conflict is needlessly begun and disastrously continued.

PERSONAL MEDIATION OF PEACE

Nevertheless, the personalities involved in these fatuous struggles magnify or minimize their worse and better results. The most amazing transformation scene ever brought about in American industrial warfare by a change of personal management is witnessed in the outcome of the prolonged, determined, and bitterly contested issue between the Buck's Stove and Range Company and the American Federation of Labor. While the conflict raged, conciliation seemed as impossible to the outsider as was anything short of the annihilation of the other to each contestant. Yet no sooner had the management of this company passed, on the death of the leader of the fight, to the hands of his successor, than this apparently irrepressible conflict was found to be amenable to a settlement by the parties themselves, which is officially reported to have been "adjusted upon mutually honorable terms, satisfactorily to all concerned." The company's attorneys were at once withdrawn from the case against the federation pending before the United States Supreme Court, which thereupon threw it out of court as "a moot case." Former friends and foes straightway shifted their positions to opposite sides in the fight.

"Minority stockholders" sought to restrain the company and the federation from carrying out their pact of peace under a claim for threefold damages of $750,000. The Federation of Labor, whose executive officers were still under suspended sentence for contempt of court in the alleged publication of the boycott against the company, recommended "that every legitimate effort be made to overcome the antagonism now being directed at the Buck's Stove and Range Company." These very officials, with their liberty still hanging in the balance, declared that this company, which had been their implacable foe, is now "entitled to the courtesy, consideration, and patronage of all." Its new management was congratulated "for its exhibition of fairness and good judgment in agreeing to the settlement," and in turn the new manager presented with his compliments, through President Gompers, a souvenir to each of the delegates to the convention of the federation.

It would surely be the irony of fate if, in these piping times of peace, Messrs. Gompers, Mitchell, and Morrison should have their sentences to jail for contempt of court sustained after the original case had been thrown out because of the withdrawal of the plaintiff's prosecution.

EMPLOYERS LEAD IN LEGISLATION

Personal influence has recently been recognized to be potent in securing equitable industrial legislation where the distrust of both parties interested had long prevented its enactment. No more notable recognition of this fact has been given than by the labor members of two legislative commissions in Illinois. Addressing their colleagues at the success-

ful conclusion of the work of drafting the law for the health, safety, and comfort of employes, which the Legislature enacted without opposition, they said: "As representatives of labor we believe that the spirit of fairness manifested by the members of the commission representing the employers emphasizes greatly the value of conference and discussion of our problems, to the end that we may find the common ground upon which both sides may stand without sacrifice of either principle or self-respect." Referring to the representatives of the public as those whose duty it would have been, under less favorable circumstances, to hold the balance of power and to act as mediators, they declared that their mediation was rendered unnecessary "owing to a truly remarkable spirit of harmony and mutual confidence by which the division lines were at once practically abolished."

More than to any other member of the commission this harmony was due to one of the employers, who was also appointed to serve as chairman of the commision on employers' liability. At the conclusion of its work his labor colleagues again expressed their appreciation of his services in the following toast:

> Here is to Charles Piez! One of the best fellows of our long remembrance; one of the finest of Chicago's citizens; one of the most unselfish and public-spirited of Illinois's captains of industry; whose good fellowship has been our good fortune and pleasure; whose sterling citizenship has been our inspiration; whose unselfish public-spirited service has been the glory of a worthy life. All hail, Charles Piez!

It is as great a misfortune to the laboring population of Illinois as it is to all employers and other citizens of the State, that the opposition of the Chicago Federation of Labor prevented this commission from rendering a unanimous report. It is hoped, however, that its just and carefully studied conclusions, which have been embodied in a bill pending before the Legislature, may be enacted into a law combining the regulation of compensation for loss by accident or occupational disease with such provision for employers' liability as will not involve the surrender of the right to enter suit for damages. The State Federation of Labor is supporting this measure in accordance with the action of the American Federation of Labor, which recommended the "utmost endeavors to secure the enactment of a comprehensive and liberal workingmen's compensation law, as uniform as possible, in every state of the Union."

TOO PERSONAL LEADERSHIP

Personality has recently played a sinister part in the leadership of the United Mine Workers of America. The successor of John Mitchell in the presidency of this great union never proved to be a large enough man to concede the greater popularity of his predecessor without resenting it as a reflection upon himself. Consciously or unconsciously, this narrow self-consciousness seemed to affect his official policies and his personal attitude toward large groups of his constituents. The loss of nearly a year's work and profits to the coal miners and operators of Illinois was due more to a strike against the president of the United Mine Workers than to any serious differences between the mine owners and their men. When their issue was taken to the United Mine Workers' Convention by the miners' leaders in Illinois, President T. L. Lewis failed of re-election by a vote of 98,000 for his successor, John P. White, to 72,000 for himself. Then it was that a reprisal was sprung in the passage of an action condemning the National Civic Federation, which will compel John Mitchell to resign either his position at the head of its department of trade agreements or his membership in the United Mine Workers of America. If this hasty, ill-advised, and narrow action, which was foisted upon the convention, were referred to the rank and file of the United Mine Workers, their love and loyalty to John Mitchell would be expressed by a vote far more overwhelming than that by which they repudiated the jealousy of their former leader.

WHERE FAIRNESS FRAMES THE LAW

It is a pleasure to attest the fairness and good fellowship of the representa-

tive operators and miners serving on the mining investigating commission of Illinois in framing a bill for a law to conserve life and property in the mining industry of the state. They are all frank, fearless, manly men, vigilantly intent, indeed, upon serving the interests of those whom they respectively represent, but generously just in seeing and conceding one another's claim to justice. No more patient or painstaking care could be taken in meeting the demand for technical knowledge and practical experience in legislating justly for these complicated interests than these men have exacted of themselves and one another.

All the mines of the state are heartily and promptly complying with their bill for protection from fire in mines, which has already been enacted. A disaster such as the Cherry mine suffered from a fire without any explosion will scarcely be possible if the provisions of this law are strictly enforced.

FOR THE HEROES OF CHERRY

The trustees of the Art Institute in Chicago have honored themselves and the manhood of their state by deciding to build a memorial fountain as a tribute to the memory of those who lost or risked their lives on duty or in the rescue work at Cherry mine. The Carnegie Hero Fund Commission has illumined its list of heroes by adding the names of the eleven rescuers who died in the descent and of the two brave miners, Walter Waite and George Eddy, whose experience and courage saved their own lives and those of eighteen others who were entombed for eight days. Illinois may well be proud of having made the most generous provision for the families of those who died at Cherry that such sufferers have ever received, as a partial compensation for their irretrievable loss.

BOOKS FOR SOCIAL WORKERS

LILIAN BRANDT, Contributing Editor

AN AMERICAN CITIZEN; THE LIFE OF WILLIAM H. BALDWIN, JR. By John Graham Brooks. Houghton Mifflin Company. Boston. 1910. Pp. 340. Price $1.50; by mail of THE SURVEY $1.61:

It is a stalwart figure of a man that stands out from the pages of Professor Brooks's biography—strong to achieve success and to resist temptation; prepared to make the enormous routine work of a railroad office slip smoothly along, or to meet the government's emergency of equipping and tracking a terminal for Cuban War troops on six days' notice; diplomatic enough on one hand to hold his men from a hasty strike, and on the other hand to secure for them full justice from the directors. Here was a glutton for work, known in his first meager clerical job out West as a "tremendous overtimer", a man who reorganized and gave substance to flabby roads in his twenties, was president of the Long Island Railroad at thirty-three, when he had been out of Harvard but ten years, and died at forty-one after a life so full and purposeful that the 300 pages of the book give only glimpses of the work he did in the world and of the good causes he served. It persuades us once more of the truth of the old story, now discredited on many hands, that any American boy who has it in him can become president.

The angle of his approach to social work was unusual. All through college he had planned that in some way he would serve his fellow men. When the time for decision came, he chose business with the definite purpose of rendering his service through it. His great contribution to us was the practical demonstration that in the most commercial of ages and of surroundings—for the Long Island presidency brought him into close contact with Wall street—a man may succeed, not in spite of his ideals, but in conformity with them. Any reader must be in hearty agreement with the author's main expressed purpose to bring this lesson home to young men, particularly to those in college.

It is interesting to see how his social service grew out of his varying tasks. From his general railroad experience he became a believer in trades unions and in the railroad Y. M. C. A. From his work in the South he was interested in the Negro. And from his residence in New York he came to have so vivid an appreciation of the life of the poor and of the immigrant, that he gave uncounted hours and thought as chairman of the Committee of Fifteen, which struck stoutly at some

of the most crying miseries that afflict the weak.

It was characteristic of the man that the two causes he served more than others were fundamental—perhaps the oldest and most stubborn of our social problems—the race question and the social evil. Equally characteristic is the evident lack of written or printed material he left on them, for he was the working member, the shrewd adviser, the inspiring chairman, the leader, and to show his attitude on this question or that Professor Brooks had to quote at length from more vocal associates with whose opinions he was in agreement.

How real these causes were to him is well shown by an incident in the work of the Committee of Fifteen. The investigations undertaken soon proved that the exploitation and commercializing of vice would be tracked by clear footprints to the door of Tammany Hall. As chairman of the committee, Mr. Baldwin would be held chiefly responsible for the ink that was poured in the footprints so that they were seen of all men. But Tammany controlled the city government from which his railroad must secure franchises. His action was prompt and characteristic. He handed his resignation to the railroad without show of martyrdom, and was surprised when it was not accepted.

Of the charm of his manner, the breadth of his sympathies, his vigor and keenness, his great power over men, his particular faculty of inspiring his subordinates to do better work than their best, there is not room to speak here. They are brought out in flashes in Professor Brooks's book, which is not a consecutively told "life," but a series of chapters showing his attitude on various problems, and perhaps the more telling for the sharp concentration possible on one thing at a time. A later book on what business men thought of him, an attempt to measure the results and reactions of such a social worker on his railroad associates, would be of prime interest. For he was, by most deliberate choice, a business man. The service he rendered as chairman of the General Education Board and of the Committee of Fifteen; as trustee of Tuskegee, of the New York City Club, of Hackley School, and of Smith College; as member of the Civic Federation, the Charity Organization Society, the Tenement House Committee, the Armstrong Association, the Citizens' Union, and the Civil Service Reform League—all was added to the day's work of a railroad president who was moreover a director of thirty-seven corporations.

What did the corporation directors think of him and his mature opinions of trades unions, of the ethics of railroad finance, of government regulation and full publicity, as against government ownership of railroads, of the possibility of cleaning up business methods and morals by capturing the little group of men who control all the others and demanding from the top that business be fair? In these questions, it may be, Professor Brooks has a theme for his next book. A. P. K.

GUIDE TO READING IN SOCIAL ETHICS AND ALLIED SUBJECTS. Edited by Francis Peabody. Harvard University, Cambridge. 1910. Pp. 265. Price $1.25; by mail of THE SURVEY $1.35.

An attempt is made in this volume to give brief, carefully selected lists of reading, for the use of "not a superficial reader, nor yet a learned scholar, but an intelligent and serious-minded student who is willing to read substantial literature, if it be commended to him as worth his while and is neither too voluminous nor too inaccessible." The lists are compiled by Prof. Francis G. Peabody and twenty-two of his associates in Harvard University, and each editor assumes responsibility for his own section. Few references are made to works in foreign languages or to periodicals.

It is not easy to tell from the table of contents which is "social ethics" and which are "allied subjects," but that is after all a matter of academic interest, and the forty-odd subjects listed are descriptive enough for all practical purposes.

The lists of course vary in the degree in which they attain their avowed object, and no doubt in every case another equally-qualified compiler would make a more or less different selection of references and would dissent from some of the estimates given. For the stranger in these particular fields of knowledge, however, the Guide cannot fail to be serviceable; and for those who are already at home in these fields it will be of interest to see what the editors have included and what they have to say about the books they recommend.

Typographical errors are not lacking. A familiar title, for example, takes on a strange appearance when it is written (p. 69) "Work, accidents and the law."

CIVIC BIBLIOGRAPHY FOR GREATER NEW YORK. Edited by James Bronson Reynolds for the New York Research Council. Charities Publication Committee. New York. 1911. Pp. 296. Price $1.50; by mail of THE SURVEY, $1.63.

On an altogether different plan from the Harvard Guide is this bibliography, which has been prepared by three well-qualified persons under the direction of Mr. Reynolds for a committee called the New York Research Council. It is limited in its field to "social conditions past and present in Greater New York City," but within these limits "the aim has been to provide a practical handbook for workers in such form as to give them access to all important material in print in their several lines of work or investigation." Periodicals, reports, pamphlets, and government documents furnish naturally by far the greater number of references. One feature which will be especially appreciated is that at least one library is mentioned where each work referred to may be found. A full table of contents and an elaborate index are also helpful accessories. The length of this list of references on social conditions, in New York city alone,

is impressive testimony to the volume of this literature. One may speculate as to how much shorter it would have been if writings of problematical truthworthiness and slight value had been eliminated, but such discrimination would have been exceedingly difficult to accomplish.

We notice with regret some typographical errors, in spite of the careful proof-reading which the book has received: on page 144, for example, "Preventative."

The Research Council has begun with the task which is fundamental (though unfortunately not always recognized to be so) in any research—finding out what has already been done before starting on anything new.

THE NATION AS A BUSINESS FIRM. By W. H. Mallock. Adam and Charles Black. London. 1910. Pp. 261. Price $1; by mail of THE SURVEY, $1.11.

On the first page of this volume we are told that all social improvements which it is proposed to effect through modifications of the economic constitution of society are "business propositions," and that those who advocate such changes are in the position of the directors of a company, or of candidates for such posts, who are asking for support from the shareholders, to whom the citizenship of a nation is compared. An obligation therefore rests upon "reformers" to be as accurate in their arguments for the adoption of a new policy on the part of the nation as the executive official of a company must be when asking for authority to take a new and radical step.

The burden of the book is much the same as that of Mr. Mallock's lectures in this country a few years ago. By somewhat intricate statistical reasoning he undertakes to make convincing proof of the fallacy of the claims of socialists and single taxers. He shows by elaborate argument that the poor as a class have prospered as much since 1800 as the rich; that the vast bulk of the incomes of the nation are earned as distinct from unearned; that, in brief, "the poor do not become ever poorer and poorer," but that on the contrary the poor man's income has doubled in a hundred years. No consideration is given to the multiplication of wants which have come to be necessities. For most people his points would be more telling if he did not go over essentially the same ground so often, especially since much depends on opinion or guesses and complete accuracy is therefore impossible. Unless one is fond of mathematical conjectures the repetition is bound to pall before the end is reached. On the other hand, the work commands respect for the ingenuity shown in handling the material from so many points of view.

INDUSTRIAL ACCIDENTS AND THEIR COMPENSATION. By Gilbert Lewis Campbell, B. S. Houghton Mifflin Company. Boston. 1911. Pp. 105. Price $1; by mail of THE SURVEY, $1.10.

This little volume, the seventh of the Hart, Schaffner and Marx prize essays, adds nothing to the literature of industrial accidents, but it brings together in compact form, from both primary and secondary sources, what facts we have in regard to the number of work-accidents in the United States, employers' liability laws and insurance, together with some useful material showing the number of accident benefit societies. The last chapter gives some idea of the principles of compensation. Though not written in as interesting a style as some of the more authoritative sources, Mr. Campbell's book should by its brevity serve as a good introduction to the subject, which could be followed up through the bibliographies contained in the footnotes of each chapter.

THE CONFLICT OF COLOUR. By B. L. Putnam Weale. The Macmillan Company. 1910. Pp. 332. Price $2; by mail of THE SURVEY, $2.17.

An interesting, suggestive, learned, dogmatic, apprehensive, unsafe, and altogether British presentation is B. L. Putnam Weale's discussion of what he considers the inevitable impending conflict between the great races of the world. He sketches historically the steps by which the scene of action has been shifted from the western hemisphere, which might except for various minor incidents have been the unhappy battleground, to the Old World, and trembles before the awful consequences of the possible future supremacy of the yellow, brown, or black race—he does not know which.

Thoroughly impressed by the rapidly increasing population of the civilized world he indicates most plausibly the necessity of clash which must result from the overflow of the natural frontiers which have hitherto served as checks. The problem is no longer one of petty interaction of related European nations, but is one of fundamentally differentiated races, of which color is not only the most convenient index, but in some way or other the deciding factor. He discusses in turn the yellow, brown, and black problems. His treatment of the Mongoloid aspect is able, sure, and suggestive; the chapter on the Brown peoples is less convincing; and his handling of the Negroid phase, while equally assured in tone, is naive and often questionable from the anthropological standpoint. The impression is made, and it is probably the truth, that the author writes from first hand knowledge and long personal observation of Eastern Asiatic conditions; from less intimate acquaintance with the problem of nearer Asia of the East Indies, and with practical ignorance of African and Negroid anthropology.

It is not a book that can be dismissed with a phrase, for with all its narrowness and often irritating assurance in doubtful fields it is an impressive statement of a great world problem, and read from that point of view commands attention and deserves it. It is in his analysis of the enormously complex factors of the problem that the author fails. The task is simply too great for any one man, or even for any number of men who have thus far made their appearance.

The book could only have been written by an Englishman. The eternal destiny of the Anglo-Saxon is a pleasant concept to fall asleep with and useful for rousing an audience

to enthusiasm, but it becomes less dazzling in the perspective of geological ages, or even of the traceable period of human history. For Mr. Putnam Weale the responsibility is even more closely defined: to quote his own words, "The problem of colour becomes finally an almost British problem." Of course this may be true, but then again it may not.

THE TREND OF THINGS

By Jacob Fischer in The Fra.

I met her on the Umbrian Hills,
Her hair unbound, her feet unshod;
As one whom secret glory fills
She walked—alone with God.
I met her in the city street:
Oh, changèd was her aspect then!
With heavy eyes and weary feet
She walked alone—with men.

* * *

It turns out that the diseases of civilization: Brights Disease, gout, apoplexy, need only the homeopathic treatment of more civilization to cure them, according to Woods Hutchinson in *Hampton's*. It turns out, too, unfortunately, as he tells us, that these diseases are not the peculiar possession of the rich, but batten upon overwork, on toxins left in the body from lack of convalescent care after infectious diseases, or neglect in their early stages, and probably only to a much smaller degree on alcoholism and high living. Cure or prevention is thus by no means impossible for the rich, who "have more of these diseases than the poor chiefly in the sense that they have more time to lay off and enjoy them and more money to pay doctors for listening sympathetically to their symptoms." Civilization, in the sense of better scientific knowledge, can help the rich; and civilization, in the sense of social legislation, that shortens the hours and improves the sanitary conditions of work, is already taking the first steps toward curing among the poor the diseases that it has helped to cause.

* * *

The *Masses*, a monthly magazine published in the interests of the co-operative movement within the Socialist Party in America, started with the beginning of 1911. In the February issue Piet Vlag, manager of the American Wholesale Co-operative, states that two hundred co-operative wholesale and retail stores throughout the United States have been organized as a result of the educational propaganda of the American Wholesale. One of these, the Astoria Co-operative, did a business of $20,000 from January to July of last year. After operating expenses were deducted $2,000 profit was left, of which twelve and one-half per cent went to the sinking fund, the same amount for socialist propaganda, two and one-half for bonus to employes, and seven and one-quarter for purchasers' dividends.

The February issue contains, also, articles by John Spargo, Ellis O. Jones, George R. Kirkpatrick, and others, as well as translations from the German.

The Masses is edited by Thomas Seltzer, and is published at 112 East Nineteenth street.

* * *

The "best chief of police that New York ever had," to use Boss Croker's old tag for him, broke silence before the Credit Men's Association of the Building Trades in New York. These are the sub-contractors and dealers in building materials, 500 of whom have organized to make sure among other things that they get a square deal from the architects and general contractors. Said Mr. Devery, according to a New York *Times* reporter:

"I don't know as I'm prepared to make any remarks, but after listenin' to your speeches this evening I gather that you wait to join in till you get nailed peekin' under a gate; then you holler and go to the association. Some of you fellows here, I bet, have scratched all of the hair off your heads trying to beat one another. My friends, you may talk all you like about fair play and a square deal, but when the long green is in sight, let me tell you friendship ceases."

Why not a paper by Mr. Devery before the next meeting of the American Economic Association on the materialistic interpretation of history?

* * *

The *Farmer's Voice* for February tells of a recent church conference on rural problems, where the Rev. Clair S. Adams presented a "survey" of the social and religious needs of fourteen communities in Illinois. He reported, in brief, a decay in agriculture, little interest in education, little or no organized recreational facilities, a church attendance of less than fifty per cent of the population—representing an absolute decrease in membership in thirty-five out of seventy-seven churches, an increase in only twenty-five—and a tendency of population to leave the farms and concentrate in the towns. R. E. Bone of Rock Creek told of the successful work of the pastor of that community in establishing a rural social and religious center, and the Rev. Matthew B. McNutt of DuPage, Ill., reviewed his ten years' experience with a little rural church that had before his coming been practically abandoned. Following the principle that the country church should be not only a spiritual but a social and educational center, Dr. McNutt organized recreation, athletics, and lectures, started a library which has now 1,000 volumes, and is at present organizing courses in scientific agriculture and the domestic and social sciences. From a mere handful the attendance at church, lectures, or clubs has grown to almost a thousand, and the wooden one-room church has been replaced by a ten-thousand-dollar brick structure.

* * *

"The playgrounds," says Dr. Henry B. Favill in an address to the Chicago Chamber of Commerce, "hitch up close to the juvenile court, and the juvenile court hitches up close to the hospital, and the hospital hitches up close to the efforts for public health, and then we make a circle round and round and find that we cannot touch one without logically, and in immediate sequence, taking up some sort of activity in the others."

SOCIAL FORCES

BY THE EDITOR

THE NEEDLESS DEATHS OF BABIES

On the rue Falguière in the Latin Quarter of Paris there is a unique monument to a distinguished physician. Professor Landouzy, dean of the medical faculty of the University of Paris, said at the inauguration of this monument that it was finer and more lasting than any monument which could have been erected of costly marble, of gold, or of bronze. This superb memorial is the Pierre Budin Foundation, and its object is the instruction of mothers in the feeding of infants. Two years earlier, when Dr. Budin lay dying, he dictated this brief message to his friend, Senator Paul Strauss, and eight former pupils:

> Dear Friends: I entrust to you the interests of the babies of France. I rely upon you to continue on your own account and through your disciples the propaganda in behalf of instruction to mothers in the nursing of children. BUDIN.

The foundation, which has a small but well-equipped building, and is supported mainly by annual contributions, is the direct response to this appeal. Quite as valuable as the professional service of its medical staff are the enthusiasm and energy put into the enterprise by Madame Budin, who takes part in this memorial of her husband's work as a labor of love, by Madame Strauss, and by their associates. These ladies not only raise the necessary funds, but in their white uniforms, under the direction of the doctor, do the actual work of handling the babies in the clinic, mingling freely with the mothers and giving them the necessary counsel, encouragement, or warning, as the case may be, always directed toward the nursing of the infants at the mother's breast. Madame Budin and her co-workers are not "volunteers" in the ordinary sense. By their regularity in attendance, by their submission to discipline and training, and above all by their single-hearted devotion to this special task, they become as much professional experts as are the volunteer physicians.

Away over on the other side of the Latin Quarter, among a remarkably interesting group of philanthropic agencies which owe their inspiration and direction to Mademoiselle Chaptal, a trained nurse and the daughter of a French countess, there is a similar life-saving station. Here, as in the Budin Foundation, devoted and capable physicians examine nursing babies who are brought to them, and tell their mothers what mistakes they are making, and what special care their particular children require. All the resources of medical science, of woman's intuition, of human experience, and of common sense are brought to bear upon the prevention of the needless sacrifice of infant life.

We are not compelled to go as far as the Latin Quarter of Paris to discover the need of such work as is undertaken by these two institutions, or to find physicians and public-spirited citizens who have undertaken to meet it. In many American cities the initial steps have been taken in the crusade against infant mortality. As we write, there lies on the table before us an urgent appeal for an annual fund of $300,000 to be expended for this purpose in New York

city, until such time as the city is able to make a more adequate appropriation than the $40,000 set aside for this year to maintain municipal milk depots in Greater New York. We infer that the appeal is confidential, because of its red ink serial number; but that it is perhaps not so very confidential, because the particular number borne by this appeal is 94,398. We trust therefore that Mrs. J. Borden Harriman and her associates in the finance committee of the Committee for the Reduction of Infant Mortality of the New York Milk Committee will forgive us for expressing thus publicly our profound interest in the success of their appeal. It is unthinkable that any contributions to this great fund would be at the expense of the diet kitchens or dispensaries, or at that of the great relief agencies which, proportionately to their resources, supply milk as a matter of course, as they do other kinds of relief. We would look with misgiving upon the direct distribution of milk by the municipality. If, however, from the surely as yet unexhausted resources of private philanthropy $300,000—or whatever sum is necessary—can be supplied to do such work here on a large scale as is done in Paris on a small scale by Mlle. Chaptal's dispensary and the Budin Foundation, this would seem to us the greatest single contribution which could just now be made to the saving of human life.

What we need to realize is that infantile diarrhœa is essentially a preventable disease. Dr. Rowland G. Freeman says that of babies well cared for and properly fed, only one in 150 dies in the first year. Of all children born in New York at present one in seven dies in the first year. But it is not long since it was two in seven. There has been progress; there is room for progress; and there is the possibility of progress. We must get in our minds a vivid picture of what it would mean if nineteen out of twenty of the babies who now die in the first year of their life were saved. For the most part, it is nothing in their heredity that slaughters them, but, as all physicians testify, the lack of care and of proper food.

That proper food is mother's milk. Dr. Woods Hutchinson is quite right that even the best cow is a poor substitute for the mother. "Cows' milk," he says, "while admirably adapted for raising calves, is a very poor thing for children, and the substitutes for cows' milk are worse." If therefore the function of the milk committee were merely to furnish milk, even if certified, pasteurized, or modified in the highest degree, we would not endorse its appeal. But out of its experience there has come a broader program, indicated by the name of its sub-committee—on the reduction of infant mortality. It is a program primarily of public education and individual instruction. We assume that the committee intends to put foremost the danger of weaning young babies; and to enforce by every means in its power the inherent right of the newborn babe to its natural food. We assume that if milk is to be sold at a reduced price or is to be given away when necessary, this is primarily as food for the mother herself and for older children; and that only as a last resort is it to become a substitute for the mother's breast in the case of infants of nursing age.

The milk depot as a place for the distribution of clean milk has doubtless a certain limited justification, so long as commercial milk is either infected or prohibitive in price. As genuine life-saving stations, as centers for individual attention to infants and individual instruction to mothers, they may become the very foundation stone of the rational safeguarding of human life.

March 11, 1911.

THE COMMON WELFARE

SOME BILLS THAT FAILED

Congress failed to pass ten of the eleven bills before it which have been of especial interest to readers of THE SURVEY as embodying some specific measure of social advance.

The one which passed was the bill urged for many years by railway employes and boiler makers, providing for inspection of locomotive boilers throughout the United States. Some states have inspection, but the country as a whole has made practically no provision for it.

The bill establishing a children's bureau passed the Senate but failed in the House. The National Child Labor Committee, its sponsor, believed that it had a clear majority in the House, but it could not be brought to a vote and thus was lost when its prospects seemed brightest.

The other measures which failed were Senator Owen's bill establishing a National Department of Health and Congressman Mann's bill in the House changing the name of the Public Health and Marine Hospital Service to the Public Health Service—a measure not at all acceptable to the Committee of One Hundred on National Health; the Goulden and Gillette bills proposing, from different standpoints, to establish a system of pensions for civil employes of the government; the bill establishing a parcels post; the Esch and Mann bills prohibiting the use of poisonous phosphorus in match manufacture; the bills incorporating the Rockefeller Foundation and the Carnegie Peace Endowment Fund.

"1,000 Brooklynites, mostly children, die annually as a direct result of dark rooms." Jacob Riis

"How can one expect good citizens to be raised in a place like this?"—Theodore Roosevelt.

LETTING THE LIGHT IN AND THE CHILDREN OUT.

Mr. Roosevelt and Mr. Riis were members of a party including city officials which made an automobile tour through the tenement districts of Brooklyn. This opened a campaign of publicity which it is hoped will arouse public sentiment against the 49,000 dark interior bedrooms in the borough. The New York tenement house law applies to Brooklyn as well as to Manhattan. Failure to enforce it in old buildings in Brooklyn is believed by the Tenement House Committee and the Committee on the Prevention of Tuberculosis to be due chiefly to lack of an insistent public demand.

VOCATIONAL GUIDANCE IN HARVARD UNIVERSITY

Harvard University is announcing a course of vocational guidance to be given in the next summer school. Inasmuch as Prof. Paul H. Hanus, the head of the education department, is also chairman of the Vocation Bureau executive board, it is altogether fitting that the course, based on a work in which he has been active with such co-workers as A. Lincoln Filene, Mary Morton Kehew, should be undertaken under his auspices.

This is the first course of its kind, and applications have come from all parts of the country from school superintendents, heads of vocational schools, social workers, college men charged with advisory duties towards students, and men and women who desire to equip themselves for this service. Meyer Bloomfield, who has been director of the Civic Service House for ten years and is now in charge of the Vocation Bureau, will be the lecturer. It was in the neighborhood house of the North End of Boston that the first Vocation Bureau in the country was started under the leadership of the late Prof. Frank Parsons.

A book by Mr. Bloomfield, The Vocational Guidance of Youth,[1] has just been published by Houghton Mifflin Company. It presents the problems of mis-employment and mis-direction, and points out how organized information and intelligent guidance of youth, keeping always in mind the social investment of the child rather than its individual employment, would greatly mitigate such conditions as have been pointed out by the Royal Commission on the Poor Laws in England and by other authoritative investigations.

That the vocational guidance movement should have met with a response from the whole country, as it has, indicates a two-fold need of adjusting the educational system so as to quicken what President Eliot calls the "life-career-motive," and of shaping conditions of employment so as to encourage vocational efficiency.

[1]The Vocational Guidance of Youth. By Meyer Bloomfield. Houghton Mifflin Company. New York. 1911. Pp. 123. By mail of THE SURVEY, postpaid, 60 cents.

Interest in vocational guidance is not confined to educators and social workers alone. A fortnight ago Mr. Bloomfield was invited by joint resolution to address the Wisconsin Legislature on the subject, and for over an hour there was a lively cross fire of questions and answers. Needless to say the potent influence of the University at Madison, with such men as President Van Hise, Professor Commons, Dr. McCarthy, and Dean Reber, has prepared that state to think seriously about the vocational needs of its youth.

In Boston the school system is committed to a thoroughgoing policy of vocational guidance just as Massachusetts is committed to a comprehensive program of vocational education. A course for Boston public school teachers has been conducted since the opening of school last fall, to which every school sends its vocational counsellor, so called, a teacher or principal's assistant appointed through an order of the School Committee. At this course representatives of the vocations that employ boys and girls come to answer questions and to present the problems of their respective occupations.

To supplement this work the Vocation Bureau is issuing a series of Bulletins on Vocations for Boston Boys. The Bulletins on the Machinist and Banking have appeared. The Girls' Trade Education League is now sending to press a series of Bulletins on Vocations for Boston Girls. It is hoped through this printed material, which is to be reinforced by the intelligent sympathy of the school people, to help the children to a better chance of finding themselves, to bridge the yawning gulf between school life and working life, and most important, to prolong the educational life of youth.

The Harvard course of ten lectures open on July 7, and continues on Mondays, Wednesdays, and Fridays for three weeks presenting the following topics:

Elements in the choice of a vocation.
The necessity of vocational guidance, as recognized in various countries.
Vocational guidance in the school system.
a. The public schools.
b. Guidance and private philanthropy.

The duties and equipment of the vocational counsellor.
How to study the vocations.
Vocational guidance and the problem of employment.
The foundations of vocational efficiency—educational, economic, and personal.
The employer's point of view in vocational guidance.
Social gains through vocational guidance.
Summary of the course, and cautions.

In this connection *Service*, the monthly leaflet of the Juvenile Protective Association of Philadelphia, announces the inception of a movement for a vocational bureau in that city.

The purpose of the proposed bureau is: first, to gather facts relative to the opportunities in the various industries for boys; second, to disseminate these facts to the schools and other places where boys may be gathered; third, to encourage a greater interest in the advising of the young into the various industries; fourth, to examine boys as to their special fitness for the various lines of industry and to advise them as to the opportunities open to them in the industries to which they are most fitted.

JUVENILE COURT LAW UPHELD IN KENTUCKY

The state Court of Appeals has handed down an opinion upholding the juvenile court law of Kentucky. The law was attacked in a case in which a girl had been committed by the County Court of Jefferson county (Louisville) to the Convent of the Sisters of the Good Shepherd. It was sought, first, to secure the release of the girl by a writ of habeas corpus, and failing in this to have the judgment reviewed on appeal to the Criminal Court. The law was attacked upon three grounds: That the creation of the juvenile court was not authorized by the constitution; that the judgment of the court being for the confinement of a delinquent child for an indeterminate period, or until she reached her majority, was the imposition of such punishment as clearly authorized an appeal under the criminal practice; that the act was unconstitutional in that it denied to the delinquent the right of trial by jury, and therefore deprived the child of its liberty without due process of law.

The court overruled all of these objections. The reasons assigned for overruling the second and third objection are of general interest. The law, following generally other laws, declares that the proceedings shall not be deemed criminal. Speaking of this declaration in the law, the court says:

> If they (the proceedings) were in fact criminal, the declaration to the contrary could not have the effect of changing their nature; but such declaration at least shows the legislative intent. This intent is to protect rather than punish the child. . . . The object of the act is to give the court authority, acting for the best interests of the child, to place it in the care and custody of someone capable and willing to do for it that which its natural parents either are unable or unwilling to do. Such an act is in no wise a criminal proceeding; nor can any restraint imposed under the act for such a purpose be regarded as a punishment for crime.

Citing numerous other cases, the court held that the child was not deprived of its liberty without due process of law in that no jury trial was allowed it, resting its conclusion upon the theory that the proceedings are not criminal, but are

> merely the services of the government called into play for the purpose of protecting, training, and correcting a class of children, who, through misfortune or lack of parental guidance and care, are unable or unwilling to care for themselves.

BRITISH SCHEME OF STATE INSURANCE

The next step in the program of social reform promised by the British Liberal Party is state insurance for sickness and invalidism. The work of preparing the tentative proposals recently made public by the chancellor of the exchequer began many months ago, and the final draft was drawn up at a series of conferences between Lloyd George and representatives of the various benefit societies in the British Isles, the intention being to make use of these societies so far as possible as agencies for distribution of the fund for compulsory state insurance. The societies are estimated to have a membership of over 6,000,000, and funds of over £46,500,000.

The government scheme of compul-

sory insurance covers the whole working population whose yearly income does not exceed £160. Five shillings a week is the amount of the proposed weekly state contribution, all benefits beyond this limit coming from purely voluntary membership in the benefit societies. Persons between sixteen and seventy years old are eligible, all beyond this age passing into the class of old age pensioners. Half the contribution toward the fund is to come from the insured, half from the state, the amount to be calculated by government actuaries.

It is impossible to calculate the expense on the basis of present actuarial tables, for unlike friendly or industrial insurance companies, the government would accept both those with good and those with frail constitutions. The most distinctively social element in the plan is, indeed, this development of the system of free hospitals and free medical treatment in the home, by which the state would undertake, or at least share, the financial support of those with frail constitutions, or those whose constitutions have been undermined by unhealthful occupations.

The boards of administration are to be made up of representatives of the government, of the friendly societies, and of employers of labor; the beneficiaries, except those who are members of the friendly societies, will not be represented.

CONSTITUTIONALITY OF LIABILITY LAWS TESTED

Two interesting developments have recently taken place in connection with the federal liability laws. On January 20 President Taft sent a message to Congress, together with his approval of a bill for the relief of the family of a workman, Samuele Badolato, killed while in the employ of the government on the Panama Canal, recommending a general act that should practically remove the three months' time limit now set for applications for compensation. He points out that special legislation has been necessary in granting compensation in the Badolato case, which was not brought up within this time limit, and that since the passing of the compensation act of May, 1908, no less than twenty-one cases have failed to receive compensation for this reason alone.

Even more important is the opinion handed down by Judge Rellstab in the United States Supreme Court, District of New Jersey, upholding the federal liability law of April, 1908, which applies to employes engaged in interstate commerce. Shortly before the present law was passed, the United States liability act of 1906 was declared unconstitutional, because it affected employes engaged in intrastate as well as interstate commerce. The later law was broader in its application than that of 1906. It also sought to remove the constitutional difficulty, and its constitutionality was not challenged until, in the Hoxie case, Judge Simeon E. Baldwin, now governor of Connecticut, held it unconstitutional on the same grounds as the 1906 law. In the case of Anderson *vs.* Lehigh Valley Railroad, Judge Rellstab challenges Judge Baldwin's decision and upholds the constitutionality of the law, as borne out by his own and a number of Supreme Court decisions previous to Judge Baldwin's.

In New York, too, the constitutional question has arisen, in connection with the compensation act of September, 1910. This is in the application of Earl Ives for seventy dollars damages from the South Buffalo Railway, for an injury sustained in consequence of no negligence on either side, but of the necessary risks and dangers of his employment. The case has been carried before the Court of Appeals. It is in effect a test case to which both sides agree, to decide the constitutionality of the first state law that substitutes the principle of automatic compensation for trade risk for the principle of employers' liability for proved negligence. In view of the movement for compensation in other states, the final decision in this case will be of the greatest interest and importance.

PENSION PROPOSAL FOR NEW YORK CITY

Following directly on a report on the subject by the Citizens Union pension committee, of which Arthur Williams

was chairman, Assemblyman Cuvillier has introduced a bill in the Legislature to amend the New York City Charter to provide a retirement fund for city employes.

The bill proposes to establish a board consisting of the mayor, the comptroller, and the city chamberlain, which shall have general jurisdiction over a fund made up of deductions from the salaries of beneficiaries of one per cent for five years' service and proportional increase for each five-year period until six per cent is reached, when the amount becomes stationary, together with donations, legacies, and other forms of gift. Membership in the fund is voluntary. Application must be made within a year after entering the service and none is eligible for a pension who has not contributed a sum equal to half the average salary received for the three years prior to retirement.

Fifty years is the minimum age of retirement, under ordinary circumstances, and the amount of payment depends on length of service, and one-half the average salary for three previous years after thirty years' service, and a proportional sum after between twenty-one and twenty-nine years. No age limit is set for persons mentally or physically incapacitated, or those who lost their office through no fault of their own, who are eligible after ten years' service.

The proposed law is designed to cover all the city departments—of which there are sixteen—except the departments of education, fire, and health, which already have pension systems of their own.

Senator Cuvillier's bill departs from the suggestions of the pension committee in making no provision for sickness or accident, in not providing for return of the contributions of those leaving the service before they are eligible for the pension, in being on a voluntary and not an obligatory basis, and in requiring no contribution from the city.

The report of the committee of the Citizens' Union shows that in 1910 the four departments now giving pensions paid out about $3,000,000, of which $400,000 came from the city budget, the rest from gifts, from fines paid to or licenses given out by the department, and, in all cases but the Fire Department, from deductions from salaries.

SUFFRAGETTE PLANS FOR PRISON REFORM

It will be remembered that Winston Churchill's plans of English prison reform, outlined in THE SURVEY of September 3, 1910, contain a clause providing for more reasonable treatment of suffragettes and other passive resisters but make no special separate provision for the care of women prisoners in general. Prison experience, however, has taught the suffragettes something about the character and special problems of the ordinary woman prisoner, and a certain section of the suffrage group, whose spokesman is Silvia Pankhurst, now lecturing in the country, is starting an agitation through the British press to secure for women the sort of protection that the juvenile court affords children, to extend the same curative treatment that the industrial school gives boys to young women prisoners, whose usual offense, prostitution, calls quite as much for protection and rehabilitation.

Miss Pankhurst's reform would begin with protection in the court and detention rooms by the separation of men and women prisoners, and the provision of police matrons and of women lawyers.

On the curative and preventive side she would do away with the practice of sending any but hardened offenders to prison. All the younger offenders should be sent to state schools, where their activities should not be limited, as now in many private reformatories, to routine household drudgery, alternating with complete idleness. Instead she advocates a system of technical education suited, as far as possible, to the bent of each girl's mind and to the length of her term, and designed to prepare her for industries which are in need of workers. Logically a system of employment bureaus, or perhaps an extension of the labor exchanges, should, she holds, accompany this educational system, whose ultimate object is to equip the girl better for the industrial struggle which, in many cases, was the cause of her moral mishap.

In addition, Miss Pankhurst's plan

would include physical rehabilitation, not only through good food and medical care, but through athletic training and instruction in habits of cleanliness.

PITTSBURGH BIG WITH DEMANDS

From local option to the street car tangle and on through a new school code, municipal courts, public utility, and municipal art commissions, measures and bills are being brought before the Pennsylvania Legislature by Pittsburgh, in such numbers and of such radical character that the state's lawmakers at Harrisburg show signs of bewilderment. Based upon popular dissatisfaction with present forms of city government, and urged by recently acquired recognition that neither state commissions nor municipalities possess adequate powers to deal with street car and railroad matters, a wave of unrest is stirring western Pennsylvania. Other parts of the state have felt the movement and eyes are turned to Harrisburg as never before.

"How much do you think we'll get?" is the current question. Even the most enthusiastic supporters of the progressive legislative program can hope for success in but part of their demands.

The proposed new form of city government, known as the Pittsburgh Plan, and similar in many respects to the Boston Plan, is foremost in the public mind. Perhaps second in popular interest is the probable fate of the school code, a measure generally endorsed by educators. Yet two years ago a similar bill was so changed in intent and possible application by amendments that a sigh of relief rolled over the state when it met Governor Stuart's veto.

Either the abolishment of the State Railroad Commission and the substitution of a bureau of public utilities, or the strengthening of the commissioners' powers will be assured by the passage of one of the alternate measures. To all intents and purposes the present power of the Railroad Commission is limited to recommendations, with which railroad and street railway corporations may conform if they choose, the sole compulsion being the weight of public opinion. The bills are part of the legislative program relating to traction matters, for which the mayor of Pittsburgh, W. A. Magee, has stood sponsor.

Pittsburgh in its intermittent war on and never ceasing friction with the Pittsburgh Railways Company, has been in the peculiar position of having the right, according to the terms of franchises granted in the past to underlying companies, to take possession of street car lines, yet the Legislature has never granted the municipality the power to possess by purchase or construction a foot of track. Therefore the club over the head of the railway company is apparently nothing but a jester's slapstick, and will so remain until the legislators act. A companion bill will hasten the abolishment of grade crossings by empowering the city to make the improvement, and by providing for the appointment of viewers to assess benefits against both railroad and street car companies.

Another legislative measure fathered by the Pittsburgh city administration is intended to further the extension of corporate limits and assimilation of adjoining boroughs. It is entitled the Greater City bill. Under existing conditions an adjacent borough or township may petition for annexation to the city by majority vote. The proposed act would make annexation depend on the combined vote of the city and its tiny neighbor. This joint-vote scheme worked well in 1907 in bringing Allegheny City into the fold. A storm of protest has been aroused in the populous residential boroughs surrounding Pittsburgh by this year's measure, and the taxation features of the proposed legislation are receiving scrutiny.

In the field of capital and labor, which is inevitably closely related to civic affairs in an industrial district, Governor Tener in his inaugural address recommended a compulsory arbitration law and the appointment of a commission to investigate all phases of employers' liability.

The various proposals enumerated come from a great variety of sources, and when viewed in the light of their backers some of them make strange bedfellows. They are all, however, in a

sense an expression of that "coming to self-consciousness" of the Pittsburgh district, as a civic unit, which was outlined in Mr Burns's article in the February magazine number of THE SURVEY—a metropolian industrial community, beginning to feel its coherence, wishing to break down old civic barriers, seeking at once larger local self-government and simpler and more direct channels through which to express the popular will, and seeking also more effective instruments (whether school board or railroad commission) through which to execute the public work.

Pennsylvania's constitution stands in the way of immediately wiping out the nefarious aldermanic courts, often selling places for petty judgments, yet Pittsburghers think they have found means for relief, if not cure, in a bill establishing minor courts of justice. A recent turning of the spot light upon methods and practices of two aldermen has renewed conviction as to the necessity for change.

Pittsburgh artists, architects, engineers, and citizens susceptible to the aesthetic have a bill ready providing for the appointment of a Municipal Art Commission to approve plans for public buildings and bridges, and to act as the final court on all questions of art concerning the city. Private builders of imposing edifices may voluntarily submit plans to the proposed commission.

Many persons believe a great advance will come through the new school code and new charter measures. The code abolishes Pittsburgh's small ward school boards and centralizes authority in fifteen men to be appointed by the circuit court bench for the first term, and afterwards to be elected at large. A comptroller is provided to audit all financial matters of the school system, in contrast to the present irresponsible expenditure by ward boards. Local interest is to be kept alive and make itself felt through ward boards of visitors of three members each, reporting to the central bodies and making recommendations.

A nine-months' popular campaign waged by Pittsburgh's civic bodies in the interest of a changed form of city government is reaching its culmination in a series of proposed amendments to the present charter which would reduce the number of councilmen from a bicameral body of sixty-seven men to one chamber of not over nine members, elected at large; would pay such councilmen salaries not exceeding $6,500 a year; would wipe out party symbols on ballots, abolish primaries, and provide for nomination by petition of five per cent of voters at the last election; would confer upon the citizenship the power of initiative on petition of fifteen per cent of the voters, referendum on ten per cent, and recall on twenty-five. The duties and powers of the mayor and comptroller would remain unchanged and the former would still appoint heads of departments, the framers of the Pittsburgh Plan being convinced of the desirability of clinging to the principle of centralized responsibility.

Scranton, as the other second-class city of Pennsylvania, would share with Pittsburgh in any changes in the form of municipal government.

REPORT OF NEW YORK CONGESTION COMMISSION

The report to Mayor Gaynor of the New York City Commission on Congestion of Population gives official standing to much propaganda of the volunteer congestion committee. The commission was appointed by the mayor last May, a majority of its members being aldermen. It has held twenty-one meetings, its various committees fifty-one meetings, and 164 witnesses have been examined. Original investigations have not been made. The secretary of the congestion committee, Benjamin C. Marsh, has served without pay as secretary of the commission and has borne the brunt of the work. During the same time he has been secretary of the State Commission on Distribution of Population which attacked congestion from the preventive side—by popularizing the farm and heading off slum growth in smaller cities—as reported in last week's issue of THE SURVEY.

The city commission's report comes to a sharp focus in the statement that in the past five years the population of

Manhattan Island south of Fourteenth street (which includes the lower East Side and the older parts of the city) has increased 27,165. Of the 122 blocks which in 1905 had a population of 750 or more per acre, sixty-five have increased in density and six of them have increased by 300 or more per acre. Room crowding is growing in Manhattan and Brooklyn and spreading in the Bronx. Serious physical, economic, and moral results are shown—"the greater the room overcrowding the higher not only the death rate, but the sickness rate as well." The tenement house law has not stopped this. The report puts it, in effect, that while the law is not responsible for making two men sleep where one has slept before, neither has it turned one of them out of bed.

Congestion and room overcrowding are discussed under five headings: conditions, effects, causes, methods of prevention here and abroad, recommendations for improvement. When printed it will make a volume of several hundred pages with hundreds of statistical tables and independent reports by twelve committees. At this writing only a summary has been given out.

The commission finds fourteen main causes of congestion in the following words:

Poverty, defined as inability to maintain a reasonable standard of living.

Concentration of factories and offices.

Consolidation of the five boroughs.

Intensive use of land.

High price of land due to intensive use.

Lack of control over aliens and citizens.

Long hours of work.

Cost of transit and the transit policy of the city, since transit has been regarded as a matter to be governed by commercial and not by social consideration, although the commission shows that the cost of transportation for large classes in the community is a distinct waste that could be eliminated by distribution of factories.

Lack of a definite city plan.

The present system of taxation, under which until very recently the owner of the land improved with buildings has been penalized, while the man who holds land out of use, so that he may secure the speculative increases of land value, has been helped by the taxation policy.

Failure to prepare land for housing purposes.

Methods of public and private charities, but especially of private charities.

Failure of the city to adopt a policy to attract people to outlying boroughs.

Immigration and failure to distribute and control immigrants.

RECOMMENDATIONS OF THE COMMISSION

The commission's recommendations have in large part been embodied in bills and ordinances to be introduced later. The findings are so voluminous that only the barest outline can be given here. Chief among them are measures directly limiting the "cubage" of all buildings hereafter erected or altered south of One Hundred and Eighty-first street in Manhattan—in other words, requiring a very large lot for a large building and outlawing the skyscraper; requiring fireproof construction; establishing a system of zones for buildings of different heights and for factories; and changing the system of taxation.

Following are the main headings of the recommendations with their purposes as interpreted in a digest given out by the commission:

Lot Occupancy of Buildings Other than Tenements. Requiring at the back of factories an open yard the width of the lot and of a depth equal to one-tenth the height of the building but not less than ten feet.

Heighth of Tenements. Providing that height shall be greater than the width of the widest street on which the building stands; no tenement shall be more than four stories high except south of One Hundred and Eighty-first street, Manhattan, except that one story may be added for every fifteen per cent of the lot area left unoccupied less than the present legal occupancy; requiring fireproof construction for tenements of four stories or fifty feet height; limiting tenements in outlying districts to three stories and other buildings in proportion; modifying the tenement house law in regard to three-family tenements in such a way as to encourage construction of them.

Room and Apartment Overcrowding. Making ninety square feet a minimum tenement room (it is now seventy), with one room in each apartment of at least 150 square feet (now 120); a minimum per apartment of 600 cubic feet of air space for each adult and 300 for each child under twelve, with a fine of twenty-five dollars for each violation (it is now 400 and 200, respectively, per *room*); requiring the Tenement House and Health Departments to placard each apartment with the number of occupants permitted; requiring a license to take lodgers; creating a bureau of

occupancy in the Department of Health to enforce the law against overcrowding.

Conditions of Labor. Appointing a deputy state commissoner of labor for New York city with more factory inspectors; creating a city industrial commission of three persons appointed by the mayor from nominations by the Employers' Association, the labor unions, and one by the mayor himself, to investigate conditions, wages, and disputes; creating a series of employment offices through the state with a number in New York city, or a municipal employment bureau with at least one office in each borough; creating a national department of labor to give wide publicity over the country to the opportunities for work, and to conditions, wages, and permanency of employment in all sections.

Distribution of Factories. Raising the cubic air space for each employe from 250 cubic feet as at present to 500 for each day and 600 for each night worker; improving the water fronts of each borough for use as factories, and warehouses; building freight lines to connect all boroughs; reducing charges for trucks on municipal ferries.

Parks, Playgrounds, Schools, Recreation Centers. Acquiring land in advance of public needs, and in outlying boroughs dividing the cost among the property benefited, the borough, and the city; limiting schools outside Manhattan to 1,500 pupils and rooms to forty seats; purchasing with each school yard area adequate to the needs of the children of the neighborhood; increasing instruction in physiology and hygiene and teaching children the results of room overcrowding; increasing school gardens, parks, playgrounds, and recreation centers.

Cheap Land and Good Cheap Housing. Making the rate of taxation upon all buildings "half the rate of taxation upon all land and that this reduction be secured by an equal change in each of five consecutive years"; recommending that the city government consider a tax on unearned increment; terminating the existing perpetual franchises of transit lines "as opportunity offers by forfeiture"; extending transit systems to utilize to their full capacity the subways, bridges, and elevated lines; running lines into all sections of the city whether or not they would pay at first, because they will be profitable in "conserving the general welfare and prosperity of the citizens"; extending the city lines to the Queens side of the Queensborough Bridge and through the Steinway Tunnel into the Borough of Queens; providing in all franchises for transfers; constructing a subway to the Borough of Richmond (Staten Island), and pending that to sell forty tickets for one dollar on the municipal ferries; amending the rapid transit law to give the Public Service Commission and city authorities powers over surface lines equal to those over rapid transit lines; preparing a city plan by the Board of Estimate, including the following items: restricting factories to certain districts, providing transit and freight lines, determining the main lines and secondary lines of streets as suggested by Chief Engineer Nelson P. Lewis of the Board of Estimate and Apportionment, providing sewers and substructures for pipes, providing adequate sites for parks, playgrounds, recreation centers, and municipal buildings, acquisition of adequate land by the city for all public purposes; reducing streets in outlying districts to thirty feet with houses set back fifteen to twenty feet from the curb in the hope of reducing rents; providing excess condemnation of land so that the city may acquire more than is needed for a specific improvement and resell or rent the surplus.

Health and Safety. Empowering the Tenement House Department to vacate insanitary and dark rooms pending structural changes and making the tenement house commissioner a member of the Board of Health; organizing a staff of medical inspectors to be assigned by the Department of Health to the Tenement House Department to pass upon cases of vacating insanitary tenements or rooms in which there has been contagious disease; requiring that tenement walls be whitewashed every year; prohibiting or adequately regulating manufacture in tenement houses.

Charities and Public Outdoor Relief. Creating a board of trustees of public outdoor relief to dispense such relief to the dependent members of families of consumptives, and to widows with children provided they will move into wards with a density of not over 300 to the acre and live under conditions approved by the board; giving the comptroller supervision over all charitable institutions exempt from taxation; encouraging the removal from congested districts of charitable institutions, except emergency hospitals and similar institutions; acquiring tracts of land for extending the work of the City Farm Colony and for teaching adults agriculture and gardening; urging private charities so to dispense their relief as to encourage distribution of population from congested districts and to encourage recipients to learn trades other than those of congested city life.

Immigration. Legislation abolishing time limit on the government's right to deport aliens for cause; progressive measures looking toward the effective control over aliens by the federal government; encouraging immigrants to become farm laborers and discouraging their segregation in congested sections; preventing artificial stimulation of immigration; establishing city and state farms; publishing information as to opportunities to learn the English language; providing for immediate deportation of convicted aliens in order to relieve overcrowding in state penal institutions.

Delinquency. Closing streets in congested districts during certain hours so that children may use them for playgrounds.

Public Squares and Buildings. Providing each borough with at least one large area for public administration buildings and a series of civic centers.

THE TREND OF THINGS

To point the moral and adorn the tale, to prove, that is, that public opinion in regard to housing is slumbering in Boston, the *Boston Common* is reviewing week by week what has been accomplished in various sections of the city as a result of the Twentieth Century Club report issued thirteen years ago. One week's investigation of one section of town finds some houses gone, only part of them in consequence of the report. Others it finds in worse condition that before, notably one so built around that it cannot be seen from the street nor approached except through the hallway of another house. Others, again, are improved by changes in surrounding conditions. One house ordered vacated thirteen years ago is still occupied, and another condemned eighteen years ago still stands and is occupied. In another place, where stood two houses too bad to improve or occupy, the report advised converting the property into a playground, but the houses still stand. The *Common* concludes, with some show of reason, that public opinion must have gone to sleep directly after the report of thirteen years ago was made.

* * *

From Tannenbaum through Maryland to the Red Flag is a far call, but new times being new issues, which express themselves sometimes through old tunes. Ebenezer Eliot gave a new meaning to the air of God Save the King when he wrote his immortal God Save the People—,

"Not thrones or crowns, but men."

It was William Morris who first adapted the March of the Workers to the tune of John Brown.

Hark, the rolling of the thunder;
Lo, the sun, and lo, thereunder
Riseth wrath and hope and wonder,
And the host comes marching on.

Hamlin Garland followed him with verses not so well known:

A BATTLE SONG FOR THE ARMY.

We have seen the reaper tolling in the heat of summer sun,
We have seen his children needy when the harvesting was done.
We have seen a mighty army dying hopeless one by one
While the flag went marching on.

. . . .

Our slavers' marts are empty, human flesh no more is sold,
Where the dealer's fateful hammer wakes the clink of leaping gold,
But the slavers of the present more relentless powers hold,
Though the world goes marching on.
But no longer shall the children bend above the whizzing wheel;
We will free the weary women from their bondage under steel,
In the mines and in the forests worn and helpless man shall feel
His cause is marching on!

Within the last few months another writer, B. F. Sutherland, makes this contribution to socialist verse, following more nearly the phrasings which Julia Ward Howe had woven into The Battle Hymn of the Republic:

Mine eyes have seen the banners of the marshalled hosts of toil;
They are pouring from the workshops, they are springing from the soil;
They are shouting for the surcease of the weary murk and moil—
The day is marching on.
I have seen a crimson ensign on the rigid battle line;
Lo, it flames, a fiery pillar, beacon of a hope divine;
They are singing in the trenches, though the angry foemen whine—
The day is marching on.
Let us sound the call to labor, for the harvest now is ripe;
Lay the sickle to its reaping, while the cheery bugles pipe;
Wind again the stentor's trumpet, and let loose the tongues of type—
The day is marching on.

Appeal to Reason.

* * *

A "Song of Subsidies," rather than a "Song of Solons," would be the more appropriate title for Dean Collins's verse in the Portland *Oregonian:*

Ho, gallant Solons, 'neath the State House dome,
There are voices calling, calling, from the ones back home,
And a thousand institutions throughout our mighty state
Are urging on a thousand claims, and none of them can wait,
And a thousand things divert you from your other legislation,
Demanding several thousand each for their appropriation;
Then for these impecunious institutions, small and big,
Dig deeply in your coffers, but remember, as you dig:

CHORUS.

To keep your foot on the soft, soft pedal;
Go slow, don't dig too far;
For cash has legs, and it surely can skedaddle,
If the lid is left ajar.
Munificence is lovely, but don't give it too much slack;
'Tis a virtue one should measure by the volume of his stack.
So keep your foot on the soft, soft pedal,
And please don't dig too far.
(N. B.—The melody should wax the more fortissimo.
The deeper in the cash box the appropriations go,
And should make a brave crescendo on the diapason stop,
As the bottom of the coin case comes the nearer to the top.)

* * *

The February *Hustler,* organ of the Boston Newsboys' Club, tells something of the newsboy's trade:

"Beginners often sell for other boys on a commission basis. In this way they secure the advice and protection of the more experienced boys while serving their apprenticeship. These 'strikers,' as they are called, keep one cent for every four collected. Few of them earn more than twenty-five cents a day, while many of them earn less than ten.

"The older boy, working for himself and sometimes employing others, builds up a patronage at some location. This place becomes his 'corner,' which, by newsboy tradition, he occupies without interference. Thus if a boy has sold papers on a certain corner for several years no other newsboy would think of competing with him there. The goodwill thus gained is a valuable asset and is either handed down to a younger brother or otherwise disposed of to good advantage. Two dollars per day is a conservative estimate of what many

of the older newsboys earn. A few make twice that amount.

"Intimately allied to the newsboy is the 'Canada Point.' 'Canada Points' are ex-newsboys employed by certain papers for a fixed salary to distribute by wholesale. Formerly boys were obliged to go to the several offices for papers; now they may be obtained at any one of the twenty points throughout the city.

"Since the busiest time of the day for the newsboy is from four to six in the afternoon, many earn enough during these hours to enable them to attend school. In the English High School alone there are over 300 newsboys; all the other high schools of the city and even the colleges in the vicinity, have their quota of newsboys. These boys, receiving daily the best business experience that can be had, appreciate the value of an education and strive to obtain cultural as well as business training."

* * *

In the February *Craftsman* Cecil I. Dorrian tells of the work of the sculptor, Jules van Briesbroeck, in a social laboring community on the outskirts of Ghent, where "all the grayness and slow grandeur of the north is in the place, and all the dull, age-long monotony of ill-paid labor is in the people." In spite of ill-paid labor, these people have built themselves a strong co-operative community, represented on the municipal government of Brussels, and they have their artist, one of themselves, whose studio was built with their own hands, and who, we are told, makes them in return beautiful images of themselves, combining "the hopeless figures and faces of the toilers" of today, with the soul of man that is to make tomorrow.

* * *

According to the *Courant*, the efforts of the women's clubs of North Dakota revealed on the statute books of that state a law excellent in many respects, but rather lacking in arithmetic, as it contains the astonishing provision that children under a certain age shall work "not more than sixty hours in any one week, and not more than eight hours in any one day."

* * *

The February issue of the *International Socialist Review* contains interesting material on the machine and the workman. In The Passing of the Bottle Blower, Robert J. Wheeler, a member of the Glass Bottle Blowers' Union, tells of the remarkable rise of that union of highly skilled workers, until in 1907 fair workmen could earn from six to eight dollars a day of eight and one-half hours, speeders as much as twelve dollars a day for ten months in the year. In 1904 the invention of the Owens Automatic Glass Blowing Machine caused a turn in the tide. Already, he says, wages have fallen twenty per cent; the number of workers, especially the skilled class, have been vastly reduced, and the first steps toward trustification of the industry have been taken. A like process of substituting the machine for the skilled worker is traced by Thomas F. Kennedy, for twenty-seven years a

Courtesy the Craftsman.

"BELGIAN MINER RETURNING FROM WORK": JULES VAN BIESBROECK, SCULPTOR.

member of the molders' union, who writes on Banishing Skill from the Foundry. He tells how the molding machine with three unskilled laborers turns out 225 molds a day of a pattern of which formerly a single skilled molder could make only seventeen a day! Like the automatic glass blower, the molding machine is leading to rapid concentration in the industry. Further articles are promised.

* * *

Some Nativity and Race Factors in Rhode Island by Carol Aronovici forms part v of the annual report for 1909 of the state commissioner of industrial statistics. The work consists of numerous carefully compiled tables dealing with the increase in the foreign elements, age, and sex distribution, the causes of emigration, conjugal condition, fecundity, assimilation, and criminality. The results, which are somewhat similar to those of studies made elsewhere, show no undue lack of interest among the foreign stock in our political institutions, nor any alarming criminal tendencies on their part; while certain grave problems of present day tendencies in the industrial world are illustrated, particularly in reference to the vexed question of women in industry.

* * *

The Massachusetts Bureau of Statistics, in its second annual report on municipal finances, analyzes the fiscal operations for the year 1907 of cities and towns that exceed 5,000 population. Information is also included for 200 small towns which tried to comply with the law requiring them to submit reports to the Bureau of Statistics, but not in the tabular detail in which the statistics for larger places are presented. Fifty-six towns had not made returns for 1907 by October, 1910. The practical value of the statistics to administrators and students of municipal affairs would be greater if they were more timely, but the director of the Bureau of Statistics shows that this is impossible when municipal and town authorities take as long as sixteen months to make their returns, which must later be subjected to verification.

The report could not furnish tables to show clearly expenditures from sums raised by taxation and sums raised by incurring debt, but is obliged to show merely the current costs properly chargeable to revenue. If these payments are in excess of the revenues available for the same, the conclusion is natural that the excess payments might have been met out of receipts from non-revenue sources and in large part probably by bond issues. Much carefully presented and valuable material is included in the report, while the fact that in two years twenty-six cities and towns have had public accountants or investigating committees examine and audit their accounts, with a view to installing a new system in accordance with the classifications of the bureau, promises more for the future.

The *Kindergarten Primary Magazine* thus summarizes Dr. Josephine Baker's advice to mothers, given in an article in the *Globe:*

"Do your children live according to a regular routine?

"Put them to bed never later than 9 o'clock.

"Don't let them bolt their food.

"Have the bedroom window open at night.

"Don't give them coffee to drink.

"Don't let them buy hoky-poky, ice cream, or eclairs, or candy for their luncheon.

"Give them cereals, and milk, and bread for breakfast and an egg if you can."

The same magazine tells of the war on the comic newspaper supplement begun by the League of American Pen Women and the Twentieth Century Club of Washington.

* * *

The Library of Congress has "printed as manuscript" a scheme of classification for literature on all subjects coming under the general heading of Social Sciences. It is very detailed, occupying 551 pages and weighing two pounds and a half. All this may be secured from the superintendent of documents, Government Printing Office, Washington, for sixty-five cents. It would be suggestive to anyone who has a collection of books, pamphlets, or clippings large enough to require a catalogue.

* * *

Does this mean that the London *Times* is congratulating the mine owners of the Rand that there has been no disturbance of the good old sane and conservative system of seven-day work for the Kaffirs?

"Towards the end of November last the Kaffir mining market, it will be remembered, was checked by rumors that the Union government intended to introduce legislation to restrict Sunday labor on the mines. Current reports then were to the effect that the proposal to close down all milling operations on the mines on Sundays emanated from the representatives of the different religious bodies on the Rand, and it was feared the government might, in deference to sentimental considerations, adopt a principle economically unsound and certain to cause undoubted injury to the Transvaal mining industry, with its resultant prejudicial effect on the profits of the producing mines. The opinion in well-informed quarters at the time, however, was that the Union government was not likely to take any step inimical to the mining industry, from which the revenues of the country were so largely derived. This view was evidently the correct one, as a telegram has been received from Johannesburg by the General Mining and Finance Corporation stating that the Draft Mining Regulations contain no vital alteration with regard to Sunday work."

COMMUNICATIONS

No department more clearly emphasizes the co-operative nature of THE SURVEY than the communications. Letters from readers are welcome; appeals cannot be published. Because of limited space, each contributor is asked to be brief so that no contributor will have to be excluded. Communications from 10 to 300 words in length are the most satisfactory and in the long run most telling. Only when the editors are convinced that so much space is needed, will communications over one thousand words in length be handled and the editors reserve the privilege of returning communications over 500 words in length to be abbreviated.

ROCKEFELLER FOUNDATION

"Quidquid id est, timeo Danaos et dona ferentes"—Virgil.

To the Editor:

I.

THE ECONOMIC ASPECT.

The problem presented to a community of great wealth in possession of the vicious soon solves itself, though much harm may be done in the process. Ordinarily two generations are more than sufficient to distribute it over filter-beds where it is purified and passed into the well-springs of healthy activities. But we are confronted in this country with a more difficult if not more serious problem, for, be it said to their credit most of our millionaires lead exemplary private lives in which they do not spend a tithe of their enormous incomes.

The vastness of some fortunes and their proportion to the average among even the well-to-do are not generally realized; so the following rather curious computation will be suggestive. If Adam was created according to the most generally accepted chronology in B. C. 4,004 and was now alive and had received fifty dollars per day for every day of the intervening 5,915 years, he would have received but a little more than half the sum which one of our millionaires has already given away!

So it is not surprising that in spite of their boundless munificence and private lives, there is a growing feeling among us that some have got more than any one should, because more than any one could acquire solely by sagacity or industry, however exceptional. This feeling leads naturally to the other: that there is some radical wrong in social conditions which make such unequal acquisition possible, and that in some way this possibility should be confined to more reasonable limits, and what might be called the balance of wealth (like the balance of power) should be automatically preserved as far as possible. For the public are beginning to see, what economists have long pointed out, that after wealth has come out of the mint of activities and been stamped with their values, its greatest value is gone; it cannot be restored to the sources from which it came—they are either exhausted or in process of exhaustion—and ready-made wealth, so to speak, that is to say wealth not acquired by activities of the generation which has it, tends either to remove the healthy incentive to enterprise or discourages or prevents its exercise.

These convictions have already expressed themselves in legislation which at first did little more than codify and accentuate previously existing laws, but afterwards added and still propose to add (by such measures as that to conserve resources and to tax incomes at an ascending rate) whatever was found to be required to subdue and thereafter control the Empire of Organized Wealth, which is discovered to exist and to embrace not only this people, but also other nations. (*Vidi* testimony on the subject in oil and tobacco cases.)

Among the many devious ways by which a dominant minority may sustain its rule, few are more effectual than that of "capturing the majority", and the most successful captor is interest. We see examples of the practice every day in town-meetings, legislatures, and Congress, when men are placed in positions and laws are enacted, contrary to the will and sometimes to the pledges of the majority affected. Of the first evil, the senator accredited to Rhode Island seems to be the most conspicuous illustration, for in popular estimation he never properly represented the state to which he was nominally accredited

at all, but the Empire of Organized Wealth to which the people of Rhode Island were through him automatically annexed; while of the other evil, the tariff (for which the same man is generally held responsible) is a still more conspicuous illustration.

It may not be generally known or, if known, appreciated, that (I believe) all the colossal donations which have recently astounded the world have necessarily been in the form of either stocks, or bonds, or both—generally and principally of the so-called "industrials" which are in the Empire of Organized Wealth. Such gifts, on the one hand, must generally make the receivers either active or passive opponents of measures which might tend to reduce or stop their incomes from those sources, and, on the other hand, furnish counsel of defendant "industrials" with a very strong plea against discipline, restraint, or extinction of them—indeed that very plea has been made.

I do not say that it was the motive or even a motive of the donors, but I point out that as a matter of fact every gift of the kind—and particularly the one proposed by charter of Congress—tightens the grasp of the giver on his own holdings of similar properties, and thus virtually is the premium for insurance against social interference with his business and a very important fortification in the chain which protects the Empire of Organized Wealth. If such gifts secure or help to secure results for that empire in the next twenty years like those accomplished in the past twenty years, the gifts will have more than returned themselves to the givers, paying a profit of over 100 per cent!

Therefore, would not the grant of a charter by Congress to the proposed enormous foundation tend seriously to hinder, if it did not defeat, present efforts of a majority of this people to emancipate the nation from industrial and commercial slavery, and to relegate a heirarchy of wealth to its position among those economic forces which are good only in their proper places?

II.

THE MORAL ASPECT.

Consideration of this aspect of the proposed foundation should take into account the following indisputable facts: that since 1884, which is to say for more than twenty-five years last past, news items and editorials on the doings of the Standard Oil Company and its allies have appeared at frequent intervals, not only in local but in reputable metropolitan papers like the New York *Times, Tribune,* and *Evening Post.* The editorials which appeared in the *Times* in May and November, 1887, headed respectively A Standard Oil Conspiracy and The Law Defied, are typical illustrations showing the universal tone of such publications, which together with their long continuance, wide distribution, and the general responsibility of the publishers are evidence that they had foundation.

Beside that, the late Henry D. Lloyd (a lawyer of exemplary character) published in 1894-5 (Harper and Brothers), a book of over 500 pages with the title Wealth Against Commonwealth, which was the first connected exposition for lay readers of the doings referred to up to that time, as those doings were disclosed by the sworn testimony in many trials and several jurisdictions. Of this book the late William Lloyd Garrison wrote: "It is a minute and searching examination of the enormous trusts which override and despoil the people of the United States. It is a tale of greed and shame almost incredible"; and the late Edward Everett Hale wrote: "It is the Uncle Tom's Cabin of the present crisis." Forty-three other similar commendations of the book, some of which were editorial, were printed by as many different papers published in eleven different states here, and seven from as many different papers published abroad.

Beside that, Ida M. Tarbell published in 1904 a history of the Standard Oil Company which sketched the life of the man who during all this time was, and I believe still nominally is, the head of the organization referred to, and to whose sagacity its achievements are popularly ascribed.

Beside that, the courts of I think three states have since convicted parts of this organization of offences either specifically charged or implied by the press for over twenty-five years, by Mr. Lloyd, and by Miss Tarbell, for which one court imposed a penalty of over $29,000,000, that, after reduction on purely technical grounds, was stated in the papers to have been paid; and finally, the highest court of the country has at this moment under consideration the termination of the very existence of the principal branch of the organization referred to, because of such offences. The head of this organization offers to found $100,000,000 for general philanthropical purposes provided Congress will give it a charter.

If this vast sum was generally acquired by methods, some of which have been long and widely stigmatized both at home and abroad as unscrupulous, which our courts have declared to have been illegal and for the use of which they have imposed penalties, is not this proposal a masterful effort to escape from such obloquy, for is it not in effect tempting Congress virtually to contradict history, rebuke public opinion, and stultify our courts? Can there now be any doubt about the character of the methods referred to? If not, is it for the dignity of this nation—is it consistent with any respect for law, morals, or religion, so to accept such a gift?

The common law provides every facility for repentance, restitution, or beneficence, and the perpetuation of them, for those who would prevent their good works from being "interred with their bones." Then why should the aid of Congress be asked, if not to an effort to disinfect a heap of unsavory "secret rebates" with the odor of philanthropy?

Fanwood, N. J. WRIGHT BABCOCK.

THE ILLITERACY TEST

TO THE EDITOR:

Certain arguments of the minority of the House committee on immigration, opposed to

the bill applying the illiteracy test, are typical of many arguments hostile to that test. Members of the minority say of it: "If enacted into law it will be ineffective to prevent the admission of the vicious, the immoral, the diseased, the pauper, the criminal, or the anarchistic classes."

Messrs. William S. Bennet and Joseph F. O'Connell say of the test that it will admit practically every foreign-born criminal who has misused early advantages. And J. Hampton Moore goes so far as to say: "The enforcement of such a test would . . , admit unworthy, educated immigrants who will not work and of whom we already have more than we need."

In the words of Mr. Gardner in his majority report, I admit the truth of such statements but not their force. It is nothing against a good thing that it has not also the qualities of some other thing which may be equally good or even better. We should not necessarily refuse beefsteak because it lacks the succulent qualities of the oyster cocktail, or refrain from bread because it is inferior to some other substances as a cure for thirst.

It is true that the illiteracy test does not entirely or specifically keep out paupers, criminals, anarchists, or the mentally defective. It only lessens the proportion of such, while protecting American labor against perpetual depression of its standard of life and wages. It is also true that there is nothing in it (directly at least) to limit child labor, to improve sanitation in factories, nor to lessen the ravages of tuberculosis. But there is nothing in it to prevent the enactment and the enforcement of laws that will accomplish these desirable results. Indeed, so far as other restrictions of undesirable immigration are concerned, the supporters of the illiteracy test have been among the leaders in advocating laws or methods of administration calculated to just these ends.

If any opponents of the illiteracy test on the ground above cited will bring forward any measures that will prove effective in excluding "the vicious, the immoral, the diseased, the pauper, the criminal, or the anarchistic classes" or the "unworthy educated immigrant" in whatever form, they will find the advocates of the illiteracy test their strongest allies in securing the adoption of such provisions. Fetch on your X-ray of virtue and we will help you introduce a dress rehearsal of the day of judgment, at this session if possible. Meantime the illiteracy test itself probably goes as far in that general direction as any practical measure yet suggested.

JOSEPH LEE.

Boston.

ITALIAN IMMIGRANTS IN CITIES

TO THE EDITOR:

May I ask through your columns replies to these questions, which arose in discussing local housing conditions:

1. What is the mortality among Italians, particularly among day laborers employed in construction work and on truck gardening farms?

2. When improved housing conditions have been provided for such Italians, have they taken kindly to them and profited by them? Or was compulsion needed and with what general result?

3. Have the Italians mentioned been known of themselves to demand better housing conditions or encouraged to improve their own conditions successfully? Needless to say these questions have reference to Italian immigrants in our towns and cities.

C. P. WELLMAN.

Winchester, Mass.

COUNTY JAILS AND IDLENESS

TO THE EDITOR:

In all our county jails idleness is probably the worst punishment to which criminals are forced to submit. How provide work for them? That is the great problem.

It is certain, however, if sheriffs were men of the proper stamp, far more could be done to keep men, women and boys occupied than is done at present in all our jails. But what hope is there to get other than political heelers appointed as sheriffs? The law of the state of New York states in regard to *sheriffs*, Article X, Section 1,[1] "An act depriving the sheriff of the custody and control of the county jail and the prisoners therein is unconstitutional," &c., according to the law as amended to January 1, 1910, and now in force.

"Sheriffs shall be chosen by the electors of the respective counties once in every three years," &c. In two counties, of which New York is one, sheriffs are chosen every two or four years.

To complete one of the greatest evils of *idleness* in jails, I need only cite from the New York *Sun*,[2] which states apropos of the Essex County Penitentiary, New Jersey:

"When the prisoners are at work their earnings go to those who are dependent on them. Eighteen or twenty of the cases of destitution that have reached the charitable societies of Essex county each month are those of families of men confined in the penitentiary."

In addition, that iddleness has an obvious bad effect upon the health, moral and physical, of all prisoners is apparent to the average inspector, or visitor, if he has only very moderate intelligence and sympathy.

BEVERLEY ROBINSON, M. D.

New York.

TENEMENT REFORM FOR UNEMPLOYED

TO THE EDITOR:

The keenest interest of labor at present is the unemployed or only partially employed laborers. So great has been the loss of opportunities to produce, that even the conservative newspapers have recognized the difference between the "unemployed," whom "we have always with us," and the "disemployed." or those thrown out of employment by the "hard times".

It is, therefore, not surprising that "labor" is beginning to consider what this means. How comes it in a country of limitless re-

[1] Birdseye's, Cumming and Gilbert's, Vol. I, p. 158.

[2] January 9

sources, with eighty millions of inhabitants requiring to be housed, fed, clothed, besides having numberless other wants, that there should be scarcity of opportunity to labor? Where does opportunity to labor arise? Who or what increases or restricts it?

In previous industrial depression the real causes have been overlooked in the anxiety to find palliatives, and labor, long-accustomed to oppression, allowed itself to be diverted from causes. But that day has gone by. Palliatives, emergency measures of any sort, can no longer blind the laborer to the fact that something at the root of things is radically wrong. He is seeking a solution, and he will surely find the source of opportunities and then discover what lessens them. When he has learned that man can gratify all his desires and profitably employ himself only through free access to land—the natural opportunities—he will surely secure that free access for himself and his fellows, perhaps by the simple method of taxing land values and destroying all other forms of taxation. When this has been done, labor will come into its own, and be able to establish the form of government it desires.

But while labor is making this discovery and remedying the evil in the slow way of humanity, there remains the necessity to relieve present great needs. A compliance with the tenement house laws would do much to relieve the pressing needs of labor in New York. There still are in this city over 100,000 rooms darker than the law allows, and if the disemployed carpenters and builders were put to work remedying this evil, the result would be a brisk awakening in all lines of work. The advantage of this effort is that it is necessary work, that will redound to the benefit of the whole city, and not merely a fictitious or charitable aid to the unemployed. It is a move that labor, without loss of dignity, can demand at once; it is a compliance with a law that all classes agree to be wise and necessary, and it would help to remove from New York the stigma that now attaches to it. It would reduce the appalling death rate of one in two, among children under five years of age, in the congested and darkened districts of the city. By demanding the opening up of this opportunity, labor would be doing service, not only for itself, but for coming generations. The plan is now before the Central Federated Labor Union.

Improved pavements would also afford an opportunity for disemployed labor. The law requires seven-feet width of paved sidewalk before each lot, but holders of vacant lots generally provided only three feet of paving. As soon as complaint is made the city must require compliance with the law, and the paving must be done at the owner's expense. Even under present wrong economic conditions there is no reason why labor should accept enforced idleness as necessary, until every means of relief within reach has been fully tried. This will clear the way for more radical and fundamental changes.

HEREDITY AND SOCIAL WORK

TO THE EDITOR:

The editorial on Heredity and Social Work in THE SURVEY for February 18 suggests a dread which has been voiced often and in a variety of ways. In that article it was put as questions: "Are we in this way perpetuating the grievous social burdens of disease, alcoholism, criminality, and pauperism? Are we breeding from the unfit as no stock breeder would think of doing, and interfering with the normal processes of social evolution?"

The writer begs space to suggest that long-range vision, such as a student of sociology may be expected to take, need see no such menace in modern humanitarianism, even if it does "undoubtedly keep alive many weak individuals who in an unmitigated struggle for existence would perish."

Paradoxical as it may seem, keeping alive is only an indispensable step of progress toward the elimination of the unfit. It is an unnecessarily extravagant waste of human life to allow the same conditions of struggle for existence and consequent survival of the fittest to prevail in human society, because at present in the world of plant and lower animal life such a sorting process seems the unavoidable method of securing an approach to perfection.

As long as society can seemingly avoid the consequences of its ignorance, its mistakes, and its crimes, under the shelter of such a theory, or of no theory at all, it is likely to keep on in error, and for the most part to be unaware of the connection between cause and consequence. But as soon as humanitarianism provides asylums for the insane, colonies for epileptics, hospitals for the wreckage from present industrial processes, homes for foundlings, and charitable organizations to provide for the victims of our economic system, we begin to complain of the burden. Escape by the avenue of neglect is cut off, the only refuge is through investigation of the causes that produced this crop of dependents.

Is not the recent interest in industrial education, in social science, and in eugenics evidence of the leaven of this positive check at work in society to raise us to a degree of intelligence that will not only prevent the dreaded increase of the unfit, but will eliminate them altogether? Then why lament the scruples which have brought us face to face with the ugly consequences of our own wrongdoing? The remedy for the present situation is not less care of the victims of ignorance and crime, but more, till it produces sufficient stimulus for investigation of all the causes that produce the supply of undesirable members of society.

THE TAXING OF CHURCHES

TO THE EDITOR:

Some time since the president of one of our oldest universities addressed his class in practical ethics upon this subject: "Is it an allowable deception for a church to use in its construction hollow pillars, which to appearance seem solid stone?"

More pertinent perhaps would have been the inquiry as to the duty of the church to pay its taxes. The New York *City Record* of 1910 shows a total of $163,000,000 of untaxed properties held by churches. Since 1907 rising values have added $13,000,000 to ecclesiastical holdings. There is no reason to doubt that the increase in values will rise from $7,000,000 to $10,000,000 a year before 1915.

What this means to the welfare of the city and the churches is a most serious question. As a church member, not as an anarchist, socialist, or agitator in the heat of a campaign, it seems wise to consider a situation which, sooner or later, will demand attention from either friends or foes of the church. As a friend, good reasons, if there are any, for giving the unearned increment to non-taxpaying societies may be invited.

A study of the assessors' lists will show many modest church properties, valued at about seventy per cent of their sale price at from $500,000 to $2,000,000 each, which business must soon acquire at even higher prices. These sums will be turned over to a very few self-elected and self-perpetuating trustees for rebuilding, investment, and endowment. The clergy, better than any else, know what a drag a too-conservative and too-influential trustee is.

Outside the church the public is alive to what a powerful economic factor an amount already over $160,000,000, increasing at four per cent annually, is destined to become. It sees, perhaps more clearly than those immediately within the church, the benefits open to all citizens which exemption of over $4,000,000 annually would provide. It sees needless economic waste in the infrequent use by the few of that which is created by all.

There are educators who see in our overcrowded schools overworked teachers, and neglected children a demand upon the church for social justice. There are social workers who find in the overcrowded jails an ever increasing class which the ever increasing wealth of the church cannot reach. There are teachers in political science who see in the character of some of our legislation an unfortunate linking of sectarianism and greed. There are politicians who desire to improve the administration of semi-public religious institutions, whose efforts are repeatedly blocked by the concerted action of the various denominations concerned; always at the expense of the helpless in their charge.

These conditions are easily magnified and lead to inflammatory denunciation of religion in general, and to the breaking down of the moral fiber dependent upon the best religious inspiration. The tax assessors' list is definite and the cess is open to the public; so upon the church there rests a great civic responsibility, which it cannot avoid though its mission is to cultivate the souls of men.

The voter may be the last person fitted to decide as to whether unearned increment upon untaxed holdings should go to the few or to the many.

What the movement in Europe has been we all know. Those who love the church and their fellowmen are anxious that its influence in our great cities shall be increased and remain untainted. Judson Harmon has said of corporate bodies, "guilt is personal." The public feel the truth of the statement and the church must be ready to meet its critics with an unanswerable reply upon any question of social justice, in so far as its interest or the interests of its ministers are involved.

A B C'S OF FOREIGN CHILDREN

TO THE EDITOR:

A writer in THE SURVEY for January 28 (p. 697) says that "the children of the illiterate foreigner show a larger percentage of literacy than do those of the native born." Can you tell your readers whether this is an established fact? If so it is of great importance in the immigration problem which you are now discussing.

F. A.

[This reportorial statement was based on an assertion of Max J. Kohler's:—"The Census of 1900 established the fact that the percentage of illiteracy among the children of foreign-born citizens is appreciably smaller than among those of native-born white parentage."

Neither statement can be proved literally from the census figures, for with respect to parentage there are no classifications of either "illiterate foreigners" or "foreign-born citizens" to go by. In census terms, the underlying meaning probably sought to be conveyed by both statements, namely, that the percentage of illiteracy among children of foreign-born parents is appreciably smaller than among children of native-born parents, is borne out by the following figures made up from the 1900 census:

U. S. CENSUS: 1900

Population groups.	Population between ages, 10 to 19, incl.	Illiterates between ages, 10 to 20, incl.	Per cent of illiteracy.
Native white, foreign parents.	3,733,773	42,677	.011
Native white, native parents. .	8,895,343	416,526	.047

The per cent of illiteracy among all whites of foreign parentage (both native and foreign born) in the same age groups as above, is three. In the four states which have the largest foreign-born populations Pennsylvania and Massachusetts show the percentage of illiteracy among native whites of native parents between the ages of ten and twenty to be less than among native whites of foreign parents—the former twenty per cent less, in the latter fifty per cent; in New York and Illinois, however, the reverse is true, the former showing one-fifth more illiteracy among natives of native parents than among natives of foreign parents, and the latter showing three times more. In Alabama and Louisiana the proportion of illiterate native whites of native parents

is four times as great as that of native whites of immigrant parents. The very high proportion of illiteracy among the whites in the southern states undoubtedly accounts for a part of the difference in literacy of children of natives and children of immigrants for the country as a whole.]

BEE AND HUMAN DISEASE

To the Editor:

With extreme regret I call your attention to the suggestive cartoon appearing on page 841 in the issue of February 18. I believe as firmly as you that the human family should be protected first and if necessary at the expense of the lower animals. On the other hand, is it right to decry any and all economic work which does not pertain to the social welfare and health of our citizens? In broader aspect you condemn the work of the economic entomologist, the plant pathologist, the horticulturist—even the sciences dealing with the inanimate world. Very little money is being spent by the Department of Agriculture considering that the bee industry in this country is capitalized at about $25,000,000.

Furthermore you were extremely erroneous in your suggestion that the investigation of the bee diseases is of no value in the control and prevention of human diseases, for there is a good deal of evidence that the cause of the foul brood disease of bees is none other than that causing diabetes in the human family.

University of California, Berkeley. L. I. Nickels.

[The cartoon was one used by the Committee of One Hundred on National Health to awaken interest in the proposed federal department of health. It showed that the loss of earnings among bees on account of disease is one million dollars annually, which the government very properly tries to prevent; while the loss of earnings among people on account of disease is three billion dollars which the government does not take adequate steps to prevent. The implication seems quite plain: since the United States has been foresighted enough to prevent the relatively small loss by bee disease, the argument is all the stronger for doing something to prevent the infinitely greater loss from human disease.—Ed.]

A PINCH OF HOPS

taken after meals is the best aid to indigestion. Instantly relieves heart-burn, cures dyspepsia. Why take malt extracts, ale or beer? Large package fresh home grown hops mailed on receipt of 25c. Robert Welles, Newburgh, N. Y.

SOCIAL FORCES

BY THE EDITOR

OVERCROWDING MUST STOP

The report of the New York City Commission on Congestion of Population is an epoch-making document. It means that a deliberate and well-considered attack on the evils of congestion has begun. No difference of opinion as to specific recommendations should deter any social worker, any public-spirited citizen, any thoughtful individual who has at heart the deeper interests of humanity, from recognizing the importance of the problem with which this report deals, and the admirable spirit in which the report as a whole deals with that problem. Heretofore no public official in this city, where overcrowding is worse than anywhere else in the world, has even attempted to deal with it in a broad and constructive way. No charitable society, no political party, no civic organization, so far as we are aware, has ever even tried to define it or to devise a solution for it. Housing reform has here been aggressive and triumphant; but it has been so largely because it wisely limited its field and did not deal with the larger aspects of congestion. Tax reform has made headway; but it has not concerned itself especially with the prevention of overcrowding. The transit problem has engrossed the attention of public officials, of the newspapers, and of citizens; but there has been no adequate and clear cut discussion of its social aspects, and the most elementary principles governing the relation between transit and the distribution of population have been almost entirely ignored. Even today such considerations are conspicuous by their absence from the current discussions of the transit situation.

Therefore to Jacob A. Cantor and his associates of the commission, and especially to Benjamin C. Marsh, its undaunted and indefatigable secretary, who has evidently supplied its driving power, we offer the tribute of our admiration and respect, for having begun a movement which will not end until the evils of congestion have at least been fought to a standstill; and let us hope, to change the figure, not until, like the Chicago river, the current has actually been reversed, and the surplus population of the congested districts is freely and advantageously moving into the vacant places.

Unfortunately the commission has made a great many starts at once, and some of them are false starts. We believe it to be a false start to suggest the relaxation of the tenement house law in relation to three-family houses. We believe it to be a false start to attempt to create a special class in the community to be known officially as "the dependent members of a family of a consumptive or consumptives", and another class, to be known as "indigent widows with children", to be dealt with in a special way by a special board of trustees. We believe it to be a false start to assume that the distribution of public outdoor relief on any plan, whether it be desirable or undesirable on its own account, will ever in practice have a favorable effect on the evils of congestion. We believe it to be a false start to connect the establishment of industrial boards of arbitration with

poverty and congestion of population; and to place the demand for public supervision of charitable societies, which is perfectly legitimate in itself, on the ground that they are encouraging congestion, or on the ground that, like universities, libraries, museums, churches, and other social agencies which are not conducted for private profit, they are exempt from ordinary taxation. We believe it to be a false start to propose that the responsibility for the supervision of private charitable societies should be lodged in the city comptroller, instead of in the State Board of Charities where it is put by the constitution of the state. Not for the breadth of its survey should the commission be criticised, for in taking up a new problem of this kind it is necessary to take nothing for granted, and to assume that anything whatever may be related to it. But if the commission had more frequently exercised the kind of discrimination which was shown by its committee on taxation in rejecting, after looking at it, the suggestion that congestion would be lessened by transferring a portion of the inheritance taxes from the state to the city, its recommendations would have been fewer in number, and they would have greater weight.

There will be other occasions, however, on which it will be more appropriate to discuss particular recommendations on which our views do not happen to coincide with those of the commission. Our present purpose is to express gratification that we have at last an attempt to describe in detail the evils of congestion, to search for their causes, to persuade the community that these causes are removable, and to put forward a series of measures which are at least intended to reach such evils as force themselves upon the attention.

Of the fourteen causes of congestion enumerated by the commission the ninth, eighth, eleventh, thirteenth, and second appear to us to reach the crux of the problem. These are, the lack of a definite city plan, the transit policy of the city, the failure to prepare land in advance for housing purposes, the failure to adopt a policy of attracting people to outlying boroughs, and the concentration of factories. A definite program based on the recognition of these and closely related causes, worked out on a logical and consistent plan, will we believe go far towards solving the problem to which the city has addressed itself by the appointment of this commission. To try to solve at the same time the problems of poverty, industrial conciliation, employment exchanges, and the federal regulation of immigration, would be to go far afield, and to lessen the prospect for effective action on those factors of the congestion problem which certainly overshadow all others.

We need an official city plan through which streets, sewage, and transportation lines can be arranged intelligently in advance of such increase of land values as will make them impossible. We need more rapid transit, and need it badly; but even more than having it quickly we need that when it comes it shall be such transit as will favorably affect the distribution of population. We need a zone or district system, which will control the location of factories and tenements with reference to the public welfare. We need to increase the inducements to live in the outlying portions of the city; and we need to facilitate the removal from the city of those who will prosper better elsewhere. Along such lines, all of which are indicated in the commission's report, there can be inaugurated a movement which will speedily gain irresistible momentum.

March 18, 1911.

THE COMMON WELFARE

CHILD LABOR MEETING AGAIN IN THE SOUTH

The National Child Labor conference held in Birmingham, Ala., last week was the seventh annual meeting of the National Child Labor Committee. As at Atlanta two years ago, the anti-child labor forces gathered from all parts of the country at one of the great centers of the child-employing cotton industry.

Ex-Governor Comer, who owns one of the largest cotton mills near Birmingham, attended the meetings and spoke once in apology for the mill as an eleemosynary institution, caring for little children who had escaped worse fates on the farms and making rosy once more the thorny path of widows and orphans. The response to this sentiment in Birmingham was indifferent. Delegates from other parts of the country found a change coming in the South. It was evident at every session of these meetings as compared with those at Atlanta two years ago. The southern people seem to want to make their remarkable material prosperty the means to greater ends and not an end in itself.

The Alabama Child Labor Committee was the first definitely organized state committee and its first leader, Edgar Gardner Murphy, was the first to suggest the organization of a national committee. The citizens' committee of Birmingham united with the Alabama Child Labor Committee as host of the conference.

Colonel Roosevelt's strenuous day, during which he made seven speeches aggregating over four hours in length and touching on all the broader general foundations of child welfare, added much to the general enthusiasm and public interest in the program. He was particularly effective in his condemnation of night work for children. Jane Addams and Florence Kelley won approval from large audiences for scathing challenges to theatrical interests in their efforts to create another child-exploiting industry.

The officers of the National Child Labor Committee presented interesting reports of progress in all directions and in every section of the country. These will be reviewed in a later issue.

This was the largest attended annual meeting of the National Committee and the most promising in its probabilities of permanent local, state, and national results.

"HE'S TO BLAME FOR THE HIGH COST OF LIVING!"

Ireland in Columbus Dispatch.

WHO'S GOT THE BUTTON?

JUDGE MACK ON IMMIGRATION

The annual meeting and dinner of the Immigrants' Protective League of Chicago was the occasion of the farewell address of the president, Julian W. Mack, who has been appointed to the new Commerce Court at Washington.

Speaking as the son and grandson of immigrants who had sought freedom from religious persecution here, he was touched most deeply by the fact that those to the American manner born were as deeply interested in the league as he had more personal reason to be. As a Jew he was proud of the American spirit expressed by the co-operation of such bodies as the Union League and Commercial Clubs, the Young Men's and Young Women's Christian Associations. "I feel as I do," he declared earnestly, "because I am a true American." He predicted the early formation of a national federation of organizations at work with and for immigrants.

The league as such takes no position on restriction of immigration that will interfere with its co-operation with the government under any law that may be passed. But personally Judge Mack expressed the opinion that the literacy test is false and ineffective—educational qualifications, however prerequisite to citizenship, do not serve equally well as requirements for admission to this country. They do not test character, he held, and they do shut out those to whom educational opportunity has been denied in the old world, and who seek it for themselves and their children in America. Such a physical test as is required for entrance to the army would, he believed, discriminate against intellectual, aesthetic, artistic, and literary ability which sometimes are cultivated at the cost of physical prowess. "No nation," Judge Mack concluded, "can get too many people of the stuff of which martyrs are made."

The report of Grace Abbott, superintendent of the league, showed vigilant care for arriving immigrants and intelligent study of the conditions under which they are received and distributed to their destinations. The policy which she and the executive officers proposed was adopted. It includes reforming the method of routing between seaports and Chicago; maintaining a staff of inspectors, men and women, on trains between New York and Chicago; establishing a federal protective bureau with authority to control the release of immigrants; arranging for the delivery of all arriving immigrants by a single, responsible transportation company.

The league is doing pioneer work for the whole country. It has secured the cordial co-operation of the Federal Immigration Bureau and the officials of the local government, the councils of foreign peoples in Chicago and the presidents of their national societies, the Chicago Federation of Labor and the Union League and Commercial Clubs. Its offices and temporary lodgings are at 157 Pymouth place, opposite the Polk street railway station where three times as many immigrants arrive as at any other terminal.

TO CLEAN UP THE LAUNDRIES

It is not often that publicity leads to such immediate results as has an article in a recent issue of *McClure's Magazine* on the laundry workers of New York by Sue Ainslie Clark and Edith Wyatt. The article was challenged in the columns of the New York *Times* by a representative of the Manhattan Laundrymen's Association, who made it appear that the writers had attacked the moral character of the workers, had misrepresented in regard to wages and unguarded machinery, and had made statements about overtime work which could not be true because the Factory Department made illegal hours impossible. Through the same paper Miss Wyatt and a representative of the Consumers' League, on whose investigations the article was based, replied so effectively that the laundrymen were convinced that conditions of work and wages in many New York laundries needed improvement.

At a conference held at the headquarters of the Consumers' League, representatives of the Manhattan Laundrymen's Association, the Brooklyn Laundry Club, and the New York State Laundry-

men's Association expressed their desire to co-operate with the league for the enforcement of existing laws, and discussed tentative plans for establishing such a standard as would make them eligible to the league's white list.

A letter received by THE SURVEY contains the statement of a woman who worked for eight years in one of the large laundries of New York. It bears out the experience of the Consumers' League investigators. This correspondent states that she worked for the first month at four dollars a week, for the following six months at four-fifty, was then raised to five and gradually to eight; that her day began at 7.15 and "on Monday, Wednesday, Thursday, and Friday it was a common thing to have to stay till eight or nine o'clock, or even later, with an hour and twenty minutes off for lunch and supper, an allowance of twenty-five cents for the latter meal", but no overtime pay.

CHAMBERS OF CITIZENSHIP

The Buffalo Chamber of Commerce has just appointed a standing committee on supervision of local charities and survey of social and industrial conditions, which will have a separate, paid secretary on full time.

This action, which was taken at the request of the Charity Organization Society and the Buffalo Polish Survey, adds Buffalo to the list of cities where, as in Cleveland especially, the Chamber of Commerce aspires to be also a Chamber of Citizenship. In Columbus something similar is on foot, and in fact both social work by commercial bodies and supervision of charities by such bodies are becoming familiar; but this seems to be the first instance where a chamber of commerce has committed itself definitely to a continuing survey of social and industrial conditions in its community.

Max Eastman has said lately that "socialism is a protest against the irrelevancy of politics." He means, no doubt, that politics has not concerned itself with public health, education, housing, and conditions of labor, but with money and ways of making money. Some of the business men of Buffalo were very much impressed with the Pittsburgh Survey. They wanted to know what was the matter with Buffalo socially, for social evils are now known to be contagious and dangerous. The result was the the Buffalo Polish Survey, under a competent director, which was described in this magazine June 4, 1910. Some were disappointed that this six-months' Polish Survey was not made general, with a large force of workers; but the majority thought that a large force would turn up more matter than could be handled promptly, and that a continuing, permanent survey would in the end be better.

The first work of the new social secretary will be a survey of the charities of Buffalo, on the lines of the study lately published by the Chamber of Commerce of Columbus, and of the charities endorsement committees of the Boards of Trade in Newark, Cleveland, San Francisco, and elsewhere. What type of endorsement will be adopted is undecided, but by request of the Charity Organization Society the work will be done by an independent committee of the Chamber of Commerce, and not by a joint committee with itself or with other charities. If cards of endorsement should be given it by no means follows that canvassers will be encouraged or allowed.

PENNSYLVANIA THREE-PLY CHILD LABOR CAMPAIGN

Social workers in Pennsylvania are not content with the good results of the two child labor laws passed by the last Legislature two years ago. Under the leadership of the State Child Labor Association, various organizations have lined up again for a three-headed campaign for the protection of the 2,500 boys under sixteen who now work all night in glass factories; or who work each day underground in coal mines; and for the moral protection of boys over fourteen employed in the night messenger service in large cities. The story of these three boys is told in a leaflet, of which 40,000 copies are being circulated. Parts

of it are here republished for their general interest.

The Boy at the Glass Tank has often been pictured in these columns:

His day begins at nightfall. His lunch hour is his comrade's bedtime. He starts for home in he cold of the winter night at two, three, or four in the morning. For a week he does this. Then for a week he tries to fit himself again into normal life, sleeping at night and doing his work by day.

It is claimed that without the night work of boys the industry cannot continue. Exactly this claim was made in Illinois in 1903 when a bill was prepared to stop the employment of boys under sixteen on night shifts in that state. It was even threatened that the glass plants would be taken to other states. The bill was passed, however, and the glass plants are still in Illinois and are very prosperous. The value of their products increased from $2,834,398 in 1900 to $5,619,740 in 1905, or 98 per cent. Ohio also passed this law, and its glass products nearly doubled during the same five years.

During the fall of 1910 an investigator of the National Child Labor Committee visited every one of the forty factories in Ohio and Illinois, in order to learn how these factories have accomplished that which the Pennsylvania glass manufacturers claim to be impossible.

It was found that many plants were employing no boys under sixteen years of age. By paying a slightly higher rate of wages for the older boys they were able to get enough of them to do their work.

In other plants foreign men were used on boys' jobs, or strong, capable American men were employed at night, each of whom did the work which two boys did on the day shift. In still other establishments the introduction of machinery has been accelerated as a result of the law.

It is impossible to print what investigation has disclosed as to the life of the night messenger boy in the tenderloin:

This boy is exposed to temptation at a time when he is least able to resist—just as he is passing through those bodily changes which accomplish adolescence, and when his mind is swayed by the natural curiosity of youth toward the other sex. Is it to be wondered at, then, that many of the boys tell how their first fall occurred only a few months after they began to do night work, or that stories, verified in several cases, come from their lips of the contracting of dreaded disease? What a boy sees of this life gives him a story he is almost sure to tell to the school boys and others in his chosen circle. And thus the moral contagion spreads.

The night messenger boy in New York is a messenger man. Pennsylvania's boys need this same protection, and the proposed bill, therefore, follows the New York law almost exactly.

The Boy in the Pit works in one of the most dangerous occupations in the world—coal mining—and yet in Pennsylvania he may legally begin that work as soon as he is fourteen years old. In 1909 there were 1,197 boys of fourteen or fifteen so employed. In five other states, notably Illinois and Montana, no mine work is allowed under the age of sixteen. This is the law which is now proposed for Pennsylvania.

A door-boy's duty is to open the door separating one mine chamber from another to allow mine cars to pass through, and to close these doors afterward. The chief of the Pennsylvania Department of Mines, in his report for 1905, speaks of their work as follows:

"If the boys tending doors in the mines would stay at their work they would be practically safe from danger, but when there is a slackness in the work they frequently run away from the doors, and when they hear the cars coming, in their haste to return to their post of duty, they are apt to fall and be run over; or they are so late in opening the doors that the cars come upon them before they get out of the way, and the result is often injury or loss of life to themselves or the drivers."

"They frequently run away from the doors," the report declares. But what normal boy of fourteen would do anything else, if left alone in the damp and dark, with nothing to do but wait, his only light the flickering lamp in his cap, and with no companionship but his thoughts?

Several companies have voluntarily fixed the sixteen-year age limit for underground work. The proposed law would merely bring the other companies up to this standard.

1911 PLANKS
BOSTON 1915

After a year of persistent study and investigation, Boston-1915 has staked out a civic program of definite projects to be put through in 1911. The thirteen planks in this municipal platform are based upon the recommendations of the thirteen conferences which have prepared "syllabi of the needs of Boston" in their particular fields. The conferences, representing some 1,200 social and civic organizations, are divided into these groups: education, fine and industrial arts, charities and correction, business, city planning, civic, co-operative, labor, neighborhood work, religious, women's clubs, and youth. After a conference has been organized the method of procedure has been to draw up a program, to be ratified by the other twelve conferences and by the executive committee and Board of Directors of Boston-1915. In this way a general

agreement has been reached on the projects of the 1911 program. The comment following each of the propositions is taken from a pamphlet which may be obtained for the asking from the Boston-1915 office, 6 Beacon street.

1. Establish a proper public authority to plan and provide for the comprehensive development of the city. (Initiated by the Chamber of Commerce and the City Planning Conference of Boston-1915.)

A definite city plan is necessary to the healthy growth of any modern city. Until the main needs of the whole community have been carefully studied and mapped out, no single project can be carried forward with any certainty that it is really best for the city.

At the present time there are pressing demands for street and boulevard developments amounting to more than $25,000,000. Which of these improvements, being the most important and most necessary to the city, should be undertaken first it is impossible to say with conditions as they are. The facts should be determined before the city's money is used for any of them.

The City Planning Conference of Boston-1915, in its recent report, declares that a city plan should include transportation (passenger and freight) by rail, by road, and by water; water supply and drainage; lands for public uses; building and housing regulations; and that such metropolitan improvements should be planned by a permanent commission.

On their recommendation the directors of Boston-1915 have put in a bill (House No. 1109) creating such a commission. Moreover, the organization is backing three bills that will help to better housing conditions.

2. Federate the cities and towns of the Metropolitan District. (Initiated by the Chamber of Commerce.)

Boston-1915 does not mean political Boston, with its artificial boundaries. It means Greater Boston, the fourth largest city in the United States and the tenth largest in the world.

Every problem with which the conference of Boston-1915 have to do is a problem for the whole Metropolitan District and cannot be solved for any one of those communities, except with the co-operation of all the others.

3. Organize a larger use of schoolhouses. (Initiated by the Home and School Association and The Women's Municipal League.)

The school buildings in the city of Boston alone have cost more than twenty millions of dollars and they are used about 1,000 hours a year out of a possible 4,000 hours. Three-quarters of the time that most school buildings stand idle they might be used for lectures, music, clubs, classes, neighborhood meetings, and gatherings of every proper sort.

To bring about the larger use of schoolhouses would be one of the best investments the city could make.

4. Secure a larger and better use of playgrounds and other recreational facilities. (Initiated by the Youth Conference of Boston-1915.)

While we are working towards a more extended use of the schoolhouse as a social center, we should strive also for a better use of the city's chances to play. It is generally recognized that Boston has the best park system of any city in the world, but that it is deficient in neighborhood playgrounds.

The Youth Conference of Boston-1915 proposes to study the needs of the community and then, with a knowledge of the failures and successes of other municipalities, to recommend definite plans and to push them through.

5. Create a central civic building. (Initiated by the Charities and Correction Conference of Boston-1915.)

It is stated that there are in Boston more than sixty charitable and civic organizations paying rents aggregating $60,000 a year. To avoid duplication and increase co-operation, these should be brought together in one building. Many civic bodies are ready for such a move and the proposition is feasible from the financial viewpoint.

6. Establish more convenience stations and drinking fountains. (Initiated by the United Improvement Association and the Neighborhood Welfare Conference of Boston-1915.)

This project, carefully studied by the United Improvement Association, is sure to make for temperance as well as for general comfort. Boston is behind almost every other city of the United States in providing public toilets. A definite plan for such stations is under consideration, together with House bill No. 1331, providing for the construction of convenience stations in all cities over 8,000 inhabitants.

7. Investigate the part-time school problem. (Initiated by the Child Welfare Committee.)

There is now practical agreement that one of the best ways to promote industrial education is a plan by which the boy spends part of his time in school and part of it in the shop or store. The plan must vary with local needs. The Massachusetts Child Welfare Committee has put in a bill (House No. 454) authorizing the State Board of Education to make an investigation and providing the necessary fund for it.

8. Create a central library for teachers. (Initiated by the Education Conference of Boston-1915.)

It has long been felt that the busy teachers of Greater Boston should have some central place wherein to find, with as little trouble as possible, the latest information and suggestions through which they and their teaching may be kept right up to date.

9. Secure laws for enforcing parental responsibility. (Initiated by the Charities and Correction Conference of Boston-1915.)

The first step is to get a law making desertion of wife or minor children a crime. House bill No. 473 makes it possible to use the provisions of probation and of suspended sentence in these cases as in those of non-support; and Section VII provides that fifty cents shall be paid to the family for each day's hard labor performed by anyone found guilty of desertion and put in jail.

10. Make definite provision for better sidewalks. (Initiated by the United Improvement Association.)

This plan is embodied in a bill (House No. 563) put in by the United Improvement Association.

11. Diminish through a prompt return of births needless blindness and disease among infants. (Initiated by the Health Conference of Boston-1915.)

If the Board of Health knew of every birth in the city of Boston within forty-eight hours of its occurrence, it would be within its power to stop every year thirty per cent of all blindness. The knowledge would go a long way, too, towards preventing the present waste of infant life. Moreover, as is shown in the experience of New York, prompt birth returns mean fuller birth returns. House No. 666 makes prompt birth returns compulsory, and every citizen should work for it.

12. Secure more practical examinations for licenses to practice medicine. (Initiated by the Health Conference of Boston-1915.)

Examinations for those who are to practice medicine are now made entirely on book work and by written tests. It is important and practicable to require every applicant, as a part of his examination, to answer questions concerning actual patients brought before him.

13. Extend free art exhibitions. (Initiated by the Fine and Industrial Arts Conference of Boston-1915.)

This work of bringing good art directly to the people, and of explaining the meaning and beauty of the pictures, has been already well begun; it should gradually be extended so as to meet the needs of all sections of the city.

There has been more or less criticism of the inactivity of Boston-1915 during the past year. The internal work which has preceded this ambitious program has necessarily been inconspicuous. Now that the preliminary work has been completed, Boston-1915 has a clear field to show that the co-operation secured by its working scheme is really worth while. The growing interest in the conferences is noteworthy, as the success of the 1911 program depends in large measure on the activity of these conference groups.

EDITORIAL GRIST

TWO REGRETTABLE EVENTS

CLARENCE ARTHUR PERRY
Russell Sage Foundation

Few events in the educational world during 1911 will probably occcasion more disappointment among social workers than the closing of Boston's chief open-air school and the shutting-down of the Rochester social centers.

Providence had only just got the first American open-air school under way in 1908 when Boston, with its customary alacrity in adopting new ideas, set up one in Franklin Park which soon became the largest and most important in the country. It is such enterprise as this that has given the chief New England city her position of leadership in the educational world. The other day this school was allowed to close and over 100 tubercular pupils were permitted to resume their precarious and infectious careers among children who are still well.

Less than a year ago four important magazines printed almost simultaneous articles on Rochester. The achievement which more than any other called forth this chorus of praise was the system of city-supported social centers. Governor Hughes inspected them and said they "were buttressing the foundations of democracy", while the stories which visitors brought away from Rochester of the new era of free discussion and neighborhood sociability that had dawned in the schoolhouses of that city enheartened the friends of municipal progress the nation over.

Recently the special appropriation from which the social centers were supported was cut down by the local board of estimate to a degree that made the school board feel obliged to close them.

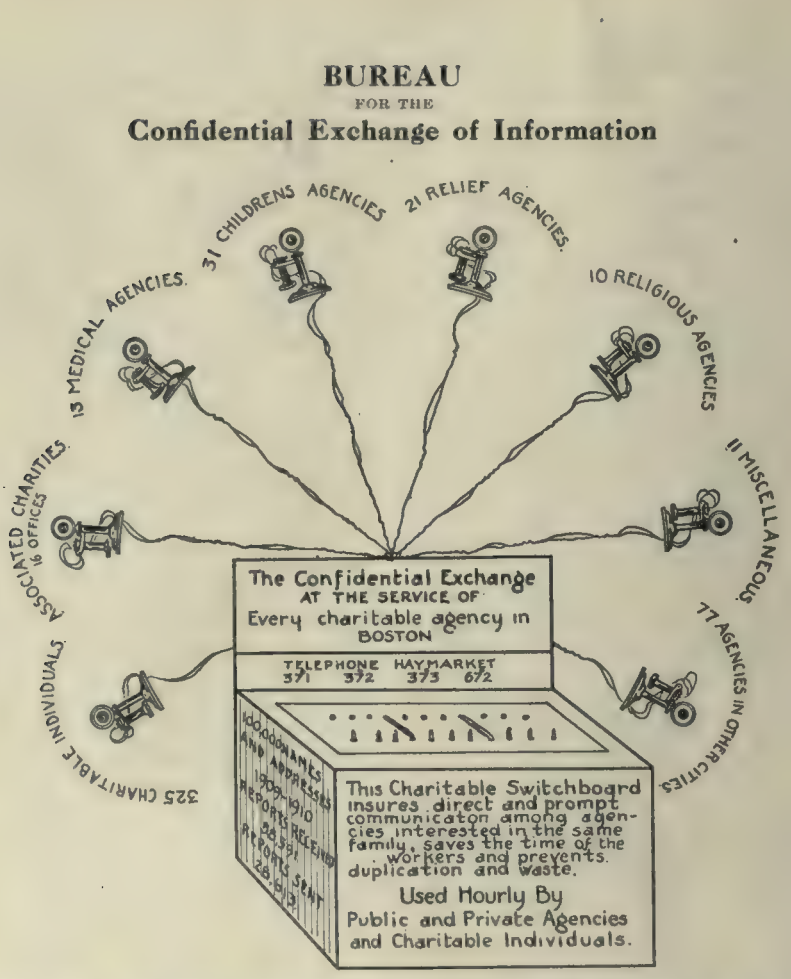
The tubercular children whom Boston has turned into the street may not

all die nor infect all of their playmates; and Rochester's centers may, after a period of maimed existence in scattered civic clubs, be restored again to full health, but the two events will still have other consequences whose lamentable effect will be widely felt. There will be the inevitable cry of "politics" which, though the facts may justify it, is only a narrow explanation, since in each case the city as a whole cannot escape final responsibility. The cynical will point out the incongruity between these acts and the two not-whispered slogans "Boston-1915" and "Do It For Rochester." But most regrettable of all will be the discouraging effect which the news will have upon the many public-spirited men and women who in the laborious effort to persuade their municipalities to support similar enterprises have been enthusiastically pointing to the work in Boston and Rochester.

THE CONFIDENTIAL EXCHANGE

MARY E. RICHMOND

Mrs. Fox presents in this number some good arguments in favor of focusing our lines of social contact through a central and confidential exchange of information in each city. A half-diagram, half-picture appears on this page, which illustrates the actual workings of such an exchange in Boston.



The Bureau for the Confidential Exchange of Information maintained by the Boston Associated Charities deserves special mention because it is attracting attention the country over, and is going to be widely copied during the next few years. The figures given in the illustration are for the last fiscal year, but this January they were more than doubled. Inquiries were made in 7,290 instances as compared with 3,373 in January a year ago. The work done for medical agencies and for children's agencies showed an especially marked increase. A nurse who is also a social worker says that doctors are now very anxious to know how a patient has reacted under previous treatment, and that the confidential index maintained by the Associated Charities gives them clues to this needed information.

But are not all social workers who are striving to be sound practitioners equally interested in the reactions of their patients to social treatment of whatever kind? As the possibilities of constructive treatment have grown, and as the school, the dispensary, the hospital, the workshop, the playground, the newspaper have become partially aware, at least, of the social implications of their tasks, some such interchange—not on the old basis of relief and its duplication, but on the broadest possible basis of social betterment—has become an absolute necessity.

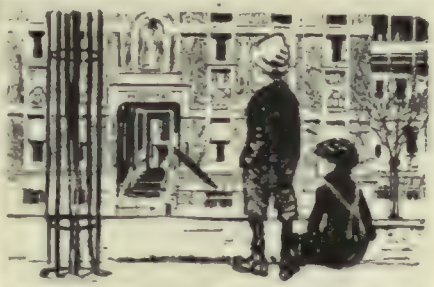
Here is an instance, told by the registrar of the Boston Exchange, involving a church, a daily paper, and a hospital. A clergyman went to the children's outing department of a newspaper, and asked that a certain child be sent to the country. As was its custom the newspaper inquired of the confidential exchange, and thus a hospital that had previously inquired about the child was at once notified. The hospital reported to the newspaper that the boy was in no condition to go to a country place, that they were continuing their interest in his case and were going to send him to a convalescent home. Or take another instance. A physician referred a sick woman to the social service department of a hospital. Before she had left the building, the confidential exchange had told the social service worker that six other agencies had inquired about her. A conference was arranged at which four of these agencies were represented, and a plan was devised for the benefit of the patient and of her six children under the age of ten. It has been put through co-operatively and successfully.

The spirit and method of the exchange are far removed from the detective, the repressive, the cheese-paringly economical. It is, as Mrs. Fox makes clear, another way of being more efficient and therefore more helpful.

We must not dogmatize as to what existing agency in any given city, or what new agencies, must undertake this particular work. It is not by accident, how-

Cartoon used by the Boston Associated Charities to illustrate the Bureau for the Confidential Exchange of Information. Eighty agencies use the exchange regularly. 14,990 families were registered during the year ending May 31, 1910, by 221 agencies and 325 private individuals. 9,167 families were registered this year for the first time.

ever, that the most successful exchanges have been under the auspices of charity organization societies or associated charities. The exchange is no mere business device, and good results will not be secured by clerks whose employers so regard it. It must be under the care of those who understand social service treatment thoroughly, who have made many sacrifices to further such treatment in the past, and who have learned from experience to do constructive work in a constructive way. Reports, telephone messages, letters, personal interviews may all be merely expeditiously despatched, with the sole purpose in view of a more or less accurate checking up of lists. Social work is already overencumbered with machinery of this grade. What is needed is something equally prompt, but far more intelligent and humane. "We are not satisfied", says the Boston registrar, "unless those who begin to use the exchange are soon induced to seek closer relations and a better understanding with other groups of workers in other lines of social work." This is achieved by tactful suggestion, by watchful avoidance of ground for misunderstanding, and by steady though gentle pressure toward the real ends in view. The ability to organize such an enterprise demands not so much clerical dexterity as social statesmanship.



"A PREMIUM ON ABNORMALITY"

In his study of poverty in York, Rowntree compared his family budgets with the per capita cost of maintaining inmates in the English poor relief institutions, classing as in primary poverty those homes whose incomes fell below the standard of physical maintenance set by the almshouses.

In an article contributed to the March magazine number of THE SURVEY on The Premium on Abnormality, Professor Nearing of the University of Pennsylvania develops a similar comparison along original lines. He sets the share which he estimates an unskilled laborer can spend for each of three children against the per capita expenditure of the child-caring institutions which with their modern standards have superseded the almshouse in the care of juvenile dependents. He finds the children of unskilled American workingmen below the "poverty line." Rowntree's method has been used many times; by casting it in terms of childhood, Professor Nearing has put the case against the pay of common labor in a way which will appeal to the imagination and challenge sober thinking.

Somebody has said that similes never walk upright; they can only creep. When we turn from the field of rhetoric to that of statistical comparison, we are dealing with figures of speech with not two but a thousand legs, so that any frailty of locomotion is accentuated and multiplied. While hailing Mr. Nearing's antithesis as immensely suggestive, therefore, it may be well to point out certain steps in his calculations which fall short of that Q.E.D. conclusiveness with which he invests them. For indications, even directly in line with common sense and observation, are not demonstrations, nor do they gain weight by being advanced as such, as is the tendency in much sociological discussion.

Despite his title, a goodly part of Professor Nearing's argument has nothing to do with abnormality. Orphans, destitute or even neglected children are not abnormal as individuals; they too will

Drawn for Browning's Magazine by C. Forbell

A CASE IN POINT.

"It sure does look com'fable in there, Billy. Don't ye wish we could get the measles or somethin'?"

be called upon to "assume the responsibilities of citizenship" and play their part in the work of the new generation. On the other hand, in so far as Mr. Nearing makes comparison with the truly abnormal, it must be remembered that the treatment of the latter always costs more than that of normal people. The special care which they require by reason of their abnormality means additional expense. Insane people cost more than sane ones; criminals more than law-abiding citizens; the feeble-minded more than the normal minded. To care for them properly is not putting a premium on abnormality any more than adequately to care for the sick is putting a premium on sickness. Cure comes high, but we must have it, and it is good sense to pay the bill. Professor Nearing has, it would seem, stretched his comparison a peg too far for its most effective contrast. It is between destitute children for whom the state or philanthropic institutions assume responsibility and the children of day-laborers' families that the comparison can most logically be made.

Even here all the elements are not in hand for so simple a calculation as the author assumes. His statement that "malnutrition, insanitation, overcrowding, sweated work, and street life" are "universal in the homes of the poor," while "wholly absent in the modern child-saving institution," is as sweeping an overstatement at one end of the sentence as at the other. Unfortunately, malnu-

trition, insanitation, overcrowding, and sweated work have entered into the régime of not a few children's institutions; and fortunately there are homes of the poor into which, whatever other deprivations may be theirs, these things do not enter; homes which also have those priceless gifts of the spirit to bestow upon their offspring, that individual nurture, which would lead a wise son to choose his own father in preference to the most thoroughly equipped congregate institution.

These points may be passed, however, for Mr. Nearing consistently focuses attention on the purely economic aspects of his comparison. As a first exception, it may be noted that the proportions he uses, as between children and adults, are merely food ratios, not necessarily true of total expenditures. Food consumption would go up in the proportions cited with the addition of each small child, but such household charges as heat, rent, furniture, would not necessarily follow the same rule. On the other hand, is the fact that the maintenance figures given for institutions do not include carrying charges, such as rent, interest, etc. Institutions, however, usually maintain class rooms of their own. Mr. Nearing disregards also the community's outlay for public schools for "normal children." With respect to the institution budget, it may well be questioned whether the average children's institution is as businesslike in service as Professor Nearing would seem to imply; possibly some of its expenditures could well be cut. Yet it would have to be borne in mind that an increase in efficiency, which would call for such economies, would call also for constructive work and a per capita outlay larger than the average he gives, as exemplified in the more progressive institutions. With respect to the family budget several sources of income affect the conditions discussed. Moneys from lodgers, from the woman's work, and from older children may involve overcrowding, parental neglect, and premature labor but they must be reckoned with in a purely economic estimate of what it means for a child's lot to be cast with the family of an unskilled workman. We must distinguish between household income and the man's wages; it is with the latter that simple comparisons are possible.

These and other factors, then, would have to be carefully worked out in any attempt to prove, by the method Mr. Nearing has followed, that the wage standard of unskilled workers in American industry is today absolutely inadequate to fulfill one of the primal functions of family life—child-care. Experience and testimony from many sources, none the less, tend to confirm the conclusion that more money is spent in the physical care and education of destitute children than is or can be spent for children in a large number of common laborers' families. What of it? What lessons are to be drawn? Are the orphans to be starved or skimperingly cared for? Or shall we put all children into orphan asylums and such like? Or shall society invest more in the "normal children" of the unskilled workman by seeing that he gets more pay. Clearly the latter. The culture of normal children, no less than the cure of abnormal ones, comes high, and we have not yet learned that it is good sense to see that the bill should be paid. It is this last point, of course, that there is something seriously out of joint between the wages of common labor and our American standards of livelihood, which, quite apart from any quibbles as to the steps of his calculation, and quite in harmony with the different studies of costs of living made in the past five years, Professor Nearing holds to view in an interrogation, which by the novelty of its terms, fastens the attention. In a letter, he answers the question in the same terms:

> I do not for an instant maintain that abnormal children should be ignored, but I do assert that progress can be most effectually made by directing the greater part of social efforts toward the development of those members of society who are, at birth, endowed with normal health and normal social surroundings. It is nothing short of social suicide to maintain a policy which involves a greater outlay in the abortive attempt to raise an individually or socially abnormal child to the normal level of the community, than is involved in the upbringing of a normal, healthy offspring of low-income parents,—or in raising that level.

March 18, 1911.

CIVICS

INTERNATIONAL CITY PLANNING EXHIBITION AND CONFERENCE

PHILADELPHIA IN MAY

GEORGE B. FORD
NEW YORK

There is something wrong with the welfare work done in a large city. A great deal of time and energy is wasted, all through no fault of the social worker. For example, a man from the thickly populated districts of the city is taken to a hospital, the best of treatment is given him, and as soon as he has sufficiently recovered he is discharged, with the admonition to continue at home a life similar to that he has been living as a patient. He knows only too well that this is the sheerest irony, for the conditions of the neighborhood in which he dwells make it absolutely impossible; the result is that at the end of a longer or shorter time the man again becomes a public charge.

A man is sent to a sanatorium to be cured of tuberculosis; his recovery is rapid and he is soon sent back to his home. Within six months or a year he returns to the sanatorium. Whose fault is it?

In his struggle for existence a man has committed a petty crime. He is convicted and sent to a reformatory. At the end of his sentence, or sooner thanks to his good behavior, he is sent home to sin no more. A little later the process is repeated. Is it the man's fault?

Sociologists are well convinced that environment has a great effect upon the individual. Statistics prove that bad housing conditions are directly responsible for much disease and crime. They have also proved that where housing conditions have been radically bettered disease and crime have greatly decreased. That being the case, in order to prevent the recurrence of these troubles, it is obvious that improved housing is worth while. The question can even be brought down to a matter of dollars and cents and it can be shown that the money spent in preventing the growth of overcrowding is far less than that spent—I would say worse than spent, for much of it is money thrown away—on strictly curative features, like hospitals, sanatoriums, asylums, and reformatory institutions.

However hard we may strive ideal housing is impossible without reasonable city planning. The latter must precede the former. City planning is a mysterious subject to most of us and implies at first thought a pretty lamp-post or a statue on a street corner; or a lawn with a tree and a shrub at conspicuous points. Perhaps it did start with this idea, but in its present-day development these are only a few of the many contributory phases. City planning today is a well-defined science based on a vast amount of experience gained under greatly varying conditions, experience which has been brought together, analyzed, correlated, and systematized so that now it is available to anyone who has at heart the bettering of life in his municipality.

Some knowledge of city planning and what it implies is absolutely essential to the social worker if he would make the results of his labor permanent and prevent the recurrence of

PROGRAM, MAY 15-17

First session.—Harbor and Dock Development, Calvin Tomkins, commissioner of docks, New York.

Second session. — Public Buildings, Open Spaces and Waterways, John M. Carrère,[1] architect, New York.

Third session.—Street Widths, and Subdivisions for Various Purposes, Nelson P. Lewis, chief engineer, Board of Estimate and Apportionment, New York.

Fourth Session.—Buildings in Relation to the Street and the Site, Lawrence Veiller, secretary National Housing Association, New York.

Fifth session. — Municipal Real Estate Policies, Frederic C. Howe, New York.

(It is hoped to have French, English and German municipal real estate policies presented by representatives from each country.)

Sixth session. — Financing City Planning, Lawson Purdy, President Department of Taxes and Assessments, New York.

Seventh session.—Proposed draft of the American Town Planning Act, Andrew Wright Crawford, Assistant City Solicitor, Philadelphia.

Frederick Law Olmsted, the chairman, will preside.

[1] Deceased after program was prepared.

those things which he has been trying to correct. If he would understand the whole subject of social effort comprehensively, he must have a fundamental understanding of how the environment of those whom he is trying to help can be made to co-operate with him in gaining results. City planning on one side or another is of interest to a great many kinds of people, but it is essentially of interest to social workers, hence the importance to them of the international exhibition and conference of city planning to be held in Philadelphia in May. Many experts from abroad as well as from America have been invited to attend. Most of the best city planning data and design now existing will be shown. The city of Philadelphia, through Mayor Reyburn, has set aside $15,000 to this end and has given free use of the City Hall. The exhibit will last most of the month of May and the first part of June. The conference itself, which will be held May 15-17, will be divided into seven sections, each in charge of a well recognized expert. The seven section subjects, each to be followed by discussion, are in the program.

A glance at the program will show that all phases of the subject are to be considered. The discussions will bring out a great deal of valuable experience. Meanwhile the exhibition will give a splendid opportunity to study how other cities have solved their problems or are trying to solve them. The secretary is Flavel Shurtleff, 19 Congress street, Boston, and the secretary of the exhibit, Arthur E. Buchholz, 395 City Hall, Philadelphia.

THE FIRST SOCIAL CENTER CONFERENCE—DALLAS, TEXAS

EDWARD J. WARD
University of Wisconsin

The opportunity which the public school building in every community offers for the free discussion of public questions, for the giving of lectures, musical and dramatic expression, and for recreational activities has been considered at the conventions of various organizations, such as the National Municipal League, Playground Association of America, and the Department of Superintendents of the National Educational Association, during the past two or three years. But the first conference called expressly for the purpose of promoting social centers through the wider use and added equipment of school houses and other public buildings met on February 17, at Dallas, Tex.

Educators, social workers, members of federated women's clubs, and leaders of movements for civic and social improvement in the Southwest have been united in urging social center development. But it was through the initiative of Col. Frank P. Holland that this first Social Center Conference was held. Colonel Holland became convinced long before the report of the Country Life Commission was presented that one of the greatest needs of rural communities is the development of a common institution in each, where the people will have an opportunity for continued study, where they will find leadership in recreation, and where live and intelligent public spirit will be stimulated. And he saw that the extension of the use of the public school house would be the most economical means of securing such an institution.

For the past year Colonel Holland has not only preached this gospel through the columns of his two publications, but he has sent out into the field Charles W. Holman, a man who knows the problems of the Southwest and who grasps the social center idea in its full significance. As an aid to the work of Mr. Holman, Colonel Holland six months ago began the distribution of small libraries, placing as many as twenty-five in a single day in school buildings in various communities.

After a year of this work it was evident from the interest manifested by farmers' associations, business men's organizations, labor unions, and women's clubs, as well as by representatives of the state universities and agricultural colleges in the Southwest, that the time was ripe to call a conference and launch a movement for securing legislation looking toward the full civic, social, and recreational use of school houses and other public buildings. Colonel Holland then sent out a call:

> to every educator and teacher, minister of the gospel, worker in social reform, newspaper man; to every holder of public office connected with the public free school system; to the organized club women and members of mothers' clubs; to organized labor; to all farmers' organizations; to any organization or individual having at heart a sincere interest in the progress of the Southwest.

The response was remarkable. From five states and from more than sixty towns and rural communities came "soldiers of the common good." The meetings were held in the auditorium of the beautiful new Dallas High School.

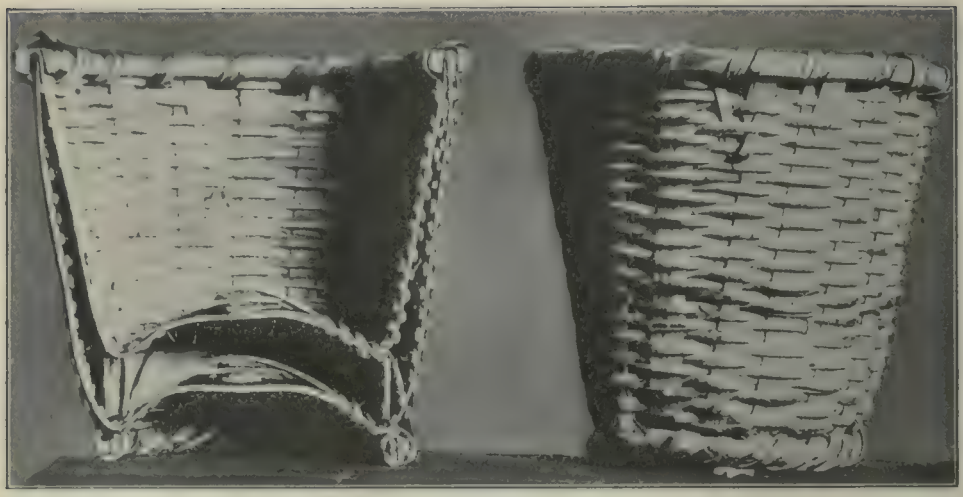
A COUNTRY SCHOOL IN TEXAS.

This was the first school to receive one of the small libraries distributed by Col. Frank P. Holland.

The afternoon session was devoted to the study of the civic, social, and recreational problems of rural communities and the best methods of developing the use of the country school houses as a means of meeting them.

Conditions almost as sad as those uncovered in Adams county, O., were depicted in the descriptions of some of the unsocialized back-country neighborhoods, and on the other hand there were such cheering statements of experience as that given by Colonel R. E. Smith, president of the Texas Good Roads Association, who had been instrumental in opening the first social center in Texas:

"I want to say to you that my ideas of farming have almost been revolutionized. Not long ago a good renter was hard to find. It seems entirely different now. Perhaps the fact that I have taken more interest in my renters—become acquainted with them on the common ground of a social center—makes them like me better, makes me like them better and consequently makes us both do better. People meeting together causes them to understand each other; the young people are fired with ambition and—if this goes on, better corn will be raised over Texas than there ever was before."



The evening session was devoted to the problems of urban communities and was opened by the well loved Bishop Alexander C. Garrett. The needs of the cities of the Southwest were set forth, and the practical experiences of New York, Rochester, Milwaukee, Columbus, and other places in developing the use of school houses to meet some of these needs were discussed.

Among the many important contributions made to the convention none was more comprehensive and effective than the statement received from Senator La Follette on the development in Wisconsin, in which he says:

"Chosen individuals may strive faithfully in meeting and solving the complex problems which arise from the industrial and economic conditions of our time, but lasting results will be achieved through the growth and development of civic interest on the part of the citizens in general throughout the state.

"There is a hitherto largely undeveloped resource for the growth of intelligent public interest, in the opportunity which the school houses and other public buildings offer for the gathering of citizens to consider and discuss together questions of common welfare.

"Should this movement became general, it would unquestionably result in the establishment of a foundation of intelligent democracy, which would make civic progress not only rapid, but conservative and sure."

TRICKS OF THE TRADE.
How some dealers give short measure.

FULL MEASURE

JAMES P. HEATON

"A false scale is an abomination to the Lord but a just weight is his delight" said King Solomon. It has always been necessary to watch and curb deceitful tradesmen. The sealer of weights and measures dates from the earliest days and is a direct inheritance from the medieval towns in England which exercised a rigid control over the prices, weight or measure, and quality of all goods. In New England the office exists in slumbering disuse along with such time honored official jobs as measurer of lumber and tan bark, tithing man, fence viewer, and pound keeper.

The indifference of the purchasing public has been vividly described of late and attention has been called to frauds and to efforts here and there to correct them. Dr. Reichmann, state superintendent of weights and measures in New York, has estimated that petty mercantile peculations cost the people of the state $10,000,000 each year. With increased cost of living causing uneasiness and distress, frauds formerly held too unimportant to bother about now strike home. The United States Bureau of Standards has shown that sixty per cent of the scales and measures in retail stores throughout the country are incorrect.

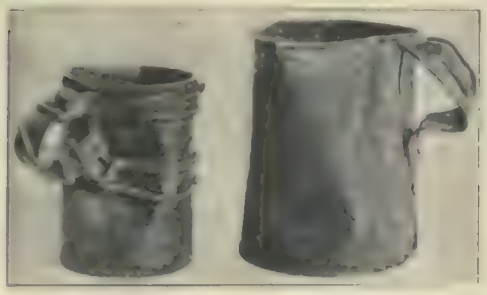
The framers of the national constitution deemed this subject important enough to justify giving to Congress specific power to "fix the standards of weights and measures." In 1830 Congress enacted a law prescribing for the use of the Treasury Department the avoirdupois pound, the English yard, the wine gallon, and the Winchester bushel. Six years later a complete set of the standards was supplied to each state.

NEW JERSEY

How poorly, at the end of seventy-five years, the states are successfully enforcing these standards in the everyday transactions within their boundaries is illustrated by a report which S. D. Dickinson, secretary of state in New Jersey, transmitted to the Legislature at the end of January. This document was submitted by the United States Bureau of Standards and the Robert Stevens Fund for Municipal Research in Hoboken and shows the conditions in eleven New Jersey cities. Representatives of the Robert S. Stevens Fund visited 574 stores in Hoboken, Camden, Jersey City, Montclair, Newark, New Brunswick, Orange, and Trenton. All but twenty-six had short weights and measures; that is ninety-six per cent had either incorrect weights, measures, scales, or packages. Of forty-eight dealers in Orange and twenty-four in Trenton only one had correct weights and measures exclusively. The United States Bureau of Standards found, though giving a lower percentage of error, substantially similar conditions in Elizabeth, Bridgeton, New Brunswick, and Atlantic City, but its report for Trenton and Camden showed a greater proportion of accurate weights than obtained a year later. Its conclusion is that "many of the inhabitants and many of the honest merchants are undoubtedly suffering from the conditions of weights and measures."

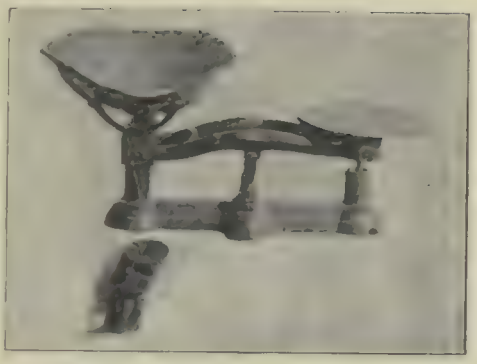
In line with this report the secretary of state prepared a remedial measure for legisla-

tive enactment, which provides a revised state law, a properly equipped state bureau of weights and measures, and similar bureaus for the counties and the larger cities. A bill embodying these recommendations was introduced early this month by Senator Prince and is now pending.



ILLINOIS

A few cities have far eclipsed most of the states in protecting the buyer of small fruits and groceries from false or indefinite measure. In Chicago John Kjellander, the city sealer, found some degree of short weight or measure, either through design or custom, in every trade he investigated. An ordinance was passed requiring that all milk bottles must have their capacity blown into the glass or otherwise permanently indicated. The dealers pleaded for leeway under and over measure. The Supreme Court of the state held that if it was impossible to make all bottles alike they could hold a trifle more, and that a quart or a pint meant just that and nothing else. Another ordinance requires a ticket showing the net weight of each load of coal, in place of the former plan of a single bill covering all loads in a given order. Formerly a driver could say he did not know how much was in the wagon, as it was part of a large delivery and any short weight could always be made up later.



Three bills relating to weights and measures were introduced at the session of the Illinois Legislature last year. One, providing for a comprehensive revision of the existing laws, was defeated by three votes. The second, which passed, gives city, town, and village authorities power to pass ordinances requiring the sale of different kinds of dry commodities by weight instead of measure. The third, commonly termed the "net weight bill," provided that all goods sold in original packages should bear the net weight, measure, or numerical count of the contents conspicuously displayed. It was not reported from committee.

NORTH DAKOTA

In North Dakota a net weight law, similar to the one rejected in Illinois, has increased the gross weight for canned corn, peas, and tomatoes approximately twenty per cent since 1903, "in spite of the fact that prices for food products have materially increased, and we might expect slack fillings were not our law being enforced," as is pertinently remarked in the state report. Before 1903 canned goods in North Dakota sometimes varied forty per cent in weight for cans of the same size. Nebraska has a similar law and the demand for one is taking on strength in New York, Colorado, and Iowa.

WHO PAYS FOR THE DENT.

FEW DEALERS LOSE.

The national pure food law does not give adequate protection in regard to the weight of goods in original packages, for it merely requires that the quantity, if stated at all, shall be given correctly.

The United States Bureau of Standards has announced that Chicago is the model city in protection from short weight. Only five per cent of the scales of Chicago retail dealers were faulty, while in some cities as high as sixty per cent of those examined gave underweight. In many cities absolutely no provision exists for checking weights and measures.

NEW YORK

The investigation of the national government was made before Clement J. Driscoll commenced the very effective work which now makes New York a rival of Chicago. Mr. Driscoll, who has since been appointed first deputy police commissioner, coming as a new man into the place of commissioner of weights and measures, destroyed tons of dishonest scales and thousands of short measures and baskets with false bottoms. He warned dry goods dealers that cloth sixty-eight inches wide could not be sold for two yards wide, and meat dealers that the canvas wrapper around hams could not be charged for as meat. A campaign is under way to compel stores that sell articles wrapped beforehand to show their weight. Candy stores have been in the habit of selling boxes that held a pound gross instead of sixteen ounces net. Similar practices existed in other trades.

The newspapers enthusiastically supported the commissioner and he secured an increase of twelve inspectors. The original force of nineteen had been kept busy watching the output of factories making weights and measures,

so that practically none was left to visit stores and shops.

In New York state the Cobb-Merritt bill, recently passed, defined the duties and powers of the sealer of weights and measures, and of the state departments which acts as a check upon city departments.

CLEVELAND

In Cleveland, after raids upon hucksters had showed short or double-bottom measures, an ordinance was passed requiring them to take out licenses and to wear numbers that they might be identified by customers who claimed fraud. As in New York, arrangements have been made to sell by weight many articles which have been retailed by measure. In the municipal market house the sealer set up scales and furnished measures to the public free, so that anybody could test whether he was securing fair treatment.

ST. LOUIS

The inspector of weights and measures in St. Louis reports the number of examinations and arrests and convictions. Scales and measures are inspected twice a year and the aim seems to be to make the department self supporting. Last year the surplus of receipts over expenditures was $4,554. There are six inspectors in St. Louis, nineteen in Chicago, and thirty-one in New York. In Baltimore the chief inspector, who has six assistants, reports the number of dealers whose weights and measures were inspected, and of weights, measures, and scales condemned and confiscated. Inspections of weights and scales and of liquid and dry measures are made by different officials and there is also an inspector at large to check up the work of the men in the districts.

An important phase of the work is the education of the public. Many do not know that cranberries sold by the liquid quart at seemingly cheap prices are more expensive than berries costing a cent more that are honestly measured by a dry quart. At the municipal budget exhibit of New York city last fall graphic illustrations were given of false weights and measures, of dishonest use of correct standards, and of the price per unit of loose and package goods. No kitchen is complete without a good scales and a set of accurate dry and liquid measures.

CIVIC IMPROVEMENT

CHARLES MULFORD ROBINSON, Contributing Editor

IMPORTUNING PROVIDENCE

There is an organization in Providence which is known as the Town Criers. It is so active that one sees references to it continually and the editor of this department is among those who have wondered what the title meant. He has just found out, and the answer is simple. Town Criers are just citizens "who believe in crying for what they want until they get it."

PRESERVING SCENERY

An interesting example of billboard restraint is to be found in the report of a successful prosecution which has lately taken place at Silloth in England. The Carlisle City Billposting Company was fined fifty shillings for exhibiting advertisements on two hoardings in such a way as to disfigure the natural beauty of the landscape. They marred the view of the Scottish hills.

STREET WORK IN PARIS

Americans who, thinking of the torn-up condition of the streets in their own cities, sigh for what they consider the perfection of Paris, may read with interest the announcement that the prefect of the Seine has just laid before the Paris Municipal Council proposals for spending $20,000,000 on street improvements. This sum does not include the proposed extension of the Boulevard Haussmann to the Boulevard des Italiens. It also suggests that Paris has not attained the beauty it enjoys without a good deal of expense and courage.

CITY PLANNING

It is significant that the news of a single week should have contained the following three items: A resolution passed by the San Francisco branch of the American Institute of Architects urging the mayor and Board of Supervisors to create a municipal commission, with power to develop a comprehensive plan for all improvements in San Francisco; an agitation started in New Britain, Conn., to have a city plan commission, and finally, a report that the Board of Estimate of New York is about to appoint a commission on city planning.

ALBANY BOYS' CLUB

It may seem like stretching this department to make room in it for "a club built just for boys." But the pamphlet report for 1910, which the Albany Boys' Club has issued in unusually attractive form, puts very tersely a reason for mentioning it here. On the cover are the words, "For Better Citizens," and inside on the title page:

THE BOY
WHO PLAYS ABOUT THE STREET
AND THEN—
THE ALBANY BOYS' CLUB
AND
BETTER MEN.

Is there not reason enough to include this boys' club in a civic improvement department?

THE CITY'S PROBLEM

The Public Athletic League of Baltimore has issued its second annual report as a large and handsomely illustrated pamphlet similar to its first. Under the presidency of Robert Garrett and the secretaryship of George W. Ehler this organization is very active. The report records the passage of a state law authorizing the mayor and City Council of Baltimore to contract with the league for the purpose of "establishing, maintaining, and conducting gymnasia, athletic fields, and recreation centers for the benefit of the people of Baltimore" and of a bill permitting the city to make appropriations for this purpose. Thus the league, though only in its infancy, is likely to receive municipal money. Mr. Ehler commences his report with these words: "Baltimore's great question: What is the really important problem of our city? Is it a supply of pure water? Is it sewerage? Is it trade with the South? Is it art and beauty? Is it smooth streets? Or is it boys and girls? Boys and girls! What are they going to be —in body, in mind, in heart? This is the most important problem of the city of Baltimore."

A SCOLDING

Edward T. Hartman in his department in the *American City* gives improvement societies something that sounds very like a scolding. Sometimes scoldings are good and necessary. After telling of a town improvement lecture delivered before a well meaning club in Massachusetts he says: "It is about time for improvement societies, women's clubs, and similar organizations to stop seeking for either intellectual cocktails or short roads to the ideal. The mental cocktail, sought particularly by women's clubs, becomes a habit. It becomes more and more expensive because the more diluted first applications soon cease to satisfy and expensive cocktail artists become a necessity. And it doesn't lead to results. Short roads to the ideal never work. . . . Let's get over the idea that a platform artist who knows nothing about our conditions (they are often found who know but little about any conditions) can show us how to use the ladder by which some other community has climbed to a higher sphere. Each community must have its particular ladder and it must be planted in the soil of the particular community it is to serve, for the people of a community cannot use the ladder of another community and remain in their own community. . . . Whitewashers and flatterers can be hired, but they are not hired by community builders. Community builders hire a man to make a diagnosis, and then they apply the remedy."

FOREST NURSERIES FOR SCHOOLS

The forest service of the United States Department of Agriculture has issued a bulletin making the happy sugggestion of forest nurseries, where they are practicable, for schools. The bulletin points out the advance lately made in the introduction of nature study and elementary agriculture into the regular public school curriculum, and the popularity of the school garden. It remarks, however, that the school garden has two rather serious drawbacks: the majority of the plants appropriate for cultivation in it reach their most interesting stages of development when school is not in session; and after the season's work no tangible results remain and apparently no lasting good has been accomplished but the instruction given. If a nursery for the propagation of forest trees were established, the crop would not disappear at the close of the season. Instead, young trees might be transferred to the school grounds, lawns, or other places where they would be permanent evidences of work done. Furthermore, this transplanting of trees can best be done in the spring when school is in session. The nursery will certainly require no more labor than the garden, and the instruction involved in its care will be of much the same kind and value as that derived from the garden. The bulletin contains full suggestions for work and many illustrations.

A CITY'S SONGS

If Rochester seems to have been receiving more than its share of publicity in recent months, the reason is found in the evidences of civic spirit and progressiveness which that city has been offering. A novel and striking illustration of this is in the publication of a Rochester Song Book. In a foreword the editors state the belief that this is the "first considerable attempt of its kind for any American city." Of the songs, which fill 175 pages, many of course have been published before and are familiar in Rochester. Others were written especially for the Song Book. They are assembled under the headings Songs of the Genesee, Songs of Rochester, Patriotic and Fraternal Songs, and School and College Songs. A professor of the university, Kendrick P. Shedd, is editor-in-chief with a representative board of associates. In Rochester, where the public schools are used evenings by immense civic or neighborhood clubs, there is perhaps a greater demand for this sort of book than in other cities of like size. The songs vary a good deal in musical and literary quality, but there can be no doubt that the compilation is calculated to increase local pride and affection for the city. No one, for instance, can read the words of the Songs of the Genesee without being impressed by the part which Rochester's river plays in the lives and hearts of the people. Nor is the fact without significance that these songs praise not the majesty or water-power of the river, but its tranquil beauty and its attractiveness for canoeing.

SOME PARK STATISTICS

The February *Bulletin* of the American Association of Park Superintendents includes some interesting data for 1909 obtained by a postal card canvass of 250 cities, conducted by the secretary. It is remarkable to find that one of the cities having the largest population per acre of park lands is Pasadena,

Calif. A city of millionaires, as it is called, and a great tourist resort, Pasadena has only fourteen acres of parks, or but one acre to 2,285 people. Of the other cities reported, only twelve have more than a thousand people per acre. The one which makes the worst showing in the statistics is Jersey City, but that may be due to the fact that the Hudson County Park System is not included because its pleasure grounds are county, rather than city, parks. Other cities which make a very bad showing are Jamestown, N. Y., with more than 2,500 to the acre, and New Rochelle, N. Y., with nearly 2,300. The best showing is made by Colorado Springs, where, thanks to the munificence of the late General Palmer, there is an acre of park land to every nineteen people. Bridgeton, N. J., has a good showing with only twenty-one people to the acre. Other cities that stand extremely high are Council Bluffs, Ia.; Winona, Minn.; Springfield, Ill.; Watertown, N. Y., and Minneapolis. The Minneapolis report is extraordinary, for, with a population of 300,000, an acre of park is reported for every eighty-eight people. The city that spends the most on its parks is Peoria, Ill., with a per capita maintenance charge of $1.60. In Savannah, Ga., the expense is about two cents a person, and there is a long list of cities in which it is ten cents or less, the lowest being Hornell, N. Y., with a cent and a half.

AN ARCHBISHOP ON TOWN PLANNING

A very interesting evidence of the social significance of town planning was given a few weeks ago in an address by the archbishop of York before a large audience in Doncaster, England. The mayor had called a conference to consider the problem presented by the certain development, during the next ten years, of a new colliery district adjacent to Doncaster, which would contain 40,000 working miners and a possible total population of about 200,000.

The archbishop said that the question which the conference had to ask itself was: What shall be the character of these new towns? The usual colliery towns, said he, reflect no honor on the civilization of the nineteenth century, but it is not necessary that they be so dreary. It is simply permitted. He knew that many of his audience would say that philanthropy was all very well, but they were there to keep an eye on business. He added: "I should have little respect for my own common sense if I was not certain of this proposition—that a wise town-planning scheme, undertaken with the good will of all concerned, will be for the direct financial benefit of landowner, colliery owner, and ratepayer. We all stand in fear of any increase of the rates, but we sometimes forget that economy, which we all believe to be associated with efficiency, is not measured by the amount of the rate, but by the things that the rate buys." They might, he said, have a technically small rate productively for securing the health and happiness of the people about them, or pay a rate unproductively for dealing with disease, drunkenness, poverty, and crime. "If you ask a man", he said, "to work all day in the depths of the earth, and then put him to sit at the front door to contemplate a barren monotony of ugliness, can you wonder if he wants to get excitement in a public house or drinking club?"

WHEN GROWTH IS DECLINE

Taking as its text a situation which has developed in the little town of Lee, Mass., The *American City* has lately protested editorially against the familiar folly of trying to bring new industries into a place when no corresponding attempt is made to house the additional employes properly. After saying that the people who are invited to Lee are apparently expected to dwell in the fields, the editorial remarks that a short time ago additional workmen were called to Thompsonville, Conn., to work in the carpet mills, and when they got there found "no houses in which they could live. The newcomers had for months to live in stores, shacks, and old places, and even yet the conditions are bad." Similarly, it says, new industries are the cry of Brattleboro, Vt., "while the town already has serious slums, and owing to the lay of the land it is almost impossible for it to expand." With this timely protest the editorial concludes: "We shall some time learn that growth (from the census point of view) does not mean progress. A town of 5,000 people may be ideal. The same town a few years later with 10,000 people may be absolutely bad."

MUNICIPAL REFERENCE LIBRARIES

The work of the legislative reference bureau in Wisconsin quickly showed its unique value, and the idea has spread to New York, Ohio, Indiana, Pennsylvania, Rhode Island, Connecticut, Massachusetts, California, North Dakota, Michigan, Iowa, Montana, Alabama, and Nebraska. The National Municipal League in 1909 appointed a committee to report upon the desirability and feasibility of municipal reference bureaus. Almost everywhere it is agreed that there is a great need for them. The majority seem to believe that they should be located in the city hall and be controlled by the public library.

Milwaukee, Kansas City, Mo., and Baltimore have municipal reference libraries. The public library of Minneapolis has recently established a municipal reference section, and the Civic League of St. Louis has urged that provision be made in the new charter, which the Board of Freeholders is drafting for the city, for a municipal reference library. Boston, Chicago, Newark, New York, and other cities possess statistical bureaus, the effectiveness of which would be much aided by reference libraries. The Universities of Wisconsin and Kansas have municipal reference bureaus to furnish information to all the cities of those states. Los Angeles has a municipal reference bureau under private auspices. The plan is being seriously considered in Cleveland and Washington, D. C.

HEALTH

SPRINGFIELD'S SANITARY AWAKENING

GRAHAM ROMEYN TAYLOR

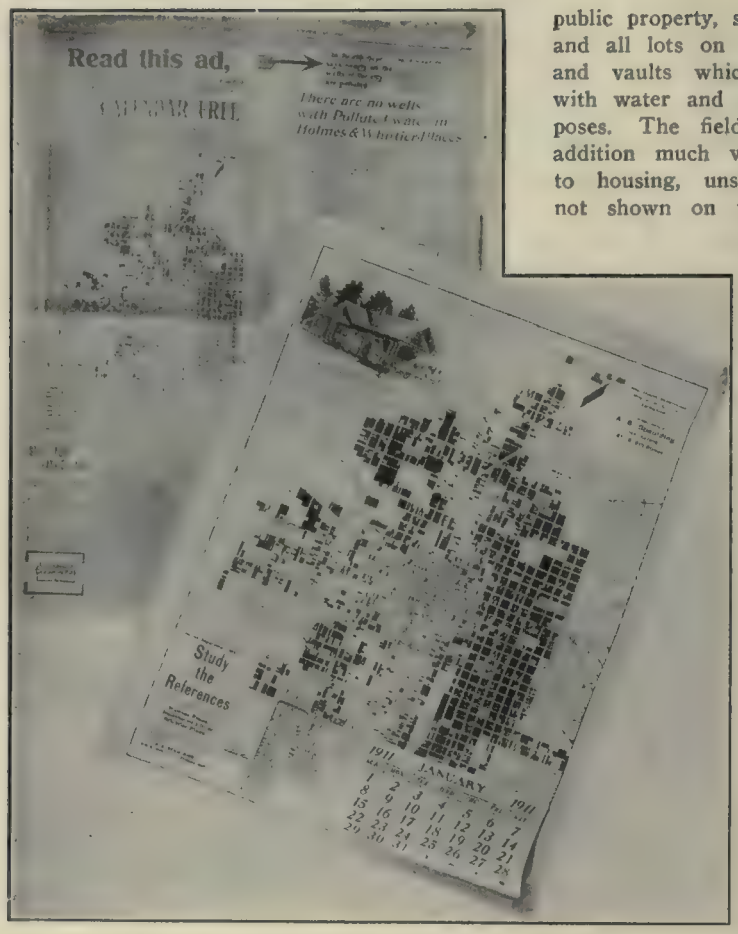
What's the matter with Springfield? From the standpoint of sanitation scarcely one among the 51,000 people in the capital city of Illinois knew. The question itself had not been seriously raised. But one day a plain map of the city—big enough to show some of the things in everybody's backyard—jolted the community into a realization of the importance of the question and at the same time furnished the ugly, unvarnished truth of the answer. Springfield has conditions probably not unlike those to be found in many middle western cities which have not yet thought to ask or answer the question. If they really undertook to "know themselves" they might get just as startling information as came to Springfield when her citizens were amazed at the disclosure that 6,000 out of the 9,000 houses in the city did not use city water and sewers, that 5,000 homes directly on sewer and water mains did not utilize them, that there were over 6,000 privy vaults and more wells in the city. That is, the municipal expenditure of $4,000,000 for sewer facilities and water supply served only thirty-three per cent of the population, although it had been thought that from sixty to seventy-five per cent were served.

The story of how this extraordinary fact came to light is the story of the man behind the map and of his work. It begins with another extraordinary fact. Until May, 1909, Springfield, Ill., had no physician actively connected with the municipal Health Department, but at that time the newly elected mayor undertook to secure efficiency in the work of public health by appointing a superintendent without regard to politics. The position was offered to Dr. George Thomas Palmer, who was to receive a compensation described in a city ordinance as follows:

> He shall receive for his service the same salary or compensation as is or may be allowed, by ordinance, to police patrolmen

The previous health officer was a cigar maker! Dr. Palmer served for several years as assistant secretary of the Illinois State Board of Health, having charge of contagious diseases and sanitation. During his incumbency he had charge of the yellow fever quarantine in Cairo in 1905. Together with the late Dr. Marcus P. Hatfield he had established and conducted through one summer the Trinity Diet Kitchen for Infants in Chicago, one of the pioneer milk charities in the West.

Only three months of the fiscal year had passed under the previous administration, yet a large part of the annual appropriation of $6,800 had been expended. Although constructive reforms were immediately instituted which increased legitimate expenses, the average expenditure for the nine months was $250 less than for the three preceding.



The milk supply of the city, notoriously bad, was brought up to a reliable standard in a campaign which began by emptying 150 gallons of doctored milk into the public sewers. Frequent inspection during the year has kept the local milk supply up to a fair commercial standard. But this is regarded merely as preliminary work—a demonstration of the necessity of systematic dairy inspection if Springfield is ever to have pure, clean milk. Such a system of inspection cannot be established with the present force and appropriation.

The city's unusually high mortality from typhoid fever is shown in the following excerpt from the Mortuary Statistics of the United States Bureau of Census:

DEATH RATES PER 100,000 POPULATION.

	1903	1904	1905	1906	1907	1908
Aurora	15.7	46.3	7.6	14.9	18.3	14
Chicago	32.1	20.2	16.5	18.3	17.7	20
Decatur	18.4	40.8	20.5	12.1	12	11
Ottawa	29.2	9.1	18		26.6	17
Quincy	39.8	52.4	25.0	33.2	20.2	22
Springfield	49.7	40	36.6	41.1	85	39

In searching for the cause of Springfield's unenviable rank, the municipal water supply was first examined. It is taken from the Sangamon river and passes through a "gallery system." It has been steadily improved during the past few years, and was found to be safe for drinking. Suspicion then turned upon the wells so generally used throughout the city. An analysis of water from 150 showed all but three to be unsafe. To determine the source

THE MAP OF HEALTH.

Real estate interests were quick to catch the significance of the sanitary survey and turn it to their advantage in ways which incidentally carried the educational campaign that much further. The photographs show the advertisement of a "sanitary property" in the Illinois State Register, and a map-calendar gotten out by the same company.

of this well pollution, the Health Department undertook the sanitary survey of Springfield. It sought to ascertain the prevalence and use of privy vaults and shallow wells and how far this situation was responsible for the excess of typhoid. The five inspectors of the department, during a period of about six weeks and while carrying on their regular work, visited the 9,000 houses and collected data on the following points: the location of each shallow well, the location of each privy vault or cesspool, the number of sewer and water connections for sanitary purposes, and the general sanitary and physical condition of each house.

From the data thus secured the sanitary map of Springfield, ten by twelve feet in size, was prepared. Every privy vault was shown by a black hollow square and every well by a black dot. A color scheme indicated all lots on which water and sewer were used for sanitary purposes, all vacant, all business, and all public property, sewers and water mains, and all lots on which there were wells and vaults which were not connected with water and sewer for sanitary purposes. The field inspectors secured in addition much valuable data in regard to housing, unsanitary conditions, etc., not shown on the map but now systematically arranged for the use of the department. A plan is now being perfected to add data on housing conditions in the congested districts of the city. Reproductions of the map, showing only the streets, lots, house numbers, sewers, and water mains, are being prepared for the department's own housing investigations, communicable disease maps, etc., and for the use of the Associated Charities and other social and civic organizations. The complete data were submitted to a board of prominent sanitarians who concurred in the opinion of Dr. Palmer that the excessive prevalence of typhoid fever was due largely to the use of shallow wells polluted by privy vaults. The map was shown to the City Council and the facts were explained. At the request of the Chamber of Commerce, Dr. Palmer told two hundred business men "the truth about Springfield." They gave him a vote of thanks for his study of the situation and en-

A SECTION OF THE MAP.

It shows the graphic method used in describing Springfield's insanitary conditions.

dorsed his recommendations for sanitary reform. The City Council instructed the city attorney to draw up ordinances requiring connection of all new or rebuilt dwellings with sewers and water mains. This passed, the council promptly instructed Dr. Palmer to devise means for the disposal of garbage. Up to this time it had been dumped on vacant property, some of which lies within the city limits and near many homes. An incinerator or reduction plant will promptly be established and garbage collection, now entirely neglected, will be undertaken by the city or under contract.

The organization of a Municipal Tuberculosis Association by the Springfield Associated Charities, the Chamber of Commerce, and the Springfield Woman's Club came next. It has now a membership of over seven hundred. Ample funds have been raised; quarters have been secured for the opening of a tuberculosis dispensary; a trained nurse has been employed, and plans are under way to establish for the first time a system of visiting nursing.

Neither business interest nor public sentiment has given voice to the narrow minded contention that the agitation "hurt the town." In fact, one real estate dealer reproduced the map in a newspaper advertisement, to show that the property he handles is in a desirable, sanitary district. Soon after the results of the investigation became known, an officer of one of the banks stated to Dr. Palmer that he was less inclined to lend money on unsanitary property than he had been in the past.

Springfield's sanitary awakening has thus roused all her people not only to remedy the bad conditions, but to start constructive health efforts of far-reaching significance.

QUICK LUNCHES FOR EFFICIENCY AND HEALTH

ALIDA LATTIMORE
Rochester

The problem of serving lunches to a large number of persons in a limited time has been solved in Rochester. When the East High School was built in 1903 the Board of Education spent as much time and thought in planning and equipping the lunch room as it did in preparing the other laboratories. The large, well ventilated and lighted room on the first floor has a central horseshoe counter fifty-five feet in length and twelve feet in width, supplied with steam and serving tables, milk, chocolate, water tanks, sinks and dish washer. Mission chairs and tables furnish the boys' as well as the girls' side of the room, and any up-to-date restaurant might be proud of the equipment. Here 1,100 students are served with an attractive lunch in twenty minutes. At the newer West High School 900 are served in the same time. As these schools have

but one session, the lunch period is necessarily short.

The success of these two lunch rooms is due to the fact that they have never been run for money profit. The food is bought by the city, prepared by the city, and sold at cost. The kitchens utilize the waste steam from the heating plant for the steam cookers, which are used as much as possible, thus eliminating one item of expense.

Mrs. George A. Hotchkiss, to whose expert management the success of the Rochester High School lunch rooms is due, is a very unusual woman. In addition to her trained intelligence she has an inexhaustible fund of that rare asset—enthusiasm.

The skill and enterprise manifested in the operation of the school lunch rooms soon attracted the attention of the manufacturers in the city who were struggling with the question of producing a higher degree of physical efficiency in their employes. In 1905 the Eastman Kodak Company engaged Mrs. Hotchkiss to install a lunch room similar to those in the high schools in its large factory at Kodak Park. The simple fact that six near-by restaurants soon went out of business is only a small part of the story.

Stein, Block and Company were the next to enlist the services of Mrs. Hotchkiss; then followed the German-American Button Company, the Bausch and Lamb Optical Company, and lastly the Adler Clothing Company. Besides planning the details of fixtures, etc., Mrs. Hotchkiss trains the women under whose supervision the lunches are served.

The methods used in schools and factories are much the same—horse-shoe counters, the open end toward the kitchen, are in all these lunch rooms. Behind the counters are the persons who hand out the lunches which are paid for in paper checks, burned after each meal. The checks are purchased at the door. The majority of the servers are employes or students who earn their lunches in this way. Often the customers purchase only a plate of soup or a cup of coffee to supplement the lunch they have brought from home.

One lunch room recently installed has found a table d'hôte lunch the best business proposition, as much waste is avoided by reducing the number of articles furnished in a given day. When the owner of this factory asked Mrs. Hotchkiss to arrange her plans so that she could serve a fifteen-cent table d'hôte lunch, Mrs. Hotchkiss said she could not undertake such a lunch for one hundred people for less than sixteen cents a head except at a loss. She was urged to make the experiment. The plan has proved a great success. Instead of the possible "hundred" expected, 400 employes daily avail themselves of the whole or a part of the generous and delicious lunch provided, and the effect of the hot, nutritious meal is seen at once in the quality of work done and in the improved health of the people.

Too much cannot be said as to the selection of the proper person to have charge of

A CHAMPION AMONG HIGHWAYMEN.

a lunch room. She must be a well-paid expert. Because a woman is a "good cook" or "has kept a boarding house" is not recommendation enough. She must be a good buyer and a first class organizer. She must have a fund of good humor and be a student of human nature.

When we say that our lunch rooms are run "without loss," we mean that the income from lunches covers the actual running expenses, in some cases the wear and tear, repairs, etc. In only one case is the initial cost of the equipment, or the cost of space, or the interest of the capital invested reckoned as cost of running the lunch room. One cannot, however, measure in mere dollars and cents the "interest on the investment," for all intelligent observers agree that the mental and physical, to say nothing of the moral effects of nutritious food supplied to students and workers in factories and stores, cannot be calculated. The profit is vital and far-reaching, and in many cases surprising. For instance, a German in a large factory, relating what the lunch room had done for him, said that he used to bring his cold lunch from home in a dinner pail. Then at night his wife was obliged to have a hot dinner for him and the children, who had already had their dinner at noon, demanded a share of his. This made it necessary for his wife to serve two dinners each school day. With the new arrangement, having had a light dinner at the factory, he found his wife upon his return home "with her crimping pins out," rested and pleasant. The whole atmosphere of the home had been changed by the factory noon lunch.

WARN, INSTRUCT, CATECHIZE

A special feature of a recent issue of the *Western Review*, a fraternal magazine published in Omaha, Neb., is a symposium on public health, to which W. O. Owen, M. D., and Charles Mulford Robinson contributed articles on a National Department of Health, and Mrs. Florence Kelley, Ellen H. Richards, and Thomas D. Coleman on other health topics. In addition to signed articles, the section contains paragraphs of useful information and advice; for instance, we are told that the state of New York spends for the protection of game, fish, and forest four times more than it does for the protection of health; there is the warning that mild cases of disease spread more contagion than the serious ones; or we are urged "not to hibernate but ventilate," if we want to keep free of colds.

By such means are adults instructed. *School Education* of Minneapolis for February points a lesson for children on the danger to health from flies. The following Fly Catechism is now being distributed to the school children of North Carolina:

1. Where is the Fly born? In manure and filth.

2. Where does the Fly live? In every kind of filth.

3. Is anything too filthy for the Fly to eat? No.

4. (a) Where does he go when he leaves the vault and the manure pile and the spittoon? Into the kichen and dining-room. (b) What does he do there? He walks on the bread, fruit, and vegetables; he wipes his feet on the butter and bathes in the buttermilk.

5. Does the Fly visit the patient sick with consumption, typhoid fever, and cholera infantum? He does—and may call on you next.

6. Is the Fly dangerous? He is man's worst pest, and more dangerous than wild beasts or rattlesnakes.

7. What diseases does the Fly carry? He carries typhoid fever, tuberculosis, and summer complaint. How? On his wings and hairy feet. What is his correct name? Typhoid Fly.

8. Did he ever kill any one? He killed more American soldiers in the Spanish-American War than the bullets of the Spaniards.

9. Where are the greatest number of cases of typhoid fever, consumption, and summer complaint? Where there are the most flies.

10. Where are the most flies? Where there is the most filth.

11. Why should we kill the Fly? Because he may kill us.

12. How shall we kill the Fly? (a) Destroy all the filth about the house and yard: (b) pour lime into the vault and on the manure: (c) kill the Fly with a wire-screen paddle, or sticky paper, or kerosene oil.

13. Kill the Fly in any way, but *kill* the Fly.

14. If there is filth anywhere that you cannot remove, call the office of the Board of Health, and ask for relief before you are stricken with disease and, perhaps, death.

HOSPITAL RECORDS AND THEIR INDUSTRIAL SETTINGS

In an address before the American Academy of Medicine in Buffalo in December, John R. Shillady, secretary of the Buffalo Association for the Relief and Control of Tuberculosis, outlined the thorough record keeping called for by the development of social service to hospitals and dispensaries. The history of a case should cover "not only the immediate physical and pathological causes, but also the less obvious but more fundamental causes that change a citizen and a man to a patient." He seconds Miss Lathrop's criticism of the use of general terms in keeping the record, "'laborer," for instance, throwing no light on the nature of the person's work; and continues:

"Laborer covers a multitude of sins. Was he a painter, and did he come in contact with dangerous poisons? Did he work in a mine underground? Did he work in contact with lead? Did he inhale dust? Did he begin work before his body and mind had a chance to develop? How many hours a day and for how much did he 'labor'? These are important qualifications as to occupation. Our records usually explain little, if anything. Why put occupation at all if we do not write some meaning into our answering notation? Then alcoholism, ignorance, incapacity, accidents, etc., were adverted to by Miss Lathrop to show that our records state usually the outside fact. The real cause often lay behind the weakness of character in insufficient wages, industrial accidents, and like causes. Let us secure the real fact beyond the apparent. . . . As social-medical workers our problem is to care for the wounded and stop the war. We must arouse the public conscience. To do this we must know what we are talking about. Not alone shall we affirm, *a priori*, that certain occupations and conditions are dangerous to health, but our institutional records should be readily accessible data. They must be transformed from histories of individuals to histories of social units. Our work must keep pace with the modern outlook."

With this challenge to the hospitals in mind, the recent report of the Massachusetts State Board of Health is illuminating.

Excessively long hours of labor in tenement homes minus decent sanitary standards, lack of proper ventilation in cigar factories, and slight care taken against the irritating dust in metal polishing and buffing industries are some of the points made by Dr. H. Lindenthal whose work covers the fifth district, including Suffolk county, Boston, and part of the populous adjacent territory. In his inspection of home work Dr. Lindenthal occasionally found women who are employed all day in tailor shops and who take home odd jobs for completion during the night. He characterizes the air in these home work-shops, as "exceedingly foul." "In several instances remaining in the room for five or ten minutes produced dizziness and headache. The air of the bedrooms was found still worse than in the kitchens, which are usually the living rooms." In the cigar factories it was found that the old habit of biting the ends of fillers and finishing cigars by rolling the ends in the mouths of the workers had been discontinued to a large extent. Again Dr. Lindenthal found the ventilation to be very bad. The workrooms were hot and stuffy, the windows closed and the air charged with the odor of tobacco leaves. Exhaust fans and ventilating flumes were installed in some factories and better window ventilation was secured in others. A thorough study was made of establishments where employes are exposed to the dust of metal polishing and buffing. In the majority of cases it was found that emery and buffing wheels were not connected with exhausts and that fine dust filled the air and settled on the workers. Hoods were installed in all factories which did not provide proper devices for protection against this dust. Apparently neither employer nor employed appreciated the danger of working in a metal dust atmosphere.

RHODE ISLAND AND ADVANCED CASES

The results of an intensive investigation of the need for tuberculosis hospital care and segregation are given in the recent report of the Rhode Island Commission on Hospitals for Advanced Cases of Tuberculosis. Because of the state's limited area the commission was able to inquire carefully into the history of a large number of cases. It summarizes its principal findings and recommendations as follows:

"(a) The number of cases reported to the commission is 1,467.

"(b) Segregation is the logical measure for prevention.

"(c) The tuberculosis death rate has declined most, and reached the lowest point, in countries where there has been the most institutional segregation of consumptives.

"(d) Of 102 patients having advanced tuberculosis whose home conditions were investigated in Providence, fifty per cent were unable to occupy a room alone without ob-

jectionable overcrowding of the rest of the family.

"(e) Only 126 out of at least 500 patients in the state having tuberculosis and in urgent need of hospital care are already in hospitals; 374 are outside.

"(f) Of 122 advanced patients in various towns who were asked if they wished to enter a hospital, 72 per cent signed blanks affirmatively.

"(g) The ideal plan for the care of advanced cases of tuberculosis is the segregation of such cases by each city or town within its own limits, either in special hospitals or in separate wards connected with general hospitals. To encourage the erection of such hospitals or wards, we recommend a state appropriation of $200 per hospital bed to each municipality erecting such hospitals or wards, the plans of which receive state approval.

"(h) A hospital, the administrative parts of which allow of its expansion to 200 beds, should be built by the state, 100 beds should be provided at once, and the second hundred beds added as soon as needed to provide room for applicants.

"(i) Towns should pay $5 per week, or one-half the estimated hospital cost, for the care of each patient for whom they are justly chargeable, and cities giving hospital care to patients should be paid $6 per week by the state—$5 plus $1 per week interest on capital invested.

"(j) The teaching of the simple facts concerning the contagion of tuberculosis and its prevention as a part of a course in hygiene in the public schools is recommended.

"(k) An amendment to the law, requiring registration of tuberculosis which will ensure sanitary teaching of all consumptives and their families, is recommended.

"(l) Tuberculosis nurses should be engaged and paid by the towns.

"(m) The thousand deaths from tuberculosis in Rhode Island each year represent an estimated loss of earnings during illness, of $1,653,750; a loss in medical attendance, medicines, and nursing, of $840,000; and a loss through the cutting off of the earning power by death, of $5,880,000, or an estimated total loss of over $8,373,750."

JOTTINGS

LIVING PATIENTS AS DOCTOR'S TEST

In order to limit the supply of ignorant physicians, Dr. Richard C. Cabot in the February number of *New Boston* suggests that candidates for licenses in Massachusetts be obliged to make examinations of living patients. Dr. Cabot says, "We cannot force our medical schools either to do decent work or go out of existence; at least I cannot discover any way to do it. As this remedy is not feasible there is left but one alternative, to make more practical our existing state examinations for the right to practice medicine. They are now mostly written examinations, and any smart boy can pass written medical examinations without any genuine medical knowledge. Six months' study of the cram-books (quiz-compends) will put a boy through. He may never have seen a sick patient, never attended a woman in labor, never dressed a wound, or written a prescription in his life." The State Board of Registration in Medicine has authority to conduct such examinations, but it has not proper facilities and sufficient appropriation to go very far in carrying them out. Dr. Cabot says that "what we need is to impress upon our governor and our Legislature the fact that it is up to them to give the board proper facilities for protecting the community against imposition." At present, "ignorant doctors can do a lot of harm. They can and they do. They fail to recognize contagious disease before it has spread into an epidemic. It might have been checked if recognized early. They fail to recognize at the top of a patient's lung a dangerous disease (tuberculosis) before it has spread and produced advanced phthisis. It might have been checked if recognized early. They fail to recognize an appendicitis before it has spread to produce fatal peritonitis. They let wounds go septic and babies' eyes get blinded by that absolutely preventable disease, gonorrheal ophthalmia. As health officers in most of our cities and towns, they fail to apply principles of preventive hygiene in the shop, the home, the street, and the school. They allow foul air, promiscuous spitting, and windowless sleeping-rooms."

A CITY OF 4,000 DID THIS

A recent report from the Anti-Tuberculosis Committee of Madison, N. J., shows what can be done with limited resources in a town of less than 4,000 inhabitants. The committee's total direct expenditures for 1910 were $426.80. The principal items were for the exhibit campaign, when practically every one in the town was reached, and $165 for the board of three patients. While the committee did not support a nurse, it interested the village officials and another organization in securing one. It has come into close relations with practically every tuberculosis case in the village, and in addition has stimulated a vital interest in tuberculosis and its prevention among school children. Practically every church, lodge, and civic and social organization in the village contributed to the support of the committee.

RED CROSS SEALS SALES

No complete official report on the sale of Red Cross Christmas seals will be available much before July; but a sufficient number of unofficial returns have been received to indicate that the total sale in the United States will reach 40,000,000. Estimates for the sales in a number of the states run as follows: New York, including New York city and Brooklyn, over 6,000,000; Ohio, over 4,000,000; Wisconsin, 3,000,000; Rhode Island, over 1,000,000; Illinois, over 1,000,000; California, over 1,000,000; and Colorado, Connecticut, Indiana, Maryland, Massachusetts, Minnesota, Missouri, Nebraska, Pennsylvania, Tennessee, and Virginia, over 500,000 each.

INDUSTRY

THE OFFICIAL FINDINGS AS TO WORK-ACCIDENTS

With the reports of seven state commissions on the subject coming from the presses within two months, with the Federal Bureau of Labor issuing an encyclopedic two volumes on the foreign laws, and the National Manufacturers' Association announcing a ten-dollar report of its special commissioners, there is tangible evidence in paper and printer's ink of the widespread interest taken in workingmen's compensation legislation.

The past two years has fairly seen a revolution. Willoughby's Workingmen's Insurance represented the situation in Europe and America in 1898, and for ten years it stood as the comprehensive text on the subject. In that decade, so far as statutory reform went, there was great progress abroad; America practically stood still.[1] Economists and students of labor conditions pointed the contrast in fugitive papers and articles, but it may be said that it was not till the end of the decade that public opinion was reached. The partial bibliography in Dr. Frankel's Workingmen's Insurance in Europe shows that Dr. A. F. Weber's review of Industrial Accidents and Employers' Responsibility for their Compensation was published in the report of the New York Bureau of Labor Statistics for 1899, and H. G. Wadlin's The Insurance of Workingmen in the report of the similar Massachusetts bureau in 1901, while Prof. John Graham Brooks published his discussion of Compulsory Insurance in Germany in 1905. The same year there was a special consular report on the subject and the St. Louis Exposition was made the occasion for an elaborate exhibit of the Imperial Insurance Funds by the German government. But it was in 1908-9 that the Federal Bureau of Labor published its bulletins on foreign workmen's compensation acts; in 1909 that Professor Henderson's Industrial Insurance in the United States and Frank W. Lewis's State Insurance appeared; and 1910 is the date borne by Work-Accidents and the Law, by Crystal Eastman; Workingmen's Insurance in Europe, by Frankel and Dawson; and Social Insurance, by Henry R. Seager. These definite contributions to the literature of the subject are now in turn followed by the governmental reports bearing upon legislation, the New York commission's report of 1910 being the advance guard for the present battery of findings.

In the crystallization of the movement which has made this latter stage possible, various briefer writings have had a notable part, for example, those of Frederick Hoffman and Arthur B. Reeve; William Hard's Making Steel and Killing Men in *Everybody's* for November, 1907; the group of articles in *Charities and The Commons* for December, 1907, which presented the gist of Professor Henderson's paper before the Philadelphia Conference of Charities and Correction, and Francis H. McLean's report to the New York conference; Miss Eastman's study of the master and servant decisions in *Charities and The Commons* for March, 1908, and the subsequent installments of her findings as to industrial accidents for the Pittsburgh Survey; papers by Dr. Farnam, Dr. Henderson, Dr. Lorenz, and others before the early sessions of the American Association for Labor Legislation, and the utterances of various Wisconsin and Illinois men associated with the early stages of the movement in those states.

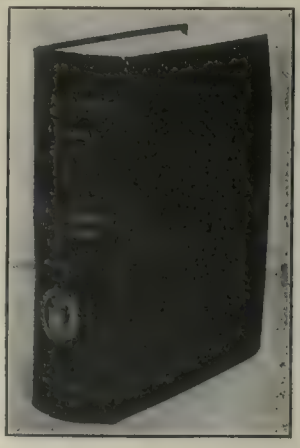
[1] It should be noted, however, that by the end of the period fully thirty states had modified their statutes as to the fellow servant rule or other defenses under the common law of master and servant, and in 1908 a federal law [illegible] which [illegible] nearly all these [illegible] mention is due the Penna [illegible] 1891, since declared [illegible] mine owners respecting [illegible] requirements in regard to [illegible] not [illegible] fulfilled and the [illegible] which [illegible] railroads [illegible] accidents to its passengers including employees. Maryland in 1902, made the first radical departure from the old negligence principle in its compensation law, declared unconstitutional two years later. It was not until 1909 that the next step came in the passage of the Montana mining act which put accident payment on the basis of trade hazard and provided for a contributory insurance fund to be met by a tax of one cent a ton on mine owners and one per cent of weekly earnings of employes to meet the accident payments of $3,000 in case of death, one dollar a day in case of injury and an additional lump sum of $1,000 for loss of eye or limb. Before this act went into effect, the New York law of May, 1910, which put a group of hazardous trades on a compulsory compensation basis had been signed by Governor Hughes and Maryland had passed a second compensation law. The New York, Minnesota, and Wisconsin commissions were all appointed in 1909; the Connecticut and Illinois commissions preceded them, the Massachusetts commission of the nineties being the pioneer in this field.

TWO BOOKS WHICH ARE MAKING HISTORY.

The Frankel and Eastman volumes—the former, an effective *résumé* of European legislation and administration brought up to 1910; the latter the first concrete analysis of the actual working out of the old common law in an American industrial district.

In THE SURVEY of March 4, P. Tecumseh Sherman discussed the bills covering industrial accidents proposed by the seven state commissions thus far reporting this year. These reports[1] vary greatly in contents, ranging in length from twenty-five pages to 400. The Washington, Massachusetts, and New Jersey commissions had less than a year to prepare their work, and in consequence depend to a great extent on the material collected by other commissions.

The Washington report prints a brief of the attorney of the commission. Besides considering the law from the point of view of the police power, the right of the employer to the three common law defences, of the employe to sue, of both to jury trial, liberty of contract, and the provisions of the Fourteenth Amendment, this brief covers the special constitutional questions involved in establishing the separate state department required by the insurance provision in the bill.



The Massachusetts commission, for which Carroll W. Doten acted as chief investigator, presents a short summary of compensation and industrial insurance legislation in Europe and America, tells briefly of the conferences and public hearings and of the character of the sources of statistical information available within the commonwealth, and gives tables of 2,849 accidents gathered from these sources.

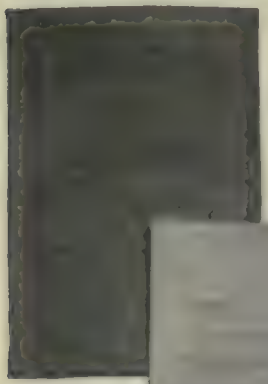
The New Jersey report contains, besides the proposed law, a brief history of the work of the commission, a short discussion of the three defences in the common law, appendices giving the discussion and the drafts of uniform codes by the Chicago Conference of Commissioners on Compensation (November, 1910), and an address on the subject of compensation by William B. Dickson, chairman of the commission, vice-president of the United States Steel Corporation, who is performing this public service as a resident of Montclair, N. J.

A preliminary statement on the Wisconsin Commission was summarized in THE SURVEY of April 9, 1910. The present report, is that presented, with its bill, by the special committee on industrial insurance. It contains, besides very full notes on the bill, a brief general statement of the work of the committee, the counsel's analysis of the bill and numerous statistical tables of accidents, under wage loss, cause of injury, length of disability and other classifications.

The Minnesota report gives the accident figures of the state commissioner of labor for the five years ending July, 1909. Incidentally the report calls attention to work-accidents in agriculture, which as a hazardous trade has not hitherto received much attention in this country. During the month of November, 1910, forty-seven hands were lost in corn shedders. Following a short study of Minnesota accidents is an outline of the growth of the present system of liability, a summary of European legislation on industrial accidents and of advanced legislation, court decisions, and private benefit associations in the United States, with a brief consideration of costs, insurance, and the constitutional questions.

A useful volume in connection with the Minnesota report is Part II of the Seventeenth Biennial Report of the State Bureau of Labor, Industries and Commerce in which Don D. Lescohier makes a study with tables of the 8,671 industrial accidents reported to the bureau during the year ending July 31, 1910, analyzing the

VOLUME I OF THE FEDERAL REPORT.



Workmen's Insurance and Compensation Systems in Europe; issued as the Twenty-fourth Annual Report of the United States Commissioner of Labor.

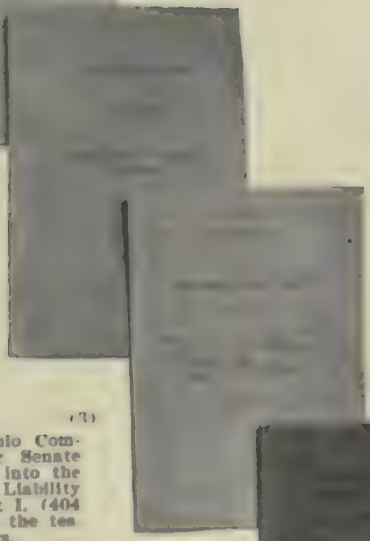
THE 1911 REPORTS

OFFICIAL FINDINGS OF EIGHT STATES

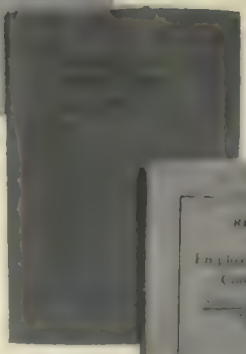


ON EMPLOYERS' LIABILITY AND WORKINGMEN'S COMPENSATION

(1)

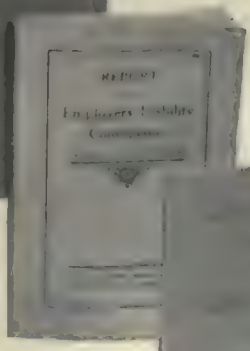
(2)

(3)



The New York Report of 1910—the advance guard both in published findings and in enacted legislation.

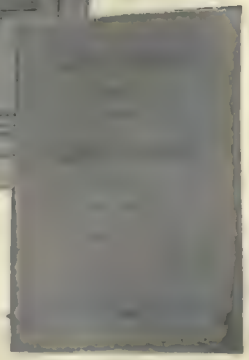
(1) Report of the Ohio Commission appointed under Senate bill No. 250, to inquire into the question of Employers' Liability and other matters. Part I. (404 pages.) Part II contains the testimony given at hearings.
James Harrington Boyd, chairman.
William J. Roha, secretary, Cincinnati, O.



(2) Report of the Commission on Compensation for Industrial Accidents of the Commonwealth of Massachusetts (25 pages).
James A. Lowell, chairman.
Amos T. Saunders, secretary, Clinton, Mass.

(3) Report of Minnesota Employes' Compensation Commission (289 pages).
H. V. Mercer, chairman, St. Paul.

(4) Message of the governor of New Jersey transmitting to the Legislature the report of the Commission on Employers' Liability, etc. (91 pages).
William B. Dickson, chairman.
Albert A. Snowden, secretary, Trenton.



(4)

(5)

(5) Report of the Special Committee on Industrial Insurance of the Wisconsin Commission on Compensation (98 pages).
A. W. Sanborn, chairman.
Paul J. Watrous, secretary, Madison, Wis.

(6) Report of the Employers' Liability Commission of the State of Illinois (240 pages).
Edwin R. Wright, secretary, 317 Fisher Building, Chicago

(6)

(7) Report of the Commission appointed by the Legislature of Washington to investigate the problems of industrial accidents and to draft a bill on subject of employes' compensation (48 pages).
Paul E. Page, chairman.
Peter Henrelly, secretary, Cle Elum, Wash.

(7)

general causes and then taking up the accidents grouped under special industries with the causes peculiar to those industries. Further reference will be made to Mr. Lescohier's distinctive contribution in some future issue. The report also reviews the general principles underlying the common law with a study of the Minnesota law as it works in particular cases, including tables of some three hundred cases.

Though public opinion in Ohio has been interested in industrial accidents for some time and in May of last year the state Legislature passed an improved liability bill, outlined in THE SURVEY of July 9, 1910, the commission only began its work last August. It has presented an excellent report on the general subject, embodying the proposed law, an outline of the Ohio law, and a very careful study with statistical tables of industrial accidents in Cuyahoga county, O. The conclusions in regard to fatal accidents, which were most fully studied, follow:

(1) A settlement was made in 36 per cent of the cases. In practically all an amicable settlement was made, in some cases after the institution of the suit.

(2) The amounts received varied from funeral expenses to $5,000. The average amount was $958. Of the total amount paid out for the 370 accidents in which compensation was secured over one-half was paid to 12 per cent of the cases.

(3) Approximately one-fourth the amount received was paid out as fees and costs.

(4) The average time required for a settlement was one year, one and a half months.

(5) 56 per cent of the widows visited by the commission and 18 per cent of the children were forced to earn a livelihood as the result of the accident.

The report covers also a brief on the constitutional question, a minority report and bill presented by W. J. Winans, and about four hundred pages of appendix, which brings together practically all advanced legislation on industrial accidents as well as other interesting material. In a separate volume (Part II) are published the minutes of the evidence and record of public hearings.

The Illinois report presents an intensive study of local conditions very suggestive to future state commissions. It covers the attorney's report on the present law of Illinois and on the constitutionality of the proposed statute. The report considers the relation of the trade unions to improved legislation, and follows the record of industrial accidents under the present law, through the courts, the Labor Bureau, the Cook County Coroners' Record, and the various charitable agencies. It also presents an excellent and painstaking separate study of each of the principal industries—coal mining, railroads, and manufacturing—covering as far as possible the extent of the industry, number of employes, percentage injured and increase with the annual increase of the industry, precautions used to prevent injuries, private insurance or compensation systems, cost of accidents, and an estimate of what the expense would be under the proposed bill. In view of the Cherry accident, as well as the known danger of coal mining, the study of the Illinois coal mines is particularly interesting. In 1897 the output of the mines was 20,072,758 tons, the number of miners 33,788 of whom 69 men were killed and 292 seriously injured. In 1909 the output was 49,163,710 tons, number of miners 72,733, number killed 213, injured 894—figures which represent an increase in output of 145 per cent, in men employed of only 115 per cent, and in men killed 208 per cent, in injured 206 per cent. The report contains many valuable tables.

While, as Mr. Sherman showed in his review, the various state commissions are far from united in their recommendations as to the way out, their verdict as to the present intolerable status of the injured workman under the common law is clear and inexorable.

Through an examination of court records and attorneys' books the Illinois commission discovered that of 614 fatal cases, from which full and accurate reports were secured, only 24 were successfully settled in court and 204 were not settled at all. Returns from all liability companies doing business in Illinois, during ten years, show the payment of indemnities to have been 16 per cent during the first year; 37 per cent the second; 20 per cent the third; 14 per cent the fourth; and the remaining 13 per cent during the six succeeding years. On this point the commission says:

"The wonder arises how any sane community can find words to defend such a snail-like method of procedure. At the moment of greatest strain, when aid is needed, when the panic is at its height, when the children are taken from school and put to work, the present system withholds assistance unless the family will accept blindly the terms that are offered."

The commission concludes:

"But this outline, convenient for certain purposes, scarcely hints at the situation which the commission found. It gives no idea of the suffering and hardship which our investigations disclosed; it tells nothing of the long and tedious fights, of the inequitable verdicts, the delays and uncertainties of the law; it scarcely suggests the unequal character of the struggle between the claim agents and the families of the deceased breadwinner. But almost every individual case reflected some aspect or other of this sort, driving home to the members of the commission the conviction that the present system was unjust, haphazard, inadequate, and wasteful, the cause of enormous suffering, of much disrespect for law, and of a badly distributed burden upon society."

Outside these state findings, this spring sees the publication of the National Manufac-

turers' 400 page volume, with 100 pages of illustrations and colored charts. The authors, Ferd. C. Schwedtman and James A. Emery, cover the subjects of both accident prevention and relief, with special attention to the systems of England and Germany. Special features include a study of German accident prevention, of different forms of insurance and of the comparative hazard of industry and agricultural labor. The volume has been announced as an interpretation of the economic and practical aspects of the accident problem from the standpoint of the progressive employer. Mr. Schwedtman has been a leading spirit in the work of arousing the National Manufacturers' Association to an interest in the subject.

But the most formidable addition—in bulk at any rate, for it covers almost 1,500 pages—to the literature of industrial accidents is the Twenty-fourth Annual Report of the Federal Commissioner of Labor, which is the first volume of an encyclopedic report on Workmen's Insurance and Compensation Systems of Europe. This takes up in elaborate detail the systems of accident, sickness, invalidity, and old age insurance of Austria (chapter by Henry J. Harris), Belgium (by E. H. Lewinski-Corwin), Denmark (by J. E. Pope), France and Germany (Mr. Harris). The second volume, not yet published, will include Great Britain (L. D. Clark), Italy (T. M. Rubinow), Norway (Mr. Pope), Russia (Mr. Rubinow), Spain (Mr. Rubinow), and Sweden (H. O. Hanson). Acknowledgment of work on several chapters is accorded C. A. Bell and the general editorial supervision was done by Charles H. Verrill. A valuable supplementary contribution is Bulletin No. 90 of the same bureau, in which Frederick L. Hoffman presents a careful study of accidents in coal mining in the decade ending with 1908. Lindley D. Clark summarizes recent action on liability and compensation in America and gives a brief account of foreign legislation, and Miles M. Dawson discusses the cost of employers' liability and of workmen's compensation insurance.

The forthcoming report of the federal commission appointed last spring, together with reports of the Missouri, Montana, Maryland and other recent state commissions yet to be heard from, makes the present grist of findings, bulky as they are, but the forerunners of further official literature; just as the proceedings of the three National Conferences on Workmen's Compensation for Industrial Accidents (July, 1909, January and June, 1910), which have been widely distributed, were, no less than the papers and books referred to, the precursors of the present reports.

STANDARDIZATION OF SAFETY

FRANCIS H. BIRD
University of Wisconsin

In the early winter twenty-two insurance inspectors representing seven large American and one English insurance company doing business in Wisconsin met in conjunction with the state factory inspectors at Milwaukee to discuss the standardization of safety devices in factories and other industrial establishments. The purpose of the meeting was twofold—first, to see what action could be taken toward making more effective that part of the Wisconsin factory law which provides for the safeguarding of machinery; second, to secure better co-operation between insurance and factory inspectors.

The meeting was most successful. Commissioner Beck of the Wisconsin Bureau of Labor briefly outlined a plan of procedure, suggesting a careful analysis of conditions in each industry in order to ascertain just what operations were dangerous and what kind of safeguards were advisable. It was decided first to take up the lumber, and then the metal and textile industries.

Some interesting facts were brought to light about conditions in the lumber industry. Many of the accidents in the logging country happen while the men are loading or unloading logs, or working around the skidways, and are directly due to chains breaking or grab-hooks spreading. If proper care were taken of these chains such accidents could be avoided; but as they are never annealed they crystallize, thus losing their strength. When they break, a frequent occurrence, they are mended with hay wire. In view of these facts the following resolution was passed:

All chains used in connection with logging operations, whether for loading, unloading, or binding logs in any way, should be annealed every six months. At the time of annealing each claim should be stenciled and a record kept of same in a card index. A standard grab-hook should be used in all logging operations.

A second meeting was held in mid-January and was attended not only by the factory and insurance inspectors, but by representatives of large Wisconsin manufacturing interests who expressed their desire to co-operate. At this meeting considerable ground was covered in brief as follows:

Owing to the fact that it is particularly dangerous for employes in sawmills to pass by the saw carriages which are often placed too close to the walls or uprights of a mill, a resolution was passed that a space of at least thirty inches be allowed between the foot-board of the carriage and any fixed object, thus insuring a minimum space for passageway

It is very difficult to guard saws because

their operation demands freedom of action; but it was shown how band saws, slasher saws, circular rip saws, trimmers, knee bolters, shapers, joiners, stickers,—all could be properly guarded. Screens hung from above and down in front of the edgers were recommended to protect the operatives from flying chips and splinters. Much trouble has been experienced in feeding the planer machines, because whenever one piece of material thicker than another is put into one of the machines it "kicks back", often injuring the machine tender. Since the substitution of sectional rolls for the solid roll now commonly used would remove this danger, such action was recommended. Boring machine tenders often catch their clothing on the small set-screws, thus mutilating an arm or a leg. These screws should either be removed or guarded. Sanders, too, are extremely dangerous. Employes often lose fingers reaching in the back part of the sander table for small work. It was moved to eliminate this danger by the use of an extension table.

Proper guards for shafting and freight elevators were next discussed and resolutions adopted. The fact was brought out that since it is extremely hazardous to climb along timbers and beams in close proximity to dangerous machinery, it is as necessary to provide adequate oiling platforms as it is to guard the machinery. In place of the present law which provides for the stopping of machinery by signals in case of emergency, it was thought advisable to have a law which would require the placing of clutch pulleys or other devices for the stopping of machinery in each department of a manufacturing establishment. A committee was appointed to investigate the matter of machinery from its original production to its final installation in the factory; and the meeting was adjourned.

The third meeting, held the last week in February, was especially interesting, because in addition to members of the Merchants and Manufacturers' Association of Milwaukee and leading business men of Beloit, representatives from the International Harvester Company of Illinois were present. R. W. Campbell, safety device expert for the International Harvester Company, gave an instructive, illustrated lecture on proper safety devices, the result of an intensive study of the methods of safeguarding dangerous machinery. He was followed by C. W. Price of the same company, who talked at length on sanitation in factories. Among other things he showed how fumes from drying labels in foundries and the oil smoke from furnaces, at present injurious to the health of employes, can be drawn off by sanitary methods. A discussion of machinery in the metal trades followed, but because of lack of time it was decided to take the matter up at length in the next meeting to be held in the latter part of March. It was encouraging to note that at this meeting the Wisconsin manufacturers took a leading part, and left with the avowed intention of seriously considering the immediate adoption in their factories of many of the suggestions offered.

If Wisconsin is successful in this attempt to embody in her factory law a clause providing for the standardization of safety devices she will have taken a significant step forward in the matter of progressive factory administration. At present the Wisconsin law provides that "proper safeguards" shall be installed in those factories where there is dangerous machinery, "when deemed necessary" by the factory inspectors. Herein lies the chief weakness of the law, for, conscientious though a factory inspector may be, until he has some standard by which to gauge his inspection, he cannot do efficient work. As long as the determination of what is and what is not a "proper safeguard" is left to his discretion he is liable to discriminate, and he does unwittingly, in favor of this or that employer. No two factory inspectors interpret the law alike. Although each may be a mechanical expert, both may prescribe different guards for the same type of machine. Thus there is no co-ordination among the inspectors, no definite policy. Furthermore, the more discretion the inspector has the more likely is he to be influenced by the factory owner. Granting that he is strictly honest and immune to bribery, if the employer assures him that he intends to remedy conditions in the near future, but at present business is dull and his finances are in bad shape, he is apt to overlook an unguarded belt here or an unprotected shaft there. Whereas, if the law definitely prescribed a standard guard for that belt or shaft, even if the employer were on the verge of bankruptcy, it would be the inspector's duty to require that such guards be installed.

What is true of the factory inspector is more true of the employer. His conception of a "proper safeguard" seldom coincides with that of the inspector or even with that of another employer. There is a great difference of opinion as to what is safe and what is dangerous. In one factory it may be considered a necessary measure of safety to guard such machinery as cogwheels, set screws, shafting, fly wheels, tumbling rods, etc., while in another shop the same kind of machinery may remain unguarded. The owner or manager of the second shop argues that, since there have been no accidents in his establishment, none of the unguarded machinery is dangerous. When an

employer adopts this attitude, unless the law specifically provides that a certain machine be guarded in a certain way, it is almost impossible to compel him to install proper guards. In order then to have the law effective, provision must be made for the adoption of a uniform standard of safety devices. Not only should dangerous machinery be considered as such, but a standard device for each machine should definitely be designated.

Such a standardization of safety devices would be advantageous to the employer or manufacturer, at least to the employer or manufacturer of the better class, for it would compel all manufacturers to comply with the minimum requirements. At present the manufacturer who safeguards his machinery as the law intends he should, has to compete with the man who leaves his machinery unguarded. If both are producing the same article at the same cost of manufacture, it is very evident that the latter has an unfair advantage over the former. Thus often the less efficient manufacturer can successfully compete with the more efficient manufacturer. By fixing certain minimum requirements, then, for all manufacturers, much of the present unfair, unhealthy competition would be eliminated. Not only would the employer benefit by this equalization of the cost of providing safeguards, but at the outset, when building his factory, he could equip his plant with standard guards much more cheaply than if he were required to make expensive additions after his machinery was installed.

The insurance companies would profit if safety devices were standardized, and those doing business in Wisconsin realize that fact. At present the insurance inspector is informed by the owner of the factory, when making his inspection, that the factory inspector who has just been there has found everything in satisfactory condition; and in turn the factory inspector is told the same story. The employer plays one against the other. Then, too, often an insurance inspector insists that a manufacturer adopt a certain safeguard if he wishes to keep his insurance. The manufacturer becomes indignant, withdraws from the company which the inspector represents, to insure with some inferior company which is less particular regarding the risk it carries. It is evident then that the better class of insurance companies, as well as the better class of employers, would benefit if safety devices were standardized.

ILLINOIS FACTORY INSPECTION CONFERENCE

JOHN C. KENNEDY

At a conference held at the Chicago Public Library Building, February 25, a movement was initiated to secure more efficient factory inspection in Illinois. Representatives were present from the Illinois Manufacturers' Association, the Illinois Federation of Labor, the Illinois State Legislature, the State Factory Inspector's Department, the Consumers' League, the State Civil Service Association, the Women's Trade Union League, the American Association for Labor Legislation, the State Federation of Women's Clubs, and other associations.

Professor Freund of the American Association for Labor Legislation presided, and opened the conference by pointing out the advantage of discussing measures for labor legislation and the administration of labor laws from every point of view before presenting them to the state Legislature for enactment. The Legislature is much more ready to consider and enact measures which have been approved by all parties concerned than those which come directly from some interested party. C. J. Piez of the Illinois Manufacturers' Association, E. R. Wright, president of the Illinois Federation of Labor, and Mary Wilmarth, president of the Consumers' League spoke on factory inspection from the standpoints of manufacturer, worker, and consumer; E. T. Davies, chief factory inspector of Illinois, from that of the factory inspector, and Mrs. Raymond Robbins, president of the Women's Trade Union League, from that of the women workers. Edgar Bancroft of the Civil Service Association emphasized the importance of bringing the State Factory Inspection Department under the civil service rules. Miss Haas, a factory inspector from Ohia, told something of the operations of the Factory Inspection Department in that state, and emphasized the need of women in the service. Dr. Alice Hamilton of the Occupational Diseases Investigation Commission pointed out the need for expert sanitary engineers in the factory inspection department.

After the discussion had closed, Mary E. McDowell, chairman of the industrial committee of the State Federation of Women's Clubs, who took the initiative in organizing the conference, offered the following resolution:

Whereas, the state of Illinois in the last few years has made important additions to its legislation for the protection of women and children in industrial life, and the health and safety of workers in various occupations, and

Whereas new legislation makes additional demands upon the departments of the state charged with the administration of labor laws, and

Whereas adequate and intelligent administration, while it tends to remove the grievance of unfair competition, at the same time improves conditions of production and thus is in the long run equally beneficial to employers and employes,

Therefore be it resolved:

1. That the administration of the labor laws of Illinois should be placed on a basis equal to the highest standards set in this country or in Europe.

2. That all state departments dealing with labor and industry should be organized with a view to more perfect co-operation and increased public service, especially in the matter of investigations and reports.

3. That these departments should be adequately officered on the basis of ascertained training and merit.

4. That the Legislature be respectfully urged to make adequate appropriations for all these departments, and to extend the state civil service law so as to include these departments in the classified civil service of the state.

This resolution was adopted by unanimous vote, and a motion was carried that a committee be appointed to carry its provisions into effect. The points which were chiefly emphasized throughout the conference, and upon which all the speakers seemed to agree, were the following:

1. That labor legislation without an adequate force of administrators and inspectors is largely ineffective.

2. That the present force of administrators and inspectors in the state of Illinois is entirely too small to do the work already required, and in view of the fact that new burdens are constantly being placed upon this department by new legislation the force should be doubled or trebled at once.

3. That there is special need of efficient factory inspection in Illinois because of the large number of ignorant and unorganized immigrants in our industries who are in especial need of protection, and whose views of American laws and institutions will be determined very largely by the efficiency with which the laws meant for their protection are enforced.

4. That the state factory inspection department should be absolutely non-political. Its duties consist of scientific investigation and compilation of statistics, and the impartial and intelligent enforcement of labor legislation. Therefore, appointments and tenure of office should depend solely upon merit, and this department should be brought under the classified civil service.

5. That it should be the function of factory inspectors not only to discover violations of the law but to instruct employers and workingmen how to comply with the law and how to avoid dangers incidental to various industrial processes.

6. That all inspectors should be familiar with the industries with which they are concerned; women as well as men should be employed on the inspecting force; and a corps of sanitary engineers and experts on devices to prevent industrial accidents and diseases should be made a part of the regular force of inspectors.

7. That sufficient salaries should be paid to secure and hold high-grade workers in the factory inspection department.

One of the most satisfactory features of the conference was the fact that all the organizations concerned seemed ready to co-operate to bring about these much needed reforms. The great majority of the workers and their representatives of course welcome every improvement in the factory inspection department. The progressive employers likewise agree that an efficient department is needed not only to protect the workers, but also to protect the humane, law-abiding employers from the unfair competition of unscrupulous employers who try to evade the provisions of the law. The employers also realize that trained, competent inspectors who understand their business are much to be preferred to incompetent bunglers whose recommendations are likely to be expensive to the employers and worthless to the employes.

The recommendations of this conference will be placed before the state Legislature immediately, and their adoption will probably depend largely upon favorable consideration by the committee on appropriations of which Mr. Shanahan is chairman, and by the committee on civil service of which Mr. Hull is chairman. Communications sent at once to the members of these committees, urging favorable consideration of these propositions, will be of material assistance in securing the passage of this desirable legislation.

JOTTINGS

ORGANIZED LABOR'S ANNUAL WAY-MARK

The full text of the proceedings of the St. Louis session of the American Federation of Labor furnishes many and varied evidences of a settled order of procedure along legitimate lines of organized effort. This is coincident with the expansion of the federation to include a larger proportion of the trades and of the people employed in them.

By adding last year 218,229 members in 2,157 new local unions, the American Federation of Labor increased the number of the rank and file in its affiliated bodies to 1,744,444, a total never reached before in its thirty years of existence. Its steady growth in paid up membership during the past fourteen years is indicative of the permanency and solidity of the organization. From 264,825 in 1897 they rose to 1,676,200 in 1904, fluctuating during the

next five years between a loss of 181,900 one year and a gain of 250,144 another.

The foreword of President Gompers's review of the past year is a defense of trades unionism against the "narrowness" charged by those whose panaceas for all social ailments it refuses to follow. While attesting its conservatism in this respect, he lost an opportunity to rebuke the jealous disposition of most unions to hold their leaders and members narrowly within the bounds of the organization's business interests and fellowship. Only those leaders whose personal influence and official position are strong enough to warrant them in asserting their independence dare participate in other movements or affiliations. Few of these escape the criticism to which even such a well loved and trusted leader as John Mitchell has been subjected because of his connection with the National Civic Federation. Because the national convention of the American Federation of Labor and its officers take a broader view of the relations of the labor movement to other human interests, it appeals more effectively to its larger constituency than many unions of the trades do to the people in their trades and to the citizens in their local communities.

PENDING OFFICIAL INVESTIGATIONS

The federation is also showing increasing insight into the need for knowing actual conditions through prompt and co-operative official investigations.

The bearing of vital statistics upon prevention of child labor thus led to its demand for a thorough registration and complete record of births. The bearing of industrial education upon apprenticeship prompted the appointment of a commission whose report last year led to the request for a government investigation of the whole subject by the Department of Commerce and Labor. This is now nearing completion.

In the field of industrial accidents, the "automatic compensation" and the employers' liability acts of Congress in 1908 were followed in June, 1910, by the appointment of a congressional commission to investigate all the facts relative both to compensation and liability and to report to Congress through the president in December, 1911. The investigations of national and state commissions should furnish a basis for uniform legislation in this field; and in the solution of this great national problem of equitably distributing the personal and family losses due to industrial casualties and occupational diseases the co-operation of the organizations of labor and of employers' associations will be a vital factor.

SAUCE FOR GOOSE—SAUCE FOR GANDER

The sympathetic action of all the Chicago newspapers in standing together to defend one of them is strangely parallel to the sympathetic strike which all of them have vigorously opposed. An ill-advised strike of the compositors on the Hearst papers, which was promptly repudiated by the International Typographical Union officials, prevented the printing of more than four pages of the Hearst papers. Although the results of the first direct primary for the city election were to be published the next day, all the morning and evening papers (except the *Daily Socialist*) printed only four pages. In explanation to their readers they denied having any trouble with their own employes, but stated that they had acted in accordance with an agreement to stand together. While they had never before been known to agree or co-operate with the Hearst journals, now "the injury of one was the concern of all." More promptly and unitedly than their employes had ever gone out in a sympathetic strike, these publishers, without claiming any grievance of their own, made common cause with their "friend, the enemy."

STRIKE TO UNIONIZE TELEPHONE SERVICE

The determined attempt to unionize all the employes of the Chicago Telephone Company threatens to tie up the whole system and precipitate a long and complicated struggle. Much of the construction work has all along been done by union labor, but the company has drawn the line at the traffic department and the inside repairing and office work. The grievance which occasioned the strike is the discharge of fifteen men for secretly joining a union and for trying to unionize others. Upon the refusal to reinstate them, linemen, repair men, cable splicers and helpers, installers, testers, and jumper men struck in such numbers as to embarrass, but not yet seriously to paralyze the system. The struggle, after a fortnight's preliminary skirmishing, has centered down upon the effort to unionize the operators The Chicago Federation of Labor and the Women's Trade Union League have united their forces in the attempt. The girls have indicated no dissatisfaction and presented no grievances. The first appeal came to them for sympathy with the men out on strike and to organize to help them. The company's well-founded claim of good conditions for its great operating force of young girls and women, and its special provision for their health, comfort, fellowship, and well being is supplemented by its plea against organizing so many temporarily employed young girls, with a sympathetic strike as the occasion. In justification of unionizing them, the representatives of organized labor plead the general advantages of organization in educating all workers to a broader view of their own and others' interests, in strengthening each one and all together to advance their rights, and to defend themselves from wrongs, and in developing the fellowship and freedom of their craft and of the working class. The long suffering public meanwhile again raises the question, why these issues between employers and employes, especially in the service of public utilities, cannot be settled without invading the rights and interfering with the interests of the innocent third party.

CRIME AND ITS CURE

ISABEL C. BARROWS, Contributing Editor

THE OPEN COURT

The house-cleaning, physical and spiritual, which the city of New York began six months ago in her minor courts, has proved helpful in many directions. An excellent description of what has been accomplished is given in a recent New York *Tribune* (February 12) by Chief Magistrate McAdoo. Referring to the changes in the court room itself he says:

"Instead of the bridge, we have today the setting of any ordinary court of justice. The judge sits alone behind the rail. Where the bridge used to be there is a big rectangular table, as wide as an ordinary desk is long, and it is screwed down to the floor, so that it cannot be moved to make a passage. Nobody gets nearer to the magistrate than the outer edge of that table. If I had my way that would be edged with broken glass like an orchard wall; we'd put spikes on it or teasers like a cat's—anything that will keep the lawyers away.

"Directly in front of the rail, to one side, is a raised witness chair. The court reporter sits at a table facing the witness. The prisoner, the complainant, lawyers, and witnesses waiting to be called sit or stand before the table. There is plenty of room so all can be heard. Any one who can be heard by the judge can be heard by everybody else.

"And that is all there is to hear. There are no complaint clerks in the court room, no lines of people waiting, no papers to rustle except the papers in the case in hand, no conversation except that before the magistrate. To judge by your ears, you would never believe that this was still the same kind of court.

"For complaints a separate room has been provided. For one thing, that means more room in the court itself. For another thing, it means that complaints as well as hearings in open court get businesslike and dignified attention. There are no more long delays and there is no more tipping of attendants to have cases advanced. For another thing, it means privacy for cases that do not come to a hearing. After a great deal of opposition, the Board of Magistrates passed a rule requiring that no persons shall be allowed in the complaint room at any time except these specified persons: complainants, defendants, counsel accompanying complainants or defendants, and counsel expressly sent for by complainants or defendants. . . .

"By no means the least of the improvements was the separation of men and women prisoners, both in trial and in detention pens. Formerly the cells, most of them of open iron-work, were placed so that any sound would carry from one end of the place to the other, from the furthest of the men's cells to the furthest of the women's. . . .

"Under the old system the rules, thirty-six of them, were in a book. Nowadays the rules are printed in big type on a card and hung up in every court. Here they are:

"Rule 1 prescribes the order of the day's business, which the presiding magistrate may alter according to his judgment, except that the hearing of complaints not taken by the clerk must invariably open and close the session. Rule 2 names seven books which shall be kept in each court.

"Rule 3 reads: 'No person other than an officer attached to this court shall go near the detention pens. No person other than an officer or clerk attached to this court, complainants or defendants, or counsel accompanying or sent for by complainants or defendants shall be allowed in the complaint room at any time. No person shall speak to another in the court room, halls or rooms adjacent thereto, inquiring as to his or her business, recommending lawyers, offering professional cards or proffering any kind of advice or instruction.' Rule 4 requires that discharge papers shall be sent to this office and filed here. Rule 5 prescribes the method of amending the rules." . . .

One very small change has added to the dignity of the courts. When the court is about to open, an attendant enters and says, as in the higher courts, "Arise, the judge." The persons who are waiting on the benches outside the grill: lawyers, complainants, witnesses and visitors, rise. The magistrate enters, wearing his back robe, and when he has taken his place behind the rail the attendant says, "Be seated", and the business of the court goes on.

This was not a part of the scheme of reorganization. One of the magistrates tried it one day and it seemed such a natural and effective thing to do that the others adopted it. It appeals especially to the foreign born, of whom there are so many who come before these courts. The first thing the judge does when he takes his seat is to announce to the court room, "If there are any persons present whose complaints have not been taken by the clerk, if they come forward they will be heard."

These are the purely physical changes. There is one which is both physical and moral. Instead of policemen, the court has today special attendants who wear the court's uniform and are responsible to the court, and to the court alone. When he was police commissioner Magistrate McAdoo bitterly opposed the practice of detailing policemen to act as ushers in the minor courts. He says of the change:

"The practice tied up some 120 men in work that did not rightly belong to any police officer. They are responsible to the Police Department, not to the courts, and yet the department could not possibly keep any proper supervision over them, for their duties were quite apart from department business. The assignments were eagerly sought after, both because the work was easy and because the opportunity for graft was great. The men who held the positions were usually men with pull. These policemen were the men with whom the prisoner came in direct contact, the only persons to whom he could appeal for advice or help. Of course they abused their privileges.

"If a prisoner had money, or friends who had money, the gang usually managed to get a good share of it. They worked in collusion with the shyster lawyers who hung around the courts, recommended them to prisoners, and even bullied prisoners into employing them.

"Our present attendants are civil service employes, and they are directly responsible to this office—to the chief magistrate of the Board of City Magistrates. There are sixty-five of them. We examined those who were reported to us as eligible as to their character, antecedents, health, and experience, and we have picked a very creditable body of men. Instead of being old and superannuated, they are particularly intelligent, ambitious young men, honest, polite to citizens, clean and neat in appearance and amenable to discipline.

"Some of the magistrates feared that only a policeman would have the prestige necessary to preserve order in court. That might have been true of the old courts, where almost everybody in the place was committing a nuisance against the ears and nerves of everybody else, but we have found that it is not true today. The blue uniform of the court is even plainer than that of the Police Department, and I fancy the fact that it is not seen on the street every day adds to its authority rather than the reverse.

"The new law centralized the control of the machinery of the courts in this office, giving control of the subordinates to the chief magistrate. This makes for discipline, good order, and honest and efficient service. Every one connected with the courts will, I am sure, be willing to testify that there is a marked improvement in the manner and behavior of the personnel. Citizens are treated politely, and the whole atmosphere surrounding the court rooms is changed.

"There is no favoritism. Every subordinate knows there is one responsible head looking after him and to whom he is amenable for his conduct, that he is being constantly watched and note taken of his behavior. The very idea of the central office open every day in the year carries with it a sense of supervision on the part of those connected with it.

"The next thing was to create a system of records in this office, by which the daily workings of these courts could be supervised and watched; where citizens could come and get information on any matter connected with them. To this end a card system has been developed. Every morning in this office there is a card for each case passing through each of the courts, showing what disposition has been made of it, with other facts that go to make up the statistics and reports made monthly.

"The bill which has lately been introduced to remove the judges of Special Sessions and the magistrates' courts and make those offices elective, instead of appointive as at present, would, I firmly believe, prove a grave public misfortune if it were to become a law. There is no analogy between these courts and the municipal courts. In those a citizen is entitled to a jury and is generally represented by a lawyer.

"In the magistrates' courts, however, the judges are vested with a vast amount of summary jurisdiction. The great majority of defendants cannot afford to employ a lawyer. The complainant cannot appeal; the defendant seldom does or can. Unlike the district civil courts, the magistrates' courts deal with the citizen's liberty as well as with his property."

TUBERCULOSIS IN PRISONS

Statistics,—such imperfect statistics as we have,—vary as to the number of convicts released every year from the prisons of the country by the expiration of sentence. It is a vast number, probably a hundred thousand. Of course as a rule they return to the community no better morally than they were when they were imprisoned. Most of them, it is to be feared, are perhaps less moral than when they stood before the judge. But in one respect they are far worse off, and that is physically, if they have been long in prison. Quite apart from the general let-down of health from incarceration for years even under the best conditions, the terrible scourge of prisons, which affects at least one in five of their occupants, is tuberculosis. The Irish prisons have such a fear of this disease and make such efforts to combat it that it is said the cases of tuberculosis in prisons, in proportion to the population, are fewer than in the outside world. That is probably true of no other prisons. Certainly in this country our penal institutions breed tuberculosis.

In the first place their structure favors its

development. If there is anything that the tuberculosis microbe dreads as the devil dreads holy water, it is direct sunlight. Our foolishly—one might say wickedly—constructed jails and penitentiaries with inside cells, encourage tuberculosis. The sun may shine into the corridors between the cells and the outside wall, but its merciful and healing rays never penetrate the dark, germ-inhabited corners. The result may be seen in every state in the Union. The figures for New York alone are appalling. Dr. J. B. Ransom, who for more than twenty years has been prison physician at the Clinton prison, and through whose hands have passed more tuberculosis prisoners than any other man in the country has dealt with (for such patients are transferred to his institution from other prisons), is authority for the statement that from sixty to seventy-five per cent of the deaths in the three prisons of New York are from tuberculosis. It is estimated that fifteen per cent of the entire prison population of the country is affeced with this disease. Why not? Look at Sing Sing, for instance, with a capacity for 1,200 and a population of 1,800. The buildings must swarm with germs, and every condition favors their development: overcrowding, lack of air, lack of direct sunshine, and depression of spirits; for next to sunshine happiness is one of the best elements in curing tuberculosis, an element forever lacking behind prison bars.

It would be bad enough if the prisoners themselves were the only sufferers. They may well question the justice which condemns them to contract this terrible disease as a penalty for their wrongdoing, a death penalty in many a case. But it is not they alone who suffer; it is their friends, their families, the community at large. Think of 20,000 persons afflicted with tuberculosis coming out from penal institutions every year and scattering the disease wherever they go!

Only fifteen states and territories make any provision for special treatment and separate quarters for tuberculous prisoners, so they infect one another without let or hindrance while in prison, and then go out to extend the empire of this dreadful plague.

Yet that the states could do much to remedy this state of things has been proved in New York. Under the skill and devotion of Dr. Ransom the death rate has been reduced in New York and good care has reduced it in Massachusetts and Texas, where separate quarters are provided for the tuberculous. Dr. Ransom presents certain things that should be demanded in every prison.

"The examination and record of every admission to penal institutions; improved housing and working environment for the prisoner; absolute separation from the prison population of all tuberculosis subjects; the recognition of the prisoner's receptivity to infection; special wards for the treatment of all active cases and open-air courts for exercise; provision for outdoor employment, such as gardening and light farming."

THE CHILDREN'S COURT IN CANADA

BERNARD FLEXNER
Louisville

Several cities in the United States, at various times, have urged their claims to the establishment of the first juvenile court. This distinction belongs to Chicago. In connection with the idea of the children's court, it is interesting to recall a speech made by J. J. Kelso of Toronto, Canada, at the Waif-Saving Congress held in Chicago, October 11 to 13, 1893. In opening his speech Mr. Kelso said:

"Some five years ago an agitation began in our province of Ontario for the recognition of the right of the state to interfere for the protection of neglected and abused children. This was in one respect a logical sequence to the enforcement of a compulsory educational law. Of course we were anxious to obtain the very best law possible for this purpose so we procured copies of all the legislation that had been passed by English-speaking countries, and by some that did not speak English, and we compared one with the other and digested them very carefully before a bill was drafted for presentation in the Ontario Legislative Assembly. It was finally introduced and carried with practical unanimity.

"This law provides that in every city of over 10,000 inhabitants there must be a children's aid society. It is no case of 'may'—it is a case of 'must.' The law says 'there shall be a children's aid society established.' The city is compelled to build or rent a large building and when it is ready it must be handed over for the use of the children's aid society for its various purposes. The law also provides for a children's court which is in every sense of the word a private court. This court is presided over by any judge of a court of record, any police magistrate, or any member of the county bench of magistrates and every time a child is brought in its parents or guardian must be there also."

Notwithstanding the origin of the idea upon Canadian soil, still it remained with the United States to develop the children's court, and the legislation of Great Britain and her colonies has drawn heavily upon the laws here. This

was true of the children's charter. It is likewise true of two acts of the Province of Alberta, one an act respecting juvenile delinquents which embodies in a striking degree the spirit of the modern juvenile court legislation. Hearings of children's cases, it is provided, "shall take place without publicity." "They may be held in the private office of a judge, or in some private room of the court house, or in the detention room." "No report of the trial or other disposition of a charge against a child, in which the name of the child or of its parent or guardian is discussed, shall, without special leave of the judge, be published in any newspaper or other publication." And again, "The proceedings may in the discretion of the judge be as informal as the circumstances will permit consistently with a due regard for a proper administration of justice." In the second act, an act for the protection of neglected and dependent children, it is interesting to note among the definitions of a neglected child, "A child who is employed anywhere between the hours of 10 o'clock P. M. of one day and 6 o'clock A. M. of the following day."

PROBATION

IN CONNECTICUT

The Associated Charities of Waterbury, under H. L. Udell, is seeking to further the interests of children by the establishment of juvenile courts and the organization of probation work. In a recent address, Mr. Udell outlined the opportunities for such work, simply and clearly, in a way which may serve other localities where it has yet to be instituted.

"There is no problem of social reconstruction which so baffles the charity worker as does the problem of distress directly due to moral delinquency on the part of parents, yet there is no point at which social work is capable of being made so effective as in helping the children. To rehabilitate the character of the mature man or woman is one of the most difficult things in the world; to save a child is one of the most inspiring of tasks. No program of reconstructive social work is complete which does not include both efforts. The problem confronting us is two-fold: first, to take hold of the adult delinquent, the parent who fails to discharge his or her parental responsibility, with a firm yet kindly hand, and see that that responsibility is fulfilled. Second, how to protect the defenseless little boy or girl from the consequences of parental cruelty, immorality, or neglect. . . .

"The Associated Charities has found during the past six months fifty-six families in which the repeated visits and gentle yet firm guidance of a probation officer would have been of incalculable value. We need such an extension of the present probation system as will make it possible for an officer to devote his entire time to the work of visiting and directing those placed under his guardianship. The experience of other cities would seem to show that this can best be accomplished by the creation of a juvenile court for the treatment of all cases of delinquency and dependence among children. . . .

"Under the administration of such a court an intelligent probation officer will go into the home of a neglected child, not as an enemy to be dreaded, but as a friend to be welcomed. He will go there before any warrant has been issued; he will put forth every moral effort; he will encourage the delinquent parent or parents in every sincere attempt at right living, and if all this fails he will have power to resort to more drastic measures.

"It would be difficult to exaggerate the influence for good which the probation officer thus empowered might exercise. He would render a service to the family by preserving it intact, improving its conditions of life, and elevating its ideals. He would be of service to the employers of labor by promoting the steadiness and reliability of working men and women, and would serve the community by preventing juvenile crime. Where the child has actually come into court before the probation officer has discovered him, the judge will conduct the case so as to remove from it so far as possible all suggestion of criminal procedure. The little one will quickly come to see that he is there to be protected, not punished; to be strengthened, not made bitter and defiant. He will look upon probation officer and judge as friends, deserving of his utmost trust.

"Such is the work of a juvenile court as I have seen it. Such is the mission which it may fulfill in Waterbury. Is it not better to save our children for a life of honest citizenship than to allow them to fall under the stigma of a criminal sentence and thus give the first impetus toward a career of crime? Would it not profit the state more to incur the expense of a few more officials if the number of its prisoners were at the same time decreased? Is it not a finer thing to prevent crime than to chastise the criminal? Shall we not follow the example of the most enlightened cities of our republic and take this magnificent step in child-saving work?"

A NEVADA JUDICIAL OPINION

Chief Justice Norcross of Nevada is quoted in the *Institutional Quarterly* as follows:

"The most practical way of dealing with existing conditions, in my judgment, is to extend the probation system both to juvenile and adult offenders. For those whom the courts are not satisfied to intrust with probation, or whose crimes are of such a character that probation could not appropriately be applied in the first instance, I believe the indeterminate

sentence the best remedy. Under the indeterminate sentence plan, the convict is confined for a term which may not be more than the maximum fixed by law. The court and all officials interested in the enforcement of law furnish the prison authorities with all information in their possession relative to the particular offender. The prison authorities then determine, from previous knowledge concerning the convict, and from personal observation of him after he has been incarcerated, the time that he should be kept confined. If he is such a hardened criminal that there is little, if any, hope of his reformation, he can be kept confined the full limit, and thus prevented from preying further upon society. On the other hand, when there is reason to believe that he can safely be permitted to go at large, he is paroled and given a chance to redeem himself, with the aid of the prison officials.

"Under the old system, there is great inequality and frequently great injustice in the sentences imposed for similar grades of offences. The personality of the individual judge is the controlling factor. For substantially the same offence, one judge may impose a maximum sentence, upon the theory that severity of punishment is the best way to deter others from committing similar offences, while another judge may be equally impressed that leniency is the better method to deal with those who have not become hardened criminals. Such inequalities cannot help but produce dissatisfaction and discouragement among many. The majority of men sent to prison are bound to be discharged sooner or later. It is a great deal better for society that a large percentage of them should go out encouraged to begin life anew as honest, industrious, and law-abiding citizens, than that they should be discharged simply as ex-convicts, with little chance to do anything other than to return to the life of a criminal."

IN PENNSYLVANIA

It is proposed to secure legislation in Pennsylvania this year favoring the creation of a state probation commission with power to supervise probation work throughout the state; to collect and publish information relative to probation systems; and to assist in probation work by consultations with probation officers on their request or the request of the court; to promote the establishment of local probation associations to advise with the court itself or the probation officer, in any way in which the court or any probation association shall deem advisable.

The proposed bill is somewhat more elaborate than the New York state probation bill, but the powers which it is proposed to give the commission are merely advisory or supervisory. The extent to which such a commission, with only limited powers, can really influence probation work in the country at large is illustrated in the work of the New York and Massachusetts commissions and their published reports.

The sixth annual report of the Probation Association of Montgomery county, Pa., [Mrs. L. C. Parham, probation officer], shows that 104 boys and 54 girls have been before the juvenile court within a year. Of these 89 were placed in homes and institutions and 64 were returned to their own families. Of this number only 19 were foreign born. The average stay in the house of detention was about 13 days. A third of these children had no home of their own and 64 were either orphans or had lost one parent. It is easy to see that lack of parental care and good home conditions must have been at the base of the juvenile delinquency that brought these children into court. Of the known homes 40 were "bad." Since the report was prepared the commissioners of that county have decided to build a new house of detention. The house will contain over twenty rooms and apartments, consisting of offices for the probation officer, private apartments for the matron, separate rooms for the boys and girls, each child having a private room. It will be equipped with every modern convenience, including a gymnasium in the basement. It is to be two stories in height and absolutely fireproof. There will be separate playgrounds for the boys and girls and every appliance to make it a home where children can be properly cared for until they can be placed permanently in institutions or homes.

IN CLEVELAND

The annual reports of the many probation officers throughout the country are coming in with the new year. J. B. Vining, probation officer in Cleveland, reports 292 cases to which he gave personal attention during the past year. Of these, 276 were boys or men, and only sixteen girls or women. They represented fifteen different nationalities and 99 were foreign born. A synopsis of the records shows not only the crimes for which they were arrested, the disposition of the cases and many other facts, but two of these items are of special interest: that the 166 having trades covered 59 occupations though there were 126 who had not a trade, and that about six hundred dollars was collected and paid to the families. Four families charged with stealing coal were required to move, which would seem to imply that the community had saved itself at the expense of some other community.

FOSTERING RESPONSIBILITY

Guild Life and Work, a small British leaflet, publishes an excellent description of the Geneva, Ill., Industrial School, and of the Reformatory for Women at Bedford, N. Y., from the pen of Mrs. Scott, who accompanied her husband, Walter Scott, head of the Scotch Prison Board, on the tour made by delegates to the International Prison Congress. After commending the work of these institutions and giving deserved praise of the two capable women managing them, Mrs. Scott mildly criticises the jails and places of detention where

the women sentenced to Bedford are kept before trial. She might have been vastly more severe and kept within limits, for the jails especially deserve severe censure as places for men as well as for women. She says:

"The women in Bedford are all sent from court for such offences as the following: theft, burglary, prostitution, vagrancy, forgery, bigamy, assault, manslaughter, habitual drinking, etc. They have all been in prison awaiting trial, either in New York or other places, and we were unfavorably impressed with the jails, which we visited, where the prisoners await trial. They are shut up in what we should call 'cages.' They may associate together through the day under little supervision; no work is provided; and women prisoners are never allowed outside in the open air. Also they may be weeks or months awaiting trial. As soon as girls are tried and sentenced to the Bedford Reformatory the matron is communicated with by telephone, and an officer immediately starts off to fetch them.

"I have described these institutions because they seem to be of a type to which we have nothing corresponding at all. True, we have our industrial schools and reformatory schools, but they only follow the children up to eighteen, while in these American state schools they must be watched till they are twenty-one, or even later, thus guiding them through the most difficult years. Then the 'parole officers' must visit and advise them when in service, and if necessary change the girls' situations, and in short act as a mother to them.

"Then you may say, 'We have our rescue and preventive homes.' Yes. And what a splendid work is being done there! But in those homes if a girl runs away there is no power to bring her back. Here there is the authority of the law behind, and surely this is a great benefit. A wild girl of seventeen needs restraining and guiding though she may not know it, and if wisely helped over the difficult years she may turn out a good woman. Placing the girls out at work in picked situations fosters their spirit of responsibility, and is a test of their ability to meet life later on. If they fail in the first place, they can be brought back and taught a little more, and then tested again. It may need two or three years after leaving the institution to get settled, and if left to herself in the world after the sheltered life of a 'home' a girl may easily drift into the old life again. We have seen that a state institution does not necessarily mean rigid, cold rule, but, with the right people at the head, may mean a beautiful family life filled with joy and love, and ruled by the spirit of Christ. Many of these women and girls are, as we know, the victims of vicious people, and, as society is at present constituted, need protection and training that they may grow into good citizens, instead of being in their turn the transmitters of disease and misery to others."

SPEEDY TRIALS

The dissatisfaction all over the country with the over-technical pleading and the inexcusable delays in criminal trials, makes the report of the American Institute of Criminal Law and Criminology on Criminal Procedure in England timely. The recent Crippen trial called the attention of editors in every state to the surprising expedition with which a most sensational murder case may be handled in Great Britain.

Some of the distinguishing features of the English system, as brought out in the report, are that the judges of the King's Bench, who hear all cases of murder and the graver felonies, try civil cases as well. Defects in the indictment, which play such a weighty part in our criminal trials, are of no importance now in England. Defects of substance only are considered, and formal objections based on rigorous strictness in the framing of the indictment are rarely upheld or the court will order amendments. The fact that a juror may know something about a case he is to try is no disqualification in itself. A man is not considered biased simply because he may have expressed an opinion on the facts of the case as he has heard them from others or read them in newspapers. Many practitioners at the criminal bar have never seen a juror challenged for any reason. The judge in his summary to the jury sometimes expresses an opinion regarding the guilt or innocence of the prisoner.

The authors of the report, John D. Lawson and Edwin R. Keedy, heard the trial of sixteen very grave cases including several murder trials. The time between the date of arrest and the trial did not exceed two months in any instance and, excepting one case of criminal libel which took eight days, the trials themselves lasted only from one and a half to four hours.

The recommendations of the report are that all objections to indictments be made before evidence is heard and errors of form amended at once; that counsel should before trial agree to the dismissal of any one clearly incompetent to be a juror; that the judge should restrict counsel to relevant questions and overrule technical objections, and that new trials be granted only to prevent miscarriage of justice and never for technical reasons.

THE WOMAN PRISONER OF NEW YORK

The burden of the sixty-sixth annual report of the Women's Prison Association of New

York is disappointment at the delay in the erection of the buildings at the Farm for Women at Valatie. Though the site was selected long ago the architect's plans are not yet drawn. Meantime the weary round of short sentences goes on with no hope of reformation from such imprisonment; and the state, by this procrastination in carrying out the admirable project of providing reformatory outdoor labor for women who need protracted discipline to help them overcome their vices and evil habits, is holding back progress in this direction.

The report devotes much space to the inferior courts bill, and speaks with vehemence against the Night Court for Women, an opinion shared by some of the members of the International Prison Congress:

"The Night Court for Women is a perfectly useless institution and has no reason for existence. The advocates of the original Night Court for both men and women claimed that it would be a means of abolishing the professional bondsman, who had preyed upon these unfortunates, but the professional bondsman simply transferred his activities from the station-house to the court and was and still is in evidence at every session. If his clients have been reduced in number, his commission has been raised to cover this deficiency. . . .

"One section of the inferior courts bill provides for a card system of identification, through which persons supplied with such cards may upon arrest for violation of city ordinances be released upon their 'own recognizance', continue their business, and appear in court at the time set for trial. The woman charged with soliciting is as much entitled to such a card as the chauffeur who endangers the lives of hundreds by overspeeding. Disorderly conduct and soliciting are not recognized under the law either as crimes or misdemeanors; they are simply violations of the consolidation act. A card system of identification for women violators of this act would be a most effective way of abolishing the professional bondsman, permitting the woman to arrange her affairs and appear for trial, and render the Night Court for Women unnecessary. All other classes of women now arraigned in the Night Court would be far better off if sheltered in the prospective house of detention until morning. To turn semi-intoxicated women adrift at night, or women convicted of prostitution, after payment of fine, means in the one case, actual suffering, and in the other, that she returns to the street to redeem the loss sustained by payment of fine.

"A day court in which all classes of women may be tried would be an improvement upon present methods, but a Night Court for Women cannot prove beneficial to the offender or to the class of curious idlers who throng this court."

JOTTINGS

PRISON REFORM IN GEORGIA

The Prison Association of Georgia was organized in Atlanta early in December, 1910. Chief among those behind it were Joseph C. Logan, secretary of the Associated Charities; John J. Eagan, a public-spirited young business man of Atlanta, and G. R. Hutchins, recently chairman of the Prison Commission of Georgia.

This organization does not purpose simply to care for discharged prisoners and visit penal institutions, but to educate on all questions of crime and its treatment in Georgia. It will advocate adequate institutions for different classes of criminals; aid in extending probation, parole, and the indeterminate sentence; investigate causes of crime and measures of prevention, and publish its findings. The board of directors is composed of twenty-one business men, from whom is chosen an executive committee committed with authority to run the society. The president of the association is Mr. Eagan; the secretary, Robert B. McCord, who will devote his entire time to the work. An office has been opened at 404 Gould Building, Atlanta.

PENNSYLVANIA'S PRISON NEED

The need of a new prison in Pennsylvania is bringing out a great deal of discussion as to the best site, the best methods to be employed, and the best results to work for. There as elsewhere the cry seems to be "back to the land" for prisoners. The state has 980,000 acres of forest preserves, and it is believed that without having to purchase land a site may be found on which convicts may erect their own buildings and raise their own supplies and a surplus for other institutions.

A TIMELY POLICE ORDER

At a recent meeting of the Board of Directors of Boston-1915, a complaint came from South Boston that the police authorities were transporting juvenile delinquents from the detention station to the court in the same vans with adult prisoners. The matter was investigated by a special committee of the Charities and Correction Conference of Boston-1915 and Police Commissioner O'Meara was interviewed, with the result that the following general order was sent out from the commissioner's office:

"No person under seventeen years of age is to be carried in a vehicle which is occupied at the same time by prisoners above that age; but when an enclosed van is used a prisoner under seventeen years of age may be placed in a compartment separated from that occupied by the older prisoners; and in emergencies, or when a prisoner under seventeen years of age has been arrested in the company of an older person or for complicity in the same offence, such prisoner may be carried in the same vehicle with persons above seventeen years of age, provided a police officer accompanies them in the vehicle."

SOCIAL AGENCIES

HOW ORGANIZED CHARITY EMPLOYS ITS FUNDS

EDWARD T. DEVINE

General Secretary of the New York Charity Organization Society

[As a back-fire against the activity of the New York Charity Organization Society in resisting the Sullivan bill, which threatened to put the magistrates' courts back into district politics, Assemblyman Cuvillier recently introduced a resolution calling for an investigation of the society. The implication was that the society is misusing its funds, and that its charter should be repealed. Disregarding some obvious errors in figures in the resolution, the apparent grounds on which the investigation was proposed was that the Charity Organization Society pays out a larger sum of money in administrative work than it expends for relief.

The incident was made the text for a prompt statement by the general secretary of the society in the New York *Press*. In various cities similar charges appear from time to time, arising from a misunderstanding of the nature of the work performed by modern social agencies. The statement, therefore, is of more than local application. Moreover, Dr. Devine's survey affords a proportionate review of the responsibilities of a charity organization society—a conscious recapitulation of structure and function which may prove of interest wherever such a society exists, or wherever any agency is found which deals in a similar spirit with constructive social work.]

In the year ending September 30, 1910, the New York Charity Organization Society disbursed in direct relief a little less than $80,000. This is about twenty times as much as the society was spending in that way when I became connected with it fifteen years ago. Some people think that it is too much. Some think that it is not enough. I am among the latter. I think that we can and should raise a larger amount for relief. We have plans under way for doing so. We need more money for widows and dependent children, more for the families of consumptives, and more for many other particular kinds of distress, especially such as arises in connection with illness of various kinds.

What we need for relief we always raise for that particular purpose, just as we raise other funds for other purposes. Except for temporary emergency relief, we believe in what is called the case by case system of raising relief funds. What we mean by this is that if we require ten or fifteen dollars a month for a family for a year we prefer to ask people to give that amount for that particular family. We open a special account with the money thus given in the name of the family for whom it was raised, just as if it were a savings bank account, and we keep it religiously for them so long as it is needed. If it is not needed we give it back to the donors if they want it, or we transfer it with the consent of the donors to some other similar case, for which we would otherwise have to raise money.

That does not often happen. Generally we need for a family all that we have secured for them. Our purpose is not the "tiding over" of a family "into next week's misery," but family rehabilitation. We want to help those who apply to us for assistance up to the point where they can help themselves. We pension widows until children can properly begin to earn wages. We care for the sick until they are well. We move people to a place where they can become self-supporting if possible. We do a lot of work in reuniting families. We go after deserters and bring them back to their families. We train women as laundresses, and we take a lot of trouble to find special kinds of employment for people who are blind, or lame, or otherwise physically unfit for ordinary employment, but who can earn something if they are put in the right place where employers will have some consideration for them.

With us relief is not an end in itself, but a means to an end. In some instances we give no relief whatever and get good results, and in other instances we may spend a large sum of money in direct relief before we get through. Of course, in the vast majority of cases some relief in groceries, fuel, clothing, or money is necessary, and we give what our experience and best judgment suggest should be given, whether it is much or little or nothing.

Besides the $80,000 which was expended for relief, and besides what was expended for other activities which have independent treasuries, the Charity Organization Society expended about $200,000. Here we have the frightful bugbear of the hostile critics of organized charity. You admit that you spend

$2.50 in administration expenses for every dollar spent in relief! You convict yourself of all your enemies have ever said about you! No honest person who has taken the trouble to go to the financial statements of the society to get his totals can go away from them with this understanding. Put it down, therefore, that when any one quotes these figures as having been obtained from the society's annual reports, and infers from them that there is a disproportion between relief and the cost of administering relief, he is intentionally deceiving the public. What these figures show is that the society is engaged in other activities besides relief giving.

Of the $200,000 about $50,000, in round numbers, was the cost of conducting the New York School of Philanthropy. This is a training school for those who are expecting to engage in civic or social work. It is not supported by contributions at all, but by endowment and tuition fees. There goes one-fourth of the whole argument at once.

About $7,500 was spent for the work of the Tenement House Committee—the committee which with the support and co-operation of the daily press, settlements, trade unions, and others secured the present Tenement House law ten years ago, and has ever since been obliged to fight attacks on it from such people as are always attacking the Charity Organization Society. This committee also has nothing to do with relief, but it is doing work which it believes to be more important and useful than that of any mere relief fund can possibly be. It is fighting for decent tenement homes, against the selfishness and greed of speculative tenement owners and builders and their political allies.

Thirty thousand dollars was spent on the work of the Committee on the Prevention of Tuberculosis and its affiliated Association of Tuberculosis Clinics. None of this was for relief, and none of it was for the expense of administering relief. It is more fundamental than relief. It is prevention. It is public education. Largely as a result of a campaign carried on by that committee the city was induced to increase its appropriations to the Health Department and to the Board of Education, and as a result we have open-air schools for anæmic children and an adequate corps of Health Department district nurses, visiting the homes of poor consumptives. These things mean more than fuel and groceries. They mean health and the saving of life. They mean stamping out infection. They mean that people will be enabled to remain self-supporting and not have to go either to the district leaders or to the charitable societies. Anybody who objects to such expenditures because they are not relief is either dishonest or incredibly stupid.

The society spent a little over $8,000 in its Bureau of Advice and Information, which is for the purpose of reporting to its members and others of charitable agencies which appeal for financial support. This bureau exposes fraudulent enterprises and gives impartial, reliable information concerning the hundreds of institutions, societies, and enterprises of various kinds in the city—or, for that matter, wherever they may be located, if they are raising funds here. Frequently through this bureau substantial aid is given in the reorganization of charitable agencies in such a way as to free them from some ground for criticism. One may put a high or a low estimate on this kind of service, but obviously it has nothing to do with the amount spent in relief.

The usefulness of any special activity is not always gauged by the amount of money which it costs. For example, the society spent less than $3,000 for its Special Employment Bureau, the object of which is to find work of special kinds for handicapped persons—those who are not able to do a full day's work in the ordinary sense, but who can do certain things very satisfactorily if they have some special consideration. Thus employed, they are both happier and better off physically than if they are supported in absolute idleness. This bureau is evidently not doing relief work, and to put its expenses down as "administrative expenses" in comparison with what is spent for relief has no justification and no meaning.

I may mention one other feature of our work which is represented in our last annual report by only a very small item—$140—for the reason that it was started just at the end of the year. I refer to the Committee on Criminal Courts. Young as this committee is and insignificant as its expenditures were last year, there is no doubt that it comes nearer explaining the present hubbub over the administrative expenses of the Charity Organization Society than any of the older and more expensive departments. For it was this committee which organized the hearing at Albany on February 15 in opposition to the Sullivan "Ripper" bill. The resolution to investigate the society followed promptly upon the heels of this hearing. Its mover is currently believed to have been one of those who were most interested in the bill, and one of those who were astounded at the outburst of public indignation wnich their raid on the courts aroused when its character became known.

I have accounted for about one-half of the $200,000 expended by the society. The other half was expended in carrying on seven central office departments and eleven district offices—all of which have to do in a more direct way than do the special activities which I have named with the relief and prevention of distress.

One of the central office bureaus is the registration bureau, which is the means through which we act as a clearing house for other charitable agencies. Another is an investigating bureau, which has nothing to do with the actual relief of distress. It investigates for other charitable and benevolent organizations.

We look into cases of relief for them, but we are not responsible for the relief. The society asking for the information gives or withholds it on our report.

As I have shown at the outset, our visitors are not primarily almoners, and the money expended in these remaining activities cannot be described as the cost of distributing relief. It is the cost of doing what needs to be done in the families that need assistance. It is the cost of skilled service. It is the cost of maintaining convenient offices in the tenement districts where application may be made, the cost of finding employment, the cost of getting people into hospitals and institutions, the cost of locating and prosecuting deserting husbands and delinquent members of the family who are legally responsible for its support, the cost of doing for the families in every way that particular thing which needs to be done. It is the cost of family rehabilitation.

FOCUSING THE LINES OF SOCIAL CONTACT

ANNA B. FOX

Assistant Secretary, Buffalo Charity Organization Society

In how many varying lines of social endeavor are workers called upon now to deal with the poor in their homes. But only in exceptional instances are the conditions in these homes such that one organization alone is, or has been, concerned. This multiple interest in the welfare of individual families brings us face to face with the fact that, while there is a general agreement regarding many of the principles involved in the wise treatment of family problems, there is not, even in this day of systematic organization of philanthropic movements, a sufficiently developed scheme of co-operation among agencies to permit the best work to be done with the least waste of energy, time, and money, or to make it possible for a community to know either its own burden of want or the facts that would serve as a lever with which to lift this burden.

The next step in securing more complete unity in social work is a central bureau of registration.

Whatever our particular form of service, we agree that our first aim in undertaking to influence the lives of others is to understand. Moreover, this understanding must be twofold, including a knowledge of existing conditions in the homes and a clear conception of causes lying back of conditions. From our desire to gain this understanding arises the necessity for investigation, which is merely the acquiring of accurate information regarding the history and situation of the family. It is essential that this investigation, upon which the whole treatment depends, be thorough and complete; that it be accomplished as speedily as is consistent with thoroughness; and that throughout the process the privacy and self-respect of the family be matters of prime consideration. But is it not common to find the representative of one organization asking questions that have already been answered to other social workers, to see him busily engaged in digging up facts that have already been unearthed, to meet him traveling this too well beaten path and neglecting altogether the mine of knowledge and wealth of clues that may lie hidden in the archives of other societies? This continues because there is no central bureau of registration where he can find the name of every social organization that has been interested in the family, or because, if there is perchance the beginning of such a bureau, all societies do not register there or care to avail themselves of the opportunity for co-operation thus afforded. As a result we see a waste of time, which is money; of effort, which is strength; an unnecessary harrowing of applicants, and a lack of valuable knowledge which might have modified appreciably our plans. For it must be remembered that many facts obtained bear not so much upon the pressing conditions to be ameliorated as upon far-reaching causes. To a breadwinner stricken with tuberculosis it may well seem of little importance whether he was born in south Italy or in Galicia, whether he has been in this country six months or six years, whether he worked at stonecutting or at tailoring. All of these facts are important for those who study the different racial and industrial conditions with a view to improving them; but, important as they are, need an applicant answer six times if once will do?

Nor is it unusual for a worker to find, after proceeding for a time with his investigation, that an individual, a church, or another agency is interested in the particular family and

wishes no interference—a fact that could have been ascertained in five minutes over the telephone of a central bureau.

A confidential exchange among agencies will lead also to a clearer and more sympathetic understanding of methods and aims—a long step towards the perfect co-operation so necessary when the situation in a home is too complex to be successfully met by the resources of a single organization. Several social forces may be called upon to treat different phases of one family's situation at the same time. The difficulties of such joint action call for the nicest balance and adjustment of each part of the social machinery to every other part. The bewildered and often dazed condition of mind of those to whom we minister, brought about by conflicting advice and variant plans; the uncertainty, the worry, the lack of confidence, the clever turning of one agency's attitude as a defence against another's, the blocking of wise measures, the not infrequent suffering—all these could be avoided by more complete co-ordination of work.

Strangely enough, it seems easier to convince groups working along different lines of social betterment of the benefits of a clearing house than societies working in practically the same field, although it is through the duplicated work of this latter class, especially through relief societies, that the greatest harm can be done to the families. Whether this difficulty arises from petty jealousy, distrust, lack of clear understanding, over-confidence in themselves and their applicants, or the fear that registration may prove their particular work to be superfluous, is difficult to say, but its existence forms a great obstacle to unity in social work and to the accumulation of valuable data. The most usual objection raised is that central registration violates the privacy of the dependent family by making its condition public property. On the contrary, registration safeguards privacy; by means of it any intruder is warned off the premises. Anyone who has had experience in the registration department of a charity organization society knows how constantly families are reported by interested friends, neighbors, casual observers, by those who have heard only rumors of distress. The necessity of sending a visitor can only be obviated by knowledge that the family is already in someone's care. Index cards are not public; no one but a confidential employe of the bureau is allowed to handle them, and with thousands on file a single card loses all individuality or prominence. Information is not given indiscriminately, especially over the telephone, but only to accredited inquirers.

Any social worker would be aghast at being told that his methods are developing beggars, liars, paupers, and cheats, are undermining the independence of families and increasing the unsocial group in a community. But to refuse to register in a central bureau, to shut eyes tight to the fact that an applicant may already be assisted by some other person or society is to do some or all of these things. Start a central registry anywhere and there will be found, as in Pittsburgh, the family helped by eleven agencies without one another's knowledge and without common plan; the man who attended twelve churches, joined four, had help from fourteen households and eight relief societies without even then succeeding in obtaining adequate support for his family, while he and his able-bodied son-in-law did no work except that involved in working the public. My own attention was attracted recently to a family whom three branches of one volunteer charitable society were aiding, unknown to one another, and were encouraging thereby a young girl in deceit and begging.

The demoralization of a family can be hastened by any occasion offered for running from one non-co-operating agency to another. This is due in part to the opportunity thus given for using the resources of several societies at once, and in part to the check put upon plans that are really constructive. For instance, permission to place her children in a day nursery is refused a woman because her husband is able-bodied and the social worker prefers to find employment for the man and to see that he supports his family. Another nursery that takes children with little or no inquiry upsets this plan and encourages one more loafer in the community. Examples of good plans defeated in like manner might be multiplied to weariness. Just for contrast take an instance where a probation officer succeeded in preventing the discharge of a deserting husband and in securing his being placed on probation by the use of the C. O. S. record of the family history. The difference between common knowledge and common plan on the one hand, and individual information

and different plans on the other, is the difference between efficiency and inefficiency. This efficiency is increased tenfold if, as Miss Richmond has suggested, each agency strengthens its work at the point of intersection with the work of some other social activity. These points of intersection are brought out in no other place so clearly as in the bureau of central registration. Only there is the intertwining of the varying lines made visible.

For illustration, let us consider the schools —a broad field for the study of incipient destitution, disease, and delinquency. A registration of those school children shown by medical inspection to be undernourished would show also how many such children had previously been brought to the attention of some organization. It would be good for the organization to know this, and to know how many are the children of widows or of deserted wives. Such registration again would make it possible to follow in later years the history of the children, or of a group of them.

Other contacts are found through the teachers, with their opportunities of discovering children who are working out of school hours, children whose uncleanliness betrays neglect that may culminate in abuse,—or children whose regular attendance is spoiled by lack of shoes or other apparel.

It would be difficult to name a single social movement that would not be aided by the data accumulated at a central bureau. The street directory there would show that certain localities of special interest to housing reformers, for instance, are likewise conspicuous in the registration from medical agencies, playground boards, and juvenile correctional institutions. The student of immigration or of racial groups would find there abundant material for study. Another benefit which would follow would be the inauguration of a more uniform and complete system of statistics by the organizations and institutions represented —one bearing upon the facts social investigators wish to find and rarely can.

If one agency cares for three thousand families, another for two thousand, and a third for one thousand, what percentage is there of conscious or unconscious duplication? Not always great overlapping of work, as each may occupy a different field; one may be a relief society, one a district nursing association and another a hospital, but fifty per cent of the work of each may be with families known to the others. With several relief agencies there is sure to be both duplication and overlapping. In Boston, where there is a registration of more than eighty agencies, a list of fifty families was brought to the registrar one day with the statement that the bearer had been guaranteed that those families were not known to any other agency in the city. The organization that had given him the names was a non-registering one. The fifty names were looked up and forty-five of them were found in the index. The registrar was not sure that the inability to find the other five was not due to peculiar spellings.

There is a movement nowadays towards having a non-philanthropic body act as a certifying committee for charities—pass judgment, that is, upon ways of raising money, upon methods, aims, and results of work. One of the duties of such a committee is to decide upon the need for any proposed social agency in the community. How much better able will this committee be to determine upon need, if it has accurate knowledge of how much work the agency is duplicating. If existing organizations cover the field or can cover it, why a new one to do the work that can as well be done by those already established? Why put money into the administration expenses of a new society that would better be spent in the field work or research work of an existing organization? All of the money for remedial or preventive work comes from the people, either through voluntary contributions or through taxes. There is every reason why it should be carefully administered, as the less money there is wasted the more there will be for effective work.

All social agencies dealing with families or individuals in a community should join in a registration bureau for the common good and the greater efficiency of each. Only by so doing will they and their clients be safeguarded against overlapping, duplication, waste, frustration of plans, and needless interference; only so will each agency be enabled to work harmoniously with every other upon a plan co-operatively worked out and really adequate.

CLUB MEETING IN A ST. LOUIS PUBLIC LIBRARY.

BRANCH LIBRARIES AS SOCIAL CENTERS

OSCAR LEONARD

The Public Library system of St. Louis is opening to the people rooms where they can meet to educate themselves, to talk about books, plays, or even the troubles that come in the day's labor. This work is still merely experimental. It is not yet doing as much as the social settlement. Nor has the library adopted the method of the latter. It does not supply leaders for classes or clubs. It furnishes shelter to those needing it and welcomes those who have a circle they wish to direct. There is not the interrelation that should exist between those engaged in settlement work. But in this even some of the settlements are deficient. In spite of these deficiencies, the experiment is a success.

The people feel at home. They do not fear that any one wishes to lead them away from the faith, opinions, or ideals of their fathers. They are not beholden to any one for the shelter so generously proffered by the Public Library. The taint of charity is not there. The library is public. Every man and woman pays his or her share toward its maintenance. They come as they would to their own.

Another important feature is the freedom allowed. The men may smoke. In a settlement building this is generally prohibited. The fact is that men do smoke. To forbid their doing so in a certain building is to make the hour spent there uncomfortable. Why place unnecessary restrictions? The same freedom is true in the case of the objects of clubs, providing they be worthy and of an educational nature.

The Crunden Branch by way of example, named in honor of the predecessor of Arthur E. Bostwick, public librarian of St. Louis, is in the most crowded district of the city. It serves a mixed population, Polish, Jewish, Roumanian, Hungarian, some native born Irish, a few recent arrivals of Erin and quite a number of Negroes. The first to take advantage of the rooms offered for meetings were the Jews. The first organization to meet there for purposes of self-education was a group of anarchist-communists. A. Diephuis, librarian in charge, was criticised for allowing the "dangerous" group to meet. They were dangerous indeed. They spent every Friday evening reading and discussing a book by Ernest Haeckel.

Little by little the people realized what an opportunity was given them by swinging wide open the doors of the club rooms and auditorium. Now the Crunden Branch needs additional rooms.

Let us take a peep at some of the organizations meeting at the Crunden Branch, which is one of half a dozen. The Industrial Workers of the World meet to lay their foundation for a new school of labor organization. They are mostly recent arrivals from Russia with just a few Americans as leaders. A Lithuanian Club comes to prepare its members for naturalization. A group calling themselves Polish Industrial Workers assemble for purposes of mutual assistance. The United Defense League stands ready to defend free speech whether it be threatened in America or in Russia. The Crunden Branch Debating Society argues the live questions of the day. The Boy Scouts find in the library a convenient home. A group of working women calling themselves the Polish Turn Society meets for calisthenic exercises, as does also a masculine branch of the same order. Then there is a Polish Self-Culture Club. A committee for social service among colored people also finds its home under this roof. Working girls and women who favor woman's enfranchisement make their home in this branch. The People's Forum, a new attempt at helpfulness, organized at the instance of Prof. T. J. Riley, director of the St. Louis School of Social Economy (affiliated with Washington University) and of which the writer is in charge, uses the branch auditorium for public lectures delivered by university professors. An organization of garment workers, women and girls, holds its meetings in the branch under the leadership of the Woman's Trade Union

League and there are many more. Recently the people using Crunden Branch have decided to present the institution with a piano and a moving picture lantern, as these are needed for more effective educational work. Under the lead of the People's Forum the organizations meeting in the library have subscribed freely and members have done so individually. The People's Forum has taken the initial step in this work.

In the year 1909-1910 a total of 757 meetings were held by various organizations in the branch libraries. The year 1910-1911 will undoubtedly show double this number as the people are becoming more and more attached to them. The more successful the experiment becomes the greater will be its bearings and influence on the development of the settlement.

CLEVELAND BOYS' EXPOSITION

Arrangements for the second Annual Cleveland Boys' Exposition, are under way to be held on May 4, 5 and 6. This unique exhibit aims to give the boys of the whole city a chance to demonstrate their ability in directions which grip thought, imagination, and activity throughout boyhood years. Any lad under nineteen who makes things, who can write or speak, who trains anything from pets to talent, may display at this exposition. Handiwork, such as the making of furniture, woodturning and carving, metal-work, electrical apparatus, mechanical drawing, printing, designing, photography, and other kindred crafts will form an important part of the exposition. Hobbies will be shown—collections of stamps, coins, buttons, or post cards. Or a boy may bring his pets, take personal charge of them and delight himself and others with their tricks. There will be contests—vocal and instrumental music and whistling, original stories, orations and poems, shorthand and typewriting, gymnastics and costumes. Not the least interesting will be the boy scout stunts—best work by one patrol in ten minutes; and the newsboy stunts—best work by group of ten in ten minutes. Competition between older and younger boys will be avoided by dividing the contestants into

MEETING OF THE PEOPLE'S FORUM.

CARPENTRY WORK.

three age groups and offering a full set of awards to each. Blue, red, and white ribbons stamped in gold with the exposition seal appropriately mark the first, second, and third honors.

The exhibit will be held in Gray's Armory. Last year over two thousand boys of every nationality and class entered their exhibits and some unusual revelations of what the American boy can do resulted—a wireless telegraph outfit made by a fifteen year old boy, a violin constructed from a cigar box, a broom stick and one string, upon which the inventor played several tunes; pen and ink drawings and oil paintings, crude of course, but in some cases showing real talent. Delighted parents and relatives took unbounded pride in seeing what their boys had accomplished. The contests in gymnastics showed skill and concentration. One "gang" of boys from the worst district in Cleveland, who were hard to hold in systematic training, cheered their teacher by saying, "Hey, kids, jess wait till next year and we'll show you fellows some stunts too." The exhibit stimulated the boys to work more eagerly for something skillful and worth while. The art and music schools encouraged their students to enter, and helped discover new talent. The Board of Education and librarians gave permission to work through the public schools and libraries, making them centers through which to give out announcements, application slips, and certificates. Permission was generously granted by the Electric Railway for the boys to carry dogs and other pets free on the street cars during the exposition days. The newspapers took pictures and advertised the forthcoming event in a way to awaken the interest of the people.

SEAL OF THE EXPOSITION.

The effective co-operation of last year has again been rallied. The officers of the exposition board are: President, M. D. Crackel of the West Side Boys' Club; vice-president, T. W. Garvin of Hiram House; secretary, Dr. E. A. Peterson of Goodrich House; treasurer, C. W. Shim of the Cuyahoga County Sunday School Association. These men are assisted by an able executive committee representing ten other social, charitable and educational institutions of the city.

YOUTHFUL EDISONS.

PERSONALS

THE NEW SECRETARY OF THE INTERIOR

The appointment of Walter L. Fisher as secretary of the interior to succeed Mr. Ballinger is a recognition of distinguished service in the cause of greater efficiency in the conduct of public affairs. He is one more among those whose efforts for better municipal government have led to high position in the national administration and wider opportunity to do for the whole country the same sort of public work which makes a citizen valuable to his city. The professional work of the secretary of war just prior to his appointment to Mr. Taft's cabinet was in Chicago, and curiously all three Chicagoans now holding portfolios, Secretary MacVeagh, Secretary Dickinson, and Secretary Fisher—come from the same ward, the twenty-first.

WALTER E. FISHER.

Mr. Fisher's connection with the conservation movement is of course the factor of immediate significance. He was president of the Conservation League of America, of which Mr. Roosevelt was honorary president, and Mr. Taft honorary vice-president. This league was merged into the National Conservation Association, of which Gifford Pinchot is president. Mr. Fisher's address at the conservation convention held last fall in St. Paul made a marked impression through its definite suggestions of practical methods in conservation administration.

Mr. Fisher's work as secretary, and later as president of the Municipal Voters' League of Chicago, has made him best known, however, to workers in the cause of better municipal government throughout the country. The successes steadily won by this militant civic organization in securing honest and able aldermen in the Chicago City Council, a body of very large powers, were due in great degree during a considerable period to the new secretary's forceful leadership. As this magazine said of him, "With a broad grasp of the political situation as a whole, and a mastery of minute campaign details, he has been able with boldness and tact so to play persons and forces over against one another as to enable the league to seize and wield with overwhelming success the balance of political power in aldermanic elections."

Perhaps no man in Chicago grasped so thoroughly and so clearly all the details and intricacies of Chicago's prolonged traction difficulties. This fact, together with his attainments as a lawyer, pointed to him as the man best qualified to serve as special counsel to the local transportation committee of the City Council through all the long and involved negotiations with the street railway companies.

More recently he has served as a member of the Merriam commission on municipal expenditures, displaying as its attorney the same cool judgment and unflinching aggressiveness in "seeing the thing through" which characterized his work in the Municipal Voters' League.

Active participation in the conservation movement is not the only way in which Mr. Fisher's service has counted nationally. Many organizations devoted to progressive civic reform have claimed his time and his constructive suggestions, while such conventions as those of the National Municipal League have listened keenly to his incisive utterances. Incidentally, special interest attaches to the fact in connection with his cabinet appointment, that as personal friend, adviser, and attorney Mr. Fisher has been identified with Charles R. Crane of Chicago, and helped in the preparation of Mr. Crane's public statements relative to the difficulties which followed the latter's appointment as minister to China.

Mr. Fisher was born in 1862. He went to Chicago in 1884, was admitted to the bar in 1888, and has been a member of the firm of Matz, Fisher, and Boyden. His all round public service to the city, expressed in so many ways, is summed up in his leadership as a founder, president, and active member of the City Club of Chicago.

G. R. T.

PRESIDENT OF HEBREW CHARITIES

Leopold Plaut, who was recently elected president of the United Hebrew Charities of New York to succeed Cyrus L. Sulzberger, has been for a number of years a director of the Hebrew Technical School for Boys and the Jewish Protectory and Aid Society. He is chairman of the committee on economies of the Council of Jewish Communal Institutions, a body composed of fourteen of the largest Jewish philanthropic organizations in New

LEOPOLD PLAUT.

York. He is engaged in an investigation of the prices paid for commodities by various institutions with a view to securing minimum prices for all organizations. The investigation, though not completed, already shows that considerable saving can be effected.

Mr. Plaut's interest in social work, combined with many years of practical experience as the head of a large manufacturing concern, augurs well for a successful administration.

THE HILL AND WILLIAM H. MATTHEWS

Pittsburgh has lost her first citizen, if the term is used in its vital, human significance, as Roosevelt applied it years ago to Jacob Riis in New York. William H. Matthews, since 1902 headworker of Kingsley House, has definitely resigned that post and is spending the year with his family on a ranch at Miner, Idaho. In the early fall it became necessary, because of the illness of his boy, for Mr. Matthews to leave the steel center.

WILLIAM H. MATTHEWS.

Kingsley House is set on a hill overlooking the business district of Pittsburgh. Below, at the right, may be heard the unending noise of the Pennsylvania trains and of a rim of iron mills along the river. Up the hill, the length of Wylie avenue, are in turn the Italian, the Negro, and the Jewish quarters. For years it has been a region of old houses, inadequate sanitary equipment, overcrowding, ill health, and overwork, overlooked by the city in its pushing eagerness toward prosperity. In this region Mr. Matthews and his household settled and made it their home, made its interests theirs. And in the years which have followed he more than anyone else has been the spokesman for "the Hill," borne the brunt of its neglect and championed fearlessly its needs. In the April magazine number THE SURVEY will publish a parting message from Mr. Matthews to his people and to Pittsburgh.

It is by more than a coincidence that this evangelist of humanitarianism in a city of great works himself began work at twelve years of age. He worked twelve hours a day and says, whimsically, that the hours have never changed since, except upward. At sixteen he quit the factory and went away to fit himself for college, going in 1898 from Williams to Union Seminary in New York and dividing the next three years between the seminary and post graduate work at Columbia, largely under Professor Giddings. Next, Mr. Matthews took up boys' club work at Bethany Memorial, working there evenings in addition to his seminary courses, and following this with a year's work as assistant headworker at Union Settlement. Neighborhood workers in New York still refer to him as the man with the most unusual knack with boys. After six months' experience as an assistant pastor in New York, Mr. Matthews moved to Pittsburgh to become headworker of Kingsley House, which the year before had moved from the Penn avenue district to the Hill. Purely on the institutional side, the succeeding years were those of advance, of enlarged buildings, of an endowment fund growing from $5,000 in 1902 to $37,000 in 1910; a budget from $4,000 in 1902 to $26,000 in 1910 (with no debts); a city plant valued today at $70,000 without encumbrances. 1903 saw the installation of a manual training department with shop equipment and the opening of the Kingsley House yard as a public playground; 1905, a new gymnasium and industrial department; 1907, the addition of a trained district nurse to the house working staff and the establishment of a small dispensary; 1908, the opening of a weaving department, and in 1909, the settlement's site was fairly doubled. Equally gratifying has been the development of Lillian Home, the ground for which was purchased in 1902 and which today is one of the best equipped summer outing places in the country, its star shaped buildings having a capacity of 250 people (described in THE SURVEY for June 4, 1910).

But these institutional developments are only half the story. It was only four months after Mr. Matthews's coming to Pittsburgh that he published in the *Kingsley House Record* photographs showing the evil housing conditions he found about him. This was the precursor of a number of civic enterprises on his part, designed to improve conditions in the Hill district but reaching out also in the direction of reforms for the whole city, some in co-operation with other organizations, some as single-handed efforts. He was one of the staunchest supporters of Dr. Edwards in his work in clearing out the insanitary privy vaults of old Pittsburgh; repeatedly his fearless editorials in the *Kingsley House Record* have worked reforms in hospital management and brought new sense of responsibility to property owners. He was the first Pittsburgher to whom the Pittsburgh Survey turned for counsel and suggestion at the outset of its work. He issued two editions of a Charities Directory in 1908 and 1910. His last two contributions were in investigating the nefarious aldermen's courts on the Hill and in instituting a vice crusade in which his investigators showed beyond all question that under the present city administration the tenement districts were being invaded by houses of prostitution. No better example of the feeling of the Hill residents to the headworker of Kingsley House could be had than the dozens of

letters expressing regret at his departure and the visits from heads of families who urged him to keep up the fight for clean living, as they had no other spokesman.

Few men have had at once such frank relationships both with their fellow dwellers in the neighborhoods of the poor and with the ablest and most successful men in the business life of their community. Mr. Matthews has never minced matters, never trimmed his sails because of personal relationships. This fighting quality, coupled with a religious earnestness, is appreciated in Pittsburgh; it gives him unique standing in the town.

Without doing violence to the ranch industry of Idaho, it is to be hoped that another year will see Mr. Matthews again in harness for the social welfare. P. U. K.

MERRIAM, FOR MAYOR OF CHICAGO

Chicago's mayorality campaign grips the attention of everyone throughout the country who appreciates the extent to which municipal administration may render social service to the city dwellers by making their communities better places in which to live and work. For on April 4 the voters of Chicago will determine whether Charles E. Merriam, professor of political science in the University of Chicago, and one of the most efficient aldermen in the City Council, who was nominated for mayor at the first direct primary election Chicago has held for that office, shall be chosen to serve the people as chief executive.

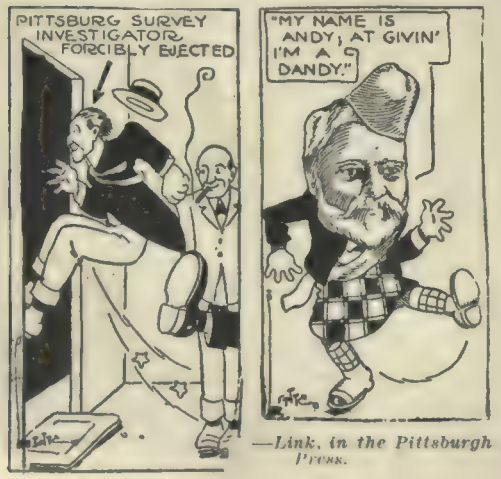
Some years ago, in commenting upon the election of "Golden Rule" Sam Jones, in spite of its opposition, the *Toledo Blade* remarked, "They say the people have spoken, but they needn't have hollered so loud." The people's voice in this Chicago primary was sufficiently emphatic to smash two "machines" and place Mr. Merriam before the people as republican nominee by a vote almost equal to that of all the other republican candidates put together. His victory over the factional organizations led by Mayor Busse, Senator Lorimer, and Governor Deneen was a triumph of the popular will which would have been impossible under the old convention system. A feature of the fight which ought to be known all over the country is that even in Senator Lorimer's own ward his machine went down to defeat under the Merriam wave the very day before the United States Senate decided that he should retain his seat in that body.

In the democratic camp there was likewise a significant vote, though in considerable measure negative rather than positive. It was the utter rout of a candidate, backed by Roger C. Sullivan, national committeeman, and that element of the Democratic Party in alliance with the most unscrupulous special privilege interests in the city, whose insolent reliance upon the power of cash expenditures for organization workers, billboard splurges, and other advertising, and every sort of "legitimate" campaign expenses, received the popular condemnation it merited. This candidate ran a poor third. The extraordinary fight made by former Mayor Dunne in leading the reputable forces of the Democratic Party without newspaper support was a noteworthy expression of independent spirit. Mr. Dunne's margin under former Mayor Carter Harrison was so small that if only half of the vote rolled up for him in the ward of "Hinky Dink" Kenna and "Bath House" Coughlin were shaved off the victory would have gone to Dunne.

CHARLES E. MERRIAM.

Mr. Merriam is known to the readers of THE SURVEY chiefly through his work as originator and chairman of the Merriam Commission on Municipal Expenditures and Accounting, which resulted in the establishment of the Chicago Bureau of Public Efficiency.[1] This is by no means his only public service of importance. Although but thirty-six years old and a resident of Chicago only seven years, he has made his expert knowledge of municipal administration count effectively in efforts for the common welfare. He studied political science at Columbia University and in Germany before coming to the Chicago faculty. His volume on Primary Elections is considered authoritative. In 1906 he prepared for the City Club an important report on the municipal revenues of Chicago. Later he was secretary of the Harbor Commission of Chicago. As a member of the Chicago Charter Convention he fought for those popular provisions in the proposed charter which was later so mutilated by the Legislature that the voters of Chicago defeated it. In 1909

[1] See THE SURVEY for Sept. 4, 1909, page 737; for February 5, 1910, page 597; for August 13, 1910, page 699; and for September 3, 1910, page 750.



Professor Merriam was elected chairman from the University of Chicago ward by the biggest plurality ever given an aldermanic candidate in Chicago. He is a member of the council committee on gas, oil, and electric light. As THE SURVEY has related, the Merriam Commission not only disclosed graft in almost every department of the city hall, but has brought about and suggested important improvements in budget making and administration.

On a platform emphasizing the need for efficiency and the conservation of popular rights, he struck out heavily in his campaign speeches at graft, spoils, and special privilege. He is continuing the same fight, directing his own campaign, but welcoming support from the rank and file. G. R. T.

THE HUNGRY CLUB'S GRIDIRON

The Gridiron Club with its grillings of men in the public eye, at the hands of the newspaper men at Washington, has become a national institution. In Pittsburgh, recently, the scene was shifted to civic affairs and the Hungry Club, in skit and pantomime and verse, "took off", with even-handed impartiality, city officials, public bodies, and the uplifters themselves. The Hungry Club, the invention of a group of Pittsburgh social workers, has grown and prospered until its luncheon discussions have become a force for candor and publicity in the town's life. Two hundred and fifty guests were bid to "join the famished brotherhood" for an evening of "civic stunts, versatile vaudeville, and merry music." They were called together by Prof. H. E. Winner, principal of the Howard School, the ringmaster, who beat a huge tin pan with a spoon. The Hungry Club rhyme was sung to *Die Wacht am Rhein.*

We're loyal sons of Father Pitt
In search of wisdom, food and wit.
Our motto is our only law,
"Cum Cibo Sap-i-ent-i-a."
Ours is a true democracy,
Where thought and speech are ever free,
Here is philosophy, combined with grub.
Pitt's great fraternity, the Hungry Club.

—*Link, in the Pittsburgh Press.*

Shiras, in The Pittsburgh Gazette Times.

A counterfeit Andrew Carnegie in kilties burst in on the diners; Dr. Cook inquired for the former president of the Chamber of Commerce who had welcomed him to the City with unction during his brief hey day; Bion J. Arnold, the traction expert, advised Father Pitt how "a loop" would double the carrying capacity of the Pittsburgh street railway, the loop produced being a double strap-hanger; the Pittsburgh Survey broke into the room only to be ejected; Allen T. Burns, secretary of the Pittsburgh Civic Commission, functioned valorously as Father Pitt; W. W. Kellor secretary of the Child Labor Committee, sang an Italian song with a Pittsburgh accent, getting off some limericks of which this is a sample:

The Chamber we can't fail to mention,
That be-whiskered old-ladies' convention,
It never arrives
But somehow it thrives
On the strength of its splendid intentions.

A "civic morality play," which rumor has it was written by P. C. Williams, assistant secretary of the Chamber of Commerce, boxed the compass with digs at the Chamber of Commerce, the mayor, the Voters' League and so on. The hero of the cast was a civic Charley Ross, Charter Bill by name, whom the machine wanted to kidnap and bring up as one of the gang. "Aunty Chamber" made Bill's clothes, consisting of small council pants, initiative, referendum and recall coat, and nonpartisan ballot hat.

One hit of the evening was a parody on

What's the Matter With Father? It was delivered with vim:

What's the matter with Pittsburgh?
He's all right.
Lime and water will never
Make him white.
All he needs is a thorough scrub,
Get together, ye cit'n, and rub.
What's the matter with Pittsburgh?
He's all right.

CAMPING OUT IN MADISON

The fourteen socialists members of the Wisconsin Legislature made a pool, rented four rooms in an old business block, bought iron bedsteads enough to go round, a big stove, a long table, and are putting in the winter in dormitory fashion. The rooms cost twenty-five dollars a month. Each man furnished his own bed clothing; several of them breakfast at the One-Minute Coffee House where coffee can be had at three cents a cup. A staff correspondent of the Cleveland *Press*, describes their barracks as follows:

"About the long table two state senators and twelve members of the House gather nightly to read new bills and thrash them out among themselves. Every night, when their work is over, the two senators and the twelve representatives sleep the sleep of the just on the little iron beds. . . . These socialists are terribly in earnest. They do not spend their evenings in lounging about the lobbies of hotels. . . . All their differences, if they have any, are settled here. When they come to pass on a bill they vote as one man.

"The personnel of the group? Oh, all sorts. Michael Katzban is a Polish molder. F. B. Metcalfe is a glass blower. E. K. Kiefer is a paperhanger. Arthur Kahn is organizer for the Milwaukee Bakers' Union. J. H. Vint is a cigar maker. So are Jacob Hahn and E. J. Berner. W. J. Golboy is a delivery clerk. George Klenzendorf is an architect. Max Binner is a bookkeeper (nicknamed "the capitalist" because once, when somebody in the House taunted the socialists with no real basis for interest in the question of taxation, he flaunted in the face of the joker a tax receipt as proof that he owned his own home). Frank J. Weber was a lake sailor for thirty years. This is his third term. The senators are Winfield R. Gaylord and Gabriel Zophy.

"The socialist group has demonstrated that a poor man can throw up his job to serve his constituents as a legislator on $500 a year without 'shaking down' any one for enough to live on, and that the business of lawmaking may be taken seriously."

FROM SOCIAL WORK TO POLITICS

William W. Kellor has resigned as secretary of the western section of the Pennsylvania Child Labor Association, to become secretary of the Keystone Party for Allegheny county —the insurgent, reform political organization which took an aggressive part in the last state campaign. Mr. Kellor was formerly headworker of the Franklin Street Settlement, Detroit, and later an agent of the Pittsburgh Associated Charities. His transfer to political activity is perhaps a sign of the times in Pennsylvania, where the participants in reform organizations are more and more seeking state political action as a means for securing changes which the dominant political machine of the state has long refused.

SOCIAL WORKER IN WHITE HOUSE

The appointment of Charles D. Hilles as secretary to President Taft brings to the White House not only a highly trained executive officer, but a man who is in the closest touch with all forms of social work.

CHARLES D. HILLES.

Mr. Hilles is president of the New York Juvenile Asylum and was its superintendent until his appointment as assistant secretary of the treasury in April, 1909. He was chosen for the place in the Treasury Department particularly for his experience in the erection of the Children's Village, the cottage institution of the Juvenile Asylum, which made him a peculiarly valuable man in charge of the erection of new government buildings in all parts of the country. His success in this position and the place he quickly made for himself in Washington led to the appointment at the White House.

Mr. Hilles was born in Ohio in 1867 and held his first position in social work as financial officer of the Boys' Industrial School at Lancaster, O., of which he was later superintendent. From there he went to the New York Juvenile Asylum. He is a member of the National Conference of Charities and Correction, of the National Conference on the Education of Backward, Truant, and Delinquent Children, and of the Playground Association of America.

At the time of his resignation from the Juvenile Asylum it was said of him in the annual report: "He has shown how the position which he occupied could be made one of commanding influence on the lives of hundreds of lads whose previous associates had started them in the wrong way of life, but who under wise and loving direction and companionship could be made useful citizens, and who were just at the period of life when such an influence was most easily exercised and most powerfully effective." A. P. K.

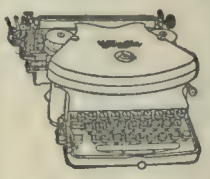
MR. FORD LEAVES PUBLIC OFFICE

Frederick L. Ford, who has for fifteen years served Hartford faithfully and with ability, has resigned his place as city engineer. He enjoys the confidence and esteem of his fellow townsmen, being a prophet who is honored in his own country. Mr. Ford is known throughout the United States because of his prominence in the work of the National Civic Association and the National Conference on City Planning. He has contributed to the technical literature of his profession and lectured in all parts of the country on such subjects as the grouping of public buildings, street improvements, and public comfort and trolley waiting stations. Though Hartford loses an official of integrity, who stood for fairness in his dealings with the city, with contractors, and with his associates, his townsmen will still have his services as a citizen on its high school building commission. Mr. Ford on April 1 becomes a member of the firm of Ford, Buck and Sheldon, having as associates men who secured their start as his assistants in public office. He expects to make a specialty of city planning in which he is much interested, and for which his breadth of view and his appreciation of the ethical side of municipal progress fit him. J. P. H.

JOHN MITCHELL'S RESIGNATION

On February 15 John Mitchell resigned as member of the National Civic Federation, as member of its executive counsel, and as chairman of the trade agreement department. In accepting his resignation, President Seth Low called attention to the fact that it was made in the face of a specific proposal on the part of the federation to renew its contract with Mr. Mitchell for another term of three years. Readers of THE SURVEY are referred to Professor Taylor's review (issue of March 4) of the action of the United Mine Workers of America, which made it necessary for Mr. Mitchell to resign from the Civic Federation or forfeit his union card. In his letter Mr. Low spoke appreciatively of the work Mr. Mitchell has done for industrial peace as chairman of the trade agreement department during the last two years and a half. "Only your colleagues in the active administration of the National Civic Federation can fully understand how helpful you have been in bringing about a better understanding between employers and employes in all sorts of directions. I feel personally under special obligations to you for enabling me to understand better than ever before the workingmen's point of view on many questions of vital interest, and I want to say that it has been a personal pleasure to be associated with you and to work with you."

[1]See THE SURVEY, March 4, page 964.



Help Yourself to this Typewriter

Use it 10 Days Free

You will find real pleasure in typewriting your letters, notes, speeches, etc., on the "Wellington." It will save you time and double your writing efficiency. Endorsed by stores, railroads, and professional men everywhere. Over 80,000 in everyday use. The

Man with marked executive ability, who has had experience in the management of Men and Boys' club. Also charge of religious work. Desires employment for himself and wife who has been in charge of Girls' club, and trained in religious work. Address Clergyman, care SURVEY.

SOCIAL FORCES

BY THE EDITOR

THE DISCOVERY OF THE INDIVIDUAL

It is quite true that we have never entirely lost sight of him. We social reformers, who have been so vehement in our advocacy of better social conditions, have mainly not had in mind a vague abstract society for whose sake these improvements are to be made. Our powers of distant social visualization are limited. Mostly we have thought of live men and women, or of our children and our neighbors' children. We have objected to a high death rate, not from a scientific statistical interest in death rates as such, but because it means for us that particular babies whom we know about are dying from poisoned milk and from mother's ignorance; because it means for us that a young girl with all the joy of living surging through her being is slipping into a premature consumptive's grave; because it means for us that through some fatal industrial accident to a wage-earner, a family which has been a self-contained, self-supporting, self-respecting unit of society is suddenly before our eyes transformed into a shattered, fragmentary remnant of a family, appealing to external aid, a "dependent family in its home," to be studied, to be relieved, to be rehabilitated, if possible, but at any rate, because of this high death rate, to be robbed forever of the proud satisfaction of having been above the need of charity. We have by no means forgotten the individual. The question is whether we have sufficiently understood him. There is no advantage in a feeling of sympathy for individual men, women, and children, if that sympathy does not become intelligent and discriminating. Human sympathy may be quite as barren as an abstract interest in death rates. There is no merit in feeling for the woes of humanity if we do not under the impulse of that sentiment direct our energies to an understanding of the cause of their sufferings and to practical remedies.

The first natural response to the sentiment of sympathy with an individual

lo not know who

opened his eyes or how it was done. They get out of their difficulties by the sudden recollection that the son is of age, but there is no such escape for the beneficiary of the miraculous operation. He seems only to have expressed a natural appreciation of the benefit which he had received and a pious belief that the healer must have had divine power; but the result is that he is pronounced to be altogether a sinner and is cast out.

His hard luck has many a modern analogy. Those who investigate to determine worthiness are following in the footsteps of their ancestors who asked whether this man had sinned or his father; and those who push unwarranted inquiries into family relationships are no wiser than the bystanders who insisted on trying to get from the parents details with which they had no legitimate concern, and who summarily cast out the first man whom they had ever seen cured of congenital blindness. They were neither scientific nor humane. No more are we when we fail to see what is happening in the prevention of blindness in our own communities; and when we persist in seeking individual causes for such evils as are plainly social.

The third stage in the development of the sentiment of sympathy is the discovery of social causes of misery. We have dwelt upon these very often and we shall have frequent occasion to discuss them again. What we wish to point out is that there is a fourth stage, or perhaps we should say a way of return to the second stage of which we have just been speaking, but a way which is free from the injustice and stupidity involved in the classical illustration to which we have referred. There are individual as well as social causes of distress, but they may be studied and taken into the fullest possible account without incurring the reproach of having formed harsh and unjust judgments.

The individual may be studied sympathetically and with understanding—not to find if he is worthy—but to find how he may be helped. Parents may be asked about the blind son, not to convict them or him of sin, but to learn whether it is a case in which spittle and clay will effect a cure. Physical differences and mental differences may be taken into account, not to enable us to reward some and cast out others, but in order that we may know what opportunities to offer, what conditions to change, what income it is necessary to provide, against what temptations it is essential to guard.

The medical diagnostician and the clinical psychologist are as necessary to the social worker as the sanitarian, the employment agency, and the relief fund. Individual and family rehabilitation is our specific task, and discriminating and thorough knowledge of individuals is a fundamental means to that end. We must know to what motives particular individuals will respond, what are their special weaknesses and dangers, what are their strong points and their exceptional capacities. We must become able to "size up" individuals, as our employer "sizes up" applicants for a position, except that we have no such easy task as his negative decision. On our power of seeing what is individual, what is exceptional, what is promising in his situation, all our real usefulness in our relation to him depends. We must rediscover the individual with unabated interest in social causes and with equal determination to apply both individual and social remedies.

March 25, 1911.

THE COMMON WELFARE

"KNOW YOUR CITY" WEEK IN TRENTON

Trenton, N. J., like most other cities, has been going through social and industrial changes in the last generation or so. Some of its people have felt that new conditions called for a new diagnosis. In the early winter, the Trenton Young Women's Christian Association, under the leadership of Caroline B. Smith, general secretary, and Edith C. Moon, president, started an "it-is-to-know" campaign, and a day in January was set for beginning the community inventory. The Chamber of Commerce, Civic Improvement Commission, Y. M. C. A., Board of Education, merchants and manufacturers, churches, hospitals, and other organizations co-operated. A day, the original idea, almost over night expanded into a week—a "know your city week." The newspapers gave the project generous publicity.

The week started on Sunday with a religious day, the ministers preaching special sermons and holding special meetings at the Y. M. C. A. and the Y. W. C. A. On Monday, educational day, the public schools gave exhibitions of their industrial work and held "know Trenton" exercises; the Public Library displayed old and new prints, books, and autograph letters of local color, and a contest, with prizes, for the best essay on Trenton was announced. Civics day, Tuesday, was given over to a state convention on the commission form of government, called at the instance of the Chamber of Commerce, and Commis-

IN TRENTON WITH A CAMERA.

sioner John MacVicar of Des Moines outlined results in Iowa's capital city. In the evening President J. Horace McFarland of the American Civic Association lectured on City Ugliness, and threw on the screen the results of a camera tour around Trenton. Wednesday was children's welfare day; Thursday and Friday, general welfare days; and Thursday evening Governor Woodrow Wilson spoke on the duties of good citizenship. Merchants gave their display windows to manufacturers for the exhibition of "Trenton made" goods, and the exhibit was a revelation even to Trentonians.

The most stimulating facts brought out seemed to be those showing "city ugliness" and those dealing with health conditions. It was stated that the latest available reports of the Census Bureau (1909) show that out of every 100 deaths at all ages in Trenton in that year, 23 were of children under one year of age; that 30 out of every 100 were of children under five; that 12 per cent of all the deaths in 1909 resulted from diseases of the digestive system, diseases very generally related to the water supply (Trenton uses raw Delaware river water), diseases now believed by experts to be largely preventable; that of the other causes of death, tuberculosis (much of it preventable also) was responsible for one-sixth of the total number; that this tuberculosis death rate was 244.4 per 100,000 of the population, a figure nearly fifty per cent higher than the average rate for all of the United States in which vital statistics are recorded; that the number of persons killed by accident in Trenton in 1909 was at the rate of 113.2 to the 100,000 of the population, the number being greater than all the deaths in the year from typhoid, malaria, smallpox, measles, diphtheria, meningitis, influenza, and whooping-cough put together; that at this rate it would take only about two generations to kill as many persons as were killed on both sides at Gettysburg; that the death rate from all causes, in 1909, was 17.5 in 1000 persons—a death rate higher than that of New York, Chicago, Philadelphia, Boston, Pittsburgh, Cleveland, or Buffalo—higher also than that of any of the following cities which are nearer Trenton's own size: Indianapolis, Springfield, Mass; Rochester, N. Y.; Harrisburg, Reading, Scranton, Paterson, Camden, or Newark, and 20 per cent higher than in some of these.

Civic and health facts of this sort, coming to an audience which on the day before, when the question was raised, was unable to give the city's tuberculosis death rate for any recent year, were a challenge. It was accepted, and in less than a week plans were outlined for beautifying the city, improving health conditions, and federating relief agencies. Not the least among the good results of the week was the co-operation developed between organizations and individuals working for city and individual improvement, for the exchange of data and the formulation of plans.

WHAT IS READ IN AMERICA

A layman at a convention of librarians nowadays might almost feel himself at a conference of charities or some other gathering of social workers. Little is said—at least on the program—of the technique of cataloguing and other matters that go on behind the stacks, and much of the ways in which the librarian may make his place one of prime social importance in his community.

At the recent meeting of the New Jersey Library Association and the Pennsylvania Library Club at Atlantic City the principal address was on Outside the Walls. It was an urgent message to librarians to do their necessary office work quickly, and then get out among the people. James I. Wyer, Jr., director of the New York State Library and president of the American Library Association, who was the speaker, would reverse the customary method of circulating books. That involved a librarian in his library giving out books to those who asked for them. Mr. Wyer would have the librarian go first, and the books follow him. The librarian should join the Chamber of Commerce, call on the teachers, the ministers, the superintendents of factories, accept every opportunity to

speak in public, meet every one possible in his city. Then he can arrange for wider distribution; comparatively few people seek out books in a library, but nearly every one will read them if they are made easy of access in school, and factory, and home.

Further, a librarian who was such a "mixer" as he described would know something of what the American people read. Mr. Wyer said: "The American people do far the greater part of their reading outside the walls or even beyond the influence of the libraries." They read newspapers, magazines, and books, in the order named. Newspapers are first, "but a negligible fraction of them are read in the library, and the library's attitude towards newspapers for current reading and newspaper reading rooms is increasingly inhospitable."

The magazines "most read are not read in the library or found in library reading rooms"—indeed Mr. Wyer believes that the very names of some of the most popular magazines are unknown to librarians. The ten of largest circulation are *Woman's World, Ladies' Home Journal, Saturday Evening Post, Comfort,* Vickery and Hill list (a group of several periodicals), *Associated Sunday Magazines, McCall's, Home Life, Delineator,* and *Munsey's.*

So, too, with books:

> Not those of the dubious literary aristocracy who make up the *Bookman's* list of best sellers, but Mary J. Holmes and E. P. Roe are the most popular American authors with sales of three and five million copies respectively, and Ann S. Stephens and Marion Harland not far behind. The works of these authors do not appear in the American Library Association catalogue, nor in any self-respecting library's best books list, yet they are unimpeachable in morals, have undoubted earnestness and sincerity and many touches of real idealism.
>
> It is plain, then, that to know what the people are reading we must go outside the walls of our libraries.

The descriptive address by Clinton Rogers Woodruff, secretary of the National Municipal League, on civic periodicals must have been of great value to a librarian who wishes to keep his readers up to date on this very special and important element in a modern library. In the United States there are no less than 140 periodicals which treat of municipal government.

GET AT THE FACTS TO SETTLE EXPRESS STRIKE

After less than four uneasy months under the terms of the settlement of last November, a large number of Adams Express drivers in New York went out again on March 11. The circumstances attending the present strike offer a particularly good opportunity for applying that clause in the New York labor law which provides that the commissioner of labor may, when he deems necessary, order an official inquiry by the Bureau of Mediation and Arbitration, which shall, in this investigation, exercise the same powers as in cases where arbitration is invited by either party to the dispute.

This power is suggestive of the Canadian industrial disputes act now in force, though it is wider in application and does not, like the Canadian act, require the suspension of hostilities during investigation. It is seldom exercised, as it is officially stated, on account of the expense involved. Its object, as has been said of the Canadian act, is to bring to bear through publicity the power of well-informed public opinion, which can then be relied upon to prevent or shorten the disturbance.

The latest example of the use of compulsory investigation in New York was in the trouble at the International Paper Pulp Company's mills last May which involved 3,000 employes, more than half the total number in all the mills of the company.

After two months' strike the inconvenience caused business men by the vastly decreased output of the mills, and the military supervision required by disorder aroused so loud a public clamor for arbitration that a compulsory investigation was begun on May 19. The publicity given by this investigation had much to do with bringing about a speedy settlement. Even more important, in the opinion of the Bureau of Arbitration, the investigation cleared up unsettled questions that had made trouble periodically either between employer and employes or between different groups of

employes, and put both sides in better relations with each other than had existed for years.

The announcement by the commissioner of labor that he was about to direct the Board of Arbitration to exercise its powers in the last express strike is believed to have had considerable influence in bringing about a speedy settlement.

The question at issue in the express strike seems to call especially for a thorough investigation into what has been going on since the November settlement. The power of bringing public opinion to bear by bringing the facts to light, and of clearing the air between the parties to a controversy, is a strong argument in favor of compulsory investigation. One member of the Board of Arbitration has recommended that when a strike has reached such proportions that the militia is called out, this very act should automatically carry with it compulsory investigation and publicity in regard to causes.

TO PREVENT NEXT SUMMER'S DEATHS

With the sites chosen for the fifteen municipal milk depots which are soon to be established by New York, the equipment and administrative details decided upon, and the conditions of the agreements for supplying milk very largely settled, the Department of Health expects to have all stations in operation by early April. Since Manhattan already has thirty-one volunteer stations the year round while Brooklyn has but four, with a large area in need of them, nine depots will be located in Brooklyn, five will be in Manhattan—four of them on the East Side below Fourteenth street, and one in the Bronx in an Italian neighborhood which had a high infant mortality last summer.

The appropriation by the city of $40,000 will supply five supervising inspectors, physicians, who will be at each of three stations on two days in the week; fifteen nurses and fifteen assistant nurses, and five cleaners. Stations will be open every day, including Sundays. The city will have nothing to do with cash transactions involved in the sale of this milk, but will enter into agreements with milk producers guaranteeing the quality and fixing maximum prices which may be charged.

The municipality gives no outdoor relief. Mothers who cannot pay for milk are not to be relieved by below-cost sales; they will be relieved through funds raised by the New York Milk Committee and distributed by the large local relief organizations after investigation.

The department has determined upon two grades of milk suitable for infant feeding, which dealers using the stations must agree to furnish. "Baby Raw Milk No. 1" must either conform to the requirements laid down for certified milk by the milk commissions of the County Medical Societies, or must be "guaranteed" milk which is produced on farms holding permits therefor from the Board of Health. The requirements for guaranteed milk are practically identical with those for certified milk. "Babies' Pasteurized Milk No. 2" must be from farms holding certificates from the department showing that at least seventy-five per cent of the rules and regulations governing the production and handling of milk have been complied with.

The New York Milk Committee estimates that sixty additional depots are needed to save the babies who die needlessly in Manhattan each year. To establish and maintain these depots and provide relief for one year, the committee figures that $300,000 will be required. Since no further city appropriation is available before next year, the committee, which now conducts four depots of the same type as those to be opened by the Health Department, has undertaken an energetic campaign to raise as large a part as possible of the sum necessary for establishing new depots this summer.

EDITORIAL GRIST

MINNESOTA LEADS

If you are fortunate enough to get hold of *Part II of the Twelfth Biennial Report of the Bureau of Labor Industries and Commerce of the State of Minnesota, 1909-10,* don't throw it away or lay

it on the top shelf to be thrown away next year. Read it. Minnesota is the first state which has made an effort to count its killed and injured, and this report is a record of the first year's count. It is the most complete statistical study of work-accidents that has yet appeared in this country.

In 1909, at the same time that it created a commission on employers' liability as eleven other states have done, the Legislature of Minnesota was wise enough to pass a law requiring "every employer of labor engaged in industrial pursuits" to make a report of any and all accidents to his employes within the scope of their employment. This report must include not only the usual information as to "age, sex, occupation," "cause, nature, and extent of injury," but also, "the wages of the injured person," "a statement of all expenses, costs, damages, and compensation to which the employer is put on account of the injury,"—and a good deal of other information.

New York state, which requires railroads, and gas, and electric corporations to report accidents to the Public Service Commissions, and requires the reporting of accidents in factories, mines, tunnels, and quarries, and since September, 1910, in construction, excavation, and engineering work—to the Labor Department—probably goes as far in collecting accident statistics as any other state in the Union except Minnesota. The new law in Minnesota really makes complete work-accident statistics possible. It apparently requires the reporting of accidents in all employments in industries conducted for gain or profit. One of the most significant things about this first report is that although the statistics must be very incomplete in the industries where employers are not yet used to reporting, and where the Labor Department must depend largely upon the newspapers for their first notification of accidents—they already indicate what a very large number of accidents occur of a class which in all other states go quite unrecorded. Thus the total record for the year in Minnesota industries was 342 deaths, and 10,463 injuries. Of course the great majority of these occur in railroading, mining, manufacture and lumber industries. But 37 deaths and 717 injuries come under "contracting"; 4 deaths and 52 injuries under "hotels and mercantile"; 7 deaths and 17 injuries under "livery and teaming"; 12 deaths and 51 injuries under "agriculture," and so on.

The report on accidents is the work of Don D. Lescohier, special agent of the bureau. It is at once graphic in a human sort of way, and practical in its incisive analysis. A table showing the personal cause of accidents according to the employer's opinion is an example of its illuminating features. In only 10 per cent of cases did the employer blame the accident exclusively on the injured workmen's negligence while in 61 per cent he laid it altogether to trade hazard. (In 4 cases or 10 per cent the employer actually reported the accidents as due to his own negligence!) There is a most interesting tabulation of Minnesota Supreme Court decisions in employers' liability cases during the past two years.

In all but 25 out of 120 cases there was a judgment for the plaintiff in the trial court and most of these judgments were affirmed. If Minnesota is typical, the western courts must lean more toward the injured workman in interpreting the liability law than the courts in some of our eastern states, Pennsylvania for instance.

A special investigation of 300 cases was conducted by the department, the results of which are given in tabular form, and also in the form of a digest. Two cases can be quoted from the latter to show the unusually interesting way in which the facts are presented:

13. Assistant engineer at a municipal electric plant. A gasoline engine stood in the middle of the floor about three feet from a valve and the shaft upon which it operates. A clutch on the valve shaft was about three feet from the floor, on the side toward the engine, and revolved rapidly.

Deceased had orders to open the valve before he started the engine. The supposition is that he forgot to do so before he started the engine, but stooped over to do so afterward. He wore a loose flapping jacket, which probably blew against the clutch. He was whirled about the end of the shaft, striking the floor each time as he went around and was killed.

The deceased was notoriously careless and

had been served with a ten-day notice of dismissal. On the seventh day he was killed.

Both the city and the deceased were at fault. The place where he was killed was unnecessarily dangerous and has since been protected. The man had been warned of the danger of wearing a loose jacket. A wife and two-year-old child survived his death. Injured carried $200 insurance in addition to $800 fraternal insurance. The city offered to settle for $250. Funeral expenses, $75; wages, $10.

14. Boy laborer at lumber mill; fourteen and one-half years old. Attempted to climb from one floor to the other in the mill on the rope that is used to run the elevator. Slipped and fell to the bottom of the shaft. Funeral expenses, $116.50. Employer paid funeral expenses and gave six months' wages, $78; wages $3.

It has been noticed, both in our field of investigations and in the accident reports sent in by employers, that a much larger per cent of the accidents to boys and girls under twenty-one years of age are due to personal carelessness or recklessness than of accidents to persons of maturer years. This raises the question, where shall we draw the line as to what constitutes personal negligence? Shall we hold every person to the standard of perfect common sense, judgment and care, and say that every accident due to human forgetfulness, thoughtlessness, overconfidence, ignorance, recklessness, etc., is an accident caused by negligence? If so, we shall double the percentage due to the indifference, carelessness or deliberate refusal to spend for the workman's protection upon the part of the employer.

On the other hand, shall we recognize human frailties—forgetfulness, recklessness (particularly of the young) ignorance, faulty judgment, misunderstanding of orders or processes, etc., as being unavoidable, non-eradicable and inevitable, as cave-ins, washouts, broken machinery, and runaway horses?

For those who are studying the problem of prevention, Chapters V to XIV, which contain a detailed discussion of the causes of accidents actually reported in different industries, are most valuable. The live, practically useful manner in which these statistics are presented is illustrated in the following paragraphs:

SCAFFOLDS

More than one-half of those injured by falling fell from scaffolds. In twenty-four cases the scaffolds broke because made of defective materials, or because constructed in a slip-shod manner. A few illustrations will make this clear: A carpenter was working on a scaffold about the eaves of a new house when he stepped on a defective plank and fell through the scaffold, sustaining body bruises. Another carpenter fell twenty feet while working on an elevator because a defective timber in the supports of the scaffold caused the scaffold to fall. He injured his head and dislocated his shoulder. Twelve other accidents in similar ways, one of them fatal, and a ninth because a scaffold was not strong enough to support the amount of cement blocks that a mason piled on it. These accidents due to poor construction are frequently chargeable to the workmen. An electrician working on a scaffold fell off, supposedly because he stepped off backwards. He had rearranged the scaffolding carelessly. A structural iron worker was removing planking from a scaffold on which he had been working when a needle-beam, insecurely fastened in a loop of rope, slipped out and caused him to fall two stories. A painter was hanging a swinging scaffold. He placed the stirrups too far apart. When he got on the platform the boards slipped out of the stirrups and allowed him to fall to the street. His partner had warned him that the scaffold was not safe and refused to go on it. Four men were hurt while building or tearing down scaffolds. In one case the workman was careless and did not properly fasten his supports. In two cases the scaffold broke. In the other the man slipped.

Defective scaffolds are not the only kind that cause men to fall. As large a number of men were injured by stepping backwards from scaffolds or losing their balance while working on them as by falling because the scaffolds broke. These accidents are all very similar. "Mr. —— lost his balance while at work on a scaffold at the —— building and broke his leg." "Mr. —— stepped backwards off of a scaffold today and sustained painful bruises and internal injuries." "Mr. —— fell from a scaffold while repairing a house today and broke his arm in two places." Occasionally a different element enters into the causes as in an accident to a roofer working on a scaffold who lost his balance while trying to open a window and fell seventy-five feet to his death.

LAUNDRIES

It is quite certain that the Bureau of Labor has been unable in the past year to gain any satisfactory knowledge of the number of laundry accidents that have occurred. Only three serious and five severe accidents were reported, but it is beyond question that many more occurred. Six of the accidents reported were caused by machinery, and one by hot water. The cause of the other is unknown. One of the accidents was caused by a shaft which caught the employe and hurled him to the floor, badly bruising him. Three happened on the ironing machine, or "mangle." In each case a girl's hand was caught and crushed under the rolls. One of these girls lost a finger and all of them were in danger of very serious injury. Mangle accidents are no longer necessary. The automatic electric stop already referred to in this chapter is an effectual preventive. The most careless girl cannot be injured when her machine is equipped with one of them. A laundry driver's leg was broken in a runaway, his horse overturning the sleigh.

Among the appendices is included a good bibliography on Industrial Accidents, employers' liability and workmen's compensation.

Unusual as the report is this is in many respects, its chief claim to attention is that it presents the valuable results of a comprehensive accident reporting law after one year's trial. The demonstration is of national significance. Among the appendices included in the first report of the New York Employers' Liability Commission last year, was an estimate of the proportion of industrial accidents in New York state of which no record is kept. This was a careful estimate based on a study of coroners' inquests and hospital records. It indicated that probably not more than half of the serious and fatal accidents of employment were reported at that time. One of the commission's recommendations last year resulted in a law requiring the reporting of building accidents. It is to be hoped that when this commission reports this spring on the Causes and Prevention of Industrial Accidents, it will follow the lead of Minnesota, and put the New York state Labor Department in a position to collect and publish complete accident statistics, covering all industries—an obviously necessary basis for intelligent efforts toward accident prevention.

EIGHT HOURS

JOSEPHINE GOLDMARK
National Consumers' League

The East and middle West are left far behind by the new laws for working women in two Pacific states, California and Washington. In both states the Legislatures have just passed bills, now awaiting the governors' signatures, providing for an eight hours day and forty-eight hours week. These are the first comprehensive eight hours laws for women and mark a notable advance in the protection of working women.

The text of the Washington bill is not yet at hand. The California bill includes all women "employed in any manufacturing, mechanical, or mercantile establishment, laundry, hotel, or restaurant, or telegraph or telephone establishment or office, or by any express or transportation company." Small wonder that an eye witness reports the bill the "hardest fought of the session!" It passed the Assembly unanimously; at the final vote in the Senate seven amendments were offered from the floor, but the bill finally passed by a vote of thirty-four to five.

The opposition of the laundry, hotel, restaurant, and fruit growing interests was especially strong, and to the great regret of the bill's defenders an important exemption had to be conceded in order to save the rest of the measure. This provides that the limitation of working hours "shall not apply to nor affect the harvesting, curing, canning, or drying any variety of perishable fruit or vegetable."

Considering the large number of women employed in the canneries and the long duration of the canning season in California, this exemption is particularly bad. Yet the skill and energy shown by the defenders of the eight hours bill, in and out of the Legislature led by Maud Younger, suggest that at another session the women employed in the canneries will at least be partially protected by some limitation of their working hours. A strong, though ineffectual, fight was put up against the exemption this year with the cry of: Save the perishable women! in reply to the canners': Save the perishable fruit!

The same interests which procured an exemption of the law in California were successful in Washington also. Fruit and fish canning establishments are exempted but it is especially provided that if this exemption should be held unconstitutional by the courts, the exempted industries shall be included in the scope of the law.

Bills providing for an eight hours day for women have also been introduced in Colorado, Minnesota, Nevada, Ohio, Montana, and Wyoming, with chances of being amended so as to allow a larger working day. In Colorado the Manufacturers' Association through its president, T. E. Williams, has issued an address to the state Senate in opposition to the proposed law, asserting that their "charity accounts alone will run more than $2,000 per year each, besides a great

deal more that we do not keep track of," and feelingly asks the senators: "Do you gentlemen believe that business men who interest themselves and give liberally to such charities that I mention, need any legislation to make them care for the health, happiness, and welfare of their own female employes?"

Some other important pending bills designed to shorten women's hours of labor are as follows:

In Illinois it is proposed to extend the present ten hours law, which applies only to women employed in factories and laundries, so as to include women employed in mercantile establishments, hotels, restaurants, telephone offices, etc.

In Missouri, after a most effective campaign, a bill passed the House, prohibiting the employment of women employed in factories and laundries more than nine hours in one day and fifty-four hours in one week. In the Senate, it was amended so as to include mercantile establishments. The House has accepted this amendment and the bill awaits Governor Hadley's signature.

In Wisconsin and New Jersey bills are pending which provide for a ten hours day for women.

The bill before the Delaware Legislature prohibits the employment of any adult woman more than ten hours in any day, and the employment of any girl under eighteen years more than nine hours in any day. Special opposition has arisen to the section which forbids the employment of adult women after 10 P. M. and of girls under eighteen years after 7 P. M.

In New York a bill is before the Legislature which seeks to remedy the present provision of the labor law permitting the employment of women in factories twelve hours in one day, provided that the weekly total does not exceed sixty hours. Four years ago the New York law was amended so as to reduce the maximum hours in factories from fourteen to twelve hours in one day, but the law has remained practically non-enforcible on account of the shifting schedule which it allows. The new bill follows the Michigan statute of 1909. It limits women's work in factories to nine hours in one day, except that women may be employed ten hours if the total week's work does not exceed fifty-four hours. The bill is strongly urged by organized labor, but a favorable hearing before the Assembly committee has been followed by violent opposition.

In connection with such state action for reducing women's hours of labor, mention should here be made of a bill introduced into Congress by Senator La Follette, shortly before it adjourned. This was done at the instance of the National Consumers' League. Since the child labor law of the District of Columbia protects from overwork girls up to the age of sixteen years only, all young girls over sixteen years as well as adult women may be employed any number of hours. While the number of women employed in manufacture in the District is not large, many are working in the laundries, stores, hotels, etc., in Washington.

The bill drawn by the National Consumers' League provides for a ten hours working day and a working week of sixty hours for women employed in any kind of manufacture, including dressmaking and millinery establishments, in stores, hotels, and restaurants, or by any express or transportation company, or in the transmission or distribution of telegraph or telephone messages. It also prohibits the night work of women between 10 P. M. and 7 A. M.—a form of work which fourteen European nations have agreed, by international treaty, to abolish, but which is prohibited in only three American states, Massachusetts, Indiana, and Nebraska!

GRAFT, CHILDHOOD, AND THE CHURCH

RUDOLPH I. COFFEE
Tree of Life Synagogue, Pittsburgh

On February 15, The Voters' League of Pittsburgh issued a bulletin concerning the public schools of the city. The opening sentence of that report said that the schools "are operated under a system inviting dishonesty and incompetency." Facts were given which clearly proved both contentions. So remarkable was this exposé that it was published all over the land. What effect did the

publication of this report have upon Pittsburgh?

To understand the situation, a brief outline of the school system is needed:

> There is a central board of Pittsburgh, and a central board of Allegheny, and in Pittsburgh there are forty-six and in Allegheny fifteen sub-districts, with 412 school directors. Each of the sixty-one sub-districts and the two central boards is a separate business organization, with power to raise tax and spend money. Thus there are sixty-three distinct and separate books of account, sixty-three different business aggregations, each engaged in large operations.[1]

The schools of Allegheny are better managed, and will not be further mentioned in this review.

An analysis of the personnel of the school directors by the Voters' League showed that

> there are fourteen bartenders and saloon keepers; thirty-eight directors holding public jobs; seven who have no legitimate occupation, (such as professional gamblers and the like); thirty-six laborers, including the lowest grade of unskilled mill-workers, drivers, watchmen, and waiters; there are sixteen contractors and builders, some of whom are engaged in public school contracting; nineteen storekeepers, a majority of whom own small grocery stores; twenty-three workmen engaged in the various trades, such as machinists, plumbers, tailors, barbers, printers, carpenters, plasterers, etc.; five conducting small real estate and insurance businesses; thirty-seven clerks, including bookkeeper, collectors, and salesmen,—seven prominent men throughout the city in business life; twenty-four in professional occupations, thirteen physicians, six dentists, and three attorneys. Of those holding positions, such as managers, secretaries, auditors, superintendents, and foremen, there are twenty-two. The good boards being composed almost entirely of good men, few good men are left to leaven the other boards.

The above shows the caliber of the men "who by lack of educational advantages and business training could not, no matter how honest, be expected to administer properly the affairs of an educational system requiring special knowledge and where millions are spent each year." These facts explain how the increased expenditures for school purposes during the years 1900-1909 amounted to fifty-four per cent, while the number of pupils increased but twenty-three per cent.

[1] See the Elementary Schools of Pittsburgh, by Lila V. North. (The Pittsburgh Survey findings.) *Charities and the Commons*, March 6, 1909.

The Bulletin contains many specific instances of deliberate graft. In many schools the board gives an annual picnic. "Some of these school picnics have been nothing more than drunken orgies for the directors and their dissolute and disreputable friends." A man who confessed to the Voters' League said, "I recollect one picnic where . . . I paid a board $1,400 graft. The picnic itself cost but $1,500. The original check made out to me was for $2,900 covering all the tickets originally for which I gave proper receipts. The directors brought this check to me after the picnic for their refund which amounted to $1,400."

"The central board is no better managed than the sub-districts." For fifteen years a constant effort was made to provide additional high school facilities. "Up to this time the board, according to a report submitted to it, has paid out to architects and attorneys $16,000 and bills have been filed against it by architects amounting to $122,050 more, and has nothing to show for it."

One month ago, this report was made to the citizens of Pittsburgh. Every newspaper contained the findings and commented editorially. Not a single paper denied the truth of the charges. There were the statements about the directors, about a fifteen-year struggle for a high school and no advance made, about school money deposited in Pittsburgh banks these past ten years amounting to $21,566,000, yet only $129,584 had been received in interest on deposits, while over a million dollars had been paid for interest charges during the same period!!! The district attorney said the charges were not new, for he possessed like information. The secretary of the Teachers Association said the half had not been told. Almost every person in position to know who was interviewed said that the charges were horrible, but true. Yet a full month has passed and not a single step has been taken by anybody. A few days of indignation and excitement followed the publication of the Bulletin, and then the incident passed as though there had never been such a report. It was scandal enough that the facts were true, but the real scandal consists in the apparent submission of the

people to the published conditions. When the Bulletin was made public righteous people said that greater scandal than this was impossible. Yet a lower level has actually been reached in the seeming tolerance of the voters of Pittsburgh to the continuance of the conditions reported.

The Voters' League published the facts and that finished its function. The league was under no obligation to prosecute the guilty men. In the first place it would have required an enormous sum of money, and then, against whichever men it brought charges, there would be a cry that others equally guilty had been protected. To be effective the proceedings against the guilty parties must come from the people affected. It was thought that these charges would rouse the public conscience, and that in every school district of this city the people would rise and remove the men who had fattened at the expense of innocent children. Nothing has happened, absolutely nothing, and the schools are being conducted today as they were before publicity was given this terrible indictment.

Indirectly an excellent result has been accomplished, but not in Pittsburgh. In the present session of the Legislature at Harrisburg there is every indication that this pernicious school system, which has so mercilessly bound Pittsburgh for the last half century, will be superseded by a proper and modern code. This Bulletin has aroused the conscience of the state to the needs of the city, and this marshalling of facts will prove a strong argument in favor of a change in the law.

What excuse can there be for the indifference to this report? Our public schools are the pride and boast of every American patriot. Are Pittsburgh citizens the exception? Yet every summer the subject of the school system receives attention when teachers are dropped for no valid reason and others, favored by some directors, are chosen instead; for Pittsburgh teachers are merely chosen from year to year. The publication of the Bulletin called for leadership, but no organization arose to continue the unfinished work begun by the Voters' League. Here a moral question was involved, and the ministers of every denomination should have joined as one man to correct this abuse, for are they not to mould and to lead public opinion instead of following it? There are strong, able, and eloquent clergymen among the various denominations in Pittsburgh, and in many pulpits this Bulletin was used as a text to preach burning words. But the system is wrong; ministers must labor together for effective work. Had they been united these past years and preached on the common platform that "righteousness exalteth a nation" their preaching must have borne fruit. It is gratifying that of late the church is taking an interest in municipal affairs. Public meetings have been held in many of them to discuss the new charter for Pittsburgh and create a sentiment to aid its passage through the Legislature.

Such individual church and synagogue work, however commendable, cannot wield the influence that would result from a united ministry. There will be theological differences about God and how to serve Him, but there can be no possible differences as to the duty of the church of the future, and of its ministry, when "sin lieth at the door." Agreed that ministers should not interfere in national politics, and perhaps individual clergymen attack problems that might more properly be left to the scientific expert, but if the ministers will not strive to uplift the ideals of a city they lose their noblest power for good. Best results come from united action, and with such a ministry in every large city enthusiastically preaching "let justice flow along like water and righteousness like a mighty stream", municipal corruption would be mightily checked in its destructive course. Let the ministers cease emphasizing differences but combine and make impossible in the future such conditions as reported by the Voters' League. Then, when people mention the leaders in the present moral fight against wrong, in addition to such names as Roosevelt, Hughes, Bryan, Eliot, and Jane Addams, there will be found clergymen equally high among the ethical leaders of this nation.

March 25, 1911.

CONGESTION AND CITIZENSHIP

Overcrowding affects every phase of urban[1] life. The report of the New York City Commission on Congestion of Population assumes that it is therefore desirable to box the compass of social reform, and it is in this sense the first comprehensive program put forward by an official body for the largest city of America as a community of human beings. The program as a whole and its various proposals are now properly before the public for criticism and for opposition or support.

THE SURVEY set forth in brief the recommendations of the commission in its issue for March 11 and published an editorial on the report as a whole on March 18. Here are published a series of short, pointed reviews by experts in different lines of social work. With respect to each subject, reviews were requested both from those who were supposedly for the proposals and those who would supposedly take issue with them. Hearty thanks are due to the contributors of the following reviews received within the limited time available before the date of publication.

[1]The commission made its report February 28, but its findings were not published by the *City Record* until March 7, and the issue containing them is entirely exhausted. Supplementary data appeared in the *City Record* for March 11. The commission will republish the report (in its entirety, it is to be hoped) in the near future.

PUBLIC OUTDOOR RELIEF AND CONGESTION

FREDERIC ALMY
Secretary Buffalo Charity Organization Society

As a result of the radical report of the Commission on Congestion I foresee a resurrection of public outdoor relief as a burning issue. It was practically abolished in New York and Brooklyn more than thirty years ago, and does not now exist in most of our chief cities. To oppose it is orthodox, but the increasing attention to the cardinal doctrine of adequate relief, and the increasing development of the costly tuberculosis relief, are now almost breaking the treasuries of many private charitable societies. In my own society, for instance, all relief is increasing, and one-quarter of all our relief, or $6,000 out of $25,000 per annum, now goes to tuberculous families. More than one-third goes to widows, one-tenth to deserted wives, and nearly three-quarters to families where there is sickness. The congestion report proposes to renew public outdoor relief in New York city for consumptives and for widows, provided they remove from congested sections, and live "under such surroundings as are approved." Both public and private out-relief are apt to be cruelly small, but this very special emphasis given to congestion is almost naive. We make regular school attendance by the children the chief condition of our relief, and consider congestion important but distinctly secondary. Moreover, public aid could not long be given in families where the father is dead, but refused where he is disabled, and therefore a living cost and care; or given to consumptives and refused to those who have typhoid. This is really a proposition for public outdoor relief complete.

After more than ten years of opposition to public outdoor relief I find myself still yearning for it on account of its seemingly limitless treasury, if it can be safeguarded and made intelligent as it appears to be in Denmark and Switzerland. I hope for it in time, but the arguments against it are too serious to be overturned easily. First is Thomas Mackay's, that to the imagination of the poor the public treasury is inexhaustible, and they drop upon it without thrift as they dare not do on private charity. Next, a large relief fund often leads to lazy charity. Pre-collected relief is more carelessly given than relief hand-picked for special families. Again, public relief is not so limitless as it seems. According to my observation it is more stingy everywhere than private relief. It not only gives small, limited doles, with no attempt at adequate pensions, but whereas private relief usually goes with a plan and with a friend, public charity usually goes bare. There is sometimes a plan, but almost never a friend, and no effort to find work, to find better paid work, to uncover relatives who will help, or to alter conditions. Of course this can be done by public charity, but today private charity is more flexible, patient, and resourceful.

This is because modern private charity believes in adequate work as essential to adequate relief. "Charity is expensive when well done," said Homer Folks to the commission (*City Record*, page 1897), but one of the advocates (before the commission) of public pensions to widows is president of a private relief society in which no salaries are paid to visitors. Is it any wonder that this society lacks money for adequate relief? Most relief by unguided volunteers is like pouring water through a sieve. Would a volunteer cook be economical, or would you eat the food? Devoted, untrained amateurs, with their scraps of time, are not competent to solve the difficult problems of broken lives, though as auxiliaries they are invaluable.

The standard of public charity is fast rising. The delicate work of placing out children is now well done by public officials in many states and cities, but I doubt whether as yet public charity would support its outdoor relief with competent paid service. There is still a feeling that anyone is competent to give alms, whereas in fact relief is as valuable but also as dangerous as the powerful drugs which ease pain but often create an appetite more dangerous than the pain. Even where there is no taint of pauperism, the problems of constructive relief are most difficult. Bad, very bad as private outdoor relief has been in the vanishing past, it has not been so bad or so niggardly with individual families as public outdoor relief. Good public outdoor relief is a consummation to be hoped for, but in my judgment its hour has not yet come.

CHARITABLE RELIEF AND CONGESTION

HOMER FOLKS

Secretary New York State Charities Aid Association
Former Commissioner New York City Department of Public Charities

The recommendations of the New York City Commission on Congestion of Population relating to the promotion of the better distribution of population through municipal control of charities and by public outdoor relief are six in number. The first two contemplate the distribution of city aid to the dependent members of families of consumptives and to indigent widows with children, such distribution to be under the control of a board of trustees constituted in some such manner as the board of trustees of Bellevue and Allied Hospitals, and presumably containing in its membership persons actively identified with societies having to do with the relief of the poor in their homes. That the private relief societies in New York city as a whole have failed to provide adequately for widows with children and for the families of indigent consumptives can hardly be questioned, since some of these societies admit it. There will, therefore, be considerable sentiment in favor of some change by which either private charity for these classes of dependents can be made more adequate, or public aid in some form provided. The commission seems to have made a wholly gratuitous but serious error in naming this board "Board of Trustees for Public Outdoor Relief." Personally I have felt disposed to favor some form of public relief for indigent widows with children, but only and emphatically upon condition that it shall be radically different in spirit and method from ordinary public outdoor relief. There is an old saying to the effect that if you give a man a bad name you might as well hang him at once. I think this will be true of the new plan proposed by the Congestion Commission for aiding the families of consumptives, and indigent widows and children, through a board of public outdoor relief.

The third recommendation is the establishment in the comptroller's office of a bureau for the supervision of charitable institutions whose property is exempt from taxation. To this I am wholly opposed. I favor supervision of charitable institutions by the State Board of Charities, whether exempt from taxation or otherwise. The proper agency for such supervision, in my judgment, is the state, and the sufficient reason for supervision is not exemption from taxation, but the protection of beneficiaries from neglect, abuse, or improper or unwise treatment.

The fourth recommendation is that the city encourage the removal of charitable institutions, except emergency hospitals and similar institutions, from the congested districts. The commission doubtless has in mind orphan asylums, homes for the aged, and similar institutions, most of which receive city aid. Its suggestion that the city use the leverage of its per capita payment to induce the institutions to remove to suburban or rural surroundings is excellent. From every point of view the removal of these institutions to rural surroundings where land is cheap, where the cottage system can be adopted, and where agricultural and horticultural training can be given, is greatly to be desired, and is one of the most urgent needs in connection with New York's charities.

The fifth recommendation is that the city acquire tracts of land in the outlying boroughs for extending the work of the New York City Farm Colony, and also for teaching adults methods of earning a living, such as agriculture and gardening. If our municipal administration were extremely competent this might perhaps be undertaken with profit. As our municipal machinery is, however, overloaded with work, I greatly fear that what we would succeed in teaching these adults would be to depend upon the public treasury for maintenance, rather than to maintain themselves by labor.

The sixth and last suggestion is that private charities be urged to dispense relief so as to encourage the distribution of population from congested districts, and to encourage beneficiaries to learn other trades than those of congested city life. Personally I doubt whether the giving of relief has or can have much part either in causing or in curing congestion. The giving of relief should certainly be accompanied with the securing of sanitary conditions in the households in which the relief is given.

CHARITABLE RELIEF AND CONGESTION

ROBERT W. HEBBERD

Former Commissioner, New York Department of Public Charities, Secretary N. Y. State Board of Charities

The report of the New York City Commission on Congestion of Population is interesting in all its aspects, and particularly so to me in its reference to the relief of the poor in the city. Whether one agrees with the conclusions of the commission or not, there is ample food for thought to be found in them. That the principal private relief giving agencies in the city have undertaken what

is generally very largely a public function, the relief of the poor in their homes, cannot be gainsaid. That they are doing much good work, I am confident.

That they have means enough to perform this function adequately and thoroughly I do not believe, and there are many who share this opinion. These societies can hardly be blamed for not doing their work adequately if they have not the means to do it. They can, however, be criticised if they fail to state clearly their inadequacy and the reasons for it.

The United Hebrew Charities set a good example in this respect some years ago when it closed its offices at that period in each month when its money gave out, and plainly stated the facts. Personally I am satisfied that the greatest need is for means to help dependent mothers keep their homes together and their children with them. Such homes should of course be maintained in non-congested districts, in accordance with the views of the Commission on Congestion of Population, whenever possible. As most of the mothers with families of children will have to be supported outright at home, this should be feasible in many cases. Others, however, may be obliged to live close to their work downtown, and they, of course, should not be deprived of aid on that account.

The question of paying for the machinery of relief giving is one that always has received much consideration. Those who are familiar with the conditions surrounding such work know, however, that adequate machinery must exist, not only to discriminate in giving, but to help people to their feet where giving is not necessary, if any real good is to be accomplished. At the same time it is important not to have over-visiting, as this injures the spirit of those who are called upon to tell their woes to many people, and even injures the reputations of those who are thus visited. For this and other reasons I do not look with favor upon the creation of another body to give relief to the poor in their homes. In my opinion the private charities should seek largely to supplement their incomes for relief, giving particularly to dependent mothers having children to bring up.

Such mothers, instead of receiving two or three dollars a week at most, should have in some cases that I personally know about ten or twelve dollars a week regularly. Those would cost no more, and of course might cost much less in the end, than the care of three or four children of such mothers in institutions. The actual cost to the community would, of course, be much greater in those cases where the children, owing to the absence of the mother from home, went astray and helped to swell the criminal ranks of the community.

There should be a definite policy in each case on which the mother could depend, so that with a tranquil mind she could attend to the requirements of her young household. At the moment I know of a widow who has been under the notice of one of the societies for seven years without any definite relief policy having been formulated. But I can attribute this only to lack of money, not to lack of humanity.

Public outdoor relief, as it had been given, was wisely banished from New York years ago. There should be a return to it only when the private relief societies after determined effort have finally proved their inability to cope with the situation with private subscriptions. If they cannot accomplish this, then I think they should frankly say so, and that public moneys should be given to them to distribute without any cost for the machinery of distribution. The rising statistics of the children's institutions show that too many homes are being broken up in New York city and that everything possible, even to the tearing down of old theories, should be done to prevent this. The lines must be reformed on the side of humanity. These poor mothers must be adequately relieved even if the public treasury has to give such relief. The relief must be forthcoming wisely and adequately administered. The attendant dangers can be and must be avoided through the more intimate and friendly interest of the representatives of the relief-giving agencies.

The Commission on Congestion of Population is to be congratulated upon having helped to promote discussion on this important subject, which means that it has helped towards its solution.

CHARITABLE RELIEF AND CONGESTION

MORRIS D. WALDMAN
Manager United Hebrew Charities of the City of New York

If the commission had done nothing else than amass the interesting and valuable information embodied in its report, its appointment would have been vindicated. One cannot help being impressed by the scope of its inquiries and the enthusiasm injected into its investigations. But it appears evident that neither breadth of scope nor enthusiasm has sufficed for a clear and rational understanding of the problem.

If the recommendations regarding charities are indicative of the logic of the commission's other recommendations, then I cannot but conclude that hasty reflection and superficial analysis have marked its deliberations.

For instance, the statement gravely made by its committee on charities that 500,000 persons in this city, or one out of every nine in the population, have been found in receipt of charitable aid, is most astounding. I cannot account for it except by the surmise that the total numbers of applicants at all charitable agencies were aggregated, no allowance being made for the fact that in many cases one and the same person is recorded at several institutions. Thus, a woman who recently showed me thirty-two cards of medical dispensaries

she was attending, according to this calculation, would have been counted at least as thirty-two persons. She had a husband and six children, and if these were recorded, as is quite likely, there would have been counted eight times thirty-two or two hundred fifty six persons. This family was recorded at several other institutions as well. This is an extreme case, but not exaggerated. Parenthetically I may say that this hasty and sensational assertion is an unwarranted reflection upon the self-sustaining qualities of the masses of this city—a reflection that is the more deplorable because of its official character.

The belief that so large a proportion of the people is dependent is the premise upon which all the recommendations included in paragraph 11 are founded. In the light of the true facts, namely, that only a very small proportion of the population seeks charitable aid of any kind, the removal of these persons to the outskirts of the city, even if feasible in all cases, would contribute but little towards the relief of congestion. The recommendation that the city subsidize widows with their dependent children, and the families of consumptives, provided such persons move away from the crowded quarters of the city, is no mean proposition. That it would involve the city in tremendous expense, though a serious matter in itself, is trivial when compared to that aspect of the question which makes it one of state polity, not hastily to be disposed of as one of a hundred recommendations of local import. The inadequacy of the relief granted to these unfortunates by private charitable agencies is not of itself sufficient ground for public outdoor relief. What effect a general policy of pensioning widows and orphans would have upon the thrift, prudence, and industry of the masses who now provide for their families against their death by insurance in one form or another, is a question that must first be satisfactorily answered. He who advocates such a plan assumes a grave responsibility.

I cannot even fall in line with the commission's recommendation to transfer to the comptroller's office supervision over charitable institutions in this city. The State Board of Charities has done this work well in the past, and is so constituted as to insure that capable and honorable men shall serve. Its function might again be extended to cover private agencies not receiving public financial support, with the result that thereby the activities of irresponsible organizations might be checked or wholly discouraged.

One must marvel at the courage and assurance of the commission to submit to the searching scrutiny of a wise mayor and an intelligent public opinion such sweeping recommendation after so hasty an investigation. I doubt whether the public is prepared to accept the commission's view that congestion is the cause of all our social evils and that its relief is their panacea. The recommendations concerning charities, it seems to me, must strike one as the exuberant efforts of impractical, though zealous, reformers to legislate the millennium into existence. The force of the other proposals, some of which are wise, must to some extent be broken by this ill-considered divergence into irrelevant questions of which the commission is ignorant, or with which at best it is only partially familiar.

CRIME AND CONGESTION

O. F. LEWIS
Secretary New York Prison Association

The three recommendations of the commission regarding the reduction of delinquency in congested districts are of an obvious nature. No one should fail to subscribe to the recommendations that certain streets in the congested districts be closed during certain hours of the day so that children in these districts may use them for playgrounds; that the Department of Education be urged to arrange talks to mothers on the danger of children occupying rooms with lodgers; that more physical exercise be provided for children in the public schools. In the last recommendation it must be presupposed that the commission has made a careful analysis of the amount of time given at present in the public schools to physical exercise.

The recommendations of the commission's sub-committee on crime and delinquency suggest, first, the securing of adequate cubic air space for adults and children in apartments, with legal provision against overcrowding. The sub-committee also emphasizes the dangers of allowing a lodger to occupy a room with a child over twelve years of age of the opposite sex. The recommendation is made that tenement house manufacture be prohibited; that more parks and playgrounds be provided, with more careful supervision; that restriction on the height of tenements in outlying districts be enforced; that relief be given by the city, where necessary, to families in congested districts, their removal to better quarters to be a condition of such relief. Dark rooms should be vacated and the principle of the city farm colony should be extended, with the teaching of agriculture and gardening. Other recommendations are made, similar to those embodied in the report of the whole committee.

The recommendations in general seem sensible. As to the giving of public outdoor relief by the city instead of through private charity, much opposition will undoubtedly be made. The burden of proof is on the committee to show that the poverty problem will be better handled by a city of the political complexion of New York than by the efforts of private charitable organizations.

The connection between congested population and crime is an indirect one. Congestion seems conducive to crime; hence the removal of congestion will reduce crime. The committee's report lacks specific recommendations as to the handling of the crime problem as it now exists. Any attention called to the conditions of congestion is useful.

INDUSTRY AND CONGESTION

H. J. F. PORTER
Industrial Engineer

The report says that the congestion of people in certain sections of the city is due initially to the establishment here of certain industries of the type engaged in the manufacture of light products not involving the operation of heavy machines, such as clothing, millinery, laundry work, printing and paper goods, metals, machines and conveyances, food, liquor, tobacco, leather and rubber goods, and wood articles, etc. The attractions to the city of these industries are the convenient factory lofts, with heat, light, and power on tap, the proximity of the supply of raw material and labor and the convenient access not only to the local market which in itself is large, but to the larger market of the world through the buyers from elsewhere, who come here to obtain supplies.

The committee on factories says that one of the most marked features of this congestion is the great concentration of factories in lower Manhattan. Out of approximately three-quarters of a million factory operatives in Greater New York, there are over two-thirds or half a million working below Fourteenth street on the East Side and below Twentieth street on the West Side of the city.

A committee of the State Conference on Charities and Corrections has reported that a minimum income of $800 per year is necessary to support a family in the city on a reasonable basis, without allowing any saving. The average wage of the factory operatives of the section referred to is less than $537.

It is shown that owing to the early hour of starting work (7 A. M.), the long hours of work, and the poor transit facilities, these operatives are compelled to live near their places of occupation. This concentration of operatives' families in a limited area causes high rents for living quarters and consequently small quarters for each family, *i. e.*, congestion, which is coupled with low wages for the operatives on account of their oversupply.

The industries themselves are very fluctuating in the amount of business they do at different seasons of the year, and the operatives have to take in boarders or do tenement contract work to tide themselves over the dull periods.

There is also a concentration of office buildings in lower Manhattan, and each of these, some with a capacity of from five to ten thousand people, necessitates a large number of employes for maintenance and attendance, who add to the resident population of the district.

These conditions have a very deleterious effect physically, morally, and mentally on those involved, and consequently, are economically wasteful and costly to the city.

For relief from the above conditions the committee recommends better and stricter enforcement of sanitary standards in factories and tenements and a late hour for starting work. By the latter means operatives who would not have to start work until 8 o'clock, could live at a distance, and need not start from their home until 7 o'clock. The extra cost of transportation would be made up by a saving through cheaper rents, less medicine and doctor's bills, and an increase in income from more continuous work due to better health.

The commission recommends also better transit facilities in order to allow operatives to live at a greater distance from their work. It recommends further a distribution along the river fronts of factories whose product is intended for local consumption, making a factory belt around the city which should be threaded by a belt transit system, not only for the transportation of people, but for the conveyance of freight.

It advocates in this connection the removal of factories whose product is intended for outside markets, together with the operatives' homes, from the city to the suburbs, under laws governing building construction and insuring attractive neighborhood conditions and adequate housing facilities. It calls attention to the fact that compensation must be given to the operatives for the loss of the attractions of city life by providing recreation, amusement, and education.

In addition to the above, greater truck accommodation would be needed and lower truck charges on ferries to lessen the cost of transportation to the city of goods manufactured in the suburbs.

The committee on labor and wages advocates several steps to put the above recommendations into execution, maintain them, and see that present conditions are not repeated. It advocates:

First, owing to the preponderance of the factories of New York state in New York city (of the 40,000 in the former 30,000 are in the latter) that the scope of the State Department of Labor be expanded (a) by the appointment of a deputy commissioner of labor for the city who will devote his time to the direction and supervision of the department's work in the city; (b) that as the present force of thirty-five factory inspectors assigned to the city is able to visit each of its factories only once a year, this force be increased to an adequate number; (c) that appropriate legislation be passed to enable a new organization to carry out its functions.

Second, as there are wage and other disputes constantly occurring between employers and employes which frequently lead to lockouts and strikes, entailing losses to both and inconveniences and expenses ultimately borne by the public, there should be an industrial commission composed of three members, one to be nominated by the unions, one by the manufacturers, and the third by the mayor, and all to be appointed by him. The duties of this commission should be to investigate (a) the labor conditions and wages of the operatives and (b) disputes before and after lockouts and strikes. The object of such in-

vestigation would be to delay the lockout or strike until after the validity of the dispute had been determined and a decision regarding it had been made public. This would be in order to establish public sentiment, which in the ultimate settles these matters.

Third, as none of these fluctuating industries pays sufficient wages to support its operatives through its dull season, and as there are some industries existing either in the city or elsewhere in the state which owing to oppositely timed seasonal fluctuations are seeking operatives when those in the city are idle, the latter can find work if apprised of it and enabled to reach it. It is therefore advocated that municipal employment offices be established in other cities of the state as well as in this city for the purpose of bringing the demand and supply together.

Fourth, in order to make this movement as broad as possible, it is advocated that a National Department of Labor be established, with a secretary who shall be co-ordinate with the secretary of commerce in the president's cabinet. It is desirable that immigrants newly arriving should not, through their ignorance of our ways, and wages, and conditions of work be allowed indiscriminately to disturb by their sudden presence in a settled community the industrial balance which fortunately existed, while it would be desirable to have them go to a locality where their presence might be very necessary for the settlement of its industrial problems. Therefore the duties of this national committee would be (a) to give wide publicity throughout the country to the opportunities for work, conditions of labor, wages paid, permanency of employment, etc.; (b) conditions of unemployment; (c) standard hygienic and sanitary conditions of factories; (d) the same information regarding housing together with the location of homes within walking distance of occupation or transit facilities; (e) cost of main staples of consumption to encourage thrift and economic living; (f) public school opportunities; (g) social and recreational opportunities; (h) general labor information as to open, closed, and union shops.

MANUFACTURING AND CONGESTION

P. TECUMSEH SHERMAN
Former New York State Commissioner of Labor

The New York City Congestion Commission has had a peculiarly difficult problem to deal with, and it is not a cause for disappointment that its report presents no simple panaceas. That report is, however, open to the criticism that its recommendations cover too wide a field, that many of them are barely material to the subject or are of most doubtful expediency, and that the principal causes of congestion and the principal measures proposed for relief are not sufficiently emphasized.

Its recommendations relevant to congestion due to manufacturing may be summarized as follows:

1. Deputy commissioner of labor and more factory inspectors for New York city; and appropriate legislation to facilitate the enforcement of the labor laws.
2. The creation of an industrial commission for New York city, to investigate labor conditions, wages, disputes, etc.
3. The establishment of a chain of employment agencies by the city, the state, and the nation.
4. To require every factory or loft building over a certain height (fifty feet or four stories) to be fireproof; and to limit in proportion to the area of the lot the cubic space of, and to require a free space in the rear of, every factory or loft building hereafter erected and of every building hereafter converted to the use of a factory building.
5. To increase the cubic air space required by the factory laws for each employe in a factory workroom from 250 to 500 cubic feet.
6. To forbid or regulate manufacturing in tenements.
7. To restrict the location of factories to certain districts.
8. To improve the water fronts with piers and docks for factory purposes.
9. To provide freight lines connecting all the boroughs; and to increase the truckage capacity of the ferries and reduce and equalize their rates.
10. To increase the rapid transit facilities and ways for truckage.
11. To regulate immigration more stringently.

In my opinion the first and second recommendations, while they contain one good point, are almost wholly valueless for their purpose.

The fifth recommendation is most objectionable because it aims to insert in the factory law applicable to the whole state a harsh regulation of no material value, except possibly in this city, and for a purpose foreign to the purposes of the factory law.

The fourth recommendation, covering requirements for "factory buildings," is one which would create endless difficulties and hardships and produce only doubtful benefits. A factory building is a building which contains a factory; and a factory is any establishment wherein one or more persons are employed in manufacturing. This definition covers not only the hand-trades, such as tailoring and millinery, but also the alteration and repair departments common to nearly all kinds of commercial shops. Are they all, whenever they may move from their present buildings or leaseholds, to be confined thereafter to one class of buildings with unreasonably discriminatory requirements? Before making any such distinction it would be better to adopt some special and limited definition of the word "factory."

The recommendation to restrict the location of factories to certain districts encounters the same and yet other difficulties. Are the alteration and repair departments of stores, the printing presses of newspapers, etc., and bakeries, laundries, etc., which are factories, to be segregated? And where are they to be segregated? And who is to determine the factory zones? The success of the German cities in establishing factory zones is not a safe guide for us, because they have had an entirely different and infinitely more simple topographical and political problem.

The recommendation to forbid or regulate manufacturing in tenements is too crude. It is the fashion to confine consideration of home work in tenements to its worst form, which

prevails in the sweated trades. But that is not all of the home work by any means. Much of the finest needlework in the clothing trades is done in the higher grade tenements, called apartment houses. The work sold through the women's exchanges, for example, is a small part of the product of this kind of home work. And there is also a good deal of art work in the tenements. Home work of these kinds should not be forbidden. And a proposal for regulation must be specific and should manifest more detailed knowledge of the subject before it deserves consideration.

The remaining recommendations really attack the evil; but, in my opinion, the report would be more useful if it differentiated the problem of relief in respect of the different industries.

In only one grand industry—"clothing, millinery, etc."—and in one branch of another—"tobacco"—is the concentration of manufacture in New York city abnormal. This concentration is due to the constant existence of an oversupply of cheap labor, maintained by immigration, which acts like a magnet upon the seasonal and sweated trades. The remedies for this evil are in the directions indicated in the report, namely, the diversion or restriction of immigration and the withdrawal of the oversupply of labor by means of chains of employment agencies.

But as between Manhattan Island and its suburbs there is an extensive and entirely abnormal concentration of manufacture on the island. In respect of those industries which are located in New York city on account of its advantages as a center for the assemblage of materials, their manufacture, and the distribution of the products, the concentration on Manhattan Island is abnormal only as between it and the two suburbs of Brooklyn and Queens, and is due to the fact that those suburbs have been without adequate railroad terminal facilities. As between Manhattan and its other suburbs—the Bronx, Yonkers, Jersey City, etc.—there is no such disproportionate concentration in these industries.

In respect of the remaining manufacturing industries which contribute to the congestion on Manhattan Island, they are, to the degree to which they exist, incidental and necessary to the consumption and commerce which are likewise concentrated there, and their factories must be connected by easy, prompt, and certain means of transit both for goods and persons with the offices, stores, shops, hotels, homes, etc., which they serve. A simple illustration of this necessity is the fact that the printing plant must be close to the newspaper office. It may be less plain, but is equally certain, that a like industrial necessity for similar accessibility prevails between the mass of the Manhattan factories and the establishments or customers which they serve. The natural and artificial topography of London, Paris, Berlin, etc., admits of relegating the factories to adjacent suburbs and yet maintaining that accessibility. In New York, under existing conditions, that cannot be done. And this concentration of factories on Manhattan Island, under existing conditions, necessarily results in concentrating the homes of their employes there. The factory is peculiarly dependent upon the punctual attendance of all its essential working force. They, therefore, cannot reside at any distance from their work-places, unless the means of transit are cheap, rapid, and certain; and in this last respect the transit facilities of Manhattan are peculiarly defective. To a certain extent congestion is an unavoidable price which this island seaport must pay for its natural advantages and prosperity. Manufacturing of the class under consideration, with its attendant homes, cannot be banished without destroying that prosperity, but can only be somewhat more widely distributed by improved ways for goods and transit for persons. Some of these lines of manufacture may possibly be removed to outlying neighborhoods, but only upon condition that the trade centers of their commerce be removed with them.

TRANSIT AND CONGESTION

JOHN P. FOX
Transit Expert to the city of Pittsburgh

The transit recommendations of the Congestion Commission are admirable, showing a rare breadth of view, a remarkably clear grasp of the subject, forming one of the best reports on city transit ever issued. The report should be circulated in every city in the country. Especially to be commended is the fundamental principle that transit has become far too vital a need in New York to be left in the hands of speculators or investors, and that there must be even more public regulation of the strictest kind, followed by eventual municipal ownership. Many foreign cities have come to realize this fact, and it is hard to conceive of any other point of view in the light of congested living conditions in our great cities, and the abuse of the riding public by the corporations.

Among the other wise recommendations are the following:

1. The unification of all the city lines into a single united system, with scientific rerouting, and breaking down of artificial barriers that cause congestion and excessive fares, with a single fare and universal transfers for the entire city.
2. A right to change perpetual franchises into limited ones, providing for eventual city purchase.
3. The proper use of all lines and bridges to their fullest capacity, and obtaining extensions to all parts of the city, especially to where land is cheap, by compulsion or otherwise, whether profitable at first or not.
4. The absolute need of limiting the heights of buildings.
5. The need of improved freight connecting and storage facilities along the water front, but without adjoining factories, which would increase the congestion of living near them.
6. Restricting factories to certain districts, and locating new and existing factories outside of Manhattan, in order to reduce the transit of workers.
7. A two and one-half cent ferry fare to Staten Island, which ought to encourage removal to that great reservoir of cheap land.
8. Giving the Public Service Commission and the city the right to build surface lines, just as they now can rapid transit lines, and thus use a cheap means of distributing population, where high priced subways would be impossible or require congestion to make them pay.
9. A gratifying endorsement of the writer's position that much transit is an economic waste,

and should be reduced by the removal of factories to localities where people can walk to work from healthy homes.

10. Building new transit lines in all directions at once, so as to avoid the developing of one section with excessive prices.

One point might be elaborated, and two added to the commission's report. In increasing the capacity of existing lines, the most urgent need is the adoption of cars and methods to provide more seats. By running existing surface cars in pairs, the capacity of the most crowded streets can be increased about forty per cent. Double deck cars, low enough for present clearances, would more than double the maximum seating capacity of a street, and if run in pairs would treble it. Third-tracking the elevated roads, which should reduce noise at the same time, could be made even to double their capacity if efficiently done; while the introduction of side door cars would afford twice as many seats per car as now, or four times as many seats per line. Side door cars are even more urgently needed in the present subway and future subways, where they would double the seats per car and per hour. The present cars are an unnecessary waste to the company in the slack hours, intolerable to the public in the rush hours; and city and company could well afford the expense of providing adequate seats with new side door car bodies.

To attract some of the surplus population out of congested Manhattan, two immediate possibilities should be considered, *viz.*, new surface lines to cheap land and workmen's fares on steam and electric roads. Could not the owners of cheap land in the Bronx, Queens, and Brooklyn somehow build or get built new surface lines to connect with First and Second avenues in Manhattan over the bridges? Then, if attractive double-deck cars as in England, with a seat for every passenger and half fares for workmen, were run through the entire East Side, might they not entice many families out to where decent homes could be built within an hour's ride?

Workmen's fares in Europe allow almost the poorest to live in the suburbs; and why should low commutation rates to the country be given in America alone to the well-to-do? Belgium is best off in this respect, workmen being able to travel fifty-eight miles for five cents. This causes large numbers to own little farms, with reduced cost of living, more independence in hard times, and ability to reach work, wherever it is, for a few cents. Our railroads and electric roads should contribute their share in relieving congestion by carrying workmen at least at cost.

TRANSIT AND CONGESTION

HENRY C. WRIGHT

Former Director Transit Bureau
New York City Club

The report of the New York City Commission on Congestion of Population has thrown no new light upon the city's transit problems, but it has re-emphasized some points which are of great importance just at the present time. Though the commission gathered no new facts, it has incorporated in its report a Memorandum in Regard to Transit facilities and Policies of New York City, which is of marked value. In speaking of the relation of transit to the problems of congestion, this memorandum says:

The reason most frequently advanced during the past forty years for the interest the city and state have taken in the development of rapid transit lines in New York, has been the necessity for relieving congestion of population on Manhattan Island. Yet substantially nothing has been accomplished to relieve such congestion.

It seems to be about time to make a united and determined effort on behalf of the interests of the city at large and of its people, to override the great special interests, whether represented by land speculators or by the present owners of street railway and rapid transit franchises, to the end that this metropolis, with all its tremendous natural advantages and acquired wealth, shall become a fit place for men of limited means to live and bring up their families.

The writer has here touched upon one of the chief reasons for the transit chaos which has existed, and still exists, in New York city, *i. e.*, that the city authorities in the past, in dealing with owners of transit lines or of land, have not kept uppermost in mind the welfare of the citizens. To this statement partial exception may be made as applied to one or two mayors whose motives in the main were right, but who, owing to their lack of knowledge and foresight, erred on the side of capital. We have city officials now who, it is believed, will give due consideration to the needs of all citizens; it is yet to be demonstrated, however, whether they see the problem sufficiently "in the large" to insure a solution which will produce the one great vital need, a unified system —a system secured under such conditions that it can and will be expanded to meet growing social needs as they arise, and a system whose operation can be controlled at all times by the city, not merely legally, but actually controlled.

The report calls attention to the needs of a unified system with universal transfers; it also states that the subways and elevated roads are the key to the whole transit situation and must be a part of a unified system. The report, however, fails sufficiently to emphasize the fact that unless the perpetual franchises of the elevated roads are surrendered, through negotiation, forfeiture, or purchase, it will be impossible to secure a unified system which will be at all times under the control of the city. It is of crucial importance that this point be emphasized at the present time, while negotiations are taking place between the city officers, the Interborough Company, and the Brooklyn Rapid Transit Company. The policy adopted as a result of these negotiations is likely to fix and determine the city's relation to and power over transit for the next generation. Social problems, in so far as they are dependent upon and are influenced by transit, will have their metes and bounds fixed by the results of the present negotiations.

The report recognizes the necessity of moving factories to outlying districts and also the difficulty of their so locating, until much better

freight and express facilities be provided. It fails, however, to point out the interrelation between transit and freight lines. Workmen's families living in factory suburbs will have need of some transit facilities between their homes and the city. Such facilities may possibly be best furnished by the lines that haul the freight to the factories. It is difficult to see how it can be furnished by any other means. This consideration, applied to the Borough of Queens, would mean that the Long Island Railroad would provide, in the main, not only the freight facilities to factories, but also the transit facilities for that territory. If this be a necessary and natural development, it is unwise to advocate the extension of the lines of the Interborough Company into that territory, as is done by the report.

The report urges the necessity of building rapid transit lines into undeveloped territory. This should be done if possible. How such non-paying lines can be supported, however, the report fails to point out. It was undoubtedly recognized, though not stated, by the commission that deficits arising from long hauls must be met by profits from short hauls, and that this adjustment can take place only in a unified system. The report would have been stronger had it recognized the vital and crucial importance of a unified system, and had it shown how each of the transit needs is directly dependent upon the creation of such a system.

Development of water front owned by the city, for warehouse and factory purposes, is urged. This would be some aid in the distribution of factories if such development took place outside of Manhattan. The open territory in Richmond prompted the commission to recommend that a subway be built under the Narrows. Since this district can be reached much more cheaply by an elevated line via Bayonne, it would seem rather unwise for the city to sink its money in such a non-paying subway.

The chief value of the report, in so far as it deals with transit, lies in the fact that it has re-emphasized the need of extending lines into undeveloped territory. Its chief defect is that it does not suggest how lines to such territory can be built and supported, nor does it bring out the fact that some territory can be served only by lines whose income can be secured from the carrying of freight, express, and passengers.

LAND VALUES AND CONGESTION

FREDERIC C. HOWE
Author of The City the Hope of the Democracy

The first official recognition by any public authority in America, of the taxation of land values, which has made such rapid development in Germany, England, Australia, and western Canada, is to be found in this report of the New York City Commission on "Congestion." The commission recommends:

A. That the rate of taxation upon all buildings be half the rate of taxation of all the land, and that this reduction be secured by an equal charge in each of the five consecutive years.

B. The question of recommending an unearned increment tax has been strongly advocated before the commission. The principal argument advanced in support of the imposition of such a tax is that in nearly every instance where real estate values have increased such increases have been due wholly to public improvements and to the general development of the city, and in no way to action on the part of the property owner.

While the commission declined specifically to recommend an "unearned increment tax" in addition to its suggestion as to halving the rate upon improvements, it urged that the question be examined by the city government "and that public hearings be had in order to determine what action, if any, should be taken by the city with respect to this tax."

The rapidity with which the taxation of land values has moved in Germany, Australia, and Canada, once it was tried, suggests the results which may be expected from the official recognition of the possibility of solving the housing and congestion problem by taxing land into use. This is the simple, natural, automatic solution of overcrowding, high rents, the tenement, and the slum. Germany began to tax the unearned increment in 1904 in the city of Frankfort. In six years' time the Frankfort system was adopted by nearly every large city in Germany with the sanction not only of officials, but of economists as well. So successful was the new tax that the Reichstag has extended it to all communities not only as a source of local, but of imperial revenue as well. The testimony of officials is that it discourages speculation, forces land into use, and encourages building.

The taxation of land values has also become the most insistent reform of all the radical groups in England. As an official movement it is less than two years old; yet in this time it has become firmly imbedded in the public thought of the nation.

A few years ago one of the cities of western Australia tentatively reduced the appraisal of houses and improvements. The effect on land speculators was so immediate that it led to inquiry. Vancouver, British Columbia, a city of about 80,000 people, reduced its improvement assessments by fifty per cent, thus increasing the tax on land values. The building permits issued during the following year doubled. In 1910 a city government was elected, pledged to continue the experiment and exempt all improvements from taxation. Today all products of labor are tax free, while land values are assessed at about twenty mills on the dollar. The result of the exemption of improvements was immediate. Land speculators, like those who own the land surrounding New York city, immediately cut them up into building lots and placed them on the market. It became too expensive to hold land idle. Houses sprang up; labor was employed and wages increased rapidly. The growth of Vancouver has even affected the neighboring cities of Oregon, which lost office buildings, hotels, and apartment houses,

lured to Vancouver by the taxing laws which exempted capital from taxation. Now the cities of Washington and Oregon are being forced to consider this proposal as a means of protection from the cities of western Canada, which, one after another, are following the Vancouver experiment.

The logic of the followers of Henry George is being proven line by line by the experience of these western cities. Relieve improvements from taxation and improvements are encouraged. A stimulus is given to building operations, to the breaking up of large estates and the idle holding of land. Suburban land speculators are discouraged; the shack and the tenement are subjected to the competition of new homes, while city and country land calls upon labor to meet the burden of taxation imposed upon the idle landlord.

The housing question is a land question. It is the high price of land which explains the inordinately high rents of New York. The high price of land in turn is due largely to the fact that the speculative increase from year to year is greater than the tax burden. Increase this tax on land to the point where it is more costly to hold idle than it is to use, and the thousands of acres of undeveloped land in and about New York city will come into the market and be developed for residential purposes.

An ounce of land taxation will do more to cure the housing problem than a pound of regulation. Land taxation produces houses. Regulation merely continues the shack, somewhat improved in character, but still enjoying monopoly rent. Land value taxation is an automatic reform. It subjects the building of houses to the same laws of demand and supply that have perfected the automobile in a few years' time. The official recognition by New York of the possibility of curing the congestion problem by taxation will lead to the further study of this question by other cities and its probable early introduction by some one of them. Once the experiment has been tried it will spread to other cities by force of its success, just as it has in Canada, Australia, and Germany.

TAXATION AND CONGESTION

DELOS F. WILCOX
Author of Great Cities in American

The Congestion Commission makes only one substantive recommendation in regard to taxation, namely this: that the rate of taxation on personal property and improvements should be gradually reduced relatively to the rate on land values alone, until at the end of five years the rate on land would be twice the rate on buildings and personalty. It should be clearly understood that the discrimination proposed is not against vacant land as such, but against land values generally, whether the land is occupied or not. The commission believes, however, that the indirect effect of the discrimination would be to discourage the practice of holding unoccupied land for speculative purposes, because of the increase of the tax burdens laid on it; and on the other hand to encourage building operations on account of the decrease of the tax burden on improvements. It is obvious that the cheaper it is to build and the greater the area made available for building purposes at a given price, the less powerful will be the tendency toward congestion of population. The committee does not go so far as to recommend the entire abolition of the tax on improvements and personalty, but if the halfway measure suggested would tend to relieve congestion, then *a fortiori* the promise of relief by the full application of the land tax principle would be still greater. In fact there is some reason to believe that the effect of a reduction in the relative rate of taxation on improvements would be cumulative. If so, then full exemption would have more than twice as much effect as half-exemption. The committee was probably actuated by consideration of expediency and caution in not recommending the complete application of the principle, the soundness of which was recognized so far as its effect upon the distribution of population was concerned.

Moreover, the committee on taxation, of of which Professor Goodnow was chairman, was of the opinion "that the influence of the system of taxation on the problem of congestion is not great enough to justify reliance upon it as even an important means of remedying the evil." One of the members of the committee, John J. Flynn, dissented from this view, and the majority opinion seems to be somewhat illogical in view of the radical nature of its proposal to cut the tax rate on improvements in two. It is clear, therefore, that one of the commission's reasons for not being still more radical was the belief that congestion cannot be relieved by tax reform alone, and the recognition, on the other hand, that taxation has something to do besides relieving congestion.

The committee on taxation even recommended that an annual increment tax at a low rate, say five per cent, be levied on the increase in land values, and that the proceeds be devoted to the construction of transit lines, on the theory that transit facilities are more directly effective in relieving congestion than any system of taxation which the city might adopt. The commission, however, merely passed this suggestion on to the regular city officials for further investigation and consideration.

HOUSING REGULATION AND CONGESTION

EDWARD T. HARTMAN
Secretary Massachusetts Civic League

THE SURVEY's request for an article on the report of the New York Congestion Commission, by return mail, is easy enough, but it precludes the possibility of reading the fifteen galleys of double-column, small-type proof upon which the article is to be based.

I shall base what I say upon the six paragraphs of the Recommendations—5. Measures to Prevent Room and Apartment Overcrowding.

Paragraph (a) provides for a minimum area of ninety square feet for a room. This is surely proper. The present requirement of seventy square feet is absurd when taken in connection with the 400 cubic feet minimum for each adult in a bedroom. Only one adult, or one adult and one child, may now occupy such a room under present New York regulations. Of course these regulations are not enforced.

Paragraph (b) requiring each apartment (not room) to contain 400 cubic feet for each adult, and 300 cubic feet for each child occupying it, is also good. It is more sound than the room unit where boarders are not allowed, for doors may be kept open and then the apartment is the ventilation unit. The twenty-five dollars' penalty for violation is necessary. An inspector cannot constantly be on guard, and without a penalty many people will violate the regulation. A law is now before the Massachusetts Legislature for a penalty of twenty dollars for the same purpose, but its adoption seems not likely. *Laissez faire* gone mad rules here now. An effort to include three-family houses in the definition of a tenement house has been defeated. The Legislature cares nothing about such things, and that the people do not care is a natural inference. Only those care who are directly involved on the money-making side. Human interests are very little considered. If New York will adopt the suggestions of paragraph (b), under this head, it will have erected a monument to the progressiveness of New Yorkers, for when New York can do it no city in the world may claim that it cannot do it.

Paragraph (d), "that no lessee of any apartment in any tenement house shall be permitted to take lodgers without notifying the owner" who shall notify the department, and paragraph (e), providing that the owner shall notify the departments, both tenement house and health, when his tenants fail to comply with the regulations, also that lessees secure a license for keeping lodgers, would all prove most far-reaching. A tenement of four small rooms, two of them attic rooms, was in Boston recently found to contain a family of father, mother, and one child, and sixteen adult lodgers. This is not an isolated case. It may be duplicated many times in Boston and even in the cities and towns of greater Boston. Paragraphs (d) and (e) would enable New York to prevent such misuse of a tenement. I know of no city or town having laws that would measure up with the possibilities of these provisions.

Paragraph (f) provides for a bureau of occupancy in the Department of Health to guard against overcrowding in two-family houses. Two-family houses are tenement houses in Chicago. The enactment of this regulation would be novel, far-reaching, but surely proper. The doctrine of "unfair interference" would bar such a provision in most places. But the time is coming when all places will have to recognize as fair all regulations which will protect people from the results of their own cupidity and, more important still, protect the community from these results, which are wide and serious. The only logical argument, that these people have to take lodgers to make ends meet, does not apply as generally as some claim, and it will disappear entirely when the laborer receives a fair share of the product of his labor, when taxation places its burden in the right place, when the proper distribution of industries enables the people to spread over the land, and when the people get a square deal from the builders and owners.

There is a long way to travel to reach all these recommendations, but even to have recommended them puts the Congestion Commission in the class of constructive statesmen which we have for so long been getting along without. I congratulate it on this part of its work and on all of its work that is as good as this.

CITY PLANNING AND CONGESTION

GROSVENOR ATTERBURY
New York

Such a report as that of the Commission on Congestion of Population would require a second commission to study properly and criticise it. Its field is so prodigious in extent and complex in character that in the few moments at my disposal I am afraid I cannot even comment upon it intelligently. The lack of any practical knowledge and experience of such subjects in this country, together with the uncertainty of the human element in the equation—so different here from what it is abroad—render deductions from foreign experience and statements of the actual results of such recommendations as those made by the commission more than ordinarily unreliable.

The general impression one gets from the report is that of a vast amount of food for thought, most diligently compiled; much of it undoubtedly good and stimulating if properly digested. In general the restrictive elements appear to be those that should be adopted with the most caution. The removal of the causes of congestion, such, for example, as the proper distribution in the suburbs of factory centers—appears to be a fundamentally sound proposition. But the attempt to check the natural working out of such causes—the measures aiming to annihilate their power or to neutralize and restrict their present results, may very well produce other effects than those desired and expected. It seems a little like fastening down the lid of the teapot to prevent its boiling over.

For example, the report recommends measures to "keep land cheap." This, of course, can be done only by limiting its usefulness. Is it certain that we want that? Cheap land, like

cheap labor, may be the most expensive from the point of view of true economy. Would the effect of the restriction on the price of land (even if feasible) be true economy? What we want in this matter is the most economical use of land compatible with hygienic and social standards, a situation which is not necessarily synonymous with "cheap" or low priced land.

It would perhaps be more to the point if there were a recommendation aiming at the reduction in the cost of building construction, which represents from two-thirds to three-quarters of the cost of the poor man's home. Here is undoubtedly a field for true economy. A study of the effect on the rental paid by the laboring man produced by the "closed shop" and the city's antiquated building code would seem a very obvious and promising field for investigation and reform. How many millions are wasted by reason of the unscientific and unreasonable requirements of our building law it would be difficult to say; but the fact that it hampers good and economic housing construction is well enough known. That the same concrete, for example, should be a little over one-third as strong in New York as it is in St. Louis; and that it should gain thirty per cent in strength again by crossing the East river from Manhattan to Queens would be laughable if it did not spell a direct tax on the New York tenement and a corresponding increase in the laboring man's rental.

On the other hand, the preventive measures recommended by the commission, where they obviously reach the root of the trouble—those measures aiming to encourage the proper distribution of population by transit facilities, city planning, and above all by educational work, cannot be too heartily endorsed or too quickly made effective.

CITY PLANNING AND CONGESTION

GEORGE B. FORD

Member Committee on Congestion of Population in New York

In general, the thorough study of congestion as carried out by the commission is summarized in a number of pertinent recommendations for relief and prevention. In particular, the commission formulates two ordinances and twenty-seven acts pursuant of this idea. Of these twenty-nine bills only one, that which would amend the New York city charter to permit the Board of Aldermen to determine zones for different heights and areas of buildings, directly affects city planning. The passage of such an act would make it possible to prevent absolutely in the outlying districts of New York that congestion which now exists in Manhattan. All witnesses agree that the principle has proved of the greatest value in Germany where it is in general use. In America it has successfully stood the test of constitutionality in Boston and in Baltimore.

Of the remaining twenty-eight bills several relate to heights and percentages of lots covered by factories, office buildings, and habitations, and thus indirectly affect city planning. It is proposed that no building in Manhattan below One Hundred and Eighty-first street should exceed a cubage of 174 times the area of the lot, and in the rest of New York 120 times the area of the lot. It is proposed further that no factory or loft building should exceed a cubage of 132 times the area of its lot. These propositions do not preclude the erection of tower buildings, but they do require a man, in all justice to his neighbors, to confine such a building to a correspondingly small percentage of his lot. The seeming injustice to a very few is far more than compensated by the great gain to all the rest of the people.

Among the bills relating to tenements and dwellings several would restrict the height or the percentage of lot covered by the buildings to a considerably greater extent than the present law does. For example, it is proposed that except in Manhatan below One Hundred and Eighty-first street no tenement, according to the definition of tenement in the present tenement law, should exceed four stories in height; and that in Manhattan below One Hundred and Eighty-first street if it exceeds that height it should be fireproof; and in no case should it surpass in height the width of the widest street on which it faces. It is further suggested that in outlying districts of New York all tenements should be limited to three stories. In Chicago and other cities where such restrictions are in force they have been most efficacious in distributing population. Of course the proposal of such measures will call forth the opposition of certain property owners who sincerely believe that they have the Godgiven right to make as much money as they can from their property, utterly regardless of the everlasting damage they cause by so doing to their neighbors and to the people at large.

With regard to taxation city planning is affected by the bill proposing to tax land at a rate double that on improvements. The commission points out that this is not "single tax." They show that in Germany, Australia, New Zealand, and certain cities of Canada where this is in practice, it has proved of great value as an incentive to building up outlying land and thereby distributing population and reducing rents. The value of this method of taxation is attested by the fact that no city which has once adopted it has ever given it up.

Aside from these bills there are in the report a great many suggestions for relieving or preventing congestion, among which are the following:

The preparation by the city through the Board of Estimate and Apportionment of a plan for the entire city which shall include the following items:

The restriction of factories to certain districts.

The provision of transit lines and means of carrying freight upon the basis of such a districting of the city.

The determination of the main lines of streets and secondary streets as suggested by Nelson P. Lewis, chief engineer of the Board of Estimate and Apportionment.

Provision of sewers and methods of sewage disposal and substructures for pipes.

Provision of adequate sites for parks and playgrounds and recreation centers and municipal buildings of various sorts.

Acquisition of adequate land by the city for all public purposes.

That as a means of reducing rents, and with the sanction of the Board of Estimate and Apportionment in each case, streets in outlying districts may be thirty feet wide, and houses be set back from fifteen to twenty feet from the curb line so as to permit the widening of street subsequently at a small expense.

That subways for passengers be provided at crowded street crossings.

Excess condemnation of land, through which the city may acquire more land than is required for a specific improvement, and resell or rent the surplus.

The adequate improvement of all water fronts with piers and docks for factory purposes and with warehouses.

The immediate construction of freight lines connecting all boroughs.

The removal of all charitable buildings except emergency hospitals from the congested districts.

The founding of city farm colonies in the outlying boroughs.

That there should be in every borough at least one large area for the public administration buildings in the borough and a series of sub-civic centers with groupings of administration buildings.

That there should be in each borough a grouping of public buildings, such as schoolhouses, libraries, etc., except fire stations, in a park with open grounds around them.

That the city provide recreational playhouses or at least sites for these in the civic centers.

That all transit franchises should be for a short or indeterminate term.

That a way be found to unite all present and future transit lines into one efficient comprehensive system with good and quick service for a single fare.

That lines should be run into all sections of the city, including Queens and Richmond, even though the outlying lines be run at a loss for the present.

These recommendations have all grown out of the evidence brought out at the numerous hearings. They are all based on the most tenable theory that the rights of the few should be sacrificed to the good of the many. Some of them call for the expenditure of a large amount of city money, but in every case the commission is prepared to prove that the ultimate benefit derived from these undertakings pays many times over, and pays not only in better citizenship and the vastly greater enjoyment of life, but in so many dollars and cents of the money spent annually by the city in curative and relief institutions, and of the money lost by individuals through sickness, decrease of efficiency, and time and energy wasted in transit and transportation.

Here, for the first time in the history of New York, we have a comprehensive program for the planning of the city. Here, for the first time, the many different sides of the problem are presented to the public. It remains now to analyze these ideas, to correlate them, determining the relative importance of each to work out of them a constructive program and then to push it with vigor.

CONGESTION A NATIONAL ILL

JOHN HAYNES HOLMES
Church of the Messiah, New York City

That the recent report of the New York Commission on Congestion of Population will receive that degree of public attention in New York city itself which its exhaustive survey of existing conditions, its careful study of causes, and its detailed suggestion of remedies deserve, goes without saying. That it will attract the interest of the country at large, however, and stimulate its citizens everywhere to decisive action is by no means so certain. Being the report of a New York commission, addressed to New York officials, surveying New York conditions, and suggesting remedies for New York ills, it will be all too easily dismissed as a document which is of exclusive concern to this one city. And yet nothing is more obvious, from even a superficial examination of the commission's work, than that the problem of congestion is not local but national, and that this study of its causes and effects in this one community is of immediate interest to every American community from Maine to California.

In the first place, it is a well-known fact that the drift of population in this country is all in the direction of the cities, and that the growth of these cities, especially within recent years, has been astounding. That this phenomenon is confined to no one section of the country, and is to be attributed to no merely local or temporary causes, has been clearly demonstrated by the figures of the 1910 census. When we discover that the average rate of increase of the 180 cities in this country of between 25,000 and 100,000 population, during the ten years from 1900 to 1910, was no less than 42.3 per cent—that one of these cities had an increase of 539.7 per cent, another of 494.2 per cent, two others an increase of over 200 per cent, and twelve others an increase of over 120 per cent—and that of all these communities only two registered a decrease; when we find that of the fifty-one cities of over 100,000 population, the average rate of increase, during this same decade, was 27.4 per cent—that the smallest rate of increase was 6.5 per cent—and that two of these cities increased over 200 per cent and four over 100 per cent; when we observe that no less than twenty-one cities enjoyed an increase of 90 per cent or more; and when we add to all these figures the fact that the rural sections of the country underwent little or no increase, and in one conspicuous instance, that of the state of Iowa, actually underwent a decrease, we begin to realize something of the significance of this problem of municipal development.

More important, however, than the obvious fact that the cities of the United States are growing, is the much less obvious fact that they are becoming congested. There is no absolute reason in the scheme of things why increased population should mean congestion; but investigations here and there are showing

that these two phenomena all too often go together. Now comes the report of Mayor Gaynor's Commission on Congestion to teach us why this is so frequently the case. Studying conditions of overcrowding as they actually exist in New York city, this commission defines fourteen main causes of congestion; and of these fourteen, only three, by any wildest stretch of the imagination, could be described as in any way peculiar to this one community. It is very evident that one of these causes of local congestion, "the recent consolidation of the five boroughs", could apply only to New York; it may well be argued that two others, "the failure of the city to adopt a policy to attract people to outlying boroughs", and "immigration and the failure to distribute and control immigrants", have a peculiarly local application; although the failure to get people out into the suburbs is a factor, I believe, in the congestion of many another city, and New York is surely not the only American city which is embarrassed by unrestricted immigration. But granted, for the sake of argument, that these conditions apply to New York with such especial cogency that they may be regarded as more local than general in character, nothing of the sort can be said of the remaining eleven causes of congestion. "Poverty", which stands first in the list, raises its ugly head in every community. "Concentration of factories and offices" is beautifully illustrated in every city in the land, although it is doubtful if this concentration is anywhere as acute as in Manhattan. "Intensive use of land", which is the next cause named, is a familiar feature of all social life in America! and the same thing is to be said of the next and closely analogous cause of congestion, namely, "the high price of land due to intensive use." The fifth cause, "lack of control over aliens and citizens", is a normal feature of a *laissez-faire* society, and not an abnormal feature of New York. "Long hours of work", which stands next in order, is a form of social injustice which is a disgrace, not to any one community, but to the entire industrial order. "The cost of transit and transit policy of the city, since transit has been regarded as a matter to be governed by commercial and not by social conditions", undoubtedly has some features peculiar to New York, due partly to its physical conformation, but more to the scandalous financial history of its public service corporations; but as a general rule it is safe to say that "the cost of transit and transit policy" has aggravated overcrowding wherever the private ownership and private operation of transportation lines have been permitted—and this means, everywhere! "Lack of a definite city plan" is a prevailing cause of congestion, to say nothing of other social ills, in every modern municipality. "The present system of taxation" is another gross injustice, characteristic not of New York, but of America. "Failure to prepare land for housing purposes" is a universal feature of municipal short-sightedness and indifference to the social needs of the people. And the "methods of public and private charities, but especially of private charities", the last of the eleven causes named, are of course as prevalent as human nature itself.

Finally, the problem of congestion belongs to no one city. Like tuberculosis and poverty it is a problem as wide as the borders of our material life and as deep as the foundations of our industrial system. Mayor Gaynor's commission has surveyed not merely New York, but the United States, and has defined causes and suggested remedies, not of a local, but of a national ill. Its report, therefore, is respectfully submitted, not to Mayor Gaynor and the Board of Aldermen, not merely to the citizens of New York, but to the American people in general. "He that hath ears to hear, let him hear."

PUBLIC HEALTH AND CONGESTION

FREDERICK L. HOFFMAN

The report of the Commission on Congestion of Population admirably emphasizes the health aspects of a question which is attracting universal attention throughout the civilized world. Perhaps the most important consideration is the necessity of accurate vital statistics, tabulated in sufficient detail by sanitary districts or blocks to bring out the local incidence of mortality or morbidity, with a due regard to age, sex, race, nativity, and occupation. If the method adopted by Dr. Billings in connection with the special census investigation of 1890, including the six years preceding, had been continued by the Board of Health or the Division of Vital Statistics of the Census, a mass of most valuable information would have been available and many important questions could have been answered upon the basis of trustworthy facts. The absence of an intercensal enumeration further complicates the accurate calculation of death rates according to age, sex, nativity, and race, all of which elements undergo more or less important changes during so long a period as a decade. Even under the present limitations the report of the commission presents some extremely suggestive facts, particularly the data relating to the Italian population, which emphasize the practical utility of statistical research in this field as a first step towards a better understanding of the true factors which underlie the whole problem of congestion or concentration as the case may be.

The report of the commission includes some rather elaborate calculations of morbidity, which at best, of course, are a mere matter of rational conjecture. We, unfortunately, have no information which enables us to calculate the morbidity of American cities, and the application of the factors of the German sickness experience may possibly lead to erroneous results. The report brings out the importance of co-ordinating all the hospital statistics of Greater New York, with a due

regard to the principles adopted by the London Metropolitan Asylums Board. As yet the statistics of our hospitals, which may yield practical results of far-reaching value, are almost entirely neglected.

The calculations of the commission as to the economic waste of disease are also open to criticism in that a clear distinction is not made between the saving of life and the saving of years of life. Obviously death must take place sooner or later—it is entirely a question of prolonging life by all rational measures and means which fall within the modern conception of community responsibility.

The occupation aspects of the problem of congestion in its relation to mortality and morbidity seem not to have been brought to the attention of the commission. It is practically certain, however, that if the subject of occupation mortality were thoroughly investigated, the results would throw much light upon the observed unfavorable consequences of human congestion, most of all in the more densely populated section of lower New York. The dust problem also may, in this connection, be referred to as one which unquestionably has an important bearing upon the high mortality from consumption.

The work of the commission within its serious limitations appears to have been admirably well done. A mass of new information has been brought to light, and upon many important questions a public expression of qualified opinion has been obtained. It is sincerely to be hoped that at least some of the more conservative recommendations of the commission will be carried into effect.

PUBLIC HEALTH AND CONGESTION

PAUL KENNADAY

Former Secretary, Committee on the Prevention of Tuberculosis, New York Charity Organization Society

Of the six closely printed pages of recommendations of the New York City Commission on Congestion of Population not more than half a page is taken up with the seven specific "measures to promote health and safety." But these measures are only incidental in the commission's big scheme for a more thorough and radical treatment of the big health problem of New York. These ninety pages of the *City Record*, with their catalogue of about all the ills to which congested flesh is heir, are in effect but convincing proof that the problem of congestion is a problem of health, and that as a city becomes more congested, infectious disease and premature death become ever more surely the inheritance of its crowded millions. That there shall be a closer correlation between the Department of Health and the Tenement House Department; that the latter department may cause the vacation of apartments judged not sanitary or habitable because of lack of sufficient ventilation or because of infection from contagious disease, that tenement walls shall be whitewashed once a year and that manufacturing in tenements "shall be adequately regulated and, if possible, prohibited by law"; these are hardly more than minor details of an administrative character in a comprehensive scheme essaying to promote and conserve the community's health through sweeping reforms in factory and tenement building, transit, taxation, parks and playgrounds, charitable relief, distribution of immigrants. So that there come up for review here the whole field of modern philanthropy and more beside. And the whole matter sums up to this, that our present methods are not getting at the root of the evils which beset us—and never will; that, indeed, we can hardly hope to keep the ground gained if we do not soon set about to apply ourselves in a more courageous fashion to the eradication of the now very well known causes of disease. The commission's strict regulation of tenements will help, factory zones will help, labor exchanges and an industrial commission may accomplish something, the extension of properly controlled subways and good and cheap housing will help a great deal. Workers from all the corners of the world are herded here together, not because they want to live too many to a room, not even because they are careless of the certain penalty tuberculosis will enforce, but because those who profit from their distress want more profit, and because transit to the factory and all these cubic feet of air space required to maintain health in the home cost more money than the wage-earner can pay. The report bears testimony again, if we must have it, that as real wages go down death rate go up, and that tinker away as we may with the results of our present wage system, that system in the end must go if preventable disease is to go.

COMMUNICATIONS

No department more clearly emphasizes the co-operative nature of THE SURVEY than the communications. Letters from readers are welcome; appeals cannot be published. Because of limited space, each contributor is asked to be brief so that no contributor will have to be excluded. Communications from 10 to 300 words in length are the most satisfactory and in the long run most telling. Only when the editors are convinced that so much space is needed, will communications over one thousand words in length be handled and the editors reserve the privilege of returning communications over 500 words in length to be abbreviated.

OVERCROWDING MUST STOP

TO THE EDITOR:

In your editorial for March 18, Overcrowding Must Stop (pp. 989 and 990), you state: "We believe it to be a false start to attempt to create a special class in the community to be known officially as 'the dependent members of a family of a consumptive or consumptives,' and another class to be known as 'indigent widows with children,' to be dealt with in a special way by a special board of trustees." On page 1034 of the same issue you state: "Of the $200,000 [which you earlier note the Char-

ity Organization Society spent above the $80,000 for relief] about $50,000 in round numbers was the cost of conducting the New York School of Philanthropy." If this expenditure for teaching "philanthropy" is justified, it cannot be on the basis of your reasoning about "creating" a class of dependent members of consumptive families or of dependent widows with children. The Congestion Commission was not guilty in any large measure of "creating" either of the two classes above referred to. The responsibility for creating those classes rests upon the powerful vested interests of New York city and the country, and it would seem that the directorates of the charitable societies in this city must take chief responsibility for "creating" these classes. If you mean, however, that it is a "false start" for the government to recognize officially the existence and provide for the relief of certain exploited classes in a community who are dependent through no fault of their own, perhaps you will be willing to state what constitutes in your mind the line of demarcation between the functions of government and of charity organizations. You will, if you can take time to read the report of the commission and the tables it has submitted as a basis for its conclusions, note that the commission has studied the causes of poverty, as given in your book, Misery and Its Causes, and by other students of poverty. The commission has attempted to strike at the causes of poverty, but in the meantime it places the responsibility for the relief of poverty upon government, since government is responsible for the existence of poverty. The committee on charities also urges "the development of a system of public social insurance, and that such a system of public insurance be adopted, based upon cost, and incumbent upon all members of the community with an income of less than $1,200 a year and permissive up to $2,000." In the meantime the commission takes the point of view that government should pay the "weregeld" until it can collect it from the responsible parties and meet the cost of caring for victims of a governmental policy of *laissez faire*.

May we not hope, too, that you will comment upon the taxation proposals of the commission and the committee on taxation of which Prof. Frank J. Goodnow was chairman, and the social significance of these proposals. Important as is the $80,000 a year spent in relief by the Charity Organization Society and the $50,000 on the School of Philanthropy, the proposals of the commission and the taxation committee to recover by taxation of land values $50,000,000 for the people who create these values is a potential social force in the extermination of poverty. At least this amount is annually extorted in rent from the people of New York. We hope you feel that the plan suggested by the committee on taxation to save rent payers and home owners this $50,000,000 which they create is so important that you will devote another valuable article to the subject.

BENJAMIN C. MARSH.

[We share the opinion of the committee on taxation, of which Professor Goodnow was chairman, and to which Mr. Marsh refers, that "the influence of the system of taxation on the problem of congestion is not great enough to justify reliance upon it as even an important means of remedying the evil"; and we regret that other sub-committees of the commission did not reach similar conclusions in regard to the matters referred to them, *e. g.*, the committee on charities and the committee on labor and wages. It is our opinion that neither the expenditures of the Charity Organization Society for relief nor the cost of maintaining the School of Philanthropy have any such bearing on the subject of congestion of population as to warrant our following Mr. Marsh's example in discussing them editorially in this connection.—ED.]

THE NUMBER OF JUDGES

TO THE EDITOR:

Referring to the statement in your editorial on the People's Courts, that the Sullivan bill would legislate "out of office on a given date all of the fifty-five justices and magistrates," may I call your attention to the fact that the total number of present judges who would thus be displaced is forty-nine. The Sullivan bill would provide for six additional judges making in all fifty-five, the number which you give.

J. T. WILLIAMS.

New York.

MALE ADULT DEFECTIVES

TO THE EDITOR:

The useful and creditable work already done by Dr. Max G. Schlapp at the Children's Court with defective children, augurs happily what further and greater results in this direction, may be accomplished. I am credibly informed that such work is now contemplated for defective or delinquent women, before or after sentence, in our courts. We may therefore be hopeful that soon perhaps we shall know what is best to do with them, so far as practicable.

It may be that the "committee on defective delinquents" has in view the even broader field of work of male adult delinquents or defectives. If so, I wish to add my voice and influence in its earnest support. If not, I urge that it be brought to its consideration, and I am confident good and far-reaching results will soon follow. It is only necessary to note what is now going on in court, and as to inmates of prison or asylum for the insane, to appreciate the need of such work. To be well done it requires united conscientious efforts of judges, alienists, and probation officers.

BEVERLEY ROBINSON, M. D.

New York.

JOTTINGS

Resignation of Howard Bradstreet.—Howard Bradstreet who, because of his experience as secretary of the Parks and Playgrounds Association, was selected last year by Park Commissioner Stover to be supervisor of the park playgrounds in the Boroughs of Manhattan and Richmond, New York, has resigned his position. He intends, however, as a private citizen to continue his interest in playground work.

Pensions for Bank Clerks.—The First National Bank of New York has adopted a carefully worked out voluntary contributory insurance scheme for aged or invalided employes. The pension fund is to be made up of contributions from the bank and from individuals, together with a three per cent deduction from the salaries of those desiring to become beneficiaries. Eligibility on account of incapacity begins after fifteen years' service; on account of old age, after sixty-five years of age and fifteen years of service.

The amount of the pension is two per cent of the average salary for the preceding five years, the maximum amount being seventy per cent of the average salary during employment, or $5,000. If the beneficiary has not completed twenty-five years of employment before retirement, the pension is to continue for as many years as his term of service; if he has completed this number of years it is to continue for life. An employe's widow or orphan children are to receive one-half the pension, under the same regulations. In case a contributor leaves the bank before he is eligible to the pension he is to receive back the full amount of his contribution without interest. Special cases can be provided for at the discretion of the bank. Francis L. Hine is president of the First National; C. D. Backus, who is largely responsible for the pension plan, is cashier.

What the Italian Girl Needs.—One of the planks in the platform of Greenwich House, New York, for 1911, is to aid "the Italian girl to become conscious of her relation to other working girls. She must learn how to work in association. At present she is an economic menace to the American working girl." Of equal significance is a plank to "aid the forces at work to drive out from the home the manufacture of artificial flowers which makes the Italian tenement in the lower West Side a factory where the mother cannot give adequate attention to her children, and where the children work late at night. One of the kindergarten children at Greenwich House was found making flowers at 11 P. M."

An Indispensable Reference

IMMIGRATION

The discussion of the recommendations of the Federal Immigration Commission adds the greatest timeliness and importance to Prof. Emily Green Balch's book

OUR SLAVIC FELLOW CITIZENS

Here we have a study of a great group of immigrants in the peasant homes and in America. They are of the races now coming to us in greatest numbers, and they are largely laborers. They are studied sympathetically but critically by one who knows them well. They not only form parts of the "foreign quarters" of great cities and industrial towns, but are scattered over the continent as farmers, shopkeeepers, workers in the trades.

A more valuable volume for American readers during the present immigration discussion could scarcely be penned.

At its publication the London *Spectator* hailed "Our Slavic Citizens" as "a remarkable example of the thoroughness with which economic investigation is carried on in the United States. . . We can warmly recommend this book to every one who is interested either in the future of the Slavs, with which the future of Europe promises to be more and more bound up, or in the conditions and prospects of European immigrants in the New World."

8vo, 550 pages; 49 full-page illustrations of Slavic types and scenes in Europe and America. Price, postpaid, $2.50.

The Thin Crust Of Civilization

Newark, Ohio, a fine community of 20,000 people, has just been the scene of a most terrific struggle with downright barbarism. The story is told by Ray Stannard Baker in the April American Magazine.

INTIMATE DETAILS of a great EXPRESS MONOPOLY

The personalities of its backers, both Wall Street and political—the master deals and contracts that brought it to its present huge proportions—the immense profits and private fortunes that have been made from it—intimate details of this character make the story of the United States Express Company so interesting and so necessary to you and all of us, the story told by Albert W. Atwood in the April American Magazine.

But most important of all, it shows you one reason why we do not have a parcels post in this country and one reason why the post-office department loses money.

If any man thinks that the Crust of Civilization is not thin, let him read Mr. Baker's stirring narrative of how Newark got into the grip of the "tough" elements, how it ran downhill to destruction, chiefly by the whiskey route, and how it finally reached the crisis in a barbaric lynching scene.

Then came the reaction, the closing of the saloons, the slow, manful struggle uphill—the patching up of the breaks in the crust of civilization.

Mr. Baker has breadth of view and a genius for getting at what is suggestive. His article will be found to be dramatic and yet exceedingly thoughtful. It is the most extraordinary document on the temperance question published in years.

And Many Other Stories

A novel by Frances Hodgson Burnett. An article on Carnegie's Peace Donations, by Paul Kellogg. An intense short story by James Oppenheim. The Iniquities of the Personal Tax System, by Albert Jay Nock. A beautifully illustrated theatrical department, by Walter P. Eaton. The Humor of Indiana Politics, by Kin Hubbard. Some interesting, important results of "Scientific Business Management" described by its originator, Frederick W. Taylor.

Pictures of interesting people, editorials, many short stories and features too numerous to mention,—the April American Magazine is full of them,—features of the kind that make The American such a great magazine.

IN MEMORIAM

ROBERT TREAT PAINE

MEMBER CHARITIES PUBLICATION COMMITTEE

FINANCIAL APPEAL

To carry out its educational work for the publication year 1910-11 Charities Publication Committee needs (above receipts from business and other sources) the sum of fifteen thousand dollars ($15,000).

CO-OPERATING SUBSCRIBERS

One hundred and sixty-eight subscribers to the magazine became co-operators in the educational work of the committee by paying $10 each in 1909–10. This body of subscribers is giving national and democratic backing to the non-commercial work of the committee. We hope to secure 300 co-operating subscribers in 1910–11, thus meeting one-fifth of the educational outlay needed.

GENERAL EDUCATIONAL FUND

To meet the balance ($12,000) we appeal for contributions in sums of from $25 to $1000. It is through the sustained and generous support of contributors to this fund that the educational work of the committee has developed beyond the limitations of advertising and subscription receipts. This development has been demonstrably practical and effective.

ENDOWMENT FUND

Charities Publication Committee is in position to administer an endowment fund to place its educational work on a permanent basis. We believe that there are few opportunities for a large gift to show such imagination, provoke such co-operation and exert so practical an influence for the well-being of America.

CHECKS

Checks should be made payable to Frank Tucker, treasurer, Charities Publication Committee, 105 East 22d Street, New York.

CHARITIES PUBLICATION COMMITTEE

DEPARTMENTS OF WORK

THE SURVEY (formerly "Charities and The Commons"): A weekly journal of constructive philanthropy.

PRESS SERVICE: Co-operating with 100 first-class newspapers throughout the country in the publication of weekly articles on some phase of living conditions and their improvement; press sheets, news letters, editorial information bureau.

BOOK PUBLISHING: Publishers; Publication agents, Russell Sage Foundation; Sales agents, all books of interest to social workers.

FIELD WORK: A flexible staff whose investigations range between prolonged scientific research on the one hand, and newspaper and magazine journalism on the other.

[CLOSED]

THE PITTSBURGH SURVEY (1907–08): A close range investigation of the ranks of the wage-earners in the American steel district.

FIELD DEPARTMENT (1905–09): For the extension of organized charity. Transferred to Russell Sage Foundation.

TO READERS AND CONTRIBUTORS:

At no juncture in the five years since Charities Publication Committee was launched in its national work have the opportunities for constructive usefulness pressed in upon us as they do now. And at no time has the every-day business proposition of financing such a piece of work in education and publicity laid greater claim upon the cool judgment of its administrators and the generosity of its friends.

The volunteer contributions which are made to the pages of THE SURVEY, in the way of articles and reports, are versatile and generous. Perhaps no magazine of its calibre and circulation has ever been published without paying for articles. This is one indication out of many showing the exceptional gifts of time, effort and hardly-won facts which are put at the disposal of the editors. To make this co-operation—this energy freely given—effective, these offerings must be printed in ways that will be read, and must be put before an increasing number of readers. Otherwise, our opportunities are misused. But to utilize them, even to a moderate degree, costs more money than the present commercial receipts of the periodical afford. Our circulation, steady in its growth, is in that tantalizing stage between hay and grass, when subscription receipts scarcely pay for the paper, ink and printed type which must be furnished to get new readers and to hold old ones; and when advertising receipts are only stubbornly responding to the efforts put forward to increase them.

Moreover, there are lines of intensive work in our field, in the way of gathering and critically analyzing facts more promptly than can be done by the agencies of scientific or historic research, more fundamentally and consecutively than is done by the general press, which even with a large circulation would not be a legitimate charge against business receipts. They are intrinsically non-commercial. They have, nevertheless, such proved educational values that we purpose to develop them. To this end, we have received notable contributions from individuals and organizations in the past, and to this end, our present appeal is issued.

It is a work which we believe to be as distinctly and sanely educational as a university or a library or a research hospital.

"A YEAR UNDER A NEW NAME"

Last April, Charities Publication Committee issued a special report of one hundred pages covering the first 12 months of the magazine under its new title—THE SURVEY. The edition was sent out to the full mailing list on that date. Two thousand additional impressions were struck off, and copies may be obtained by anyone interested in this full statement of the history and scope of the Committee.

PRESS SERVICE

It is only necessary at this time to refer briefly to the means through which the Committee is attacking its educational problem—its press service, its weekly journal magazine service, and its book distribution.

All three are essentially publication work, beginning with the short "fillers," the broadsides and the press sheets which are sent out to half a thousand newspaper offices. One hundred leading newspapers co-operate in the publication of a series of weekly articles bearing on different phases of living conditions, papers of the standing of the Louisville Courier Journal, The Springfield Republican and Kansas City Star. The papers in this group are scattered throughout 37 states and 109 cities. They have an aggregate daily circulation of over 2,900,000. The article of a given week may be handled by comparatively few papers, or it may appear in a majority of them.

The general work of the Press Service is far from mechanical; material is worked up for groups of trade papers and in connection with special state movements for reform; editors throughout the country are continually writing for suggestions and data that will bear upon their local conditions. The Congregationalist, The Advance, The Living Church, The Christian Advocate and The Churchman are among the church periodicals whose departmental editors co-operate from week to week. During the past year a further line of co-operation has been developed in connection with press services which supply local Methodist and Baptist papers with news of social work.

Through the officers and field agents of the Russell Sage Foundation, the National Conference of Charities and Correction, the National Consumers' League, the National Child Labor Committee, the National Association for the Study and Prevention of Tuberculosis, etc., we are kept in touch with local conditions and receive many "leads" that help in distributing material to the best advantage. Editorials and news clippings are followed up promptly with "stories" which relate city or state happenings to national movements.

SOME RECENT LETTERS FROM COPY DESKS

From the news editor of the Richmond Evening Item [Indiana]:
Your weekly letter has become an established feature in our Saturday publication.

From the managing editor of the Providence Journal [Rhode Island]:
We are always pleased to get the Survey articles and consider them most valuable and interesting material from every standpoint.

From the editor and publisher of the Reading Herald [Penna.]:
We have used much of your press bureau matter, so much in fact that I have sometimes feared we are overdoing the thing. I am personally much interested in the sort of matter that you publish and was a reader and editorializer upon what was then "Charities" long before most of the newspapers discovered it.

From the managing editor of the Youngstown Telegram [Ohio]:
We have failed to get the last two letters and fear that the service has been cut off. The copy has been used regularly.

From the editor of the San Antonio Daily Express [Texas]:
I find it useful and I believe helpful in our circulation territory.

From the associate editor of the Sioux Falls Daily Argus-Leader [South Dakota]:
Your "copy" is the easiest to handle we ever saw in that line.

THE MAGAZINE

It is, of course, this newspaper audience which is the largest reached by THE SURVEY. The magazine itself goes to 15,000, sometimes 20,000, people weekly. This is not a large circulation if it is compared with that of the successful general periodicals. A better comparison is to consider the difficulty and expense which the various national movements for health, housing reform, child labor, the improvement of living and industrial conditions, etc., would be put to should they endeavor to reach an audience of 15,000 every week, or every time they had something important to say on the subjects within their fields. This is effected through THE SURVEY, and the people reached are a picked group—those who will not only read but act.

It is immensely important that the thinkers and workers for social advance in many states and cities are kept abreast in a consecutive and enlivening way with these movements. Locally and nationally, they are to be counted as indispensable vertebræ in the backbone of public opinion. To meet this demand and need effectively is an exacting undertaking in editorial rooms and publishing office. It is a work which is increasingly difficult with the spread of social causes, the organization of new lines of activity, and the settling down of the older movements from a period of

evangelization to a period of technique and sound conviction. It is first of all a mechanical proposition, of getting into a few pages the material which will satisfy the professional worker, will strike and hold the attention of the outsider and will not overburden the general reader. It is a research proposition, demanding a staff which can, without too great an expenditure of time and money, get at and present the underlying facts and tendencies in charitable, civic and labor conditions. It is essentially a financial proposition, demanding and justifying the raising of money beyond the business receipts of a small if growing circulation.

THE MAILING LIST

The net paid mailing list of THE SURVEY is 13,000. The core of a magazine's circulation is its list of renewing subscribers. New readers may be added in hundreds, or they may fall off in disheartening groups; but if this central core expands consecutively, you are sure of substantial growth. For the last four years THE SURVEY has each year added over one thousand names, net, to its roster of regularly renewing subscribers.

THE SURVEY has, however, reached beyond the group of people bound up in the subjects it presents. While a host of common ties hold such friends to the magazine, this is not the case with many outsiders who are enrolled each year and whose interest may be transient. Such subscribers cost more to get and are not so permanent. With respect to these newcomers, the number of discontinuances has become a radical problem. The material which will satisfy one clientele will overtax the reading time of another; the subjects which are eagerly sought after by one are time-worn to another; the treatment which will fasten the attention of a man who has given no thought to such matters—and by so doing will increase the body of informed public opinion by one—is considered sensational by another; the scrupulousness which satisfies some readers by stating all the related facts in a case, merely spoils the story for others, and takes the edge off their interest. The problem of THE SURVEY is to hold and serve these readers; the least tenacious of them are the ones who need the magazine most; but this is not to be done by merely striving to please; the editors must set and keep an even course.

In such a transitional period, THE SURVEY bespeaks the consideration, the suggestions and the subscriptions of its friends. The effort during the coming year will be to keep down the number of pages to the minimum and at every point to make the journal a time saver; to add to the physical attractiveness, the readability and the orderliness of the material presented; to crystallize the news developments of the year in the weekly issues, making the magazine numbers appeal directly to the general readers, and bringing out in mid-monthly numbers the more fundamental articles and discussions useful to the professional groups represented.

The publication of the Pittsburgh Survey issues and the change of name made the spring of 1909 the largest circulation months in our history. Two thousand five hundred readers were added in a single quarter. While there have been no such spurts the past year, the monthly tallies for the other quarters all show fair increases.

CIRCULATION DOUBLES

THE SURVEY has doubled in circulation in the past three years. 1910–11 opens with the largest October we have ever had, and the largest month, save one, in the record of the magazine.

BOOK DISTRIBUTION

During the publication year ending September 30, 1910, no less than 150 books in the field of charitable and social work were reviewed in THE SURVEY. The editors have two responsibilities to meet with respect to this increasing volume of printed matter. We must put before our readers the gist of important contributions to the literature in this field, and we should exercise a critical faculty with respect to them which shall serve to raise standards. The Publication Committee, in connection with the magazine, is attempting a third service, that of book distribution—of securing a hearing for volumes which have a message or method for practical workers. The acquaintance which THE SURVEY has with people throughout the country puts the Committee in an especially fortunate position for this work. Its most important commission has been as publication agent for the Russell Sage Foundation. As such, during 1909–10, it published 12 titles, and had bound, ready for October delivery, the set of four volumes on Correction and Prevention, edited by Prof. Charles R. Henderson, in connection with the International Prison Congress, together with a digest of juvenile court laws and Dr. Hart's book on cottage and congregate institutions. These illustrate the contributions to method and current history which make up one major category of books issued by the Russell Sage Foundation. Into other volumes the Foundation is putting the results of investigations made by its own staff, or by other organizations with its assistance. These books form a shelf of research, thorough and scientific, but none the less timely and important in their bearing upon current problems and the drafting of legislation. For instance, Miss Eastman's "Work-Accidents and The Law" and Dr. Frankel's "Workingmen's Insurance in Europe" give both historical background and a great body of timely facts from America, for the commissions and legislative committees which, in seven states and for the national government, are examining into our systems of relief and compensation for death, injury and disease in industry.

BOOK LISTS

The total books sold by or through Charities Publication Committee for the year ending September 30, 1910, was 11,656, made up as follows:

Russell Sage Foundation publications (15)	4,775
Charities Publication Committee books (4)	3,059
Books by other publishers (jobbing)	3,822

This work involves no expense to the Committee; and the jobbing business is bringing in a small income. It has enabled us to secure a revenue from our advertising pages, by selling books on commission.

A list of the Sage Foundation Publications appears on the back cover of this report.

Under its own imprint the Committee has published during the past year:

"Social Forces," by Edward T. Devine.
"How Two Hundred Children Live and Learn," by R. R. Reeder.
"Our Slavic Fellow Citizens," by Prof. Emily Greene Balch.
"Visiting Nursing in the United States," by Ysabella Waters.

The first three first appeared in serial form in the magazine. Professor Balch's book, the results of two years' investigation, has notably impressed the reviewers. The London Spectator, for instance, gave it a review of more than a page, the New York Sun over five columns in a Sunday edition, and the Springfield Republican a column and a half in addition to a thoughtful editorial.

The 3822 books of other publishers which we have distributed run from big governmental publications, and series like Booth's "Life and Labour in London," to pamphlets sold in hundred lots.

DOVETAILING THE PUBLICATION WORK

How naturally these three lines of publication work—press service, magazine and book publishing—are bound up in each other can be readily illustrated. The facts gathered by Miss Eastman for the Pittsburgh Survey were the first comprehensive body of data as to the actual working out of the old employers' liability laws in vogue in America. The gist of them was brought out in THE SURVEY (then *Charities and The Commons*), and attracted widespread attention. The report was published in its complete and final form by the Russell Sage Foundation as "Work-Accidents and The Law." A series of six short special articles on accidents in the different industries, made up from the chapters, was handled in a group of American newspapers during the past winter. For each purpose, the form of presentation was, of course, different. A point developed in the book at the length of a chapter was reduced to a paragraph for the press. But in all, the effort was made to combine graphic presentation with a thorough method of case study —to make people stop and think, to give them a sound body of information—and to help them to see the meaning of things in human lives.

WORK OF INTERPRETATION

All this is a work of interpretation. For purposes of editorial audit on the magazine we have mapped the work out into nine categories. These of course overlap to an extent, and for a sharper definition of their scope the reader is referred to the statement of April, 1910. It may be interesting here to run over the different

headings and indicate under each of them, by way of illustration, four or five distinctive contributions which THE SURVEY and those who co-operate in it have made during the past 12 months:

a. As interpreter of inter-related social movements, charity organization, the prevention of tuberculosis, housing reform, and so on.

The work of twelve national and state conferences of charities and correction reviewed—of fifty charity organization societies—of conferences on prison reform, probation, juvenile courts, hygiene, tuberculosis, play, health, alcoholism, sanitation—two notable special numbers: one summing up the ten years' work since the founding of the juvenile courts; the other presenting the recent pioneering in the joint work of physician and jurist in dealing with the inebriate.

b. As interpreter of civic and social advances in every part of the country to every other part.

The finished work of Boston's Finance Commission and the program of its new "1915 Movement"—the human ideals which Oklahoma is putting into its laws—the children's charter in England—Atlanta's tuberculosis dispensary for Negroes—the Los Angeles children's crusade for more school facilities—the state inspection of bakeries in Wisconsin—the new program with respect to vice in Chicago—the District of Columbia's plan for paying prisoners wages.

c. As interpreter of different groups in society to one another.

What the Italians are doing in the fight against tuberculosis—the Jewish Agricultural Fair—the Immigrant Girl in Chicago—and especially the work in social photography through which Mr. Hine is giving human and artistic expression to racial and economic conditions.

d. As interpreter of the social work of the several professions.

Law and Social Science—the Church and Organized Charity—the Public Library as a Social Force—the Postal Bank as Savings Stimulators—the Social Work of the Hospitals—Democracy in Religion—to name a half dozen titles out of many.

e. As interpreter of social invention in industry.

The system of safety protection developed by the United States Steel Corporation—protection and relief in mine disasters—the work of State Commissions on Employers' Liability and Workingmen's Compensation—the State Commission on Industrial Diseases in Illinois.

f. As interpreter of movements for the betterment of industrial relations and conditions.

The ten hour decision by the Illinois Supreme Court—the cutting down of Sunday work in the steel industry—experiments in industrial training—Professor Taylor's unique department: Industrial Forces—a monthly review of social and labor legislation—the program of occupational standards, covering hours, wages, health conditions, compensation for accidents, etc., put before the National Conference of Charities and Corrections;—this last, a special number.

g. As interpreter of social research.

The survey of conditions in the great Polish district of Buffalo is an example. Here was an inquiry carried on by a progressive local committee and involving the expenditure of several thousand dollars. We were able to present the gist of the findings in a way which brought out the whole problem of common labor and the inadequacy of its payment as a basis for American family life.

h. As interpreter and advocate of reform and social advance, where none other exists.

One of the best examples of this work has been the "shop early" campaign which THE SURVEY has managed for the last four or five years in co-operation with the National Consumers' League. Through our press service, we are able to enlist far in advance of the holiday season the co-operation of a group of leading American editors, department stores throughout the country, women's clubs, cartoonists, etc.

i. As quick investigator and interpreter of the facts of living conditions while they are in process rather than after they have happened.

Professor Taylor's report on the Cherry Mine disaster—the tour of the construction camps of New York State by Miss Wald, Miss Kellor and Mr. Hine, which has resulted in important reforms—Dr. Hutchinson's interpretation of the hygienic aspects of the shirtwaist strike in New York—Miss Dinwiddie's analysis of conditions among Trinity's Tenements.

FIELD WORK

This fragmentary recapitulation of material handled brings us to the second chief phase of the work of Charities Publication Committee. To quote from the report of 1905, that work is—

> To get at the facts of social conditions and to put those facts before people in ways that will count.

The various points taken up in the preceding pages have dealt mostly with the question of putting the gist of facts and movements before the public. There remains to be shown, in a very skeleton sort of way, something of methods and plans for getting into touch with the realities which underlie this subject matter. Our 100 page statement of last April reviewed two important lines of extension work. The Committee made its report on the Pittsburgh Survey, which was carried out under its supervision, and also on the close of its Field Department, which was initiated in 1905 and through which the charity organization societies of the country have co-operated in a national plan for spreading the spirit and operations of

organized charity. This latter work was relinquished by the committee in order that it might be formally constituted as a stated department of the Russell Sage Foundation.

Relieved of these outside responsibilities, the present publication year is being given over to developing the departmental organization of the magazine along more effective lines than ever before. On the business side, a competent advertising man has been engaged; in the press service, a man of experience in both newspaper and civic work will devote the major part of his time to this one responsibility.

On the reportorial side the plan is to slowly develop a flexible investigating staff which can get at facts quickly and can write, which can "nationalize our Pittsburgh work and make a current, stirring, sane American survey." We can announce the beginnings of such a staff. By transferring all business work from our western office to the New York headquarters, a considerable share of the time of Mr. Graham Romeyn Taylor, who is familiar with conditions and movements throughout the west, is released for interstate work in the Mississippi Valley. Through a gift, the Committee has been enabled to engage, for special lines of industrial inquiry, Mr. John A. Fitch, whose investigation of conditions in the steel industry were an integral part of the Pittsburgh Survey, and who has since been an expert agent of the New York Department of Labor. A catalog of investigations, through which we hope to keep in touch with all lines of social research carried on throughout the United States, giving our readers the meat of it, is an important feature in the plan. This will be developed by Mr. Shelby M. Harrison, who, like Mr. Fitch, was a member of the staff of the Pittsburgh Survey, and who comes into the work with a graduate equipment in statistical method. These are so many initial steps toward carrying out the plan proposed last spring; namely—

> To develop a staff of investigator-reporters whose work will range between prolonged scientific research on the one hand and newspaper and magazine journalism on the other.

Author, Economics; The Practice of Charity; The Principles of Relief; Efficiency and Relief; Misery and Its Causes, Social Forces.

CHARLES P. EMERSON.....1909-.....Contributing Editor; Public Health
Amherst, 1894; Johns Hopkins, M.D. 1899; studied in Universities of Strassburg, 1900, Basel, 1901, Paris, 1903.
Formerly associate in medicine Johns Hopkins, and resident physician Johns Hopkins Hospital; superintendent Clifton Springs (N. Y.) Sanitarium, 1908–; assistant professor of medicine, Cornell University, 1909–.
Member American Medical Association.
Author, Pneumothorax; Clinical Diagnosis; Hospitals for Children; Essentials of Medicine.

JOHN A. FITCH.....1910-.....Editorial Staff; Investigations
Yankton College, B.A. 1904; graduate student in political economy, University of Wisconsin, 1906–7, fellow 1908–9.
Instructor (history and civics) Weeping Water (Nebr.) Academy, 1904–6; member staff of The Pittsburgh Survey, 1907–8; expert New York State Department of Labor, 1909–10.
Author: The Steel Workers.

BERNARD FLEXNER.....1909–.....Contributing Editor; Juvenile Courts

University of Louisville, LL.B.; further study in law in the University of Virginia.

Member and chairman Louisville Juvenile Court Board; member board of trustees Association Sanatorium; board of directors Louisville Anti-Tuberculosis Association.

HOMER FOLKS.....1897–.....Contributing Editor; Children and Probation

Albion, A.B. 1889; Harvard, A.B. 1890.

Superintendent Children's Aid Society of Pennsylvania, 1890–3; secretary State Charities Aid Association of New York, 1893–1901, 1904–; assisted United States Military authorities in reorganizing public charities of Cuba, April–May, 1900; commissioner Public Charities, City of New York, 1902–3; president New York State Probation Commission, 1907–.

Alderman from 29th district, New York, 1897, 1898; chairman Municipal Charities Section, National Conference Charities and Correction, 1898; president National Conference Charities and Correction, 1911.

Author, History of the Care of Destitute, Neglected and Delinquent Children in the United States During the Nineteenth Century.

SHELBY M. HARRISON.....1910–.....Editorial Staff; Investigations

Northwestern, B.A. 1906; graduate student, Boston University 1906–7; university scholar in economics, Harvard Graduate College, 1907–8, 1908–9.

Bank work, 1895–1899; graduate secretary, Boston University Y. M. C. A., 1906–7; member staff of The Pittsburgh Survey, 1908; executive secretary, Federated Boys' Clubs, Boston, 1909.

AMES P. HEATON.....1910–.....Editorial Staff; Press Service

Columbia, B.A. 1905, M.A. 1906, LL.B. 1907. Admitted to New York bar 1907

In office of Edward M. Grout and Paul Grout, Attorneys, 1907; member of staff Bureau of Municipal Research in New York and Philadelphia, 1907–10.

Settlement classes, Speyer School, Teachers College, New York, 1902–4; resident University Settlement, New York, 1905–7.

LEWIS W. HINE.....1908–.....Staff Photographer

Oshkosh (Wis.) State Normal School, 1900.

Teaching in Public Schools previous to 1898; Teaching (Nature Study and Photography) Ethical Culture School, New York City, 1901–8; professional Social Photographer, 1908–.

MARTHA HOHMANN.....1910–.....Cashier

BELLE LINDNER ISRAELS (MRS. C. H.) 1906–10.....Editorial Staff

Assistant to Committee on Entertainments and Exhibitions, Educational Alliance; publicity work for the United Hebrew Charities; previous to 1906.

Assistant secretary, N. Y. State Conference, 1906, 1907; board of directors Council of Jewish Women, board of directors and executive committee Travellers' Aid Society, 1907–; board of governors Prospect House, Yonkers; executive committee Women's Conference, Society for Ethical Culture, 1907–; chairman committee on Lakeview Home for Girls; chairman committee on Amusements and Vacation Resources of Working Girls, 1909–.

PHILIP P. JACOBS.....1909–.....Contributing Editor; Tuberculosis

Syracuse, A.B. 1903; Drew Theological Seminary, B.D. 1908; Columbia University, Ph.D. 1910.

Editorial staff Binghamton (N. Y.) Republican, 1903–5; Hospital Committee State Charities Aid Association, 1906–8; assistant secretary National Association for the Study and Prevention of Tuberculosis, 1908–.

Author, New Hospitals Needed in Greater New York; Ambulance Service of Greater New York; The Campaign Against Tuberculosis in the United States; German Sociology.

ALEXANDER JOHNSON.....1905–..Contributing Editor; Public Care of Dependents

Attended private schools and Owen's College, Manchester, England.

General secretary Associated Charities of Cincinnati, 1884–1886; general secretary Charity Organization Society, Chicago, 1886–1889; secretary State Board of Charities of Indiana, 1889–1893; superintendent Indiana School for Feeble Minded 1893–1903; lecturer Chicago School of Civics and Philanthropy, 1903–; associate director New York School of Philanthropy, 1904–1906; lecturer New York School of Philanthropy, 1906–; general secretary National Conference Charities and Correction, 1904–.

Director and friendly visitor Associated Charities of Cincinnati, 1881–1884; chairman National Conference Committee on Charity Organization, 1885, 1886; chairman National Conference Committee on Feeble Minded 1896, 1903; secretary National Conference, 1891, 1892, 1893; general secretary International Congress of Philanthropy, Chicago, 1893; president National Conference, 1897.

Compiler of The Guide to the Study of Charities and Correction; editor, Conference Proceedings, 1904–.

FLORENCE KELLEY.....1903–.....Contributing Editor; Child Labor

Cornell, 1882; Northwestern University Law School, 1896.

Special agent Bureau of Labor Statistics of Illinois, 1892; state Inspector of Factories of Illinois, 1893–7; secretary National Consumers' League, 1899–.

Member New York State Commission on Distribution of Population; colleague The Pittsburgh Survey, 1907–8.

Author, Some Ethical Gains Through Legislation; translator, Friedrich Engel's Condition of the Working Class in England; Editor Edmond Kelly's Twentieth Century Socialism.

ARTHUR P. KELLOGG.....1903–.....Managing Editor

New York School of Philanthropy, 1903.

Five years' newspaper experience in Michigan and Chicago; press representative, Michigan Legislature, 1900–1; assistant editor, *Charities and The Commons*, 1903–06; business manager, 1906–9; managing editor, 1910–.

Assistant secretary National Conference Charities and Correction, 1906, 1907; New York State Conference, 1904, 1905; member Press Committee, National Conference Charities and Correction, 1908; member Committee of One Hundred on National Health.

PAUL U. KELLOGG.....1902–.....Associate Editor

Special student, School of Political Science, Columbia University, 1901–5; New York School of Philanthropy, 1902.

Reporter and city editor, Kalamazoo (Mich.) Daily Telegraph, 1898–1902; director The Pittsburgh Survey, 1907–8.

Assistant secretary National Conference of Charities and Correction, 1904, 1905; member Board of Managers Co-operative Social Settlement; Committee for Improving the Industrial Condition of the Negro in New York; Commission on Social Service, Federal Council of Churches of Christ in America; chairman, Committee on Occupational Standards, National Conference Charities and Correction, 1910; member Committee on Congestion of Population in New York.

Editor, six volumes, The Pittsburgh Survey.

CONSTANCE DAVIS LEUPP.....1907–.....Circulation Manager

Bryn Mawr, B.A. 1903; New York School of Philanthropy, 1907.

Clerk, University of Chicago Press, 1906–07.
